ROTH, FRIEDRICH CHRISTOPH (1840). A German sculptor, born at Nuremberg. Although for six years a pupil of Siekinger and then of Knoll in Munich, he was largely self-taught. In 1866 he attracted notice through the publication of *Der anatomische Atlas*, an instructive work for artists, and soon obtained numerous commissions for portrait busts and statues, among which were those of Bismarck (the first made of from life by any sculptor), of the philosopher Fenerbach, the monument to the naturalist Siebold, at Würzburg, and some in the military museum of the Royal Arsenal in Munich. His impressive life-size group 'Dying' (1899) was acquired by the Zúric Museum. He was a married several children, and made royal professor.

ROTH, HERMANN LEOPOLD ABBOT (1818-92). A German zoologist and conchologist, born in Heidelberg. In 1848 he went to Berlin as private docent of zoology, and he was made professor there in 1867. Roth published *Die Gasteropoden* (1864), *Beiträge zur Petrographie der germanischen Gasteropoden* (1869-84), and *Allgemeine und kochenselbst Gasteropoden* (1879-94).

ROTH, RUDOLF VON (1821-95). A German Orientalist and Sanskrit scholar. He was born in Stuttgart and was educated at Tübingen and Berlin. He continued his studies in Paris and London, and in 1848 received the appointment of extraordinary professor of Oriental languages in Erlangen University, becoming full professor and principal librarian in 1856. His chief work is the monumental *Sanskrit Wörterbuch* (7 vols., Saint Petersburg, 1853-95), compiled in collaboration with Otto von Böhtlingk (q.v.) and published by the Saint Petersburg Academy of Sciences. He edited Yaska's *Nirukta* (1852) and, with Whitney, the *Atharva Veda* (1856-57). His original works include: *Zur Litteratur und Geschichte des Veda* (1846); *Der Atharva-Veda in Kaschmir* (1875); *Ueber Yagna 3I* (1876).

ROTHE, RICHARD (1799-1867). A German theologian. He was born at Posen, and became successively member, professor (1828), director, and ephorus (1832) of the theological seminary of Wittenberg. In 1837 he was nominated professor of theology at the University of Heidelberg, which position he exchanged in 1849 for a chair in Bonn. In 1854 he returned to Heidelberg. One of his well-known works is the *Theologische Ethik* (2d ed. 1869), a complete system of speculative theology. Another book is *Die Anfänge der christlichen Kirche*, of which only the first volume appeared (1837), and which, by the peculiar standpoint assumed by the author regarding Church and State, evoked many fierce counter-treatises. His posthumous works are his lectures on *Dogmatik* (1870); *Predigten* (1872); *Vorlesungen über Kirchengeschichte und Geschichte des christlich-kirchlichen Lebens* (1875-76); *Abendandachten über die Pastoralbriefe* (1876-77); *Der erste Brief Johannis* (1878); *Theologische Encyclopädie* (1880); *Geschichte der Predigt* (1881); *Gesammelte Vorträge* (1886). Consult his *Life* by Nippold (Wittenberg, 1873-75).

ROTHENBURG OB DER TAUBER, RÖTENBÖRCK ÖP DËR TAU'BËR. A town of Bavaria, Germany, 30 miles south-southeast of Würzburg (Map: Germany, C 4). It is a very ancient place, and is still surrounded by well-preserved fortifications. It manufactures baby carriages, toys, gold, and silver ware, agricultural implements, and wine. Rothenburg was a free Imperial city from 1274 to 1803. Population, in 1900, 7,923.

ROTHERHAM, RÖTH'ËR-AM. A manufacturing town in the West Riding of Yorkshire, England, 6 miles northeast of Sheffield, on the Don (Map: England, E 3). The Free Grammar-School, founded in 1584 and restored in 1858, and the court-house are handsome buildings. There are also an Independent College, a mechanics' institute, an infirmary, and two fine parks. The town owns its gas and water works, and maintains libraries, a museum, and technical schools. Neighboring coal and iron mines furnish materials for the manufactures, the chief of which are stoves, grates, glass, and pottery. The town dates from the Roman period. During the Civil War it sided with the Parliamentarians, was taken possession of by the Royalists in 1643, and retaken by Parliament after Marston Moor. Population, in 1891, 42,100; in 1901, 54,300. In the vicinity are the well-preserved remains of

Roche Abbey, erected in 1147, and Conisborough Castle, a massive ancient stronghold, mentioned in Scott's *Travels*. Consult Guest, *Historical Notices of Rotherham* (London, 1879).

ROTHERMEL, RÖTH'ËR-MËL, PETER FREDERICK (1817-95). An American historical painter, born at Nescopeck, Pa. He was a pupil of Bass Otis in Philadelphia, and at first painted portraits, but soon devoted himself to historical subjects. From 1847 to 1855 he was director of the Pennsylvania Academy, and in 1856-59 lived in Europe—for two years in Rome. His best works include: "Columbus Before Queen Isabella;" "The Christian Martyrs;" the "Battle of Gettysburg" (1871), Memorial Hall, Fairmount Park, Philadelphia, a gigantic canvas, one of the attractions at the Centennial Fair; and the "Embarkment of Columbus," Pennsylvania Academy. Rothermel was a very prolific painter, possessing some talent for composition, but was deficient in real technical ability. He died near Pottstown, Pa.

ROTHERSAY, RÖTH'SÄ. A seaport and popular watering-place, the capital of Buteshire, Scotland, situated on the island of Bute, at the head of a deep bay in the Firth of Clyde, 40 miles west of Glasgow (Map: Scotland, C 4). The bay offers safe anchorage and is spacious enough to contain the largest fleet, and is regularly entered by nearly all the Clyde steamers to and from the West Highlands. In the middle of the town are the ruins of Rothersay Castle, built about 1103. Rothersay is a favorite resort for invalids suffering from pulmonary affections. Fishing is the employment of a number of the inhabitants, and ship-building is carried on. Population, in 1901, 9,323. Consult Roger, *Rothersay Castle* (London, 1896).

ROTHERSAY, DAVID STEWART, DUKE OF, and EARL OF CARRICK (c.1378-1402). A Scotch lord, eldest son of Robert III. of Scotland. Upon his father's coronation he became Earl of Carrick; and in 1399, after governing Northern Scotland for more than two years, was made Duke of Rothersay and became Regent of Scotland. About the same time he married Elizabeth, daughter of the Earl of Douglas, thus jilting his fiancée, daughter to the Earl of March, and bringing on Scotland an expedition of revenge led by Henry IV. of England, which accomplished nothing, thanks to Rothersay's strategy and coolness. In 1402, when he had been regent for three years, Douglas, to punish Rothersay's infidelity to his wife, joined with the Duke of Albany, captured the Lord Lieutenant at Straththyrum and imprisoned him in Falkland Castle, where he died of starvation or—less probably—of disease.

ROTH'ROCK, JOSEPH TRIMBLE (1839—). An American botanist, born in McVeytown, Pa. He graduated at Harvard in 1864, served in the Civil War as captain of Pennsylvania cavalry, and in 1867 completed a course in medicine at the University of Pennsylvania, where, after service on the Wheeler geographical survey, he became professor of botany. He held a like post in the Pennsylvania Agricultural College and became State Commissioner of Forestry. Rothrock published *Flora of Alaska* (1867), *Botany of the Wheeler Expedition* (1878), and *Forestry Reports of Pennsylvania* (1895-97).

ROTHSCHILD, rôt'shilt, *Eng. pron.* rólts'child. A family of European bankers and financiers. The founder of the family, **MAYER ANSELM**, was born at Frankfort-on-the-Main, in 1743, the son of a Jewish merchant. After some experience as clerk in a counting house at Hanover, he returned to Frankfort and opened a money-exchange business. Being a man of good character and considerable information, he attracted the attention of the Landgrave (afterwards Elector) of Hesse-Cassel. In 1806, when the Elector fled before the French, he intrusted Mayer Anselm with the care of his large private fortune. The merchant fully justified the trust reposed in him; his fame as a financier spread, and he accumulated a large fortune. His three sons, Anselm, Salomon, and Nathan, became associated with him in business, and later on his two youngest, Jakob and Karl, were taken into partnership. Mayer Anselm died at Frankfort, September 19, 1812. All his sons were made barons by the Emperor of Austria in 1822. The oldest, **MAYER ANSELM** (1773-1855), carried on the business at Frankfort, where he died without issue. The Frankfort business was carried on by the sons of Karl, on the death of the younger of whom in 1901 that firm went into liquidation. **SALOMON** (1774-1855) became head of a banking establishment at Vienna. He was succeeded by his son Anselm Salomon (1803-74), who was followed by his son Albert (1844—). The third son, **NATHAN** (1777-1836), founded a branch of the house at Manchester in 1798, and removed in 1803 to London. Large sums of money placed at his disposal were invested with so much judgment that his capital multiplied with great rapidity. **KARL** (1788-1855) founded a banking house in Naples. **JACOB** (James) (1792-1868) became chief of the family interests in Paris in 1812, and was succeeded by his son Alphonse (1827—). In addition to their five principal establishments the Rothschilds established agencies in many other cities both of the Old and New World. **LIONEL** (1808-79), eldest son of Nathan, and head of the London house, was born in London, and was educated at Göttingen. He was elected to Parliament for London in 1847, 1849, 1852, and 1857, and at each election claimed the right to take the oaths and his seat in the House of Commons. The latter words of the oath—"on the true faith of a Christian"—he insisted upon omitting, "as not being binding on his conscience." He was then desired to withdraw from the House. In 1858 he was placed on a committee which was to hold a conference with the House of Lords, and this was virtually the means of establishing Jewish emancipation. The Commons sent up another bill, and the Lords gave way, merely taking measures to prevent the admission of Jews into the Upper House. Lionel Rothschild thereupon (July, 1858) took the oaths and his seat. He sat till 1868, when he was defeated, but was reelected in 1869, and again lost his seat in 1874. The descendants of the five brothers still carry on the large financial and banking operations of the firm. Lionel's son, **NATHANIEL** (1810—), was raised to the British peerage in 1885 with the title of Baron Rothschild. Consult: Reeves, *The Rothschilds* (London, 1887); De Schreb., *Geschichte des Hauses Rothschild* (Berlin, 1892); Demachy, *Les Rothschilds* (Paris, 1896).

ROTH'WELL. A town in the West Riding of Yorkshire, England, 4 miles south of Leeds (Map: England, E. 3). It has collieries, stone quarries, and rope and match factories. Population, in 1901, 11,700.

ROTIFERA (New Lat. nom. pl. from Lat. *rotā*, wheel; *fero*, to bear) or Rotatoria. A group of minute animals, the 'wheel animals,' including many of the smallest of multicellular animals. They form a class of the phylum Trochilanthozoa (p. 1). They are almost without color, though with pigment eyes in most cases, and are generally microscopic. They occur in both fresh and salt water in all parts of the earth and many species are nearly cosmopolitan in their distribution. They are now regarded as highly specialized or degenerate worms, but their nearest relatives are still undetermined. Rotifers are only slightly elongated animals, covered with a smooth, hard, chitinous cuticle, generally marked off into six folds or sections, but there is no internal evidence of any true segmentation. The body usually ends in a prolongation popularly called a 'tail,' but known to zoologists as the 'foot.' It is composed of muscular and glandular tissues and often terminates in a pair of forceps by which the animal can attach itself to leaves and other objects. At the anterior end of the body are a pair of ciliated disks, with the mouth between them. These disks are rarely circular in outline, but are usually lobed on the margin, or may even be separated into two disks. The margin of each disk is surrounded by one or two bands of cilia, by means of the constant movement of which food is collected and swept into the mouth, and this movement is so rapid and uniform that the entire disk appears to revolve, and thus have arisen the various names of the group. Not only do these ciliated organs serve for collecting the food, but they are also the means of locomotion, rotifers swimming about gracefully, though not with remarkable rapidity, by means of them. They are entirely under the control of the animal. The digestive apparatus is well developed in the female, but in the males it consists of only the pharynx and cloaca. The nervous system consists of a cerebral ganglion with radiating fibres. Eyes are also present in many rotifers, but they are merely pigment spots, rarely provided with a lens. There is no circulatory system, but excretory organs are well developed. The female reproductive organs consist of a round or oval ovary, lying beside the stomach, and an oviduct opening into the cloaca. Two different kinds of eggs are produced, thin shelled summer eggs and thick shelled winter eggs. (See Egg.) Males are very rare, and in many species are as yet unknown to science. They are much smaller than the females and of much simpler organization, and are produced mostly by the last laying of small summer eggs, each season. The males are very short lived and hence have little need of a digestive canal. Consult: Parker and Haswell, *Fresh Water Zoology* (New York, 1897); Hudson and Gosse, *The Rotifera or Wheel Animals* (London, 1889). For an account of the rotifers of the United States, consult Jennings, "Rotifera of the United States," in *Bulletin of the United States Fish Commission for 1899* (Washington, 1900).

ROTROU, rô'trô', rô'trô' (1609-50). A French dramatist, born in Dieux. At nineteen he was successful on the stage with *L'hyppocrisie*.

1635). About 1635 Richelieu made him one of the famous five employed to write tragedies from his plots. Rotrou's earlier plays were mostly based on Spanish dramas, especially on those of Lope de Vega; and at a later period he was more clearly under classical influence. Corneille also influenced him considerably. The more important of his plays are: *La baguette d'oubli* (1635); *Chongneur et Doriste* (1635); *Venceslas* (1648), a tragedy which long held the stage; and *Cosroüs* (1648), probably his best tragedy. A complete edition was brought out by Viollet-le-Duc (Paris, 1820 et seq.). Consult: Jarry, *Essai* (Paris, 1868); Chardon, *La vie de Rotrou* (ib., 1884).

RÖTSCHER, röt'shër, HEINRICH THEODOR (1803-71). A German dramatic critic. He was born in Mittenwalde, studied at Berlin and Leipzig, and from 1828 to 1845 was professor in the Gymnasium of Bromberg. Then he became dramatic critic to the *Spenerische Zeitung* of Berlin. His principal work is the *Kunst der dramatischen Darstellung* (1841-46; 2d ed. 1864). Among his works may be mentioned *Aristophanes und sein Zeitalter* (1827) and *Abhandlungen zur Philosophie der Kunst* (1837-47), both strongly tinged with Hegelianism; *Shakespeare in seinen höchsten Charaktergebilden* (1864); *Dramaturgische und ästhetische Abhandlungen* (1864-67); and *Seydelmanns Leben und Wirken* (1845).

ROTTENHAMMER, röt'ten-häm'ër, JOHANN (1564-1623). A German historical painter, born at Munich. He was a pupil there of Hans Donauer from 1582 to 1590, studied afterwards in Venice after Tintoretto, went thence to Rome in 1605, and settled at Augsburg in 1607. His best pictures are those on a small scale, to be found in all the principal galleries of Europe. He supplied the figures in some of the landscapes of Jan Breughel and Paul Brill. A good example of his early style, in which he approaches Tintoretto, is the "Death of Adonis," in the Louvre. Among his best works are those painted for Emperor Rudolph II., including a "Nativity" (1608), "Battle Between Centaurs and Lapithæ," and four others, in the Vienna Museum.

ROTTEN ROW. A fashionable bridle-path in Hyde Park, London, 90 feet wide, extending for a mile and a half from Hyde Park Corner to Kensington Gate, along the south side of the Serpentine. It runs parallel with the driveway, from which it is separated by a promenade fringed with turf. Some of the most brilliant displays of fashion and wealth in London are to be seen here on fine afternoons during the season, and at the church parade on Sundays. The name is supposed to be derived from Route de Roi or King's Drive.

ROTTEN-STONE. A soft abrasive material that is used for cleaning and polishing brass and other metals, and wood. It is supposed to be a decomposed siliceous limestone, and consists essentially of aluminum silicate with carbonaceous matter. Several localities in Derbyshire, England, in Wales, and near Albany, N. Y., in the United States, are the principal sources.

ROTTERDAM, Dutch pron. röt'tër-däm'. The second largest city and chief commercial port of the Netherlands, situated in the Province of South Holland, on the Meuse at the mouth of the Rotte, about 15 miles southeast of The Hague and 44 miles south-southwest of Amsterdam

(Map: Netherlands, C 3). It is divided into two parts by the Hoog Straat (High Street) and is intersected by an iron railway viaduct. Adjoining the old city on all sides are the new quarters which have sprung up on the southern as well as on the northern bank of the river and are generally well laid out. Along the Meuse extends the beautiful quay known as the Boompjes, on account of its many trees. The principal square is the Grootte Markt. Rotterdam has few ecclesiastical buildings of interest. The Grootte Kerk is a fifteenth-century brick edifice, built in the Gothic style and containing an organ notable for its size, and many monuments to Dutch naval heroes.

Among the secular buildings the following deserve mention: the exchange, a sandstone building of the beginning of the eighteenth century, with an exterior court, and a tower containing a set of chimneys; the town hall; the court-house; and the post-office. On the northern side of the town is the Delft Gate, the only one remaining of the old city. Beyond it is situated the fine zoölogical and botanical garden, founded in 1857. West of the city is a fine park. The principal collection of Rotterdam is the large picture gallery in the Boyman's Museum, containing numerous excellent paintings and drawings by Dutch masters. In the ground floor of the museum are the municipal archives and library. There are also interesting collections in the maritime museum. The municipality operates gas and electric plants and maintains a pawnshop. The water supply is obtained from the Meuse and is purified by filtration.

The principal industry is shipbuilding; of some importance are the manufactures of cigars, spirits, paints, and other chemicals, and sugar. The Rotterdam system of docks and harbors is among the most extensive in the world. A canalized arm of the Meuse known as the *Nieuwe Waterweg* extends from Rotterdam to the North Sea. The position of Rotterdam makes it the centre of the maritime as well as of the Rhine and Meuse trade of the Netherlands. Its commerce shows an extraordinary increase from 1850 to 1900. Its share in the shipping of the country in 1900 amounted to 63 per cent. (or 5,816,928 tons) of the tonnage entered and 47 per cent. (or 2,191,614 tons) of the tonnage cleared.

The chief imports are grain, ores and metals, petroleum, coffee, tobacco and cigars, tea, and skins. The exports consist chiefly of the above mentioned articles and include also timber and animal products. Rotterdam has regular steam communication with the principal seaports of Europe as well as with the United States, Dutch East Indies, and Africa. The population increased more than 50 per cent. from 1890 to 1900, on account of the annexation of the adjacent communities. It rose from 203,701 in 1889 to 318,507 in 1900. The inhabitants are mostly Protestants.

Rotterdam received municipal rights in 1299 and grew so rapidly that its boundary lines were repeatedly extended. It gained its commercial ascendancy during the nineteenth century.

ROTTI, röt'té. An island of the Dutch East Indies, situated near the southwestern end of Timor (Map: East India Islands, F 7). It has an area of 637 square miles. It is fertile and well watered, producing rice, tobacco, sugar, cotton, and indigo. The island is still ruled by native chiefs under the supervision of a Dutch resident

at Baä, and forms a part of the Dutch colony of Timor. The population is estimated at 80,000, principally Malays.

ROTTMANN, röt'mán, KARL (1798-1850). A noted German landscape painter, born at Hand-schuchheim, near Heidelberg. He formed himself chiefly through the study of nature and of great masterworks, and after gaining prominence by "Heidelberg at Sunset" (water color), and "Castle Eltz," he settled in Munich (1822), devoting himself to Bavarian scenery. His success in characterizing the main features of a landscape, and producing ideal effects in line and color, created a new epoch in landscape painting. During his travels in Italy (1826-28) he made sketches for the 28 Italian landscapes in fresco which he was commissioned to paint in the arcades of the Hofgarten at Munich (1829-33) and which constitute Rottmann's most sterling work, but unfortunately deteriorated under climatic influences. The cartoons for them are in the Darmstadt Gallery. In 1834-35 he was in Greece, and the results of this journey were 23 Greek landscapes, which were placed in a special room in the New Pinakothek, Munich. Of his easel pictures "Ammer Lake" and "Marathon" are in the National Gallery, Berlin; "The Acropolis of Sikyon" and "Corfu" in the Pinakothek, Munich; others in the Schack Gallery, Munich, and in Karlsruhe; and seven in the Leipzig Museum. Consult: Pecht, *Deutsche Künstler*, ii. (Nördlingen, 1879); and Regnet, in *Dolme, Kunst und Künstler*, iv. (Leipzig, 1885).

ROTY, rô'té', LOUIS OSCAR (1846—). A French medalist and engraver, born in Paris. He was a pupil of Ponscarne and Dumont, and won the Prix de Rome in 1875. His subjects are treated with remarkable skill in obtaining the most delicate results. His portraits are also admirable. With Chapu, Degeorge, and Chaplin, he ranks as the greatest reviver of medallie art in France during the last century.

ROUARIE, rô'á'ré', MARQUIS OF. See ARMAND, CHARLES.

ROUBAIX, rô'bá'. A manufacturing town in the Department of Nord, France, 7½ miles northeast of Lille (Map; France, K 1). Its rise dates from the first quarter of the nineteenth century, when its population was 9000 and rapidly increased after the establishment of modern textile industries. The annual value of its textiles is over \$80,000,000. There are also other manufactures. The town possesses the important Ecole Nationale des Arts Industriels. Population, in 1901, 124,365.

ROUBILLAC, rô'bé'yák', or **ROUBILLIAC**, LOUIS FRANÇOIS (1695-1762). A French sculptor, born at Lyons, France. He studied under Nicolas Coustou and then under Balthazar. About 1738 he settled in England, where he executed many well-known works. His most important monuments are those of John Campbell, Duke of Argyll, of Mrs. Nightingale, and of Handel (1761), in Westminster Abbey; the statue of Newton (1755) at Trinity College, Cambridge; and the statue of Shakespeare (1758), in the British Museum. Among his busts of life, which are his best works, are those of Hogarth (National Portrait Gallery), Garrick (Garrick Club), and Handel (Foundling Hospital), all in London. His style is mannered, but is not with-

out graceful, and his portrait busts are highly characteristic.

ROUCOUYENNE, rô'kou-yen'. A tribe of Cariban stock (qv) in the mountain country about the headwaters of Maroni River, French Guiana. They take their name from the roucou, a vegetable coloring matter with which they paint their skins. They are naturally of light complexion. Marriages of father and daughter and of brother and sister are said to be common among them.

ROUEN, rô'ou-á'. The capital of the Department of Seine-Inférieure, France, on the Seine, 87 miles northwest of Paris by rail (Map; France, H 2). It is one of the principal manufacturing and trading cities of France. It stands on the north bank of the river on level ground slightly rising toward the east. Some of the streets are regularly built, traversed by street railways, and lined by fine modern stone houses, but the majority are of the medieval, ill-built, and narrow though picturesque order, crowded with lofty, quaintly carved timbered houses with overhanging gables. A stone bridge and a suspension bridge connect the faubourg Saint Sever, on the left bank of the river. A viaduct across the river connects the Western with the Orleans railway. The site of the former encircling ramparts is now occupied by spacious, tree-bordered boulevards, which, as well as the quays that line the river banks for a distance of a mile and a half, rival the boulevards and quays of Paris.

Rouen is noted for its ecclesiastical architecture, of which the finest specimens are the Cathedral and the Church of Saint Ouen. The former is a remarkably fine specimen of Gothic architecture. It is of cruciform shape and has two towers at the sides of the west entrance, and a lofty but incongruous tower, 464 feet high, which was constructed after the destruction by fire in 1822 of the belfry, which bore the date of 1544. The cathedral was erected by Philip Augustus between 1200 and 1220, and contains in its 25 highly ornamented chapels numerous monuments of great interest. The Church of Saint Ouen is as large as the cathedral and in its restored state presents a pure and elegant specimen of Gothic architecture. Other notable churches are the fifteenth century flamboyant Gothic Church of Saint Maclou, the sixteenth-century churches of Saint Vincent, Saint Gildard, and Saint Patrice, and the restored Romanesque Church of Saint Gervais, with a fourteenth-century crypt. Of the secular buildings the finest are the Palais de Justice, belonging to the fifteenth century and built for the Parliament of the province; the Hôtel de Ville, with its well-equipped public library and its gallery of pictures; the Hôtel Dieu or hospital, one of the largest of its kind; the fifteenth-century Hôtel Bourgtheroulde (now used as a club) ornamented with historical reliefs; and the striking fourteenth-century belfry or Tour de la Grosse Horloge, with its double-headed and richly sculptured clock on a sixteenth-century arch spanning the street. The finest square is the Place de l'Hôtel de Ville. Jean of Arc was burned in the Place du Vieux Marche (since 1902 decorated with a fine memorial of the Maid of Orleans), and not in the Place de la Pucelle, where a mean looking statue marks the spot that was long pointed out as the site of her martyrdom. The town possesses a

museum with valuable art and other collections, including a library of 140,000 volumes. Rouen is the seat of an archbishop.

The artificially deepened waters of the Seine form a commodious port admitting vessels of 5,000 tons. There is a large export and import trade, chiefly with Great Britain, Spain, Russia, Italy, and the United States. The principal industry is the manufacture of cotton goods, including the checked and striped cottons especially designated as Rouenmeries, lace, cotton velvets, shawls, etc. There are also extensive manufactures of hosiery, mixed silk and wool fabrics, blankets, flannels, shot, chemicals, and refined petroleum. Among other branches of industry are shipbuilding and the manufacture of machinery. Population, in 1901, 116,316.

Rouen is the ancient Rotomagus, which under the later Roman emperors was the capital of Lugdunensis Secunda. It figures early as the seat of a bishop, Rollo, with his Northmen, settled here at the close of the ninth century, and the town became the capital of the Duchy of Normandy. It was wrested from King John of England by Philip Augustus in 1204. It was in the hands of the English from 1419 to 1449, and Joan of Arc was buried here in 1431. Rouen was a Huguenot stronghold. It was occupied by German troops in the war of 1870-71. Consult: Périaux, *Histoire de la ville de Rouen* (Rouen, 1874); and Cook, *Story of Rouen* (London, 1899).

ROUERGUE, rōw'ārg'. A mediæval county of France, the capital of which was Rodez (q.v.).

ROUERIE, rōw'c-ré'. MARQUIS OF. See ARMAND, CHARLES.

ROUGE, rōwzh (Fr. *rouge*, OE. *rouge*, *roge*, red, from Lat. *rubius*, *rubeus*, red; connected with *ruber*, *rufus*, red, and ultimately with Eng. *red*). A preparation of safflower, used to give an artificial color to the cheeks. The color is obtained through a long and elaborate process by precipitating it from the safflower, by means of citric acid or lemon-juice, on to prepared cotton. It is then washed out of the cotton with a solution of soda, and again precipitated with citric acid; but previous to adding the acid, finely powdered French chalk is added to the solution, which becomes colored and falls down when the precipitation takes place, giving the necessary body and a peculiarly silky lustre to the coloring matter. (For rouge as a polish material, see ABRASIVES.) *Javelier's rouge* is a preparation of iron formed by calcining sulphate of iron, or green vitriol, until the water of crystallization is expelled; it is then roasted in a strong heat, and afterwards washed with water, until it no longer affects litmus paper. *Liquid rouge* is the red liquor left in making carmine.

ROUGE, rōw'zhâ', OLIVIER CHARLES EMMANUEL, Vicomte de (1811-72). An eminent French Egyptologist, born in the Department of Sarthe. He at first studied law, but soon took up with ardor the study of Egyptian. His first memoir placed him among the foremost of living Egyptologists. It was a refutation of the theories of Bunsen and was published (1846-47) in *Annales de philosophie chrétienne* under the title: *Examen de l'ouvrage du chevalier de Bunsen, La place de l'Égypte dans l'histoire du monde*. In 1849 he was appointed keeper of the Egyptian collection of the Louvre.

He made a valuable catalogue of the Paris collections (*Notice sommaire des monuments égyptiens du Louvre*, 1st ed., Paris, 1849; 3d ed. 1855). In his *Memoire sur l'inscription du tombeau d'Ahmes* (1849) and his *Etude sur une stèle égyptienne* (1856) he for the first time gave connected translations of entire hieroglyphic inscriptions, and established the principles upon which the systematic study of these texts should proceed. His *Chrestomathie égyptienne* (4 vols., Paris, 1867-76) placed the study of Egyptian grammar upon a new footing, and in his *Recherches sur les monuments qu'on peut attribuer aux six premières dynasties de Manéthon* (Paris, 1864-65) he made a most valuable contribution to early Egyptian history. In 1860 he became professor of Egyptology in the Collège de France. After his death was published the valuable collection *Inscriptions hiéroglyphiques copiées en Égypte* (Paris, 1877-79).

ROUGE DRAGON. See PURSUIVANT.

ROUGET DE L'ISLE, rōw'zhâ' de lél, CLAUDE JOSEPH (1760-1836). A French poet and composer. He was born at Lons-le-Saunier. It was at Strassburg on the night of April 24, 1792, that Rouget de l'Isle, then a captain of engineers, wrote the immortal *Marseillaise*. (See article MARSEILLAISE.) A few days later he was suspended from his rank because he refused to sanction the extreme measures of the Revolutionary Party. After a two months' exile in Alsace, he entered the army again as a volunteer under General Valance, who restored him to his former rank. During the Reign of Terror he was again proscribed, and was confined to the prison of Saint Germain-en-Laye, on being released from which after the fall of Robespierre, he composed the "Hymn of the Ninth Thermidor." Later he served with Tallien's army, and was wounded at Quiberon, after which the Convention endeavored to atone for former injustice done him by giving him substantial promotion. In 1796 he abandoned military life and went to Paris to devote himself to poetry and music. In 1830 he was pensioned by Louis Philippe. His published works include: *Chant des vengeances* (1798); *Chant du combat* (1800); *50 Chants français* (1825); and the libretti to a few operas.

ROUGE ET NOIR, rōwzh â nwâr (Fr., red and black), or TRENTE ET QUARANTE. A game famous throughout Europe and a favorite mode of gambling. It is played on a long table covered with a green cloth at each end of which there are two lozenge-shaped figures marked 'rouge' (red) and 'noir' (black), and colored accordingly. There are two centre divisions known as 'couleur,' and at each end a triangular division known as 'inverse,' the opposite of couleur. The stake or bet may be placed on four different risks according to the division of the table the player prefers. Six packs of cards are used shuffled together, each player shuffling a part of them, after which the whole are shuffled by the banker or dealer, who is always seated in the middle at one side of the table. The 'croupiers' sit facing the banker, and attend to all receipts and payments. The game begins by the dealer taking a single card, which is usually the blank one, and presenting it to one of the players, who inserts it in the complete pack at any point he desires. This constitutes the cut, after which the

ROULROUL (Malay name). A beautiful small forested partridge of the Malayan Islands and Borneo, two species of which are contained in the genus *Rollulus*. They dwell in the forests in small flocks, and are extremely active. See **PLATE OF PARTRIDGES, ETC.**

ROUMANIA. See **RUMANIA.**

ROUMANILLE, *români-né'y*, JOSEPH (1818-91). A Provençal poet. He was born at Saint-Rémy (Bouches-du-Rhône). He is commonly known in Southern France as the father of the Félibrige; for he first conceived the idea of raising the patois of his region to the dignity of a literary language. When Roumanille was a teacher in Avignon, he discovered the genius of Frédéric Mistral, one of his pupils, and together they began what later became the Félibrean movement. In 1847 Roumanille published a volume of verse called *Li Margarideto*, and in 1851 another entitled *Li Soumajarello*. In 1852 along with Mistral and Anselme Mathien he edited a collection of Provençal verse called *Li Prouvençalo*. In 1853 he wrote a dissertation on Provençal spelling. His writing is of the wholesome, simple sort, adapted to the country-folk of the region. The complete edition of his works includes *Lis oubreto en versè*, *Lis qubreta en prosò*, *Lì capelan*, *Li conte prouvençau e li caucareto*, *Lì nouvé*, *Lis cantarochin*, and *Letters*.

ROUND (OF., Fr. *roul*, It. *rotondo*, *ritondo*, from Lat. *rotundus*, round, wheel-shaped, from *rota*, wheel). In music, a short vocal composition, in three or more parts, all written on the same clef. Each voice takes up the subject at a certain distance after the first has begun. The second voice begins the first part when the first begins the second part, and the third takes up the first part when the second begins the second part, the whole ending together at the mark of a pause, or at a signal agreed on. The round is really an *infinite canon*. It was very popular in England from early times. The famous round *Sumner is icumen in* is assigned to the thirteenth century. Originally the round was identical with the catch, but the latter became of a humorous character, while the former remained serious. See **CATCH**.

ROUND, WILLIAM MARSHALL FITTS (1845—). An American prison reformer, journalist, and novelist, born in Pawtucket, R. I. After public-school training Round entered the Harvard Medical School, did not graduate, was given charge of the New England Department of the World's Fair, Vienna (1873), engaged in journalism in Boston and New York, was associate editor of the *Boston Globe*, and afterwards on the staff of the *Independent*. In 1883 he was elected corresponding secretary of the Prison Association of New York, and of the National Prison Association. He was also a delegate from the United States to the International Penitentiary Congresses at Rome (1886) and Paris, and to the Congress of Criminal Anthropology at Brussels, and planned (1887-88) the Burnham Industrial Farm for Unruly Boys, at Canaan, N. Y. His books include: *Achshah, a New England Life Study* (1876); *Child Marian Abroad* (1876); *Torn and Wounded* (1887); *Hal, the Story of a Chodhopper* (1878); and *Rosecraft* (1880). See **PRISON ASSOCIATION, NATIONAL**.

ROUNABOUT PAPERS. A collection of delightful essays by Thackeray, contributed to

the *Cornhill Magazine* in 1859-63, and published in 1863.

ROUNDEL. See **FORTIFICATION.**

ROUNDERS. An outdoor ball game. The game has long been popular with boys in England, and is the father of the more scientific and highly developed American baseball. Nine on each side play. The 'in' side bat in rotation on a home base and the striker drops the bat before he runs, for the use of the next batsman. The pitcher, or, as he is called, 'the feeder,' occupies the same relative position as in baseball. The 'out' side fields for the side that is 'in,' and must put the runners out by a catch or by striking them when between bases, or by touching an empty base to which the runner is approaching. There are six bases. Every player has the option of refusing to strike at as many balls as he pleases, or three only if so arranged, but whether he hits the ball or not (with one exception) if he strikes at it he must run. The ball is dead when it leaves the feeder's hands until it has been struck at by the player, and no one may move from his base while the ball is dead. The players on the 'in' side when reduced to two may select one of their number to make what is termed 'three hits for a rounder;' the player not selected then retires. The selected one has to be served with the ball until he has had three trial hits thereat, and on the third hit or attempt (if not before) he must run from the home base, round to every base in succession, and back again to home, without being hit with the ball, and without it being grounded at the home base while he is running. If the round is successfully made his side is again all in. If the contrary the sides change places.

ROUND FISH. One of the American lake whitefish. See **WHITEFISH**.

ROUNDHEADS. A name contemptuously used of the English Puritan or Parliamentary Party in the time of Charles I., originating in their fashion of wearing the hair short, while the Cavaliers wore flowing locks.

ROUND POMPANO. See **POMPANO**.

ROUND TABLE. The name commonly given to the fellowship of knights which gathered around King Arthur, from the table at which they sat in the hall of his palace. See **ARTHUR**; **MORTE D'ARTHUR**.

ROUND TOWERS. Tall narrow towers tapering gradually from the base to the summit, and found abundantly in Ireland, and occasionally in Scotland, are among the earliest and most remarkable relics of the ecclesiastical architecture of the British Islands. They are the work of Christian architects, and seem to have been in all cases attached to the immediate neighborhood of a church or monastery, and were capable of being used as strongholds in times of danger. After the introduction of bells, they were also probably used as bell-towers. They are usually capped by a conical roof, and divided into stories, sometimes by yet existing floors of masonry, though oftener the floors were made of wood. Ladders were the means of communication from story to story. There is generally a small window on each story, and four windows immediately below the conical roof. The door is in nearly all cases a considerable height from the ground. The tower at Devenish, in Ireland, which may be considered

as a typical example of the class, is 82 feet high, and is furnished with a conical cap. A battlemented crown occasionally supplies the place of the conical roof, and in one instance the base of the tower is octagonal. They are usually assigned to a period ranging from the ninth to the twelfth century. The source of this form of tower has not yet been cleared up. The only group of related examples of earlier date are the round towers of the churches of Ravenna dating from the sixth and seventh centuries, such as those of both basilicas of Sant' Apollinare, of San Vitale, the Cathedral, and Santa Maria Maggiore.

ROUNDWORM, OF THREADWORM. A nematode, specifically *Ascaris lumbricoides*, which occurs in the human intestine and resembles an earthworm. It is milk-white in color, and has three lips, which when pressed down upon the wall of the intestine of its host form a sucker, in the centre of which is the mouth. The female is larger than the male, sometimes 16 inches long, while the male is 10 or less. The female also seems to be more common. The eggs are very numerous, are fertilized within the body of the mother, and have usually begun their development when laid, but ordinarily pass out of the intestine of the host and remain in a dormant condition until they are finally taken into the alimentary canal of some other human being, probably in most cases by drinking impure water, although eating fresh leaves, fruits, and roots may be an important means. It is said that geographical and climatic conditions have much to do with the frequency of the parasite. For other species of these worms parasitic in domestic animals, see ASCARIS; also THREADWORM.

ROUP (from *roup*, *roop*, AS. *hrōpan*, OHG. *hrōfan*, *ruofan*, Ger. *rufen*, Goth. *hrōppan*, to cry out), **DIPHTHERIC ROUP.** A supposedly contagious disease of poultry resembling diphtheria in man, but attributed to a different organism. Diphtheritic patches appear on the mucous membranes. The measures to adopt in combating roup are isolation of all affected birds and a thorough disinfection of the premises with a 5 per cent. solution of carbolic acid. All birds that have died of roup should be burned or buried. Consult: *Delaware Agricultural Experiment Station Bulletin 47*; *Montana Agricultural Experiment Station Bulletin 22*; *Rhode Island Agricultural Experiment Station Reports, 1898*, p. 97; *1889-1900*, p. 233.

ROUS, FRANCIS (1579-1659). An English writer on theology. He was born at Dittisham, Devonshire; graduated B.A. at Oxford (1596-97); subsequently at Leyden (1598-99); studied law (1601), but subsequently confined himself to theology and attained high rank among the Presbyterians, and after 1649 among the Independents. He was an intimate friend of Pym (q.v.), a member of several Parliaments, and supported Cromwell and the Commonwealth. He is remembered for his *Psalms of David in English Metter* (1643), which was adopted by the Westminster Assembly, and estates of Scotland, and authorized by Parliament for general use.

ROUSAY, *roo'sā*. One of the Orkney Islands (q.v.).

ROUSSEAU, *roo'sō'*, JEAN BAPTISTE (1670-1741). A French lyric poet, born in Paris.

Then, 'a shoemaker'—son, he was well educated, enjoying the patronage of Bourbon and Breton, and of Lalland, whom he accompanied as secretary to London. He won reputation for stringing satires, directed especially against La Motte and Saurin. La Motte retaliated by compassing Rousseau's defeat in an academic election (1710), Rousseau accused Saurin of circulating libellous epigrams as to even, but he could not legally prove this and was banished (1712). Rousseau lived in Switzerland, Austria, Belgium, and England. His congeners, the *bourbons* and *lallands* stung. Though called by contemporaries 'prince of lyrists' he lacks a true lyric spirit. Rousseau's *Works* are in five volumes (Paris, 1820); the poetry, in one, edited by Marmontel (ib., 1852); some *Contes inédits* were edited by Lutzsch (ib., 1881).

ROUSSEAU, JEAN JACQUES (1712-78). One of the greatest French writers of the eighteenth century. He was the son of a dancing-master, Isaac Rousseau, a descendant of a French Huguenot, who had in the seventeenth century emigrated to Geneva in order to escape religious persecution. Jean Jacques never knew his mother, and was educated first by his father, who made him read mostly sentimental novels, then by an uncle and an aunt, M. and Mme. Bernard, who were a little higher than the Rousseaus in the social hierarchy of the Calvinistic city. Family troubles interrupted his education. Jean Jacques became an apprentice to an engraver, named Ducommun, by whom he was not well treated, and when sixteen years of age he left Geneva to try his fortunes in the adjoining Duchy of Savoy. This was Catholic, and its clergy constantly strove to make converts among the children of republican Switzerland. Rousseau was among these converts. His change of religion was effected at the 'Maison des Catéchumènes' of Turin, whither he had been sent on the advice of Madame de Warens, herself a convert, who was soon to exert a decisive influence upon his destiny. Jean Jacques was now for two years a servant in Madame de Verellis's household, and he acted in a somewhat similar capacity in the Goyone family. He also fell in with adventurers of a low type. This led to his return to Annecy, where Madame de Warens resided, and to his admission among her regular companions. She remained the ruling spirit of his life for about ten years, during which time he was several times engaged in more or less lucrative employments, especially in the office of the land survey of the Kingdom of Sardinia and in the choir of the Cathedral of Annecy. He left Madame de Warens several times, making trips to Erlbourg, Lyons, Paris, and Montpellier. On his return from the last voyage he found things so changed in the house, especially owing to the arrival of a new comer named Wintzenried, that he decided he had better seek his fortunes unaided. The most profitable period of this part of Rousseau's life, as far as his education was concerned, was spent in a small country house not far from Chambéry, whither Madame de Warens had removed from Annecy. In his *Confessions* he has left us a fascinating description both of the place, called *Les Charmettes*, and of the life he led there, which may be called his honeymoon with Madame de Warens. His intellectual powers and acquirements so developed there that he could a little later occupy the position of resident tutor in the

family, of the Grand Prieur de Mably, a brother of two distinguished writers of the time, the Abbé de Mably and the philosopher Condillac.

In 1741 Rousseau arrived in Paris, depending for his fortune upon a new and ingenious system of writing music. He laid his plan before the Royal Academy of Sciences, from which he received praise but no indorsement. Though baffled in his expectations, he had by the bringing forward of his musical investigations gained access to the most intellectual circles of Paris. He soon became a kind of secretary in the highly gifted family of Madame Dupin, the wife of one of the wealthy farmers-general, and her stepson, M. de Francueil, and shortly afterwards he was, through their influence, engaged in the same capacity by the Count de Montaigne, who had been appointed Minister of the King of France at Venice. For his new position the knowledge of Italian acquired by him in Turin gave Rousseau special fitness. His employer was wholly unable to understand his young secretary's mental superiority and to avoid inflicting upon him humiliating treatment. Rousseau left him, full of anger and indignation, and returned to Paris, where he expected to find justice for himself and punishment for his persecutor, but he soon discovered that for a man of the people to obtain redress for a wrong inflicted upon him by a member of the aristocracy was a thing not possible in France at that time. This was the first experience that led him to think of the system of social distinctions then in existence, and to examine whether any philosophical justification for them existed. He resumed his position near M. de Francueil and mingled more than ever with the world of artists, thinkers, and writers. He wrote for the stage, remodeled for the Court of Louis XV., with the consent of the author, Voltaire's dramatic cantata *La Princesse de Navarre*, which he renamed *Les fêtes de Romire*, and took sides passionately in the conflict then raging in Paris between French and Italian music. He defended the latter in the first of his numerous polemical writings, the *Lettre sur la musique française* (1748). While in contact not only with refined society, but with thinkers like Diderot, D'Alembert, and Grimm, whom he considered in no way his superiors, Rousseau met Thérèse Levasseur, a young woman not above the condition of a servant, totally illiterate, according to Rousseau himself. Without marriage, he made her his permanent companion. Soon he was saddled not only with Thérèse herself, but with her father and mother and the rest of the family. If we may believe Rousseau's *Confessions*, he was fully conscious of the unworthiness of the surroundings thus created by him for himself. He is himself authority for the statement that Thérèse bore him several children, and that every one of these children was carried by him immediately after birth to the Home for Foundlings.

Rousseau was now on the eve of celebrity. In 1750 he published a short discourse in answer to the question propounded by the Academy of Dijon, whether the re-establishment of sciences and arts had resulted in making morals purer. He answered negatively, but with such a force of eloquence and declamation that the Academy awarded him the prize, and the publication of his paper made him illustrious. An opera, of which he had written both words and music, *Le Devin du village*, was performed with great applause first

before the Court, at Fontainebleau, then at the Paris Opéra. More and more, however, he moved away from the bright Paris circles. He grew displeased with a social order in which he knew that he could not occupy a position in keeping with his mental superiority. This appeared when in 1754 he published his first important work, again an answer to a question propounded by the Academy of Dijon, as to the origin of inequality among men and whether it is justified by the law of nature. Of course again his answer was a negative one; but this time, although in style and argument the *Discours sur l'Inégalité* is vastly superior to the *Discours sur les sciences et les arts*, the Academy dared not reward him with a prize. Before a society which was a curious blending of autocratic power and aristocratic privileges he had laid the claims of all men to an equal share not only in the government, but in the enjoyment of nature's blessings.

He was henceforth acknowledged a democrat, an advocate of the people. He would yield no more to aristocratic prejudices. He discarded the elegant dress of good society, ceased to act as secretary for members of the privileged classes, and announced that he would earn his living as a copyist of music. Ambition, however, had not forsaken him. His eyes turned toward his native State, to which he had dedicated his book. He visited Geneva, was welcomed with the highest honors, gave up Catholicism, and thus was allowed to resume his rights as a citizen; and when he left Geneva in order to return to Paris everybody understood that it was with the intention of soon coming back for good and competing for the municipal honors so dear to the heart of every citizen of the tiny Republic. Rousseau never returned to Geneva. Voltaire soon settled there himself, and Jean Jacques concluded that both could not live near each other in so small a place. His break with society was soon followed by similar treatment of his friends. Diderot and D'Alembert were then publishing their famous *Encyclopédie*, to which Rousseau had originally contributed articles on music, and also on political economy. But he had ceased to sympathize with a work the chief doctrine of which was that the happiness of mankind was bound up with the progress of enlightenment. He first simply moved away from Paris, not very far, to the Hermitage, a small house surrounded by woodlands on the estate of La Chevrette, which belonged to his friend, the wealthy and sprightly Madame d'Epinau (1756). But he soon quarreled with Grimm, Diderot, and Madame d'Epinau herself. In December, 1757, he left the Hermitage, where he had been Madame d'Epinau's guest, and moved to the village of Montmorency, near by. There he enjoyed the companionship, and to a certain extent the hospitality, of the Marshal Duke of Luxembourg.

Rousseau's masterpieces were written at the Hermitage and in Montmorency. After his *Letter on Providence*, addressed to Voltaire, in reply to the latter's poem on the Lisbon earthquake, he had written, as his declaration of war against not Voltaire alone, but all his old associates, the *Lettre à D'Alembert contre les spectacles*, in which he condemns the stage as a school of immorality. But these two comparatively slight works were shortly followed by *Julie, ou la nouvelle Héloïse* (1760); *Du contrat social*

(1762); and his treatise on education, *L'Émile* (1762). These three works, so different from each other, coming from the same pen in such quick succession, raised him to the front rank of the literary men of his time, with only one left that could be considered his rival, Voltaire. *La nouvelle Héloïse* was mostly written at the hermitage. Begun simply as an idealized record of his youthful memories, it was suddenly transformed by the ardent and unrewarded passion which he conceived for a sister-in-law of Madame d'Épinay—Madame d'Houdetot. The society of his time was purely intellectual and spurned all sentimentality. Rousseau pleaded for nature, for passion, for love with the energy of a heart ablaze with an overpowering passion. The success of the book, especially with the feminine public, brought about nothing short of a revolution in the manner of looking upon nature and society. Then came the *Contrat social*, which presented as the ideal and natural government the direct government of the people and which applied the name of sovereign, not to an hereditary monarch, but to the whole body of citizens. Finally, *Émile*, which must not be considered a formal treatise on education, but rather a string of interesting ideas and disquisitions on the subject, again said to the world: Trust to nature. All these teachings, helped by Rousseau's eloquent declamation, told upon society. Their climax was reached in a writing inserted in the fourth book of *Émile*, *La profession de foi du vicarieux sacrotyrd*, in which Rousseau puts into the mouth of a poor village priest a complete exposition of his system of natural religion.

Although M. de Malesherbes, the public official in charge of the supervision of new books, had read and approved of *Émile*, the Parliament of Paris condemned it and ordered the arrest of the author. Rousseau took refuge at Yverdon, a village belonging to the Republic of Bern. Bern ordered him out of the territory of the Republic. Geneva acted in the same manner and condemned both *Émile* and the *Contrat social*. At last Rousseau found a refuge in the County of Neuchâtel, then belonging to the King of Prussia, and governed in his name by Marshal Keith. There, in the village of Môtiers-Travers, Rousseau spent three peaceful years (1762-65), during which he wrote the letter to Christophe de Beaumont, Archbishop of Paris, by whom he had been openly censured, and the eloquent *Lettres de la montagne*, in which he answered the jurist Tronchin of Geneva, another of his critics.

Another storm came, real perhaps, perhaps only stirred up by Thérèse, who wished to get away from Môtiers-Travers. Stones were thrown against Rousseau's house. He believed his life in danger. He was then a prey to the idea that the whole of the world was making dark plots against him. After another vain attempt to settle within the boundaries of the Republic of Bern, in the island of Saint Pierre, on the Lake of Bièvre, he returned to France, and, on the invitation of Hume, he crossed to England. His sojourn there is unimportant in the history of his life, save that it is marked by his wanton quarrel with Hume, and by his writing there a large part of his *Confessions*. In 1767 he left England, wandered then for a few years mostly in the south of France, going from one friend's residence to another, and finally in 1770 returned to Paris and settled unmoored in his

old home, in the Rue Plâtrière, now Rue Jean-Louis Rousseau, where he spent the last years of his life in comparative peace. He died July 2, 1778, after a four weeks' stay in the Château of Ermenouville, a few miles from Paris, belonging to the Marquis de Girardin. Some ascribed his death to suicide, but the idea is not entertained to-day.

His last work, the *Discours sur l'économie politique* (*Discours sur le Commerce*), *Le projet d'un dictionnaire de la musique*, *Le projet d'un dictionnaire de la botanique*, and the other, the subject from the mental aberration created in him by his insensensitive, self-relativeness and by the real persecutions that assailed him. There is no good complete edition of Rousseau's works. The best was published at Paris in 1823-26 by Musset-Patry in 23 volumes, but it must be supplemented by a number of later publications, never included in the so-called complete editions, notably by the *Œuvres et correspondances inédites* (2 vols., published at Paris in 1861 by Streckeisen-Mouton).

BIBLIOGRAPHY. The best English work on Rousseau is John Morley's *Rousseau* (London, 1873). The best short work in French is the monograph of Arthur Chuquet in the *Collection des grands écrivains français* (Paris, 1893). Consult also the biographies by Brockenhoff (Leipzig, 1863-74), Vogt (Vienna, 1879), Saint-Marc Girardin (Paris, 1875), Graham (Edinburgh, 1882), Gehrig (Neuwied, 1889), Mahrenholtz (Leipzig, 1889), and Baudouin (Paris, 1892); moreover: Streckeisen-Mouton, *Rousseau, ses amis et ses ennemis* (ib., 1875); Desnoiresterres, *Voltaire et la société française*, vol. II. (Berlin, 1881); Davidson, *Rousseau and Education According to Nature* (New York, 1898).

ROUSSEAU, LOVELL HARRISON (1818-69). An American soldier, born in Stanford, Lincoln County, Ky. He studied law at Louisville, removed to Bloomfield, Ind., and was admitted to the Indiana bar in 1841. He fought in the Mexican War as a captain in the Second Indiana Regiment, and distinguished himself at Buena Vista. On his return from the war he was elected to the Indiana Senate, but two years later left the State and settled in Louisville, Ky. Upon the breaking out of the Civil War he endeavored to keep Kentucky in the Union, and in 1860 he raised the Fifth Kentucky Regiment, of which he was made colonel. He was promoted to the rank of brigadier-general in 1861, served with great credit in the second day's battle at Shiloh, and for gallant conduct at Perryville was made a major-general of volunteers. Later he commanded the Fifth Division of the Army of the Cumberland at Stone-River and at Chickamauga; in 1861 made a destructive raid into Alabama,

and the command of Fort Roscerans under General Sherman in the Nashville campaign. After the war he became a member of the National House of Representatives, and while serving in this capacity he made an assault upon Josiah B. Grinnell of Iowa, was censured by the House, and resigned, but was reelected during the following recess. In 1867 he was made a brigadier-general in the Regular Army, and was sent to Alaska, where he received the formal transfer of that Territory from Russia. At the time of his death in 1869 he was commander of the Department of the Gulf.

ROUSSEAU, PHILIPPE (1816-87). A French painter. He was born in Paris in 1816, and was a pupil of Gros and Victor Bertin. He began as a landscape painter, but later painted chiefly animals, fruits, and flowers, ranking with Chardin and Decamps in depicting monkeys. His painting held the qualities of the Dutch School and was deep, broad, and harmonious in color. Ivory work, metal or porcelain bowls of glowing fruit, he displayed to perfection against a background of exquisite tone. Among his works are: "Storks Taking a Siesta," "The Monkey Photograph," "Le rat de ville et le rat des champs," etc.

ROUSSEAU, THÉOPHORE (1812-67). A French landscape painter, of the Barbison School, born at Paris, April 15, 1812, the son of a well-to-do bourgeois tradesman. He was the brother of Philippe Rousseau. At the age of fourteen he produced "The Signal Station," which secured for him permission to devote himself to art. He studied under Remond and Lethière. As a pupil of the Ecole des Beaux-Arts he revolted against the prevailing classicism, and though competing for the Prix de Rome in 1831, he produced, instead of the historical landscape set for a subject, a "Site d'Auvergne," that failed of the prize but determined his own independent course. In 1834 he received a third-class medal for "Les Côtes de Grandville," but when he next essayed the Salon with his "Descente des Vaches," he found himself, along with Decamps, Delacroix, Champmartin, and other Romanticiests, shut out from exhibition. Academic hostility lasted until the reform of the Salon jury in 1848, and the consequence to Rousseau was a bitterness of spirit hardly appeased by his later honors. At the Exposition Universelle in 1867 he was made president of the French jury, and received the grand medal of honor by the votes of all the juries of the various nations. His later life was passed at Barbison, where he built his home in 1848. He was a recluse from society, married to a peasant woman who became stricken with insanity and whom he tenderly cared for. On December 20, 1867, he succumbed to paralysis, attended to the last by the painter Millet, his most intimate friend. A distinguishing characteristic of Rousseau's art is the remarkable balance of intellectual and emotional qualities. He has well been called the epic poet of landscape art. He chose the most solid features of the landscape, the vigor of oak and beech tree, the structural emplacement of rock and hills, the serene placidity of water and plain. Always a good and careful draughtsman, his early pictures show almost an over-insistence on details; the eye is carried back into remote reaches of distance, from point to point of subtly developed

planes. But he never sacrificed breadth and harmony of color.

In 1833 Rousseau took up his abode at Barbison and spent his life mainly in painting scenes of the forest. He visited Brittany in 1837 and painted his "Avenue of Chestnuts;" he also painted in the Ile-de-France, and in Berry and Gascony, but no characteristic feature of the forest of Fontainebleau escaped his eye and brush. Many of Rousseau's masterpieces are owned by private collectors in America. His principal works include: "Landscape After a Rain;" "Edge of the Forest of Fontainebleau" (1852, Louvre); "Hoar Frost," in the Walters Collection, Baltimore, and "Fens in the Landes" (1854, Louvre); "The Gorges of Apremont" (1859, in the Vanderbilt collection, New York); "Le chêne de roche" (1861); "Road in the Forest," and "Setting Sun" (1866), both in the Louvre. Consult: Samsier, *Souvenir sur Théodore Rousseau* (Paris, 1872); Gensel, *Millet and Rousseau* (Bielefeld, 1902); Muther, *History of Modern Painting* (London, 1896); Coffin, in Van Dyke, *Modern French Masters* (New York, 1896).

ROUSSEL, rōō'sōl', GÉRARD (c.1480-1550). A French reformer, born near Amiens. He was an intimate friend of Lefèvre d'Étaples (see FABER), and, like him, embracing the Reformation and boldly defended it, with the view that he could do so without separating himself from the Catholic Church. He taught in the college of Cardinal Le Moine, in Paris, but in 1521 his religious views brought him under disfavor, and he went to Bi-hop Breconnet, at Meaux, another of the open sympathizers with the Reformation. But persecution followed him and he went to Strassburg (1525). The next year the Queen of Navarre, Marguerite d'Angoulême, made him her confessor, and under her powerful protection and patronage he lived securely. She had him appointed to the Bishopric of Oléron (1536). Early in 1550, while preaching at Mauléon against the excessive number of ecclesiastical festivals, he was set upon by a fanatic and fatally injured. Consult his *Life* by Charles Schmidt (Strassburg, 1845) and the letters and notes given by Hermingard, *Correspondance des réformés* (2d ed., Paris, 1878).

ROUSSET, rōō'sā', CAMILLE FÉLIX MICHEL (1821-92). A French historian, born in Paris. He became professor of history at Grenoble in 1843, and from 1845 to 1863 held the chair of history at the Collège Bourbon in Paris. In 1864 he was appointed historiographer and librarian to the Minister of War, a post which he held until 1876. He was elected to the French Academy on December 30, 1871. Among his works the following deserve mention: *Précis d'histoire de la Révolution française* (1849); *Histoire de Louvois et de son administration politique et militaire* (1861-63); *Les volontaires de 1791-94* (1870); *Histoire de la guerre de Crimée* (1877); *La conquête d'Alger* (1879); *Les commentements d'une conquête* (1887).

ROUSSILLON, rōō'sē'yōŋ'. Formerly, a province of Southern France, lying between Languedoc, Foix, the Pyrenees, and the Mediterranean; now comprised within the Department of Pyrénées-Orientales. (See, under FRANCE, map showing former French provinces.) Its capital was Perpignan (q.v.). Its ancient inhabitants were the Cardones, whose capital, Ruscino, gave

the country its name. From the Romans, the region passed, about 460, to the Visigoths and in 720 it was conquered by the Arabs. The Franks conquered it in 759. Under the Carolingians it was ruled by counts who, about 900, succeeded in establishing their independence. In 1172 Roussillon was acquired by Aragon, and in 1642 it was wrested from Spain by Louis XIV. of France. It was definitely ceded to France by the Peace of the Pyrenees (1659).

ROUTH, routh, EDWARD JOHN (1831—). An English mathematician, born in Quebec, Canada, and educated at University College, London, and at Peterhouse, Cambridge. He received high honors in London and Cambridge, and was a well-known tutor from 1855 to 1888. Routh was long examiner in Cambridge and London universities; was fellow of Peterhouse (1857-64); was elected to the Astronomical Society in 1866 and to the Royal Society in 1872. He published a *Treatise on Rigid Dynamics*, which went through six editions and was translated into German; a *Treatise on Analytic Statics* (1891-92); and *Dynamics of a Particle* (1898).

ROUTH, ROUTH, MARTIN JOSEPH (1755-1854). An English scholar and educator, born in South Elmham, Suffolk, and educated at Queen's and Magdalen colleges, Oxford. At Magdalen he became fellow in 1775, librarian in 1781, and senior proctor in 1784. Elected president of the college in 1791, he held that post for sixty-three years. Routh lived into his one hundredth year with no impairment of his mind and little of his bodily strength. He was a thorough scholar, an especial authority on ecclesiastical law and history, and an intimate friend of Porson. Routh's library became the property of Durham University. He published editions of Plato's *Euthydemus* and *Gorgias* (1784), *Reliquiæ Sacre Secundi Tertiię Sęculi post Christum* (1814-18), Burnet's *History* (1823) and *History of the Reign of James II.* (1852), *Scriptorum Ecclesiasticorum Opuscula quędam* (1832), and *Tres breves Tractatus* (1853). Consult the sketch in Burgeon's *Lives of Twelve Good Men* (London, 2d ed., 1888).

ROUTHIER, rōw'tyá', ALOF BASILE (1839—). A Canadian jurist, born at Saint Placide, Province of Quebec. He graduated in 1858 at Laval University, Quebec, was admitted to the bar in 1861, practiced at Kamouraska, and in 1873 he became a puisne judge of the Superior Court of Quebec Province. In 1897 he was appointed judge of the Vice-Admiralty Court of Quebec. He was also professor of international law in the Laval University, and a fellow of the Royal Society of Canada. Previous to his appearance on the bench he was active as a journalist, and he published several volumes, including *A travers l'Europe* (1882-83), his most important work; *Les échos* (1883), a collection of verse; and *Conférences et discours* (1890).

ROUTLEDGE, rut'lej, GEORGE (1812-88). The founder of the London publishing firm now styled George Routledge & Sons. He was born at Brampton, in Cumberland. After serving his apprenticeship with a bookseller at Carlisle, he went to London (1833), and in the course of three years he opened a retail shop of his own (1836). In 1843 he began publishing. Routledge was a pioneer in publishing cheap books, especially of American authors, for the masses.

Among his successful ventures are *The Railway Library* (1848 et seq.), heading off with Cooper and numbering over a thousand volumes; *Rail Road Library*; *Universal Education*, edited by Henry May, by 100 vols. (1884 et seq.); and edition of Irving, Cooper, Ainsworth, Bulwer, etc. Of *The Town's Club*, he said nothing.

ROUVIER, rōvavá', MAURICE (1842—). A French politician, born at Aix. He studied law, and became an advocate at Marseille. In politics he was a Republican, he attacked the Empire in opposition journals, and in the National Assembly, to which he was first elected in 1871, he was identified with the Extreme Left. In 1881-82, during the Premiership of Gambetta, he was Minister of Commerce and the Colonies, and he held the portfolio of Commerce also in 1884-85, in the Ferry Cabinet. From May to December, 1887, he was at the head of a Cabinet in which he also was Minister of Finance. He received the portfolio of Finance (1889) in the Tirard Ministry, and retained it during the successive Ministries of Freycinet, Loubet, and Ribot, until he withdrew from it in 1892 in consequence of his implication in the Panama affair. In 1902 he became once more Minister of Finance, in the Combes Cabinet.

ROUX, rōw, PIERRE PAUL EMILE (1854—). A French physician and bacteriologist, born at Cognac (Charente). He studied medicine at Clermont-Ferrand (Puy de Dôme), and at Paris where from 1874 to 1878 he held a subordinate post in the Faculty of Science. In 1878 he entered the laboratory of Pasteur, in 1883 became adjunct assistant director, and in 1896 assistant director of the Pasteur Institute. He assisted Pasteur in various experiments, including those concerning the aetiology of carbon and the preventive treatment of hydrophobia. He also did some work in the development of Behring's diphtheria toxin treatment. Of his other researches may be mentioned those conducted with NoCARD regarding pneumonia, among the results of which was the discovery of the pneumococcus microbe.

ROUX, WILHELM (1850—). A German physiologist and anatomist, born at Jena. He studied at Jena, Berlin, and Strassburg universities, in 1879 was appointed an assistant in the Hygienic Institute at Leipzig, afterwards became a lecturer at Breslau, and in 1886 professor there. In 1889 he was called to the chair of anatomy at Innsbruck, and in 1895 received a similar appointment at Halle. His particular researches were in connection with the science of 'Entwicklungsmechanik'—the influence upon physical development of the mechanical demands made upon various organs. Roux published in exposition of this theory *Die Entwicklungsmechanik der Organismen* (1890), and other works.

ROVE BEETLE. Any representative of the Staphylinidae, one of the largest families of beetles. The body is long and slender, while the wings are very short, well developed, and when not in use are folded under the short wing covers. The abdomen is soft and flexible, and these insects have a habit of turning up the posterior end, particularly when annoyed, whence the English name 'cocktail.' Their food is carried in different kinds, and some will feed upon living insects as well as dead ones, and probably on

fungi. Many of them have a fetid odor. About 9000 species have been described, 1000 of which occur in North America. A very large and pow-

A ROVE BEETLE.

erful species lives in the nests of wasps and hornets. Other species live in the nests of termites.

ROVEREDO, rō'və-rā'dō (Ger. *Rofreit*). A town in South Tyrol, Austria, picturesquely situated on the Leno, 15 miles by rail south-southwest of Trent (Map: Austria, B 4). Roveredo is the centre of the Tyrolese silk trade. It manufactures leather, paper goods, and strings for musical instruments, and trades in wines, cereals, hams, and fruits. Near by is a castle where Dante sojourned. Roveredo belonged to Venice in the fifteenth century. Population, in 1900, 10,180, mostly Italians.

ROVIGNO, rō-vō'nyō (Lat. *Arupennum, Rubinnum*). A seaport in the Crownland of Istria, Austria, situated on a rocky promontory in the Adriatic, 40 miles south of Trieste (Map: Austria, C 4). Rovigno is famous for its wine, hazel-nuts, and olive oil. There are ship-building yards, a large tobacco factory, and tunny and sardine fisheries. The inhabitants are famous as pilots. Population, in 1900, 10,205, mostly Italians.

ROVIGO, rō-vī'gō. The capital of the Province of Rovigo, Italy, situated on the Adigetto, 38 miles southwest of Venice (Map: Italy, F 2). Its ancient walls and towers and the ruins of an old castle are still to be seen. There are a town hall with a picture gallery and a library of 80,000 volumes, a gymnasium, a lyceum, and a technical school. In the Middle Ages Rovigo belonged to Venice. Population (commune), in 1901, 11,174.

ROVIGO, DUKE OF. See SAVARY.

ROVING. See SPINNING.

ROVNO, rōv'nō. A town in the Government of Volhynia, Russia, situated on two important railway lines, 115 miles west-northwest of Zhitomir. It has some flour mills, and trades in grain, cattle, and wood. It belongs to the counts of Lubomirski. Population, in 1897, 24,905, mostly Jews.

ROVUMA, rō-vō'mū. A river of East Central Africa, forming the boundary between German and Portuguese East Africa (Map: Congo Free State, G 5). It rises on the Livingstone Mountains, which extend along the east shore of Lake Nyassa, and flows eastward into the Indian Ocean. Its length is about 400 miles. About half way to its source it receives the Lujenda, a rapid and shallow stream. Below the confluence the Rovuma is navigable during the wet season for river craft of considerable size. The river was first explored in 1861 by Livingstone.

ROWAN, rō'wā. STEPHEN CLEGG (1808-90). A distinguished American naval officer. He was born near Dublin, Ireland, but emigrated to America with his parents at an early age and settled in Ohio. In 1826 he was appointed mid-

shipman in the navy. In the Mexican War, as executive officer of the *Cyane*, he assisted in the capture of Monterey and San Diego and in the attack on Guaymas. He also commanded the naval battalion under Commodore Stockton at the battle of Mesa in Upper California, and later helped to surprise a Mexican outpost near the town of Mazatlan. The outbreak of the Civil War found him in command of the *Paucue*. With that vessel he protected Washington for a time and covered the Federal force in Alexandria, and on May 25, 1861, engaged a Confederate battery at Aquia Creek, thus fighting the first naval action of the war. Later he took part in the *Paucue* in the capture of the forts about Hatteras Inlet, participated in the expedition under Goldsborough in January, 1862, and in the following month assisted in the capture of Roanoke Island. On February 10th, as commander of the *Delaware* and a flotilla of other vessels, he pursued the Confederate fleet into Pasquotank River, captured it, and destroyed the fortifications on shore. Following up this success, he passed on up the river, seized Elizabeth City and Edenton, captured and destroyed several armed vessels, and then obstructed the Chesapeake and Albemarle Canal. In March, 1862, he cooperated with General Burnside in the capture of Winston, Newbern, and Beaufort. For his services Rowan received the thanks of Congress, and was promoted first to be captain, and afterwards to be commodore. He was in command of the *New Ironsides* off Charleston, and in the absence of Admiral Dahlgren was in command of the entire blockading squadron. In 1866 he was made a rear-admiral, and in 1870 was advanced to the rank of vice-admiral. He retired in 1889. Consult an article by Admiral Stevens in Hamersly's *Naval Encyclopedia* (Philadelphia, 1881 and 1884); Johnson and Buel (eds.), *Battles and Leaders of the Civil War* (New York, 1887).

ROWAN-TREE (*Pyrus Aucuparia*). A small tree of the natural order Rosaceæ, often planted for its graceful pinnate foliage, corymbs of small whitish flowers, and bright-red berries. See MOUNTAIN ASH.

ROWE, NICHOLAS (1674-1718). An English dramatist and poet laureate, born at Little Bedford, Bedfordshire. He was educated at Westminster, and studied law in the Middle Temple, but devoted himself to literature. Between 1700 and 1715 he brought forth eight plays, of which three were long popular: *Tamerlane* (1702), *The Fair Penitent* (1703), and *Jane Shore* (1714). The character of Lothario in *The Fair Penitent* is the prototype of Lovelace in Richardson's *Clarissa Harlowe*. Perhaps Rowe is now best known for his critical edition of Shakespeare (6 vols., 1709; revised, 8 vols., 1714), really the first critical edition. His popular talents and engaging manners procured him many friends and several lucrative offices. The Duke of Queensberry made him Under-Secretary of State. In 1715 he succeeded Tate as poet laureate. He died December 6, 1718, and was buried in Westminster Abbey. After his death appeared his complete verse translation of Lucan's *Pharsalia*.

ROWENA, rō-wā. In Scott's *Iranhoe*, the ward of Celric the Saxon, and the successful rival of Rebecca for Ivanhoe's love.

ROWING (from *row*, AS. *rōwan*, Teel. *rōa*, to row; connected with OIr. *rānu*, Lat. *remus*, Gk.

ῥοῦπόν, *cremona*, oar. Skt. *aritra*, rudder; *ῥοῦ*, *ar*, to drive, push, OChmch Slav. *ropiti*, to push, and ultimately with Eng. *rubber*, etc. The art of propelling a boat by means of oars. Professional boating is almost exclusively single sculling, which method will be found treated separately. This article is, therefore, confined to fresh-water rowing in competitive races, by crews mostly of eight men, though occasionally of four, and more rarely of two.

The boats are light, long, and narrow. The English custom in an eight-crew boat is to seat each man as far over to the opposite side from his rowlock as possible, so that, in effect, four sit on one side and four on the other. In America, the men sit in a straight line down the centre of the boat. In eights, the boat is kept in its course by a steersman (cox-swain), sitting in the stern and guiding it with tiller ropes attached to the rudder. In fours, however, it is usual to dispense with a steerer, the first rower from the stern keeping the boat in the desired position by pressing a board with his feet to which the rudder lines are attached. Pairs dispense with a rudder altogether. The styles of rowing differ with place and period, and each has staunch advocates. But there is one fundamental principle governing the whole subject; what the oar does in the water is the only thing that gives pace to a boat. *The swing forward* is to put the oar, held horizontally so as to minimize the resistance of the atmosphere, back beyond the rowlock, so that, when turned on edge it may drop into the water at the most effectual spot. *The beginning* is the applying the whole weight of the body against the water in front of the blade. *The swing back* carries the blade onward. *The finish* is when the body has passed the perpendicular, and *the recovery* is when the oar is lifted out of the water by the rower lowering his hands, when the swing forward for another stroke begins.

The boats have had an interesting development in the aim to combine lightness and strength. In the early days they were heavy, wide, and deep, with a keel and with rowlocks or ruts for the oars on their sides. The first decided innovation was that of Clasper, a celebrated Oxford builder, who in 1844 designed light iron brackets extending out from the sides of the boat. These enabled the rowlock to be at a point farther out than before from the rower's hand, and thereby increased the power of his stroke. They were adopted both in England and by Yale and Harvard. The next improvement was in 1856, when the first keelless boat was built by Taylor. This was a revolution necessitating a new method of rowing; in fact, modern rowing styles all date from that event. The sliding seat, introduced by Yale in 1870, was the next, and remains practically the last of the steps in the evolution of the design of the rowing boat. It made rowing much more pleasant and necessitated the use of a longer leverage of the oar inboard, but it did not require any material alterations in methods of rowing. It was quickly improved, and by 1872 was in general use in England as well as in America. The boat of a racing eight is approximately 60 feet long, two feet wide, and one foot deep. The slide varies in length, as does the distance of the rowlock from the centre of the seat. Thirty inches is the average distance in England where fixed rowlocks are used. In

America the rowlocks rest on a swivel. The material of the boat in Great Britain has nearly uniformly been cedar, and this wood is now used in the United States, although paper mache and aluminium have been tried with more or less success under suitable conditions. Expert boat-builders, however, seem to prefer cedar. The oars of America are heavier and of a different shape from those in use in England, and vary, ranging from 6½ to 7½ inches across the blade. The standard English length is 12 feet 6 inches over all, butted at the rowlock at 3 feet 8 inches from the handle end, and 5½ inches wide in the blade, although the oar must be accurately fitted to the individual oarsman.

In all probability rowing, as we now know its origin to the Hellenic age. The Windsor watermen of the royal barge and their aquatic contests would naturally interest the Eton boys directly across the Thames, so that it is not surprising to find the earliest instance of a rowing club at Eton. Its list of oarsmen is complete from the year 1812, although its operations extend back into the previous century. Since then Eton has been the nursery of the best oarsmen of both the American English universities. The rowing history of Oxford does not go further back than 1815 when Brasenose was at 'the head of the river,' a term that necessarily implies earlier struggles, the records of which are lost. Cambridge has no authentic racing data earlier than 1825. There, too, for many years every college has had one, two, or three rowing clubs. The first English club not located at a public school or university was the Leander Boat Club, on the Thames, which was incorporated in 1812 for the purpose of keeping together 'old blues' of both universities who were resident in London. Its membership is limited to men who have actually rowed in the Oxford and Cambridge crews, or in the trial eights from which the crews were selected. Its influence on rowing has been of the first importance, and to-day its crews hold the premier honors of the rowing world. The Australian Rowing Association, founded in 1879, is the governing body for general rowing in Australia.

ROWING IN THE UNITED STATES. American boating has been greatly advanced by the colleges, whose crews represent on the whole the most finished watermanship, and hold nearly all the records for the distances and conditions in which they compete. These contests, between colleges represent, also, clean and well-conducted sport. Rowing began in the United States early in the nineteenth century, and the first important race was held in 1811, when a New York City crew, rowing in a four oared barge, defeated a Long Island crew. The oldest boat club in the country is the Detroit Boat Club, founded in 1829. In 1843 the second, and existing club, was founded at Yale. Rowing at Harvard had been originated as early as 1839. Serious boat racing began with intercollegiate boating nine years after the formation of the Yale Boat Club, and its history ever since has been intimately connected with collegiate athletics. The first intercollegiate regatta was held in 1852, Yale and Harvard then being the only boating colleges. Harvard won the race, and also a second one, which was held in 1855. In 1858, at the suggestion of Harvard, the Union College Regatta Association was formed, com-

posed of Harvard, Yale, Trinity, and Brown. Harvard won all the races of this association, which dissolved upon the breaking out of the Civil War. There were no races during the early years of the war, but in 1864-70 Yale and Harvard met in six-oared barge races, and Harvard won five of the seven contests. In 1871 the famous Rowing Association of American Colleges was formed, having at one period sixteen members. In the six annual regattas held by this association, the Massachusetts Agricultural College, Amherst, Yale, and Columbia won in the four-oared races. Cornell won the last two. Yale refused to row in 1876, and competed instead with Harvard in a dual race, the first in the Harvard-Yale series in eights for four miles. Harvard competed in both races that year, but it was the last regatta held by the Intercollegiate Association, which then ceased to exist.

With Harvard and Yale rowing together, a few of the remaining colleges competed in various combinations until 1883, when for the third time an intercollegiate association was formed by Bowdoin, Columbia, Cornell, Princeton, Rutgers, University of Pennsylvania, and Wesleyan, rowing in four-oared shells over a 1½-mile course. In 1883, also, Cornell and Pennsylvania met for the first time, and have competed annually ever since, either in dual races or at the larger regattas. After 1887 rowing ceased at most of the colleges, in addition to Harvard and Yale, the races of 1888-94 being between Cornell, Columbia, and Pennsylvania only. In 1895 the present Intercollegiate Association was formed by these three colleges, with whom the management rests. The regatta is open to all college crews. The entrance of Harvard in the regatta of 1896 is connected with one of the most notable chapters in intercollegiate rowing history. In 1896-97 Cornell and Harvard had a dual agreement in athletics. Harvard had dropped all relations with Yale, owing to a serious athletic rupture, and while Yale rowed at Henley (England), Harvard competed in the Poughkeepsie races. In the following year, 1897, Harvard resumed relations with Yale, and as she had an engagement to meet Cornell and did not wish to row two races, suggested that Yale be admitted to the Harvard-Cornell race. Cornell agreed, but suggested in turn that Columbia and Pennsylvania be also admitted. This Yale refused to consider, on the grounds that the race would be unwieldy. Cornell was unwilling to forsake Pennsylvania and Columbia. At the same time she was anxious to compete with the New Haven university, whom she had not met on the water since 1875, except in a freshman race in 1890. As a result Cornell rowed in two regattas in 1897 and again in 1898, defeating Yale and Harvard both times. In the latter year, however, the races were rowed in different places, within a week of one another, and Cornell in the intercollegiate regatta lost to Pennsylvania. This was her first serious defeat, with one exception, in 14 years. In 1899 Cornell declined the invitation of Harvard and Yale to row in their dual race, but expressed herself as willing to meet them as competitors in the Intercollegiate Regatta. The victory of Pennsylvania in 1898 proved a turning point in Pennsylvania's career, and her 'varsity' crews won both in 1899 and 1900. It has been the aim of the Intercollegiate Asso-

ciation to make its regatta a representative meeting of American boating colleges. A four-oared 'varsity' race was added in 1899 to the regular 'varsity' and freshman events in eights, and in 1900 pair-oared and single events were provided for in case of three entries in each race.

The formation of the American Association of Amateur Oarsmen in 1871, as the governing rowing association of the United States, was the first satisfactory step toward the enforcement, outside of the colleges, of amateur rowing, although an amateur standard had been recognized in a way some thirty years before, when the Castle Garden Boat Club Association was formed. The association has held annual regattas at various places, with singles, doubles, pair-oared, four-oared, and eight-oared events. In 1900 at New York the winners of special races were sent to compete in the international races at the Paris Exposition. Besides the national body there are fifteen organizations of rowing clubs representing the various sections of the country, each of which holds its annual regatta, and many of which enter even in the national races. In Canada an association of amateur oarsmen was formed in 1870 and has since held annual championship regattas.

There have been several international rowing contests, of which the following is a summary: 1869—Harvard 'varsity' four against Oxford, over the Thames course, lost by six seconds. 1876—London Rowing Club on the Schuylkill River course at the United States Centennial Regatta were defeated. 1881—Cornell 'varsity' four lost at Henley. 1878—Columbia 'varsity' four won the Visitors' Cup at Henley Regatta. 1882—The Hillsdale crew rowed against the Thames Rowing Club and lost by reason of the bow oarsman breaking his oar. 1895—Cornell 'varsity' eight entered for the Grand Challenge Cup at Henley defeated by Trinity Hall, Cambridge. 1896—Yale 'varsity' eight entered for Grand Challenge Cup at Henley, defeated by Leander Boat Club. 1901—University of Pennsylvania eight entered for the Grand Challenge Cup at Henley, won the first heat over London Rowing Club, the second heat over Thames Rowing Club, but lost the final heat to the Leander club by one length.

ROWLAND. 157*land*, HENRY AUGUSTUS (1848-1901). An American physicist, born at Honesdale, Pa. He studied civil engineering at Rensselaer Polytechnic Institute, Troy, where he graduated in 1870. He became instructor at Wooster University, Ohio, and then instructor and afterwards assistant professor at Rensselaer Institute. He became (1876) professor of physics at Johns Hopkins University, a chair he occupied at the time of his death. Professor Rowland was one of the greatest physicists of the nineteenth century and had an international reputation. His determination of the mechanical equivalent of heat was one of his most important investigations. His determination of the ohm was likewise of great value; and his study of the magnetic proper-

ties of iron led to entirely new conceptions of magnetism. His interest in spectroscopy led him to the discovery of the principle of the concave grating, and to the construction of a dividing engine provided with a screw of extreme accuracy and uniformity of pitch, by which gratings were prepared under his direction. Rowland not only made an eye study of the spectrum, but also applied photographic methods. He investigated the solar spectrum and the arc spectra of various elements, and carried on many researches in allied fields. His work on alternating currents and their application has also been of importance. One of his last investigations resulted in the development of a system of multiplex telegraphy based on the use of synchronous motors, for which he received a gold medal from the Paris Exhibition. Perhaps his most important discovery was that of the magnetic effect of electric convection, which has a wide-spread theoretical bearing upon electrical phenomena. At the time of his death Professor Rowland was the president of the American Physical Society, of which he was one of the founders. Some of his important researches are the following: *On Magnetic Permeability* (1873); *On the Magnetic Permeability and Maximum Magnetization of Nickel and Cobalt* (1874); *Studies on Magnetic Distribution* (1875); *On a Magnetic Effect of Electric Convection* (1876); *Research on the Absolute Unit of Electrical Resistance* (1878); *On the Mechanical Equivalent of Heat* (1880); *On Concave Gratings for Optical Purposes* (1883); and *On the Relative Wave Lengths at the Lines of the Solar Spectrum* (1886). His collected physical papers were published by the Johns Hopkins Press, 1902. To this collection there is prefixed a biographical sketch by Professor T. C. Mendenhall.

ROWLANDS, rō'landz, SAMUEL (c.1570-?). An English author, who published about twenty-five famous pamphlets in prose and verse. Some are on religious themes, but most are satires on contemporary manners. The series began with *The Betraying of Christ*, a poem (1598), and closed with *Heaven's Glory, Seeke it, Earth's Vanitie, Flye it, Hells Horror, Flee it* (in verse and prose, 1628). Of his satirical work, a good specimen is *The Letting of Humours Blood in the Head-Vaine* (1600), a collection of satires and epigrams, assailing his contemporaries under fictitious names. To the same year belongs the similar *A Mery Metinge, or 'Tis Mery when Knaves meete*. Both these pamphlets were burned by the authorities, and the publishers were fined for handling them. *Martin Mark-all, Beadle of Bridewell* (1610), is an excellent account of the rogues of the time. Consult the reprint of his *Works*, with an introduction by Gosse (Hunterian Club, Glasgow, 1872-1886). The introduction was re-issued in Gosse's *Seventeenth Century Studies* (London, 1883).

ROWLANDSON, rō'land-son, MARY. An English colonist of the seventeenth century, famous for one book. Her husband was Joseph Rowlandson, the first minister of Lancaster, Mass. On February 10, 1675, Lancaster was destroyed by the Indians, who carried off Mrs. Rowlandson and her children. After her release three months later appeared her book, called *A True History of the Captivity and Restoration of Mrs. Rowlandson, a Minister's Wife in New England, Whereunto is Annexed a Sermon by*

Joseph Rowlandson, Her Husband. She tells of her sufferings by cold and hunger, of her child's death by cold, and of her sale by her Narraganset captor to an Indian chief. She was at last ransomed for about 880, a sum raised by several women of Boston. Her book went through various editions.

ROWLANDSON, rō'land-son, THOMAS (1756-1827). An English artist and caricaturist, born in Old Leary, London. He early displayed skill in caricature, was a student at the Royal Academy, and afterwards at a drawing-school in Paris, and set up in London as a portrait artist. In 1777-81 he also exhibited landscapes and portraits with much success at the Royal Academy. In 1781 or thereabouts, he assumed to greater extent the manner of caricature. He was known for his representations of Napoleon, but more particularly for his series, including the "Lions of Dr. Syntax" (1812, 1820, 1821), "The English Dance of Death" (1815-16), and "The Dance of Life" (1816), all with text by William Combe. His work was chiefly in pen and ink, lightly washed or retouched in water colors. His humorous quality included the picturesque, for example in posting and driving scenes at the inn or on the big road. In attempts along other lines he was unmistakably inferior. It has been frequently asserted that his technical merits and originality might well have entitled him to occupy a more serious place in the history of English art. Consult: Wright, *History of Caricature and the Grotesque in Art* (London, 1845); and Gage, *Rowlandson the Caricaturist* (ib., 1880), with a detailed enumeration of the artist's works.

ROWLEY, rō'li, WILLIAM (c.1585-c.1642). An English actor and dramatist about whom very little is known. He was connected with the Prince of Wales's company of actors, and collaborated on many plays with Middleton and other dramatists. He was a master of stage effect, and wrote with vigor. To him are assigned *A New Wonder* (1632); *Ill's Lost by Lust* (1633); *A Match at Midnight* (1633); and *A Show-water a Gentleman* (1638).

ROWLEY POEMS. See CHATTERTON, THOMAS.

ROWLEY REGIS. A town in Staffordshire, England, 5 miles west of Birmingham (Map; England, E 4). It has extensive coal-mining and iron industries. Population, in 1891, 39,800, in 1901, 34,670.

ROWSON, rō'sŏn, SUSANNA (HAWFIELD) (1762-1824). An Anglo-American dramatist, novelist, and actress. Her novel *Victoria* (1786) brought her father a pension. Her husband became bankrupt, and in 1792 she sought support from the stage, coming in the next year to America, where she acted at Annapolis, Philadelphia, Baltimore, and Boston, until 1795, appearing mainly in her own plays, *The Volunteers*, a farce (1793), *Acrobats in England* (1797), and others. Leaving the stage, she opened in Boston a school for girls which she conducted with honorable success until 1822. She also edited *The Boston Weekly Magazine*. Of her novels the most popular was *Charlotte Temple, a Tale of Truth* (1790), founded on an adventure of a kinsman with a girl whose grave may still be seen in Trinity Churchyard, New York, with Temple sub-

tree for the tree name, Stanley. In three hundred and thirty thousand copies of this book were printed. A sequel to this story, *Lucy Temple*, appeared posthumously (1828), and she was author of several other novels. Consult her *Life* by Elias Nelson (Albany, 1870).

ROWTON HEATH, BATTLE OF. A battle in the Civil War in England, fought September 24, 1645. Though the royal cause was actually lost at Naseby, Charles attempted to collect a new force in Wales. At the head of 5000 troops the King with his vanguard entered Chester, which was but partially surrounded by Brereton. Colonel Poyntz and Brereton made a combined attack on Sir Marmaduke Langdale, commander of the King's rear guard, at Rowton Heath, near Chester. The King lost about 1300 men.

ROXA'NA (Lat., from Gk. Ροξάνη) (?-B.C. 311). A wife of Alexander the Great. She was a daughter of the Bactrian Prince Oxyartes. Soon after Alexander's death (323), and before the birth of her son, Alexander Ægus, she induced Statira, one of Alexander's wives, to come to Babylon, and there caused her to be murdered. Her son was recognized as first of the heirs of the King, but both he and Roxana were put to death by Cassander's orders (Plutarch, *Alexander*; Arrian, *Anabasis*, vii. 27; Diodorus, books xviii. and xix.).

ROXBURGH, rōks'būr-ŭ. A southeastern border county of Scotland (Map: Scotland, F 4). Area, 665 square miles. The physical aspect is varied and picturesque, with the Cheviot and Lauriston Hills bounding a considerable portion of its borders. The interior is generally fertile and is famed to the greatest advantage. The chief river is the Tweed. Chief towns, Jedburgh, the capital, and Hawick. Population, in 1901, 48,800.

ROXBURGH, JOHN KER, third Duke of (1740-1804). An English bibliophile, born in London. He was appointed by George III. a lord of the bedchamber in 1767, and groom of the stole and privy councillor in 1796. He collected one of the most remarkable private libraries ever amassed in Great Britain. His more important acquisitions included a collection of works printed by Caxton, the two rare editions, both dated 1566, of the Scottish Acts of Parliament, a collection of the rare broadsides, including 1340 numbers, and Valdarfer's edition of Boccaccio, which, when the library was dispersed by sale in 1812, was bought by the Marquis of Blandford for £2260.

ROXBURGHE CLUB. A famous English book club, the first of these associations devoted to the reprinting for their members of old and rare books. It was founded in London after the sale of the magnificent collection of books formed by John, third Duke of Roxburgh, which realized nearly £25,000. The sale of the Valdarfer Boccaccio for £2260 was celebrated by a dinner at the Saint Albans Tavern, at which the club was founded, to consist of twenty-four members, each of whom was made responsible for the reprinting of one book. See **BOOK CLUB**.

ROXBURY. Formerly a city in Norfolk County, Mass., but since 1868 a part of Boston (Map: Massachusetts, E 3). Roxbury was settled in 1630, and included among its early inhabitants Thomas Dudley, thrice Governor of Massachusetts, and John Eliot, who was minister

here for nearly sixty years (1632-90). The famous Roxbury Latin School was established as the "Free School in Roxburie" some time between 1642 and 1645, and was endowed by Thomas Bell in 1674. Consult Drake, *The Town of Roxbury* (Roxbury, 1878).

ROXOLA'NI. In antiquity, a warlike people of Sarmatian origin, who dwelt north of Meotis Palus, between the Tanais (Don) and Borysthenes (Dniéper). They appear in history as early as the time of Mithridates the Great and about A.D. 69 had reached the boundary of Mesia. Their dangerous inroads into the Danubian provinces induced the Emperor Hadrian to come to terms with them by paying an annual tribute. At a later period, however, they appear as Roman auxiliaries. Mention is made of them last in the eleventh century.

ROY, WILLIAM (1726-90). A British military engineer and geodesist. He was born in Carlisle Parish, Lanarkshire, and at the age of twenty became connected with the army. He was the first British geodesist. He was employed in preparing for the Government a map of the Highlands, and finally of the whole mainland of Scotland, which, however, owing to imperfect instruments and the hurried nature of the survey, was only, to use Roy's own words, "a magnificent military sketch." After a military career in which his engineering skill was frequently availed of, Roy devoted himself to scientific pursuits, and in 1783 was employed by the British Government to connect the geodetic surveys of France and England in order to determine the relative positions of the Paris and Greenwich observatories.

ROYAL ACADEMY OF ARTS, THE. The most important of all British art institutions. It dates from 1768 and was founded by George III. Sir Joshua Reynolds was its first president. The number of academicians usually is about forty, and the number of associates is a little less. The president is knighted upon election, and the presidency is for life. Among the painters who have filled this office are Reynolds, Benjamin West, Lawrence, Eastlake, Leighton, Millais, and Poynter (1896). The first permanent rooms of the Academy were in Somerset House (1780). It removed to Trafalgar Square in 1834 and finally to Burlington House, Piccadilly, in 1869. About 2000 works of art are brought together at the Academy exhibitions, which take place each spring, and no artist may exhibit more than eight works. There are also other exhibitions, besides those of the Academy proper, which take place under its patronage. The permanent collection of the Academy contains many valuable paintings, as well as the diploma works of nearly all the academicians. The art schools of the Royal Academy, also in Burlington House, are free to all students in painting, sculpture, and architecture. The professors are academicians, and they also deliver lectures during the school year. There are several traveling scholarships, and various medals and prizes, which are awarded annually and biennially. Consult: Sandby, *History of the Royal Academy of Arts from its Foundation in 1768* (London, 1862); Laidlay, *The Royal Academy: Its Uses and Abuses* (ib., 1898); and *The Year's Art* (ib., annually).

ROYAL ANTELOPE. One of the diminutive steinbocks of the genus *Nanotragus*, remarkable as the smallest of all the ruminants, standing

only 12 inches high at the shoulder. It is chestnut in color on the upper part and pure white below. It is a native of the Guinea coast. Consult the *Proceedings* of the Zoölogical Society of London, for 1872.

ROYAL ARCANUM, THE. A fraternal and beneficial society organized by Dr. Darius Wilson and John A. Cummings, at Boston, in 1877. Starting with nine members, the society has now in Boston a substantial building in which the business affairs are conducted and where the Supreme Council meets. The society is governed through councils, which are dominated by the Supreme Council or governing body. Benefit certificates are issued for \$1000, \$2000, and \$3000, payable at death of a member. Should a member desire to increase his insurance over the limit fixed by the society, he can do so by making application for the increase in the Royal Additional Benefit Association, formed in 1880, practically within the Royal Arcanum, and incorporated in 1890 in New Jersey. The following statistics of the Royal Arcanum are brought down to February 28, 1903: Number of grand councils, 27; number of subordinate councils, 2045; approximate membership, 258,746; total amount of death claims from date of organization, \$76,190,352; amount of emergency fund, \$1,885,786. The emblem of the society is a royal crown within a circle, on the circumference of which are ten small Maltese crosses with the motto, "Mercy, Virtue, and Charity."

ROYAL ARCH MASONS. See MASONS, FREE.

ROYAL FERN. See OSMUNDA.

ROYAL GEOGRAPHICAL SOCIETY. See GEOGRAPHICAL SOCIETY, ROYAL.

ROYAL HISTORICAL SOCIETY. See HISTORICAL SOCIETY, ROYAL.

ROYAL INSTITUTION OF GREAT BRITAIN. An organization founded in London in 1799 and chartered in the following year as the Royal Institution for the Promotion, Diffusion, and Extension of Science and Useful Knowledge. Its principal objects are to further scientific and literary research, to spread the principles of inductive and experimental science, and to promote the application of such principles to the arts. The idea of such an institution originated with Benjamin Thompson, Count Rumford (q.v.), who was supported in the execution of his plans by Sir Joseph Banks, president of the Royal Society. It was Count Rumford's desire to extend a knowledge of the principles of physics and mechanics among the lower classes by means of public lectures and demonstrations, with a view of ameliorating the material condition of the people. Almost from the beginning the Institution assumed a leading place in the scientific world, although it was soon found necessary to depart from Count Rumford's idea of making the work of the society deal exclusively with the welfare of the lower classes. Its continued prosperity has been due chiefly to a succession of brilliant lecturers and experimenters, beginning with Thomas Young, who was professor at the Institution from 1801 to 1803, and including such great names as Sir Humphry Davy, Michael Faraday, John Tyndall, Sir Edward William Robert Grove, Sir Edward Frankland, William Odling, John Hall Glad-

stone, Edm. Ray, Lancaster, Sir James Dewar, and Lord Rayleigh. Within its laboratories have been made some of the most notable discoveries in physical and chemical science, and especially under Faraday and Tyndall valuable work was done in the popularization of these sciences. A feature of the work of the Institution is its evening lectures, at which the most eminent scientists are invited to present the latest achievements within their fields to the public. The Institution has been the recipient of many benefactions, the most noted of which is the bequest of £10,000 by Mr. John Fuller, M. P., in 1831, for the establishment of a Fulbrian professorship in chemistry and physics. Young men of special aptitude are offered facilities for carrying on research work, and in case of need are given pecuniary assistance. The library of the Institution contains 60,000 volumes. On June 27, 1899, the centenary of the Institution was celebrated with fitting ceremonies.

ROY'ALL, ISAAC (c. 1719-81). An American colonist, born probably in Antigua, B. W. I., where his father had large plantations. He early settled in Medford, Mass., and was chosen to fill various local offices. From 1752 until 1774 he was a councillor of the province, and in 1761, for his services in the French War, was commissioned brigadier general, the first American to attain that rank. During the agitation which preceded the Revolution he remained loyal to the King, and three days before the battle of Lexington went into voluntary exile. After remaining for some time in Halifax, he went to England, where he died of smallpox. Though he had been proscribed and banished and his estates confiscated, in 1778 he left by will an endowment for the law professorship at Harvard which still bears his name. The town of Royalston was also named in his honor.

ROYAL NAVAL COLLEGE. A professional school of the British Navy located at Greenwich (q.v.), and formally opened in 1873. It is designed for the training of midshipmen and higher officers and affords technical instruction in the various theoretical and scientific studies, such as navigation, mathematics, engineering, ordnance, etc. See NAVAL SCHOOLS OF INSTRUCTION.

ROYAL OAK. An oak tree which stood near the farm of Boscobel in Shropshire, and which for twenty-four hours afforded concealment to Charles II. after the battle of Worcester in 1651. The tree was destroyed after the Restoration by relic-hunters, but an oak grown from an acorn of the original tree stands on the spot, and there is another, said to have been planted by the King, in Hyde Park.

ROYAL SOCIETY, THE. A society organized in London in 1660 as "The President, Council, and Fellows of the Royal Society of London for Improving Natural Knowledge." It is the oldest scientific society in Great Britain and one of the oldest in Europe. The preliminary meetings were held on the suggestion of Theodore Haak, a German resident at London, at different places, principally at Gresham College, where, on November 28, 1660, the first journal of the society was opened by the originators. Gresham College became the permanent headquarters and on March 6, 1661, Sir Robert Moray was elected president, which position he held until the incorporation of the society, July 15, 1662. The charter was

formed in 1663, and on May 13th of that year the council of the Royal Society met for the first time.

From the outset the society established and maintained correspondence with men of philosophical attainments on the Continent, from which sprang the well-known work of the society, *Philosophical Transactions*, the first number of which appeared in March, 1665. By 1750 there had been four hundred and ninety-six numbers, or forty-six volumes, issued, and it was decided that thereafter the work be published annually in volumes, under the superintendence of a committee of the council. In 1666, on invitation of Henry Howard, of Arundel, the home of the society was changed to Arundel House. Howard also presented the council with the library of his grandfather, Thomas, Earl of Arundel, which was the foundation of the fine library of over 45,000 volumes now possessed by the society. In 1710 the society moved from Arundel House to Crane Court, where it remained until 1780, when the Government assigned it apartments in Somerset House. The present home of the society is Burlington House.

The Royal Society, among other duties, has the administration of the annual Government grant of £2000 to be divided among a limited number of persons as compensation for outlay incurred by them in scientific research during the year. Four medals are awarded every year, viz. one Copley, two Royal, and a Davy. The Copley Medal was founded on a bequest from Sir Godfrey Copley in 1709, and is awarded to the living author of such philosophical research, either published or communicated to the society, as may appear to the council to be deserving of that honor. The Royal Medals were established by George IV, and are awarded annually for the two most important contributions to science published in the British dominions not more than ten years nor less than one year from making the award. The Davy Medal was founded by Dr. John Davy, brother of Sir Humphry Davy, and is bestowed annually for the most important discovery in chemistry in Europe or British America. Foreign members of scientific eminence, to the number of fifty, are also eligible for membership. The session of the society lasts from November to June, ordinary meetings being held weekly. Papers are read at various times and during the year are published in either the *Philosophical Transactions* or the *Proceedings* of the society.

ROYAL UNIVERSITY OF IRELAND.

An examining and degree-conferring institution, situated in Dublin, Ireland. It was established by the University Education Act of 1879 and was formally organized in 1880. The Queen's University in Ireland, established in 1850 and consisting of the Queen's College at Belfast, Cork, and Galway, was dissolved in 1880 and superseded by it. It confers the various degrees in arts, sciences, engineering, music, medicine, and law. Diplomas are also granted in treatment of mental diseases, sanitary science, teaching, and agriculture. Both sexes are equally eligible for the examinations.

ROYAN, rwä'yän'. A seaside resort in the Department of Charente-Inférieure, France, at the mouth of the Gironde, 22 miles southwest of Rochefort. It is a well-built town with a handsome municipal casino. Royan dates from a

priory in which the Abbé de Brantôme wrote part of his memoirs. As a Huguenot stronghold it was besieged by Louis XIII. in 1622. Permanent population, in 1901, 8374.

ROYCE, JOSHUA (1855—). An American philosopher, born at Grass Valley, Nevada County, Cal. He graduated at the University of California (Berkeley) in 1875, studied also at Leipzig, Göttingen, and the Johns Hopkins University (Ph. D., 1878), in 1878 was appointed instructor in English in the University of California, and in 1882 instructor in philosophy in Harvard. In 1885 he became assistant professor, and in 1892 was advanced to the chair of the history of philosophy. In addition to a work of fiction, *The Feud of Oakfield Creek* (1887), his publications include *A Primer of Logical Analysis, for the Use of Composition Students* (1881), *The Religious Aspect of Philosophy* (1885), *California from the Conquest in 1846 to the Second Vigilance Committee in San Francisco* (1886; in the "American Commonwealths" series), *The Spirit of Modern Philosophy* (1892), *The Conception of God* (1895), *Studies of Good and Evil* (1898), *The Conception of Immortality* (1900; Ingersoll lecture on Immortality, Harvard), and *The World and the Individual* (2 vols., 1900-01; series i., The Four Historical Conceptions of Being; series ii., Nature, Man, and the Moral Order), being the Gifford lectures delivered at the University of Aberdeen, Scotland, in 1899-1900. Professor Royce also wrote a brief *Psychology* (1903), laying particular emphasis upon the psychical characterization and development of the 'self.' In metaphysics Royce is considered to be one of the foremost exponents of neo-Hegelianism in America, and his work in popularizing and interpreting the abstrusities of Hegel has been of great importance. Of still greater significance have been his original contributions, especially on the development of the concept of the 'self' or individual, his expositions of idealism, his doctrine of truth and error, and his insistence upon the ethical aspects of philosophy.

ROYER-COLLARD, rwä'yä' kô'lär', PIERRE PAUL (1763-1845). A French statesman and philosopher, born at Sompnis (Marne). He practiced law and held various offices after the outbreak of the Revolution. Being proscribed for his moderate views during the Reign of Terror, he returned to his old home at Sompnis, and lived as a farmer, in order to evade the suspicions of the Jacobins. In 1797 he was elected to the Council of the Five Hundred, but after the 18th Fructidor he retired from politics. In 1809 he accepted the chair of philosophy in the newly created University of France and soon came to exercise an immense influence on philosophic thought in France. He rejected the sensualist system of Condillac, and adopted an eclectic philosophy, giving special prominence to the principles of the Scottish school of Reid and Stewart. In August, 1815, he was appointed president of the Commission of Public Instruction, which office he held, with the title of counselor of State, till July, 1820. In 1815 also the electors of Marne chose him as their Deputy. In 1817 Royer-Collard for the first time withdrew his support from the Government, and in 1819 the rupture was complete. In spite of his royalist leanings, he founded the political party of the Doctrinaires in 1820

(see DOCTRINAIRE), and advocated a constitutional monarchy. The French Academy elected him to membership in 1827, and in 1828 he was named president of the Chamber of Deputies. In that capacity Royer-Collard had to present the famous address of the 221 Deputies (March, 1830), refusing their support to the Government, which the King declined to hear read. On the next day the Chamber was prorogued. After the Revolution of July, 1830, he reëntered politics, but in 1842 he withdrew completely from public life. Consult the biographies by Philippe (Paris, 1857); Lacombe (ib., 1863); Barante, containing many of his speeches (ib., 1878); also Fagnat, *Politiques et monarchistes du XIX^eme siècle* (ib., 1891).

ROYLE, JOHN FORBES (1799-1858). An English naturalist, born at Cawnpore, India. He studied at the Military Institute of the East India Company, Addiscombe, was appointed assistant surgeon to the company, and served on the medical staff of the army of Bengal. In 1823 he was appointed physician at the station of Saharunpore, and superintendent of the garden there. In that post he made useful researches in botany and meteorology. He was appointed professor of materia medica at King's College, London, in 1837, and in the same year was elected a fellow of the Royal Society. He was a careful observer, and accurate in his published writings, more especially those on technical matters. Among his works are: *An Essay on the Antiquity of Hindoo Medicine* (1837); *On the Culture and Commerce of Cotton in India and Elsewhere* (1851); and *The Fibrous Plants of India Fitted for Cordage* (1855). Consult Britten and Boulger, *Biographical Index of British and Irish Botanists* (London, 1893).

ROY'TON. A town in Lancashire, England, 2 miles north-northwest of Oldham (Map: England, D 3). It has large cotton industries. The town has undergone much modern improvement, maintains gas and water supplies, and owns markets. Population, in 1901, 14,880.

ROZE, MARIE (1848-). A French operatic singer, born in Paris. She studied at the Paris Conservatory, where she gained the highest honors. She first appeared in opera in 1867, singing the part of Hérold's *Marie* with great success. At the end of three years she withdrew to study grand opera under Wartel, Gounod, and Ambroise Thomas, reappearing as 'Margarite' in *Faust* at the Grand Opera with much success. During the siege of Paris she remained in the city, turning her house into a hospital for the wounded, and organizing numerous concerts for their benefit. After the war she made a tour through the principal cities of Europe, and first appeared in London in 1872, where for four years she sang in the Italian opera. In 1877 she married Henry Mapleson, and began a two years' tour in the United States, returning to London after its completion, where she became a popular concert and oratorio singer.

RUABON, rō-ä'bōn. A parish town and railway junction of Denbighshire, Wales, on the Dec. 5 miles southwest of Wrexham (Map: Wales, C 4). Iron ore and anthracite coal are mined extensively in the neighborhood, and there are important iron works and brick and tile factories. Population of parish, in 1891, 17,609; in 1901, 21,721.

RUÁTAN, rō-ä'tän', or **ROATÁN.** The largest of the Bay Islands (q.v.).

RUBAIYAT, rō-boi'yät (Arabic plural of *rubā'ī*), quatrain, from *rubā'ī*, four. The term applied to a collection of Persian quatrains. The *rubā'ī*, or quatrain, is the distinctive Persian metre, and has the following verse scheme, read from right to left:

— — — — — | — — — — — | — — — — —

with the rhyme *aaab* or *abaa*. The rhyme may, however, go back several syllables, or even words, as in the following example cited from the forty-fifth quatrain of Payne's translation of Omar Khayyam:

Skinker, since ruins of Iram are gone, or thee and me,
This nether world is no abiding land for thee and me.
Yet, so the wine cup in the midst set stand for thee and me,
Best thou assured the very Truth's in hand for thee and me.

There are many variations in rhyme which may become as intricate as quatrain 779 of the same translation:

I spake, thou spakest; heart gave I thee, thou need'st not,
I take, thou takest; I thou merry from me, I from thee poor.
I am, thou art, too—thou merry and I for thee sad,
I make, thou makest (thou wrong and I patience in vain)

Nearly all the poets of Persia include in their works a Rubaiyat. Through the translation of Omar Khayyam (q.v.) by Edward FitzGerald (q.v.) this quatrain, modified to the English heroic metre of the iambic pentameter, was made an English verse form. For a knowledge of the metrical variations in Persian with an exact reproduction in English, consult Payne, *Quatrains of Omar Khayyam of Nishapour* (London, 1898).

RUBASSE, ru'ä'sä' (Fr., red colored quartz), *Ancosa Ruby*, or *Mont Blanc Ruby*. A variety of crystallized quartz containing occluded spangles of hematite or specular iron, which reflect a bright red color resembling that of the ruby.

RUBATO, rō-hä'tō, *Tiempo* (It., stolen). In music, a phrase indicating that the performer is to modify the regular rhythmic movement, by emphasizing, and thus prolonging, important notes. The less important notes of the bar must consequently be curtailed, so that its aggregate value may remain unchanged.

RUBBER (from *rub*; perhaps connected with Gael. *rub*, Welsh *rhubio*, to rub, Fr. *rubour*, Gael. *rubair*, a rubber), *India Rubber*, or *Caoutchouc*. A substance which, on account of its peculiar properties, is much used in the arts. Probably no single article has within the past century experienced more rapid growth in its relation to commerce and manufactures. Rubber is not, as is often supposed, the product of a single species of trees, but is produced by a number of different kinds, all of them thriving in tropical climates only. Some of them require a moist, alluvial soil, and others flourish in a stony soil with only an intermittent rainfall. Rapidly as the consumption of rubber has increased, there seems no danger of exhausting the world's supply, so abundant and widely scattered are its sources. In 1900 india rubber forests of vast extent and superior quality were found in Bolivia, and other similar regions doubtless await the explorer. The Province of Para, in Brazil, furnishes the largest quantity and best quality of rubber yet known to commerce, the standard by which all other varieties are compared.

The first record of india-rubber was made in accounts of Columbus's second voyage to America, where it is related that he found the inhabitants of Hispaniola (Haiti) amusing themselves with rubber balls. In a book published in Madrid in 1615, Juan de Torquemada mentions the tree which yields rubber in Mexico, describes the mode of collecting the gum, and states that it is made into shoes; also that the Spaniards use it for waxing their canvas cloaks to make them resist water. It was at first known by the name of *elastic gum*, and received that of india-rubber from the discovery of its use for rubbing out lead-pencil marks. It is stated that the first rubber was brought into the United States in 1800, the very year in which was born Charles Goodyear (q.v.), a man whose inventions made possible the modern rubber industry.

India-rubber is obtained from the milky juice of the rubber tree. This is not the true sap, but a secretion which does not seem to be essential to the life of the plant. In this juice float minute globules of rubber which, when the juice is allowed to stand, rise to the top, like cream. Various methods are employed for collecting the sap, the future character of the rubber depending much upon how this is done and the separation of the caoutchouc from the aqueous liquid is effected. The annual yield of a single tree is from 2 or 3 to 16 or 17 pounds. The rubber is sometimes collected by simply cutting the trees down, but this wasteful method has been in most cases abandoned, and it is customary to make incisions in the trunk through which the milk oozes out. The trees are tapped at sunrise, as the milk is supposed to flow more freely during the morning hours. The first row of incisions is often made in a circle surrounding the tree about six feet from the ground, the next morning a row somewhat lower down is made, and so on, each succeeding morning till the ground is reached. In each incision a little clay cup, molded by the workman and holding about a gill, is placed, and its contents emptied daily into a larger vessel, in which it is allowed to smolder over a slow fire until the water is evaporated and the rubber shaped into cakes is ready for export. This is the almost universal method of collecting Pará rubber. Recently, however, in regions where the rubber milk is collected in large amounts, a more scientific means has been adopted for obtaining the caoutchouc by using a machine similar to a cream separator which collects the rubber on the top quite as effectually, and causes the water and all impurities to be driven to the bottom.

A favorite but wasteful way of collecting rubber is followed by the natives of Central America and Assam, who allow the milk to run into a hole in the ground and after the water is absorbed a spongy mass is left, mixed with dust and leaves. In Africa and New Guinea the natives smear their bodies with the milk, and after this has evaporated scrape off the layer of caoutchouc which has dried on the skin and mold it into little slabs or cubes. In Fiji the milk is taken into the mouth and the small pellets thus formed are heaped and molded into balls. In Borneo, Africa, and some parts of Brazil, salt water is used to form the clot. The *Pernambuco* rubber of commerce is produced in this way. Sometimes the milk is simply allowed to trickle down the tree and dry in tears as it flows. These scraps and strings are collected and molded into balls.

The *Ceará* rubber, a dry elastic rubber, free from stickiness, is produced in this way. At the close of the nineteenth century the world's annual production of rubber was about 57,500 tons, of which 21,000 tons are consumed in the United States and Canada and as much more in Great Britain. Of this amount the chief producers were: the Amazon district, 25,000 tons; the rest of South America, 3,500 tons; Java and Borneo, 1000 tons; East and West Africa, 24,000 tons; India, Burma, and Ceylon, 500 tons.

The manufacture of rubber did not begin till about 1820. The application of rubber to the making of waterproof cloth first gave it commercial importance, although it had been previously made into flexible tubes, for the use of surgeons and chemists, and into bottles. Waterproof cloth was first made by Charles McIntosh, a Scotch chemist, who reduced the rubber to a solution in naphtha and spread it between two layers of cloth. Waterproof coats still bear his name. In 1852 a Boston sea-captain imported into America 500 pairs of rubber boots which had been made by the natives of Brazil. These were readily sold for from \$3 to \$5 per pair, and a great demand for them was created. During the next 15 years probably more than 1,000,000 pairs were sold. In the meantime William Chaffee had developed a rubber varnish for coating different materials to make them waterproof. In 1833 the Roxbury India Rubber Company was formed and for a time the new enterprise flourished. But it was soon found that these waterproofed articles had an unfortunate tendency to grow hard and crack in the winter and to become soft and sticky in the summer. The demand for them ceased and their manufacture was given up.

Charles Goodyear, an unsuccessful merchant, in the meantime had turned his attention to the manufacture of rubber goods and was striving to find some process which would obviate the defects of pure rubber and render it less susceptible to the influence of heat and cold. He tried mixing it with magnesium, with quicklime and water, and with nitric acid. It had already been discovered by Leudersdorf, a German chemist, and also by Nathaniel Hayward of Woburn, Mass., that by mixing dry sulphur with rubber its stickiness was removed. Hayward's patent and process were acquired by Goodyear, who, by accident, dropped upon a hot stove some of the mixture, and found to his astonishment that the high heat did not melt it. He next placed it in extreme cold and its texture still remained unchanged. Thus after years of patient experimenting, the art of *vulcanizing* was accidentally discovered. Goodyear immediately developed the process and placed it upon a commercial basis.

VULCANIZING is simply the process of mixing sulphur with rubber and then subjecting the mixture to moderate heat (say 300° F.) for six or more hours. Its effect is to render rubber elastic, impervious, and unchangeable in texture under all ordinary conditions. The product varies from soft to hard, according to the amount of sulphur and heat applied. Although sulphur is the only essential ingredient, other materials are often added at the same time, as silicate of magnesium, carbonate of lead, asphalt, and tar, each of which imparts a different quality to the product.

Commercial rubber is a tough fibrous substance, possessing elastic properties in the highest

degree. Reduced to the temperature of freezing-water (32° F.), it hardens, and in greater part, if not entirely, loses its elasticity, but does not become brittle. When heated, as by placing in boiling water, it softens, and becomes very much more elastic than at ordinary temperatures, though it does not in any degree dissolve in the water. If suddenly stretched to seven or eight times its original length, it becomes warm; and if kept in this outstretched form for several weeks, it appears to lose, in great part, its elastic properties, and in this condition is readily cut into those thin threads which are used in the elastic put in gloves, bonnets, etc., and the elasticity of which is readily renewed by the application of gentle heat. Elastic thread is now prepared with vulcanized rubber. Commercial rubber is insoluble in water and alcohol, is not acted upon by alkalis or acids, except when the latter are concentrated, and heat is applied; but is soluble in ether, chloroform, bisulphide of carbon, naphtha, petroleum, benzol, and the essential oils of turpentine, lavender, and sassafras. Many other essential and fixed oils, when heated with caoutchouc, cause it to soften, and produce thick glutinous compounds, especially linseed oil. When heated to 248° F., caoutchouc fuses; and at 600° it is volatilized, at the same time undergoing decomposition, and yields a liquid called *caoutchoucine* or *caoutchisine*, possessing great solvent powers over rubber and other substances.

There are some useful applications of india-rubber in the liquid or semi-liquid state, which it is worth while to note; thus, when melted at 398° F., and mixed with half its weight of slaked lime, it forms a useful cement, which can be easily loosened, but it will dry and harden if red lead is added. A very tenacious glue is formed by heating rubber, coal tar, and shellac together. It forms an ingredient in some special kinds of varnishes, and it also improves the lubricating qualities of mineral oils, when a small quantity is dissolved in them. Pure india-rubber is now used only to a limited extent in the arts, but it is applied in the vulcanized state to an almost endless variety of purposes.

PROCESS OF MANUFACTURE. The first step in the manufacture of crude rubber is one of thorough cleansing. The rubber is allowed to remain in steam-heated water for about twenty-four hours, after which it is cut up and the larger impurities removed by hand. It is then washed by passing between two heavy corrugated iron rollers. A stream of water flows over the rubber from a pipe directly at the point of contact with the rollers, and the combined action of the rollers and water removes all foreign substances adhering to the rubber. The rubber is next placed in drying chambers and after thorough drying is stored in a dark, dry room until needed.

Methods of vulcanizing vary with the article to be vulcanized, but in general the purified and masticated gum is thoroughly kneaded with the requisite amount of sulphur and cut and shaped before heat is applied. In case the goods are to be made of a rubber cloth, as in the case of shoes (q.v.), the rubber is spread on its backing with heated iron rollers and the goods made up before they are vulcanized. The material is not sewed, but held together by some solvent, as turpentine, which makes the edges adhere. To prevent adhesion of the articles during the vulcanizing process, they are very carefully packed, and pow-

dered soap-stone, talcum, or other powder, being used. The rubber is heated in a cast-iron cylindrical oven with one end fitted as a door.

Goodlyan invented two different kinds of rubber, the pliable *soft rubber* and *hard rubber*, or *ebonite*, which is used for making a great variety of useful and fancy articles. The chief difference between the two is in the amount of sulphur used and heat applied.

A few general classes of vulcanized rubber goods are: (1) Footwear and other waterproof clothing; (2) mechanical goods, including hose, belting, tires, etc.; (3) electrical and other scientific appliances; (4) medical and surgical apparatus and allied articles; (5) hard rubber goods; (6) liquid or semi-liquid materials, as varnishes and cements. This classification is obviously imperfect, but it will serve to suggest the enormous variety of commercial products of which india rubber is an essential constituent. In electrical appliances rubber is almost indispensable as an insulating material. Recently this field has been extended by substituting it for gutta-percha in insulating submarine cables. (See CABLES, ELECTRIC.) During the last decade of the nineteenth century the value of the crude rubber imported into the United States increased from \$18,020,801 in 1891 to \$31,553,483 in 1900. This increase of value was caused not only by the additional amount consumed, but also by the rise in price, which in 1900 was 63 cents per pound. With the increase in cost of the raw product, old rubber is more and more used for re-manufacture.

RUBBLE. See MASONRY.

RUBEFACIENTS (from Lat. *rubefaciens*, pres. part. of *rubefacere*, to make red, from *rubere*, to be red, from *rubere*, red; *facere*, to make). Substances employed in medicine for the purpose of stimulating and reddening the skin over the part to which they are applied. These agents have the power of relieving congestion, pain, spasm, or excessive irritability of superficial parts or deep-seated organs. All substances which after a certain period act as blisters may be made to act as rubefacients if their time of action is shortened. Among the most commonly used rubefacients may be mentioned: *Heat* in the form of hot baths, cloths soaked in very hot water, poultices, bottles filled with hot water, and heated solids such as bricks, sand-bags, etc. *Mustard*, either in the shape of mustard leaves (sheets of paper coated with mustard and applied moist) or thick poultices, composed of various proportions of mustard, mixed with flour or meal and cold water. (See POUltICE.) *Oil of Turpentine*, applied by means of flannels wrung out of hot water and sprinkled with the oil, the turpentine staves, or as a liniment. *Unguenta* in the form of a liniment (volatile liniments), *Cap. Siccum* (cayenne pepper) in the form of a poultice or alcoholic lotion is much used in the West Indies. *Cantharidia* (Spanish fly) is properly

a coloring agent, but may be used as a rubefacient if modified by the free admixture of soap or resin plaster. Plasters of Burgundy pitch and resin cerate are also slightly rubefacient. Rubefacients are used to reduce inflammations or congestions, as in pleurisy and pneumonia; to cause the absorption or removal of inflammatory products as found in chronically enlarged joints; to relieve pain and spasm, as in neuralgia and intestinal cramp. See COUNTER-IRRITANTS.

RUBELLITE (from Lat. *rubellus*, reddish, diminutive of *ruber*, red). The pale rose-red or pink variety of tourmaline, of which the gem varieties in the United States come chiefly from the famous locality of Mt. Mica, near Paris, Me. Excellent gem varieties of rubellite are also found in Ekaterinburg, in Siberia, and on the island of Elba.

RUBENS, PETER PAUL (1577-1640). The chief master of the Flemish school of painting, one of the most prolific and versatile artists of all times. He was born at Siegen, Westphalia, June 29, 1577, son of Jan Rubens, a lawyer of Antwerp. His father had come to Cologne in 1568, but, owing to his illicit relations with Anna of Saxony, wife of William of Orange, was kept in temporary captivity at Siegen. After his death at Cologne in 1587, the widow returned to Antwerp, where Peter Paul frequented school for three years, then was a page in the service of Countess Lalaing. He began his artistic training under Tobias Verhaegt, a mediocre landscape painter, then studied four years (1592-96) under Adam van Noort and, until 1600, under Otto van Veen, being in the meanwhile received as master into the guild in 1598. The works of the great Italian colorists attracted him to Venice in May, 1600, and in the same year Duke Vincenzo Gonzaga made him his Court painter at Mantua. Sent to Rome in 1601 to make copies of old masters, Rubens also executed there, for Archduke Albert, Governor of the Netherlands, three altar-pieces in the Church of Santa Croce in Gerusalemme, which are now at Grasse, in Southern France. In 1603 Gonzaga made him the bearer of presents to King Philip III, of Spain, whence he returned to Mantua in 1604, then was in Rome again from the end of 1605 till June, 1607, when the Duke summoned Rubens to accompany him to Genoa. The special interest he took here in the works of architecture resulted in the publication, in two parts, of 136 engravings, under the title, *Palazzi antichi di Genova* (Antwerp, 1613 and 1622). For the Church of Sant' Ambrogio at Genoa he painted (at what period it is not known) the "Miracle of St. Ignatius," a work of great splendor. Stopping at Milan, on his return, he made drawings of Leonardo da Vinci's "Battle of Anghiari" and "Last Supper," which are both in the Louvre. In 1608 we find him once more in Rome, studying the great masters, and occupied with several compositions of his own, when news of his mother's illness called him back to Antwerp. Intending, after her death, to return to Mantua, he was induced to remain, by Archduke Albert, who appointed him his Court painter. In 1609 he married Isabella Brant, with whom he appears depicted in the splendid portrait of 1610, in the Pinakothek at Munich. A highly finished work of his Roman period is the "Saint Jerome," in the Dresden Gallery.

His first great commission came from the city

of Antwerp, to paint for the city hall an "Adoration of the Magi" (1610), of large size and glowing color, now in the Madrid Museum. In the same year he completed the famous "San Ildefonso Altar," now in the Vienna Museum, a work of unsurpassed mastery in the combination of chiaroscuro effect with luminous color, and the "Elevation of the Cross," which, with its far-famed companion piece, "Descent from the Cross" (1612), adorns the Antwerp Cathedral. A modified treatment of the latter subject is in the Hermitage, Saint Petersburg, which contains also one of his most successful mythological subjects, dating from 1612 and 1615, the "Perseus and Andromeda," an equally fine version of which is in the Berlin Museum. To this period belong also the exquisite "Madonna Surrounded by Children," in the Louvre, and the genial group of "Children with a Fruit Garland" (c.1615), in the Pinakothek, Munich. Dated 1614 are a small but precious "Flight into Egypt," in Cassel, and a highly finished "Pieta" in the Vienna Museum, of which there is a larger replica, with landscape by Jan Breughel, in the Antwerp Museum. Breughel also painted the fine garland around the "Madonna with Angels," in the Pinakothek, Munich, which bears the features of Isabella Brant.

From the first, after his settling at Antwerp, pupils had flocked to his studio in such numbers that, as early as 1611, he was obliged to refer applicants to other masters for years in advance. With the constant increase of orders, he availed himself of the assistance of his pupils in the execution of the larger paintings and of replicas frequently in demand. Such works were more or less retouched by him to give them the impress of his genius. But he also often worked in conjunction with his fellow-artists, notably, beside Breughel, with Frans Snyders, who was his collaborator in the spirited "Boar Hunts," in the Dresden and Munich Galleries, and in the "Chase of Diana," in the Berlin Museum. Rubens himself was an animal painter of the first rank, witness the "Lion Hunt" (1616), in the Pinakothek at Munich. That gallery also contains several of his most important religious and mythological pictures of this period, to wit: the "Last Judgment" (2 treatments, 1616 and 1618), "Christ and the Four Sinners" (c.1619), "Nativity" (1620), "Descending of the Holy Ghost" (1620), "The Chaste Susanna," the "Assumption," "Castor and Pollux Abducting the Daughters of Leucippus," "Meleager and Atalanta" (same subject in Cassel), "Drunken Silenus" (1617), and above all "The Battle of the Amazons" (1619), his most famous example of depicting the tumult of battle. Other masterpieces of this period are: "The Conversion of Saul" (c.1617, Berlin Museum); "Scourging of Christ" (1617, St. Paul's, Antwerp); "Expulsion of Hagar" (1618, Hermitage, Saint Petersburg); "The Miraculous Draught of Fishes" (1616-18, Church of Our Lady, Mechlin), a striking piece of realistic conception; "St. Ignatius Casting Out Devils" (Vienna Museum); "Incredulity of Thomas" (1615), "Christ à la Paille" (c.1617), "Last Communion of Saint Francis" (1619), "Christ on the Cross" (known as "Le Coup de Lance," 1620, a work of remarkable dramatic effect), all in the Antwerp Museum. Among the numerous Madonnas, one of the most sympathetic is "Mary, the Refuge of Sinners" (c.1619, Cassel Gallery), which

THE DESCENT FROM THE

PETER PAUL RUBENS

100

plainly shows the coöperation of Van Dyck. Mythology is represented by "Jupiter and Callisto" (1613) and "Meleager and Atalanta," both in the Cassel Gallery; "Neptune and Amphitrite" (c.1612-14), "Bacchanal" (c.1618-20, with Van Dyck), and "Andromeda" (c.1638), all in the Berlin Museum; "Jupiter and Antiope" and the "Freezing Venus" (both, 1614, Antwerp Museum); "Venus in the Smithy of Vulcan" (Brussels Museum); "Judgment of Paris" (Madrid Museum); "Boreas and Oreithyia" (Vienna Academy); "Bacchanal," "The Daughters of Cecrops," and "Toilet of Venus" (all in the Liechtenstein Gallery, Vienna). Of allegories there are the "Hero Crowned by Victory" (Dresden), replicas in Cassel (1617), Munich, and Vienna; "Tigris and Abundantia" (c.1610, Saint Petersburg); "The Four Quarters of the Globe" (Vienna Museum); "The Terrors of War" (1638, Palazzo Pitti, Florence). In 1622 Rubens was called to Paris by Maria de' Medici, to adorn the Luxembourg Palace with the chief episodes from her life. The twenty-four paintings executed within three years by his pupils from his designs were taken by him to Paris, where they now occupy a separate room in the Louvre; the sketches of eighteen of them are in the Pinakothek at Munich. Another series to represent the history of Henry IV. was only partly finished (1628-30). For Louis XIII. he completed (1622) twelve cartoons for tapestry with the history of Constantine the Great.

Having already undertaken diplomatic missions in 1623-25, for the Infanta Isabella (Regent after the death, in 1621, of Archduke Albert), he was intrusted in 1627 with the negotiations concerning the conclusion of peace between England and Spain. He went to Madrid in 1628 and thence with the King's instructions in 1629 to London, where he brought his mission to a successful ending and was knighted by Charles I. in 1630. The same distinction was conferred upon him by Philip IV. of Spain. In Madrid, as well as in London, his brush was in great demand, especially for the painting of portraits; in Madrid he also renewed the study of Titian, which strongly influenced the works of his later period. In 1626 his wife had died, leaving him with two sons, and in December, 1630, he married the youthful Helene Fourment, who bore him two more sons and three daughters. Her features are preserved to us in numerous portraits, which her admiring husband never tired of painting at various stages. Noteworthy among the master's later works, and some of the earlier not as yet mentioned, are the "Conversion of Saint Bayon" (1824, Ghent Cathedral); "Adoration of the Magi" (1824), Antwerp Museum, an imposing composition, containing many figures over life-size, said to have been painted in a fortnight; "Lot's Family Leaving Sodom" (1625, Louvre); "Assumption" (1626, altarpiece, Antwerp Cathedral); "East Supper" (completed 1632, Brera, Milan); "Holy Family Under an Apple-tree" (Vienna Museum); "The Way to Golgotha" (c.1636, Brussels Museum); "Samson Taken Prisoner" and "Massacre of the Innocents" (c.1637, both in the Pinakothek, Munich); "Bath-sheba at the Bath" and "Quo-Ego" (1634, both in Dresden Gallery); "Saint Francis Receiving His Stigmata" (c.1638, Cologne Museum); "Crucifixion of Peter" (1639, Saint Peter's, Cologne), vigorous, but of repellent fidelity to nature; and a "Santa Conversazione,"

for the altar of his mortuary chapel, one of his last and finest works. A work of great thought in the expression of religious enthusiasm is "The Brazen Serpent" (c.1625-30), in the Madrid Museum. Of historical compositions the most prominent are "Saint Ambrose Forbidding the Emperor Theodosius to Enter the Church" (Vienna Museum); "Apotheosis of William of Orange" (National Gallery, London), which also contains the "Triumph of Julius Cesar"; and an allegory, "War and Peace," presented by Rubens to Charles I. in 1630. In the Metropolitan Museum, New York, the master is represented by "Return of the Holy Family from Egypt" (c.1610), "Susanna and the Elders" (c.1630), and "Pyramus and Thisbe."

His landscapes, about fifty in number, the majority of which date from after 1635, are models of arrangement and coloring, and may be judged by the examples preserved in the galleries of London, Dresden, Munich, Vienna, the Louvre, and the Palazzo Pitti, Florence. Even the genre is ingeniously represented by "La Bondia," a dance of Italian peasants, in the Madrid Museum, and the splendid "Kirmess" (c.1636), in the Louvre. Of the famous so-called "Garden of Love," styled by Rubens himself "Conversation à la mode," the picture in the Madrid Museum is the original, while the more familiar specimen in Dresden is a good school-piece. A less restrained atmosphere pervades the subject called the "Festival of Venus," in the Vienna Museum, which contains another genre piece, entitled "The Château-Park." His eminence as a portrait painter is attested by the numerous specimens in the foremost galleries of Europe, among which may be mentioned the group portrait in the Palazzo Pitti, Florence, known as the "Four Philosophers" (the artist, his brother Philip, and two scholars), and the portraits of himself in Windsor Castle (with Helene Fourment), and in the Vienna Museum. Among several of Isabella Grant, that in Saint Petersburg (c.1620) is the finest. Most attractive are "Rubens' Sons" (c.1627), in the Liechtenstein Gallery, Vienna, and in Dresden, Helene Fourment is depicted in the galleries of Amsterdam, The Hague, Munich (three, besides the "Family Group in the Garden"), Florence, and Saint Petersburg, also with two children, in the Louvre (unfinished), and as "Saint Cecilia" in Berlin. Celebrated is the portrait of 1629, known as the "Chapeau de paille," in the National Gallery, London. Others of note are those of Jean Charles de Cordes and his wife (1618), in Brussels; of Baron Henri de Vlieg, in the Louvre; of Maria de' Medici, in Madrid; of Dr. van Thullen (c.1629), and of an "Old Scholar" (1635), in Munich; and of "Jan van der Moelen" (1616), in the Liechtenstein Gallery, Vienna.

For several years a victim to gout, the great master, in the fullness of his power, succumbed to paralysis of the heart at Antwerp on May 30, 1640, and was buried with great pomp in the Church of Saint Jacques. An eclectic in the highest sense of the term, his inspirations derived from the great Italian masters served to establish a bond of union between the art of Italy and that of the North, without in any wise involving a sacrifice of his individual tendency toward a sound realism. In power of invention he can be compared only to Dürer and Raphael. The lofty strain of his composition,

his extraordinary facility of production and the sedulous brilliancy of color, his inimitable treatment of the nude and wonderful luminosity of his tones, exercised a far-reaching influence upon his contemporaries and disciples, which was felt in Flemish art for more than a century, extending to every branch of painting. In the nineteenth century it proved an inspiration to the Romanticist movement, not only in Belgium, but in Europe. Of his extremely numerous pupils Van Dyck was the most famous, and Theodor van Thulden was his favorite. The number of his paintings amounted to 1300, nearly two-thirds of which were by his hand alone. He also educated a school of engravers, which acquired fame through the reproduction of his renowned works, and a large number of drawings bear witness to his industry also in that field. Rubens was a man of scholarly attainment and universal culture, who had a thorough command of Latin and six other languages, and corresponded with many distinguished contemporaries.

RUBEOLA. See MEASLES.

RUBIACEÆ (Neo-Lat. nom. pl., from Lat. *rubia*, madder, from *rubens*, *ruber*, red). THE MAJER FAMILY. One of the largest orders of dicotyledonous plants, consisting of more than 350 genera and 4500 species of trees, shrubs, and herbs most abundant within the tropics. Various schemes of classification of this order have been presented, some botanists limiting it to the herbs like *Galium*, etc., but most systematists extending it to include much larger numbers. The classification of Schumann as given by Engler divides the order into two suborders, Cinchonoideæ and Colloeoideæ, both of which are again subdivided, twenty-one tribes being recognized. Some of the better known and more important genera are: *Houstonia*, *Cinchona*, *Gardenia*, *Guetarda*, *Chiococca*, *Coffea*, *Uragoga* (which includes *Cephalis*), *Coprosonia*, *Morinda*, *Asperula*, *Galium*, and *Rubia*. The name of the family is derived from *Rubia tinctoria*, the madder.

RUBICON. The ancient name of a stream flowing into the Adriatic, which formed the boundary between Cisalpine Gaul and Italy proper. It obtained a proverbial celebrity from the well-known story of its passage by Cæsar, who, by crossing it in B.C. 49, virtually declared

war against the Republic. Hence the phrase 'to cross the Rubicon' has come to mean to take an irrevocable step. The modern Rubico, called by the peasants on its banks *Il Rubiconc*, has claims to being the ancient Rubicon; but arguments preponderate in favor of the Fiumicino.

RUBIDIUM (Neo-Lat., from Lat. *rubidus*, reddish, from *ruber*, red). A metallic chemical element discovered by Bunsen and Kirchhoff in 1861, by means of the spectroscope, in the mineral waters of Dürkheim, Germany. It is found with cesium in the minerals lepidolite and petalite, in the waters from various springs, in the ashes of seaweed and tobacco, in tea, and in beet-root molasses. Bunsen separated rubidium chloride by evaporating large quantities of the mineral water mentioned above, and then subjecting the molten chloride to the current of an electric battery, when the metal rose to the surface in the form of globules. It is more commonly obtained by heating a mixture of sugar-charcoal, charred acid rubidium tartrate, and calcium carbonate at a white heat, in an iron cylinder connected by an iron tube with a glass receiver, into which the rubidium distills over.

Rubidium (symbol Rb; atomic weight, 85.43) is a silver-white soft metal that melts at 38.5° C. (101.3° F.) and evolves a bluish vapor at a dull red heat. It oxidizes rapidly in the air and decomposes water with ignition of the liberated hydrogen. It is the most positive element next to cesium. With oxygen it forms a monoxide similar to that of potassium, and its salts are readily recognized by the red color that they exhibit when heated in the non-luminous flame of a Bunsen burner.

RUBINSTEIN, רובין-stein, ANTON (1830-94). A famous Russian pianist and composer, born at Wechwotynecz, near Dubossary, Government of Kherson, of Jewish parentage. His mother commenced his musical education when he was but four years of age, and in two years he had exhausted her knowledge. He was then placed under Villoing. In 1840 he entered the Paris Conservatory and shortly afterwards attracted the attention of Liszt, Chopin, and Thalberg. He stayed in Paris eighteen months, after which he made some extraordinarily successful tours. His parents, who for business reasons had moved to Moscow soon after his birth, about this time (1844) moved to Berlin, a step strongly advised by Liszt. There Anton was placed under the famous Dehn for composition and theory. From 1846 to 1848 he was thrown on his own resources, his parents having returned to Moscow, and he took up teaching in Vienna, returning to Russia in 1848, and settling in Saint Petersburg. Here he came under the patronage of the Grand Duchess Helen, and for the following eight years studied and wrote assiduously, producing several operas, and accumulating the manuscripts which subsequently brought him a world-wide fame as a composer. He made a tour of Germany, France, and England (1857), and upon his return to Saint Petersburg in 1858 received the appointment of Court pianist, and conductor of the Court concerts. He founded the Saint Petersburg Conservatory of Music (1862), and remained its director until 1867. In 1861 he organized the Russian Musical Society, and in 1889 was decorated with the Order of Vladimir, which

- 5. RED HERRN-BLUMHEIDE - RUBUS STRIGOSUS
- 6. BLUMHEIDE - RUBUS OCCIDENTALIS

made him a noble, receiving also the title of Imperial Russian State Councillor. In 1870 he was engaged to direct the Philharmonic and Choral societies of Vienna, after which he entered upon an extended tour of the principal countries of the world, in the course of which, and in company with the violin virtuoso Wieniawski, he visited America (1872). From 1887 to 1890 he was again director of the Saint Petersburg Conservatory. From 1890 to 1892 he lived principally in Berlin, and the next two years he spent in Dresden, after which he returned to Saint Petersburg, in which city he died. The lines of his greatest development were in a degree formulated by Liszt, and German thought and tendency influenced his virtuosity. He was of the Beethoven type, and curiously enough was not unlike that master physically; yet he differed from Beethoven in just such ideals and tendencies as made him naturally a worshiper of Chopin, and correspondingly distrustful of the music and school of Wagner. Among his greatest works may be mentioned the *Ocean Symphony*, *Dramatic Symphony*, and a sketch for grand orchestra, *Iran the Terrible*, which have established his fame as a symphonist. Of his operas the following may be singled out: *Die Kinder der Heide* (1861); *Feramos, oder Lalla Rookh* (1863); *Nero* (1879); *Die Makkabäer* (1875); *Dimitri Donskoi* (1852); *The Demon* (1875). His oratorios include *Paradise Lost* (1875) and *The Tower of Babel*. Many of his songs are standard concert favorites, and with few exceptions his numerous compositions, chamber, salon, and concert, are strikingly beautiful, and possess every element of permanency. He also wrote *Die Musik und ihre Meister* (Leipzig, 1892) and *Gedankenkorb* (1897). He instituted the two Rubinstein prizes of 5000 francs each in playing and composition, open to all nationalities, competitions for which are held quinquennially in each of the following cities: Saint Petersburg, Berlin, Vienna, Paris. Consult: *Erinnerungen aus 50 Jahren, 1839-89* (Leipzig, 1893); MacArthur, *Life of Rubinstein* (London, 1889).

RUBINSTEIN, NIKOLAI (1835-81). A Russian composer, brother of Anton, born in Moscow. From 1844 to 1846 he was Kullak's pupil in piano-forte and Delm's in composition, in Berlin. He founded the Moscow Musical Society in 1859. This society opened the Moscow Conservatory in 1864 and appointed Rubinstein director, which position he occupied until his death. Among his pieces are tarantellas, mazurkas, polkas, and waltzes. He died in Paris.

RUBLE (Russ. *rubli*, perhaps from *rubiti*, to cut off, or from Pers., Hind. *rūpiya*, rupee, from *rūpa*, silver, from Skt. *rūpa*, silver, wrought work, handsome, from *rūpa*, natural state, form, beauty). A Russian silver coin of the value of 100 kopecks, the unit of Russian coinage. Since the adoption of the gold standard in 1897 the value of the ruble has been fixed at 51 cents.

RUBRIC (Lat. *rubrica*, red earth, red ochre, red law-title, law, rubric, from *ruber*, red). A name applied to the directions for the conduct of divine worship found in various service books, so called because they were originally written, and are now frequently printed, in red ink, to distinguish them from the text of the prayers.

RUBUS (Lat., bramble). A genus of perennial herbs and often subglossous stemmed shrubs of the natural order Rosaceae. The fruit is edible in all, or almost all, the numerous species, which are natives chiefly of the colder parts of the Northern Hemisphere. The raspberry and bran-ble, or blackberry, and cloudberry (q. v.) belong to the genus; *Rubus spectabilis*, the salmonberry found in British Columbia and Southern Alaska, is a shrubby species, with large dark purple fragrant flowers. Its dark yellow or red, acid, somewhat astringent fruit is about the size of a blackberry, and is extensively used as a dessert and for pies, etc. *Rubus saxatilis*, sometimes called the stone bramble, is a perennial herb, with pleasant fruit of few rather large drupes. It is a native of stony places, in mountainous parts of Europe. *Rubus acetosus*, native to mountainous regions, is a small herb with rose-colored large flowers, and purplish-red exquisitely flavored fruit. *Rubus stellatus*, an Alaskan species known as 'Knes-hoeka' and 'merong,' has a similar fruit. The dewberries resemble and are closely related to the blackberries.

RUBY (OF. *rubi*, *rubis*, Fr. *rubis*, Sp. *rubi*, *rubin*, It. *rubino*, from ML. *rubinus*, *rubicus*, *rubium*, ruby, from Lat. *rubens*, red, from *rubere*, to be red, from *rubor*, red). A red transparent variety of corundum much prized as a gem. The darker colors are wine red, carmine, or blood red, and most rubies have more or less of a blue or violet tint when viewed by transmitted light. The most valuable shade is the deep, clear, carmine red, commonly termed pigeon's-blood red. Others of poorer quality are of a lighter shade, or may contain white spots, which in some cases disappear on heating. Unlike other gems, the ruby can be heated to a high temperature without the red color being destroyed. Rubies are dichroic by transmitted light, and they possess the advantage of appearing equally brilliant by artificial or natural light. Rubies of large size are scarce and of high value, so that a 3-carat stone of proper color and free from flaws is worth several times as much as a diamond of the same size. Among the largest rubies may be mentioned two belonging to the King of Bishampur, in India, which weighed 50³/₄ and 17¹/₂ carats respectively. The largest ruby known is one from Tibet weighing 2000 carats, but it is not of first quality. Rubies are found in many localities, but most of the occurrences are of little value. The celebrated pigeon's-blood stones are obtained from Mandalay, in Burma. The rubies are separated from the loose earth or 'byon' by washing. Small rubies, generally of pink color, are found at Ratnapura, in Ceylon, and others are obtained from Siam. They are also known to occur in Victoria and New South Wales, as well as in the Government of Perm, Russia. In the United States rubies have been found in stream gravels near Franklin, Macon County, N. C., from which they are extracted by washing. Those found in Arizona and other Western States are not true rubies, but a variety of garnet. The same is true of the so-called Cape rubies found with the diamonds in South Africa. Rubies have been made artificially up to 1¹/₂ carat in size, and have been used as watch jewels. Consult Bauer, *Edelsteinkunde* (Leipzig, 1896).

RUBY MINES. A district of Upper Burma, India. See *MOOK*.

RUBYTHROAT. The humming-bird of the Northeastern United States. See *HUMMING-BIRD*.

RUBY WEDDING. See *WEDDING ANNIVERSARIES*.

RUCELLAI, ʀʊˈtʃel-licˈe, BERNARDO (1449-1514). An Italian scholar, born in Florence. He was ambassador of the Republic of Florence successively to the Court of Ferdinand, King of Naples, and to that of Charles VIII, of France. One of the most prominent members of the Platonic Academy, he opened his famous gardens, known as the *Orti Oricellarii*, in 1494, as the meeting-place of the organization. RuCELLAI was an excellent student of antiquity, and wrote in Latin two noteworthy works, *De Urbe Roma* and *De Bello Italico*, the former a topographical description, the latter a history of the struggle with Pisa and the expedition of Charles VIII. of France against Italy.

RUCELLAI, GIOVANNI (1475-1526). An Italian poet, born at Florence. He was appointed prothonotary apostolic and governor of the Castle of Sant' Angelo. His didactic poem *Le api* (1539; new ed. 1797) is an obvious imitation of the fourth book of the *Georgics*. In diction it belongs, says Symonds, "to the best period of polite Italian." It is among the earliest specimens in Italian literature of the *versi sciolti*, or unrhymed verse. RuCELLAI wrote also two tragedies, *Rosamunda* (1525) and *Oreste* (1726), the latter based on the *Iphigenia in Tauris* of Euripides and much superior to the former in style and dramatic skill.

RÜCKER, rük'çer, SIR ARTHUR WILLIAM (1848—). An English scientist and educator. He was educated at Brasenose College, Oxford, was a fellow of the college in 1871-76, was also for a time demonstrator in the Clarendon laboratory of the university, and in 1874 became professor of mathematics and physics in the Yorkshire College of Leeds. From 1886 to 1901 he was professor of physics in the Royal College of Science, South Kensington, London, and in the latter year was appointed principal of the University of London. He was elected (1884) a fellow of the Royal Society, whose medal was awarded to him in 1891. In conjunction with Reinold he published a series of papers (*Transactions of the Royal Society*, 1880-92) on the properties of liquid films, and with Thorpe executed the magnetic surveys of England, Scotland, and Ireland, for 1886 and 1891, the results of which were published in 1890 and 1896 respectively as *Magnetic Surveys of the British Isles*. Further publications by him include a study *On the Expansion of Sea Water by Heat* (with Thorpe, 1876).

RÜCKERT, rük'çert, FRIEDRICH (1788-1866). A German poet, first known by his pseudonym "Friedrich Raimar," born at Schweinfurt. He was educated at Würzburg and Heidelberg, and, after being a docent at Jena, taught in various places and in 1816-17 edited the *Morgenblatt in Stuttgart*. In 1826 he became professor of Oriental languages at Erlangen, went to Berlin in 1841 as Privy Councillor and professor, and in 1849 retired to his estate at Neusesz near Coburg, where he died. Rückert's first popularity was achieved by political poems, *Geharnischte Sonette* (1814),

against Napoleon, but his lyrics are in the main philosophical and contemplative. The most popular collections are *Liebesfrühling* (1844) and *Die Weisheit des Brahmanen* (1836-39). He turned much Oriental literature into admirable verse, notably Hariri's *Abu Seid* (1826); Firdausi's *Rostem und Sohrab* (1838); *Amrillkai* (1843); *Hamasa* (1846); and a portion of the Indian Mahabharata, *Nal und Damajanti* (1828). He also adapted Theocritus, Aristophanes, Sadi's *Bustan*, and the Indian drama *Sakuntala* to German taste. These were published posthumously. Rückert, who had mastered many languages, is unsurpassed as a translator. His poems reflect with wonderful fidelity the Oriental spirit and the verbal felicities of the Oriental style. He wrote dramas, too, but they are inferior to his lyrics. Rückert's *Werke* were collected in 12 vols. (Frankfort, 1868-69), and have also been edited by Laistner (Stuttgart, 1895-96), Beyer (Leipzig, 1900), Stein (ib., 1897), Ellinger (ib., 1897), and Linke (Halle, 1897). For his biography, consult Forlage (Frankfort, 1867), Beyer (ib., 1868), Suphan (Weimar, 1888), and Müncker (Bamberg, 1890).

RUCKSTUHL, rük'stuˈool, FREDERICK WELINGTON (1853—). An American sculptor, born at Breitenbach, in Alsace. His family went to Saint Louis when the boy was hardly a year old. He was educated in the city schools of Saint Louis and in Paris. His statue "Evening," which had honorable mention at the Salon in 1888, received a grand medal at the World's Fair in Chicago in 1893, and is now at the Metropolitan Museum in New York. Returning to Saint Louis, Ruckstuhl carved a statue of "Mercury Leading the Eagle of Jupiter," which is owned by that city, and the statue of "Solon" in the Congressional Library (Washington). Among his most successful works are the equestrian statue of General Hartranft in Harrisburg, Pa.; a portrait bust of John Russell Young; the Soldiers' and Sailors' Monument in Jamaica, Long Island. He directed the sculptural decoration of the Appellate Court House in New York.

RUDAGI, rüˈdä-gi, or **RUDAKI** (early part of the tenth century). The earliest of the great Persian poets. He was born at Samarkand, and according to legend was blind from his birth. He was not alone a poet, but a singer and a musician as well. Toward the end of his life he lost favor with his royal patron, the Samanid prince Nasr II, and died in poverty, probably about 945. A few fragments of his poems have been preserved, mostly in anthologies and lexicons. His most important work was a translation into Persian of an Arabic version of the Pahlavi rendering of Bidpai (q.v.). To judge from the fragments which survive, his style was simple and direct, comparatively free from the mannerisms and artificialities of later Persian poetry, while in religion he seems to show the influence of Sufiism (q.v.). Consult: Ethé, "Rüdagi der Samanidendichter," in *Nachrichten der Göttinger gelehrten Gesellschaft der Wissenschaften* (Göttingen, 1873); Browne, *Literary History of Persia* (New York, 1902).

RUDBECK, OLOF (1630-1702). A Swedish scientist, born in Westerås and educated at Upsala. There he studied natural science and at twenty-three discovered the lymphatic canal, winning thereby a European reputation. After

medical studies at Leyden, he became professor at Upsala (1655), and made himself famous by his knowledge of botany, physics, and mathematics, and of archaeology. With his son Olof (1660-1740), he published a great botanical atlas, *Campus Elysius* (1701-02). But his especial fame is in the department of curious literature as the author of *Atlant eller Munheim* (1675-98), in which he attempted to show that Sweden was the original garden of Eden and Plato's Atlantis.

RUDDER. See HELM; SHIP.

RUDDER-FISH (so called from its habit of following vessels). A general name applied to a family (Centrolophidae) of fishes of the open seas, allied to the pompanos and harvest fishes, which includes the blackrull of the genus *Centrolophus*, and the 'black rudder-fish' (*Palaenichthys per-*

RUDDER-FISH (*Palaenichthys periformis*)

formis), the latter with the oblong form shown, and blackish-green in color. They are about one foot long. These fish gather in schools off the coast of the Northeastern States and have the habit of sheltering themselves under anything floating, as a log, a barrel, or boat, where they find not only some protection, but food in the form of hydroids, small barnacles, and other growths. Hence the name 'log-fish,' often applied to them. They are good eating.

Another rudder-fish is the large amber-fish (*Seriola zonata*) also called 'shark's pilot,' and common from Cape Cod to Cape Hatteras.

RUD'DIMAN, THOMAS (1674-c.1757). A distinguished Scottish scholar, born at Raggel, Parish of Boyndie, Banff-shire, and educated at King's College, Aberdeen. He began his career as an editor by publishing an edition of Florence Wilson's *De Animi Tranquillitate Dialogus*, to which he prefixed a life of the author. In 1709 he published Arthur Johnstone's *Cantici Solomonis Paraphrasis Poetica*. In 1714 appeared his well-known work *Rudiments of the Latin Tongue*, a Latin grammar which at once superseded all others. In 1725-32 he published his *Grammaticæ Latinæ Institutiones*. As principal keeper of the Advocates' Library (1730), he published a magnificent edition of Anderson's *Diplomata et Numismata Scoticæ* (1 vol. folio). In 1751 he published an edition of Livy still known as the 'immaculate' edition from its entire exemption from errors of the press. Consult his *Life* by Chalmers (1794).

RUDDY (or **RUDDER**) **DUCK** (from AS. *rudu*, redness, from *riodan*, to make red, from *read*, red). A small fresh-water duck, common throughout Northern North America, and visiting the southern part of the country in winter, noted among gunners for its skill in diving after the

manner of grebes, and for the length of time it can remain under water. This duck (*Fusautara ruddy*) has the bill slaty blue, top of the head black; chin and sides of the head white; neck and upper parts bright chestnut; and the lower parts silly white. The female is duller in color.

RUDE, LOU, FRANÇOIS (1781-1855). A French sculptor, born at Dijon. He studied in Paris at the Ecole des Beaux Arts under Cortotier, received the Prix de Rome in 1812, and from 1815 to 1828 lived in Brussels. In the latter year he returned to Paris, and exhibited in statue of "Memory Fastening His Sash" (Louvre) in the Salon of that year. This was followed by his "Neapolitan Fisher Boy" (1831, Louvre), the first of that short series of striking masterpieces which have placed him in the first rank of French sculptors. Rude was undoubtedly a classicist in a large way, but in the "Fisher Boy" he shows himself quite capable of sympathizing with the Romantic School, then in its full vigor. From this time (1831) his work became increasingly naturalistic, evolving into thoroughly modern realistic art. In 1830 he was first employed in the decoration of the Arc de Triomphe de l'Étoile, for which Rude made designs for four great groups of sculpture at the base: "Le départ," "Le retour," "La défense," and "La paix." These evidently intended at first to allow Rude to execute all four, but later gave two to Cortot and one to Cortot, leaving only the "Départ" to Rude. This great group was finished in 1836. It represents the departure of the volunteers in 1792, and is, perhaps, the most powerful and perfect work in sculpture produced by the French nation.

Compared with the "Départ" the rest of his production is mediocre, except perhaps the superb mortuary figure of Godefrey Cavaignac (1847, Montmartre Cemetery). Other statues by Rude are a charming Louis XIII (1842) as a boy; "Awakening to Immortality;" "Maréchal de Saxe" (1838); "Napoleon" (1847); "Christ on the Cross" and "Joan of Arc" (1852, both in the Louvre); "Maréchal Ney at Paris" (1833); "Hebe and the Eagle" and "Amor Victor," in the Museum of Dijon. The most complete biography of Rude is by Foucaud in the *Gazette des Beaux-Arts* (1888, 91). See also Bertrand, *François Rude* (Paris, 1888); and Rosenberg, in *Démo, Kunst u. d. Künstler des neunzehnten Jahrhunderts* (Leipzig, 1886).

RU'DENS (Lat., Cello). A romantic comedy by Plautus, the plot of which, taken from Diphilus, preserves much of the Greek atmosphere. The scene is laid near the African Cyrene. Shakespeare borrowed from the play in *Pericles, Prince of Tyre*.

RUDERAL PLANTS (from Lat. *rudis*, rubbishy). Plants of roadsides and waste places. Close observation of ruderal areas shows that there is a rapid order of succession of the plant forms, commencing with annuals, largely because of the quick germination of their abundant seed. Then grasses and other perennial plants gradually crowd out the annuals, a change sometimes accomplished within ten years. Naturalized plants (see NATURALIZATION) frequently gain foothold in ruderal areas, doubtless because the

struggle is here somewhat less severe than in older and more established plant societies.

RÜDESHEIM, *ry'des-him*. A town in the Province of Hesse-Nassau, Prussia, on the right bank of the Rhine, opposite Bingen (Map; Prussia, P. 31). It is celebrated for its wine of the same name, the oldest brand of the Rhine wines. Population, in 1900, 4812.

RÜDINGER, *ry'ding-ër*. **NIKOLAUS** (1832-96). A German anatomist, born in Büdesheim, and educated at Heidelberg and Giessen. He was appointed professor of anatomy at Munich in 1870. He was a pioneer in the use of photography in anatomic instruction. He published an *Atlas des peripherischen Nervensystems* (1861-65), an *Atlas des menschlichen Gehörorgans* (1866-75), *Topographisch-chirurgische Anatomie* (1872-79), and *Kursus der topographischen Anatomie* (1891).

RUDINI, *röö-dë'né*. **ANTONIO STARRABBA DI**, Marquis (1839—). An Italian statesman, born in Palermo. At the age of twenty-seven he was chosen Mayor of Palermo, and distinguished himself by suppressing an insurrection. In 1869 he was for a short time Minister of the Interior. Subsequently he was a member of the Chamber of Deputies until February 7, 1891, when he became Prime Minister, having as leader of the old Right made an alliance with the Radical leader Nicotera to overthrow Crispi (q.v.). During his administration occurred the diplomatic tension with the United States over the killing of seven Italians by a New Orleans mob. His general policy differed from that of his predecessor in its more conciliatory attitude toward France. He gave way to Giolitti in May, 1892, but after the Abyssinian disaster he was in 1896 recalled to the head of the Ministry. His Government went down in the disturbed Italian politics of 1898.

RUDISTÆ (Neo-Lat. nom. pl., from Lat. *rudis*, rough). A group of fossil marine lamelibranchs characterized by the great conical elongation of the right valve, which was attached to the sea bottom by its apex, and by the redue-

pegs on the upper valve, which fit into sockets in the lower valve, and which permit the operculum to be raised and lowered in a vertical motion instead of in a rotary motion, as in the normal pelecypod. The principal genera are Radiolites, Hippurites, Sphaerolites, and a large

HIPPIURITES RUDIOSUS.

1, Upper valve; *s*, sinus of the hinge; *a, b*, grooves corresponding to anterior and posterior columns of the lower valve; *c*, anterior process of the elithrum; *d, d*, posterior processes of the elithrum. 2, Interior of lower valve seen from above; *e, f*, position of anterior and posterior columns; *gg*, adductor scars; *h*, socket of anterior, and *kk* of posterior processes of elithrum; *l*, body-chamber of cell; *m*, vacant cavity near sinus.

form, Barretia, which attains a length of two feet. These most curious of pelecypods resemble corals so closely that they were formerly classed as such. Consult Bernard, *Elements de paléontologie* (Paris, 1895).

RU'DOLF, LAKE. A large lake in British East Africa situated 200 miles northeast of the Victoria Nyanza (Map; Africa, R 4). It lies in the Great Rift Valley and is of elongated shape, about 185 miles long from north to south and 20 to 35 miles wide. It is bordered by high cliffs in the south; elsewhere the surrounding country consists either of rugged lava fields or sandy plains, and is treeless and sterile. Several active volcanoes stand close to the shores, whose contour is said to have been changed in recent years by volcanic activity. The lake is deep near the southern end and shallow in the north, where the Omo or Nianam River enters it through a marshy delta. As there is no outlet, the water is brackish. The lake was discovered by Teleki in 1888.

RUDOLF OF EMS (?-1254). A German poet, born probably in Switzerland, and getting his name from Hohenems. He died in Italy in the service of Conrad IV. Rudolf's earliest work was *Der gute Gerhard*. More famous was the story of *Barlaam und Josaphat* (c.1225; edited by Pfeiffer, Leipzig, 1843). He also wrote a *Weltchronik*, based for the most part on the Old Testament and coming down only to the death of Solomon. In a revised form it had a great vogue up to the time of Luther's version of the Bible, being practically the only form in which the earlier part of the biblical story was available for the common people.

RUDOLPH I. (1218-91). King of Germany and head of the Holy Roman Empire from 1273 to 1291, founder of the present House of Austria. He was the son of Albert IV., Count of Hapsburg and Landgrave of Alsace. Through inheritance, through his marriage with Gertrude, Countess of Hohenberg, and by successful wars with his neighbors, he became the most powerful prince in the extreme southwest of Germany, with possessions in Switzerland, Swabia, and Alsace. He acquired a great reputation for brav-

HIPPIURITES GOSAVIENSIS.

HIPPIURITES CORNU-CACULNEM.

tion of the left valve to the condition of a lid-like operculum in which no trace of the original spiral form of the shell remains. The Rudistæ occur in great abundance in some portions of the Middle and Upper Cretaceous of Europe, Asia Minor, and Central America. The hinge of the shell has been entirely changed from its original form and now consists of a system of

ery, wisdom, and fair dealing. During the Great Interregnum, which began in 1256, Germany was without an acknowledged head. In 1272 Pope Gregory X., alarmed at German disunion, used every means in his power to force an Imperial election. The great Rhenish princes, in whose hands rested the power of election, wished to find someone who would not be unmanageable or strong enough to excite jealousy. Their choice fell on Rudolph of Hapsburg, and he was crowned at Aix-la-Chapelle, October 24, 1273. Rudolph's most formidable opponent was Ottokar, King of Bohemia, who refused allegiance to the new King. Rudolph made war upon him, vanquished him, and forced him to give up the duchies of Austria, Styria, and Carinthia, and some other territories (1276).

Ottokar, having renewed the war, was defeated and slain in a battle on the Marchfeld (1278). The Emperor, in 1282, invested his sons, Albert and Rudolph, with the territories wrested from Ottokar. (See AUSTRIA-HUNGARY.) Rudolph did a great service to Germany in suppressing the 'robber barons' and destroying their strongholds. He is said to have condemned to death thirty nobles and to have razed to the ground twice that number of castles. His efforts to preserve peace, by prohibiting private wars, were very acceptable to the towns and lesser nobles, but the lack of effective police and judicial organizations prevented the execution of his laws. Moreover, he antagonized the towns by attempting to raise an Imperial revenue by taxation. Consult: Koop, *König Rudolf und seine Zeit* (Leipzig, 1845-49), continued by Busson (Berlin, 1871); Hien, *Rudolf von Habsburg* (Vienna, 1874); Schulte, *Geschichte der Habsburger* (Innsbruck, 1887); Zisterer, *Gregor X. und Rudolf von Habsburg* (Freiburg, 1891); and Redlich, *Rudolf von Habsburg* (Innsbruck, 1903).

RUDOLPH II. (1552-1612). Holy Roman Emperor from 1576 to 1612. He was the eldest son of the Emperor Maximilian II., and was educated in the Spanish Court by the Jesuits. On the death of his father, in 1576, he succeeded to the Imperial crown and to the possession of the Archduchy of Austria, Bohemia, and part of Hungary. He was weak-willed and little concerned with the affairs of government, which he left in the hands of the leaders of the Counter-Reformation. The liberalizing tendencies which had been at work in the Austrian dominions under his predecessor came to an end. Intolerance and persecution on the part of Rudolph aroused bitter discontent and in 1604 an insurrection broke out in Hungary. Matthias, the younger brother of Rudolph, put himself at the head of a formidable party against the Emperor, and in 1608 forced him to cede to him the government of Austria, Hungary, and Moravia. In 1609 Rudolph was forced to issue the *Majestätsbrief*, guaranteeing the Bohemians religious freedom, but at the same time preparations were already going on for the great struggle that was to break out in less than a decade. In 1608 the Evangelical Union was formed by some of the German States for the defense of the Protestant religion, and this was followed by the organization of the Catholic League in 1609. In 1611 Bohemia was taken from Rudolph and transferred to Matthias. The Emperor died January 20, 1612, without issue

and was succeeded by Matthias. Rudolph's taste for astrology and the occult sciences, and his desire to discover the philosopher's stone, led him to extend his patronage to Tycho Brahe and Kepler. The important astronomical calculations begun by Tycho and continued by Kepler, which are known as *The Rudolphine Tables*, derive their name from this Emperor. Consult Gindely, *Rudolph II. und seine Zeit* (Prague, 1863-65).

RUDOLPH (1858-89). An Archduke and crown Prince of Austria, son of Francis Joseph I. He was educated carefully and entered the army in 1878. He was an enthusiastic hunter and traveler, and the author of *Lauf und Jagd auf der Donau* (1881), and *États Généraux* (1884). He planned and partly edited the work *Österreichisch-ungarische Monarchie* (1886 et seq.). Rudolph married Stephanie, daughter of Leopold II. of Belgium, in 1881. The Archduke was found dead in his shooting lodge at Meyerling, near Baden.

RUDOLSTADT, रूढलस्टाट. The capital of the Principality of Schwarzburg-Rudolstadt, Germany, on the Saale, 18 miles south of Weimar (Map: Germany, D 3). Its most beautiful church is the thirteenth-century Stadtkirche, rebuilt in the seventeenth century, and restored in 1879. The castle has been the residence of the Prince since 1599. The city has a palace with a natural history collection, a gymnasium, a national seminary, and a library of 65,000 volumes. It manufactures porcelain, pianos, metal and wooden artistic cabinet work, children's building blocks, chocolate, essential oils, and chemicals. Rudolstadt is first mentioned in the year 800. It came into possession of Schwarzburg in 1355. Population, in 1900, 12,407.

RUDRA, रूढद्रा (Skt., howler, or perhaps, red, bright), or MAHADRMA. A deity of Vedic India. He is described as an archer bearing the lightning shaft, and in personal appearance he is of dazzling brilliancy. He is either copper colored or with a black belly and a red back, while his neck is blue and his eyes are a thousand in number. He is associated most frequently with the Maruts (q.v.), although in some passages he is identified with Agni (q.v.), or with Vishnu (q.v.). His character is twofold. For the most part he is represented as a terrible deity, mighty, and dangerous, to whom prayer must be offered to induce him to avert his shafts both from men and from animals, occasionally even from the gods, while disgraceful attributes are assigned to him in the later Vedic period. On the other hand, Rudra is a divinity of healing, and his blessings are besought repeatedly. In the post-Vedic period the place of Rudra in the Hindu pantheon has been usurped by Siva (q.v.). Consult: Muir, *Original Sanskrit Texts* (London, 1868-74); Macdonell, *Vedic Mythology* (Strassburg, 1897).

RUE (Gk., Fr., *rue*, from Lat. *via*, from Gk. *πέρι, perí, rhotí, ruez, Ruta*. A genus of about 50 species of half-shrubby plants of the natural order Rutaceæ, natives of Southern Europe, Northern Africa, the Canary Isles, and the temperate parts of Asia. Common rue or garden rue (*Ruta graveolens*) grows in sunny stony places in Mediterranean countries and is cultivated in American gardens. It has greenish-yellow flowers, and glaucous evergreen leaves with small

oblong leaflets, the terminal leaflets obovate. It was formerly called herb of grace (see *Hamlet*, act iv., scene ii.), because it was used for sprinkling the people with holy water. It was in great repute as an amulet against witchcraft in the

RUE (*Ruta graveolens*).

time of Aristotle. The smell of rue when fresh is strong, and to many disagreeable; yet it is used in some parts of Europe in cookery. Some of the species found in Northern India are similarly used.

RUE CROWN. A Saxon order founded in 1807 by Frederick Augustus I., and intended as a distinction for high State officials. The cross is green, with white edges, and has golden rue leaves between the arms. The medallion is surrounded by a wreath composed of sixteen rue leaves and bears the initials of the founder, with the motto *Providentia Memor*.

RUEDA, रू-आदा, LOPE DE (?-c.1567). A Spanish dramatist, born in Seville, where he was a gold-beater for some time. It seems probable that he was a versatile actor and manager of his troupe. He was the first popular dramatist of Spain. His works include four comedies, mostly from Italian sources, where there is much pleasant fooling and a plot usually hinging on mistaken identity. Rueda also wrote bucolic dialogues, which are somewhat stiff, and ten *Pasos*, all drawn from every-day characters. His complete works are published in volumes 23 and 24 of the *Colección de libros españoles raros ó curiosos* (1895-96).

RUPELLIA (Neo-Lat., named in honor of Jean Ruel, a French botanist of the sixteenth century). A large genus of plants of the natural order Acanthaceae, mostly natives of tropical and subtropical Asia and Australia. Some beautiful species are cultivated for ornament in hot-houses. In Assam and in some parts of China *Ruellia indicifera*, called by some botanists *Strobilanthes flaccidifolius*, is much cultivated for the excellent indigo which it yields. A few species, especially *Ruellia strepera* and *Ruellia ciliosa*, with large blue or purple attractive flowers, are natives of the United States.

RUFF, or **REEVE** (probably from *ruff*, abbreviation of *ruffe*, from Dutch *ruyffelen*, to wrinkle; so called because of the neck-ruff). A European snipe (*Machetes pumax*) noted for pugacity. It is about a foot in entire length, and in color ash-brown, spotted or mottled with

black; the head, a prominent erectile ruff of neck feathers, and the shoulders are black, glossed with purple, and variously barred with chestnut. The female (the reeve) is mostly ash-brown, with spots of dark brown, is much more uniform in color than the male, and lacks the ruff. See Colored Plate of SHORE BIRDS.

RUFFED GROUSE. See GROUSE.

RUFFIN, EDMUND (1794-1865). An American agriculturist, born in Prince George County, Va. He attended William and Mary College from 1810 until 1812, and then, on the outbreak of war with England, enlisted in a volunteer company. After scarcely six months' service, however, he returned to the estate left him by his father and thenceforth devoted himself to agriculture. He made a number of experiments which resulted in the discovery of the value as a fertilizer of the great deposits of marl in Eastern Virginia. In 1833 he founded the *Farmer's Register*, a pioneer in arousing interest in scientific farming. In 1842 he was appointed agricultural surveyor of South Carolina, and later he founded the Virginia State Agricultural Society, of which he became president. As the oldest member of one of the military organizations which besieged Fort Sumter, he fired the first shot of the war at half past four o'clock, Friday morning, April 12, 1861. Four years later when the conflict ended he committed suicide rather than give his allegiance to the United States. Consult *Yearbook of the United States Department of Agriculture* (1875).

RUELLIA (*Ruellia ciliosa*).

RUFFINI, रुफ-फ'ने, GIOVANNI (1807-81). An English writer of Italian origin, born in Genoa. He studied in his native city and came to know Mazzini, whose "Young Italy" (q.v.) he joined in 1833. He fled from Italy, and from 1836 to 1842 lived in England. He then went to France. The revolutionary movement of 1848 permitted his return to his native land, and he entered the Sardinian Parliament in that year, becoming in 1849 Sardinian representative at Paris. After the battle of Novara he returned to England and devoted himself to the writing of novels. He published *Doctor Antonio* (1855), *Dear Experience* (1878), *Lavinia* (1860), *Vin-*

cenzo (1863), and other works. His autobiography appeared in 1853 under the title *Passages in the Life of an Italian*.

RUFFO, FABRIZIO (1744-1827). An Italian cardinal and general. He was born in Calabria, a descendant of the ducal family of Bionello, and was trained as a priest. In 1791 he was made cardinal. He entered afterwards the Neapolitan service, and offered stubborn and successful resistance to Championnet, who, at the head of a French army, attempted to capture Naples. Having gathered a large number of royalists in Calabria, with the aid of the celebrated brigand chief Fra Diavolo (q.v.), he expelled the French and the republicans from the country and restored King Ferdinand I. to the throne in 1799.

RUFUJI, *ṛufu-fo'jé*. The principal river in German East Africa. It is formed by the junction of the Luvu and Ulanga and flows northeastward and then eastward, entering the Indian Ocean through a large delta 120 miles south of Zanzibar. The headstreams rise on the Livingstone Mountains northeast of Lake Nyassa, and flow through a sparsely inhabited forest country. Some distance below the confluence the Rufiji receives the Ruaha, which rises north of Lake Nyassa, and exceeds the main stream in length. The Rufiji is navigable for small steamers up to the falls below the confluence of its headstreams, above which the Ulanga is again permanently navigable for the greater part of its course.

RUGBY. A market town in Warwickshire, England, 15 miles northeast of Warwick (Map: England, E 4). It is an important junction of five different railways. It derives its celebrity from Rugby School (q.v.), founded in 1567. Population, in 1901, 16,830. Consult: Bloxham and Smith, *Rugby: Its School and Neighborhood* (London, 1889); Rimmer, *Rambles Around Rugby* (ib., 1882).

RUGBY. A town in Morgan County, Tennessee, 7 miles from Rugby station on the Cincinnati Southern Railroad, and 114 miles north of Chattanooga. The town was founded in the expectation of developing an ideal community. The first steps were taken by New England capitalists, who soon transferred the enterprise to an English company, which invested £150,000 in a tract of 50,000 acres and improvements. The site was ready in 1880, and a colony of English farmers took possession. The plan contemplated a combination of industrial activity with attention to culture and out-of-door English sports, such as cricket and hunting, and it was expected that the colony would consist of both American families and the sons of English farmers of the better class in fair circumstances. It was, however, never successful, and after a few years the distinctive features of the colony were abandoned. The town is now a popular health resort.

RUGBY SCHOOL. A famous public school, situated at Rugby, England, founded in 1567 under the will of Lawrence Sheriffe as a free school for the children of Rugby and Brownsover. Edward Rolston was appointed the first master in 1574. Up to 1667 the school remained in comparative obscurity. Its history during that trying period is characterized mainly by a series of lawsuits between descendants of the founder, who

tried to defeat the intentions of the testator, and the masters and trustees, who tried to carry them out. A final decision was handed down in 1667, confirming the findings of a commission in favor of the trust, and henceforth the school maintained a steady growth. Under the vigorous administration of Francis Holyoake, headmaster from 1688 to 1731, Rugby assumed considerable importance among English public schools, there being at one time an enrollment of more than 100 pupils. Thomas James, an Etonan by education, was elected headmaster in 1778. He was an accomplished scholar in classics and mathematics, and a firm disciplinarian. He introduced exhibitions, forms, tutors, 'praepostors,' and tugs, and in general all the methods in vogue at Eton. At the end of his regime (1794) the attendance was about 200. James was the first real organizer of Rugby as we find it to-day.

The choice of Thomas Arnold (q.v.) in 1829 as headmaster of Rugby marks the beginning of a new spirit in English education. The aim hitherto had been the inculcation of knowledge with a view to preparation for university examinations. Arnold conceived the idea of education that makes for character. He sagaciously accepted the organization of Rugby as he found it, but he infused new life and light into it. He did not abrogate the liberty of the older boys, but he added to it responsibility by placing the discipline of the school in the hands of the sixth form. The unhappy lot of tugs was under his influence considerably ameliorated. Since his death in 1842 the successive masters have with more or less success striven to maintain the high standard set up by Arnold. In 1868 the government of the school was transferred to a board of governors, the board of trustees retaining management of the finances and the appointing of masters. The lower school was established in 1878 for foundationers, Rugby School proper being devoted to the education of non foundationers. The studies at Rugby are still mainly classical. The modern tendencies are, however, fast making an inroad into the school curriculum. There are 14 competitive scholarships, ranging from £20 to £100 annually. In 1900 Rugby had an attendance of about 600, distributed among the classical, specialist, and modern 'sides' and the army class. The principal buildings are the Rugby and New Big Schools, built in quadrangles; the chapel, the gymnasium, and the museum. In 1900 there were 9 dormitories. The 'close' is the principal playground and contains about 47 acres, the most popular game being football. Rugby includes also a library, a laboratory, a vivarium, and a workshop. Two missions, one home and one foreign, are supported by Englishmen. *The Meteor* is the principal publication. By far the best known of English public schools, Rugby owes its celebrity in part to the truthful picture of the school life of real boys as drawn by one of her sons, Thomas Hughes, in his classic *Tom Brown at Rugby*.

RUGE, *ṛū'gə*, ARNOFF (1802-80). A German political agitator and miscellaneous writer, born at Bergen, island of Rügen. He studied at Jena and Halle, shared in the student agitations of 1821-24, was imprisoned (1824-30), became private docent at Halle (1832), founded the *Hallscher Jahrbücher* (1837), as an organ of the Young German Hegelians, and, on its suppression by the

Prussian censorship, he went to Paris (1843-45), and then to Switzerland. He then became a lecturer in Leipzig, published a democratic journal, *Die Reform*, was elected to the Frankfort National Parliament (1848), and in the next year he went to England. He aided Mazzini and Ledru-Rollin in organizing the Central European Democratic Committee (1849), and, from 1852, lived in Brighton, teaching and writing. He wrote, among other things, a *Manifest an die deutsche Nation* (1866), and *Geschichte unserer Zeit* (1881). In 1877 he was pensioned by the German Government. His autobiography *Aus früherer Zeit*, appeared in Berlin, 1863-67; his *Letters* were edited by Nerrlich (ib., 1885-86).

RÜGEN, rü'gen. The largest of the islands of Germany, situated in the Baltic Sea off the coast of Pomerania, from which it is separated by the Strelasund, one mile wide (Map: Germany, E 1). It is 33 miles long from north to south, and 26 miles wide, and has an area of 362 square miles. It is of extremely irregular shape, the northeastern portion being separated from the remainder by a deep and irregular inlet known as the Jasmunder Bodden. It is level in the west and hilly in the east, nearly the whole eastern coast consisting of steep chalk cliffs rising in one place to a height of 528 feet. The scenery is pleasing, and, together with the good sea-bathing, attracts many visitors. The soil is fertile, producing grain and rape-seed; cattle-raising and herring fisheries are also important. Population, in 1900, 46,270. The chief town is Bergen. Rügen was taken possession of by Valdemar I. of Denmark in 1168, and was united with Pomerania in 1325. In 1648 it passed to Sweden, and in 1815 was acquired by Prussia, to which it still belongs.

RÜGENDAS, GEORG, PHILIPP (1666-1742). A German battle and military genre painter and engraver, born at Augsburg. He was a pupil of Isaac (or Jacob) Fischer, an historical painter, took Bourguignon, Lembke, and Tempesta for his models, but formed his style more especially through the study of the various phases of the military profession, from real life. He continued his studies for two years in Vienna, and in 1692 under Molinari in Venice, thence went to Rome. During the siege and pillage of Augsburg in 1703 he exposed himself to great danger by drawing, in the midst of the engagements, the scenes around him. The six etchings resulting from this are perhaps the most meritorious part of his work. His oil paintings, spirited in drawing, but defective in coloring, may best be studied in the Brunswick Gallery, which contains nine battle-pieces by him. Consult the monograph by Count Stillfried (Berlin, 1879).

RUGER, rü'g'er, THOMAS HOWARD (1832-). An American soldier, born at Lima, N. V. He graduated at West Point in 1854, and was assigned to the engineers, but resigned a year later and became a lawyer at Janesville, Wis. On the outbreak of the Civil War he reëntered the service as lieutenant-colonel of the Third Wisconsin Volunteers, and during the first half of the war participated in the campaigns in Virginia, Maryland, and Pennsylvania, becoming brigadier-general of volunteers in November, 1862. In 1864 he commanded a brigade of the Twentieth Corps during the invasion of Georgia, and later commanded a divi-

sion of the Twenty-third Corps in the Tennessee campaign against Gen. John B. Hood (q.v.), and for his gallantry at the battle of Franklin received the brevet rank of major-general of volunteers. Later he took part in the operations in North Carolina. After the war he was commissioned colonel of the Thirty-third Infantry, in July, 1866, and in 1871 was appointed superintendent of the United States Military Academy, where he remained until 1876. He was promoted to be brigadier-general in March, 1886, and to be major-general in February, 1895, and was retired from the service in May, 1897.

RUGGLES, SAMUEL BULKLEY (1800-80). An American lawyer, born in Connecticut. He graduated at Yale in 1814, and was admitted to the New York bar in 1821. In 1838 he was elected a member of the State Legislature. In 1839 he was chosen as a canal commissioner, and the following year became president of the canal board, an office which he held again in 1858. He represented the United States in the international monetary conference in Paris, and was a delegate to the statistical conference at The Hague in 1869. As a member of the New York Chamber of Commerce he collected valuable statistics concerning production and transportation.

RUGGLES, rüg'g'lz, TIMOTHY (1711-95). An American jurist and soldier, born at Rochester, Mass. He graduated at Harvard in 1732, studied law, and in time became one of the foremost lawyers of the colony. He was made a judge of the Court of Common Pleas for Worcester County in 1757, and five years later became its Chief Justice. For many years he was a member of the General Court. When the French and Indian War began he entered the army, was second in command at the battle of Lake George in 1755, was made a brigadier-general, and in 1759-60 took part under General Amherst in the conquest of Canada. As a reward for his services he was given a farm by Massachusetts, and later was appointed to the office of surveyor-general of the King's forests. In 1765 he was president of the Stamp Act Congress, but, having refused to transmit to England the addresses and petitions drawn up by that body, he was censured by the Massachusetts General Court and reprimanded by the Speaker. In 1774 he received an appointment as mandamus counselor, and as he expressed his intention to serve, became so unpopular that he was forced to seek safety in Boston. When the British were forced to evacuate that city, he accompanied them, and ultimately settled in Nova Scotia, where he died. Consult: Washburn, *Sketches of the Judicial History of Massachusetts from 1630 to the Revolution in 1775* (Boston, 1840); and Paige, *History of Hardwick* (Boston, 1893).

RUGS (from Swed. *rugg*, rough tangled hair; probably connected with LGer. *rug*, OHG. *rüh*, Ger. *rauh*, AS. *räh*, *räg*, Eng. *rough*, and with Lith. *raukas*, fold, wrinkle). Floor coverings made in one piece, covering usually only a portion of the floor. A rug may be woven or it may be made from an animal's skin. Oriental rugs are sometimes used for hangings as well as for floor coverings. The ordinary power-loom rugs of Europe and America differ from carpets in their shape and size, rather than in the method of their manufacture. A *Smyrna* rug is simply a chenille Axminster (see CARPETS), with the wool on both

PUNJAB INDIA
BEECHAPORE DESIGN

INDIAN
BEECHAPORE DESIGN

sides instead of one. They were first manufactured in Glasgow, in hit or miss and mottled patterns, from the waste chenille of carpet manufacture. They were introduced about 1880 into America, where, in place of a mottled design, the patterns were copied from Oriental rugs and the goods were given their name of Smyrnas.

MOSAIC WOOL RUGS are made of variously colored woolen threads, arranged so the ends form a pattern. These threads, about 17 feet long, are stretched firmly in iron frames, in a dense mass. To convert the threads into separate rugs, with the pattern on each, the upper surface, composed of the ends of the threads, is cemented onto a canvas backing. When dry, the threads are cut across by a very keen circular cutter, leaving a horizontal slice about $\frac{3}{16}$ of an inch thick adhering to the backing. This slice, when turned up, presents the original design in a soft nap of woolen threads. The process is repeated until the whole mass is transversely cut up and forms about a thousand rugs.

ORIENTAL is a general term for the hand-made rugs which are woven by the peasants of Western Asia, particularly of Turkey, Persia, Daghestan, and India. Their designs are chiefly geometrical figures or conventionalized flowers. This is due to the fact that the weavers are Mohammedans, whose religion forbids the representation of the forms of human beings or of animals. The colors most used and most durable are the blues, reds, and yellows. Formerly only animal and vegetable dyes were used, producing colors of wonderful softness and durability. The advent of aniline dyes has greatly deteriorated the permanency and beauty of Oriental colorings. In Persia the Government has forbidden their importation and confiscates all brought into the country.

The loom used for the weaving of an Oriental rug consists of a crude frame of poles and tree trunks. The threads of wool which form the pattern are attached to the warp by a running knot, and a weft thread is woven in at the back. The different names which Oriental rugs bear are usually derived from the district in which they are woven. Formerly each district had its own peculiar patterns and coloring, so that it was easy to identify a rug at a glance. But since rugs have been made so extensively for the Western markets it is not so easy to determine the make.

In general Turkish rugs are loosely woven of coarse yarn, with a long, thick pile. Among the most common varieties are the Carabagh, Syrian, and Daghestan, the Anatolian, and the Bokhara. Of the Indian rugs the Candahars and Agras are perhaps the most beautiful. The Persian rugs are the handsomest Oriental rugs produced. They are fine, closely woven, with a short pile. Camel's hair is much used in their manufacture. The Hamadan, Kirman, Shirvan, Teheran, Khorassan, Herat, and Kurdistan are well-known varieties.

The jute rugs of China and Japan are not durable in color or texture and are among the cheapest and also the most unsatisfactory of floor coverings.

Consult Mumford, *Oriental Rugs* (New York, 1900); *History and Manufacture of Floor Coverings* (New York, 1899).

RÜHMKORFF, rüm'kôrf, HEINRICH DANIEL (1803-77). A German physicist and instrument maker, born at Hanover. In 1848 he founded at

Paris an establishment for the manufacture of instruments and scientific apparatus, devoting himself especially to the construction of electrical and magnetic instruments. His name is associated with a special form of induction coil which he invented in 1851. In 1864 he was awarded a grand prize of 50,000 francs for his applications of electricity.

RÜHNKEN, rüen'ken, DAVID (1723-98). A German classical philologist. He was born at Stolpe, Pomerania, and studied at Wittenberg and Leyden. He prepared a new edition of Plato, collected the scholia of that author, and published an excellent edition of Timon's *De rena Voana Phitandria* (1754, reedited in a much improved form 1789). In 1761 he was appointed to the chair of eloquence and history at Leyden. Rühnken's chief service was in establishing university instruction in Greek throughout the Netherlands upon the same basis as that in Latin. There are three collections of his letters, and his life has been written by his famous pupil Wyttenbach (Leyden, 1799; last ed. Freiburg, 1846).

RUHR, rüör. A river of Western Prussia, entering the Rhine near Duisburg, after a course of 145 miles through an important industrial and mining region (Map: Germany, B 3). By means of 10 locks it has been made navigable 46 miles.

RUHRORT, rüör'ört. A town in the Rhine Province, Prussia, at the junction of the Ruhr and the Rhine, 12 miles west of Essen (Map: Prussia, B 3). It has the largest river harbor in Europe, and possesses immense ship-building docks. It is the seat of a great coal trade. The manufactures include machinery and tin and iron ware. Population, in 1900, 12,407.

RUIPÉREZ, rüé-pá'ráth, LUIS (c.1832-67). A Spanish genre painter, born at Murcia. After frequenting the academy of Barcelona, under Claudio Lorenzale (1814-89), and that of Madrid, he studied in Paris under Meissonier and became one of the most successful imitators of that master's style. The delicate and spirited touch of his pictures attracted much attention at the various exhibitions in Paris and London, and the best of them found a ready sale in France and England. Among these may be mentioned: "A Novice of the Order of St. Francis" (1859, medal at Paris); "The Card Players" (1862); "A Philosopher"; "Scene from Gil Blas" (1864, medal at Madrid); "Orange Vendor"; "Evening Lesson"; "A Violinist" (1867, great gold medal at Valencia).

RUISDAEL. See RYSDAEL.

RUIZ, rüé'eth, JEAN (c.1351). A Spanish poet, more commonly known as the Archpriest of Hita. Between 1337 and 1350 he was imprisoned by order of the Archbishop of Toledo, Gil de Albornoz. There he wrote most of his poetry, which, under the title of *Libro de buen amor*, is prefaced by a prose apologue urging the moral purpose of the work. The book involves a strange mixture of devotion, satire, humor, and bold attacks on the corruption of the Church, and includes an unusual collection of fables, legends, and humorous stories.

RUKWA, rüök'vá. A lake of German East Africa. See RUKWA.

RULE BRITANNIA. One of the national pieces of Great Britain. Its original appearance was in a mask entitled *Alfred*, the words of James Thomson and David Mallet, the music of Dr. Arne. It was first performed in 1740. The composer afterwards changed the mask into an opera (1745). Beethoven wrote five variations on the theme of "Rule Britannia." The words were certainly written by Thomson, though claimed by Mallet. Lord Bolingbroke wrote three additional but unsuccessful verses.

RULED SURFACES. See SURFACE.

RULE NISI (Lat., unless). In English practice, a rule or order that the thing applied for be granted, *unless* the person against whom the relief is asked, upon being served with a copy thereof, shows *cause* on a certain date why the rule should not be made *absolute*, or final. The word 'rule' is used in the sense of 'order.' The English practice acts now confine the use of this form of an order to cases where the court has summary jurisdiction. A *rule nisi* is obtained on an *ex parte* application. See MOTION.

RULE OF FAITH. One of several names given in the ancient Church to the statements or belief which constituted the standard of orthodoxy against prevalent errors, and which were solemnly committed to catechumens at their baptism. Other designations were Rule of Truth, Canon of Truth, Ecclesiastical Canon, etc. With slight variations they were current from the latter part of the second century onward, in Rome, North Africa, Gaul, Asia Minor, and Alexandria. The Rule of Faith was regarded as of Apostolic origin, being based upon the baptismal confession, or perhaps in some cases, like the baptismal confession itself, directly upon the formula of baptism (cf. Matt. xxviii. 19, and *Didache* 7). This statement of belief in the Father, Son, and Holy Spirit received short additions, mostly of a descriptive nature, and served the purpose of a creed, in the later sense. After the fourth century the Nicene Creed gradually displaced the earlier and shorter formulas, especially in the Eastern Church. Since the sixteenth century a new interpretation of the phrase 'Rule of Faith' has come into use among Protestants, according to which it means the Scriptures, as the sole authority in religion. This is asserted by them against the Roman Catholic appeal to the concurrent authority of Church, Scripture, and tradition. These two applications of the term should be carefully distinguished. On the various forms of the *Regula*, consult: Hahn, *Bibliothek der Symbole* (3d ed., Breslau, 1897); Schaff, *Creeds of Christendom* (New York, 1884); in general, Hahn, *Introduction to the Creeds* (London, 1899); McGillfert, *The Apostles' Creed* (New York, 1902); Allen, *Christian Institutions* (New York, 1897). See further the article CREED, with the literature there cited.

RULE OF THREE. See PROPORTION.

RULES OF THE ROAD. Regulations, prescribed either by custom or by statute, to be observed by travelers either on land or water.

RULES FOR TRAVEL ON LAND. The fundamental rule for travelers on land highways is that each must so use his right of passage as not to interfere unduly with another in the exercise of that other's coordinate right of passage. Accordingly he is bound to use reasonable skill and

care, not only in directing his movements as a pedestrian, but in his selection and management of animals or vehicles. In case of travelers whose courses cross, the one first reaching the crossing is entitled to pass on without stopping, while the other should moderate his speed or halt, as occasion may require. This rule applies to pedestrians crossing a city thoroughfare in front of teams. Driving at an immoderate rate of speed, where other vehicles or persons are on the highway, or leaving horses unhitched and unattended, is evidence of negligence, which may render the person who is responsible therefor liable to damages. In England the rule prevails that vehicles going in opposite direction shall pass to the left when meeting; but in this country they must pass to the right. Statutes enforce this rule in many of our States. If vehicles are traveling in the same direction, it is the duty of the foremost traveler to permit any one behind him, who wishes to go more rapidly than he is driving, to pass. In England the rule seems to be that the passing vehicle should bear to the right, while the other bears to the left. In this country the practice in cities is for the passing vehicle to bear to the left; and this has been enjoined by statute in a few States.

RULES FOR TRAVELING ON WATER. The rules of the road for water craft are for the most part quite modern. Those relating to sea-going vessels were formulated, in their present shape, as the result of a maritime conference held in Washington during 1889. They were not entirely new, although they contained some important modifications of existing regulations. In England they are set forth in an Order in Council of November 27, 1896, pursuant to an act of Parliament (57 and 58 Vict., ch. 60). In this country they are embodied in several acts of Congress and a Presidential proclamation (see 28 Statutes at Large 82, 672; 29 *ibid.* 381, 885). The object of these rules is not only to prevent collisions, but to minimize the effects of those which happen. English courts treat them as a part of the municipal law of each country adopting them. Our courts, however, have declared that, as they have been adopted by all maritime nations, they form a part of the international or general maritime law of the world. In the United States a separate set of rules has been enacted by Congress for the guidance of vessels along our coasts, in our harbors, and on waters connected therewith. (See 30 Statutes at Large 96; 31 *ibid.* 30.) Still another regulates navigation on the Great Lakes and their adjacent streams. (See 28 Statutes at Large 645.) A fourth applies to vessels navigating the Mississippi River and its tributaries as well as the Red River of the North.

RULES OF THE ROAD AT SEA. The rules of the road are of four classes, concerning (a) lights, (b) fog signals, (c) steering and sailing, and (d) distress and other signals.

LIGHTS. Steam vessels are required to carry the following lights: a white light on the middle line, at a height of 20 to 40 feet, visible at a distance of 5 miles, and which may be seen from directly ahead to 22½° abaft the beam on each side; a green light on the starboard (right) side and a red light on the port (left) side which are visible at a distance of two miles and may be seen from right ahead to 22½° abaft the

beam, each on its own side; these lights must be fitted with screens on the inboard side so that the green light cannot be seen over the port side, nor the red light over the starboard side. Sailing vessels and vessels being towed are required to carry the red and green side light, but must not carry the white (or masthead) light. A vessel which is not under control because of injury to her steering or motive power must carry two red lights, one over the other, in place of the white (masthead) light. If moving through the water, such a vessel must carry her red and green lights, but not otherwise. In the daytime a vessel which is not under control must carry, in place of the red lights, two balls or shapes at least two feet in diameter. A steam vessel towing other vessels carries the red and green lights and two white lights, one over the other, in place of a single white light. In the inland waters of the United States steam vessels (except sea-going vessels) are required to carry two white range lights, the forward one being the white masthead light, while the after one, showing all around the horizon, must be at least fifteen feet above the other. Sea-going vessels may carry the range lights under the international and United States rules. Small steam vessels (under forty tons, gross measurement) may carry the white light at a height of nine feet; it must be visible at a distance of two miles and the side lights must be visible at a distance of one mile. Steam launches, such as are carried by sea-going vessels, may carry the white light at a less height than nine feet, but it must be carried above the side lights, or such a boat may have a combination red and green lantern which will show the proper colored light on each side and be visible on that side only. Vessels under oars or sails, if of less than twenty tons, must have ready at hand a lantern with red and green sides which may be shown on the proper side to prevent collision. Small boats, whether under oars or sails, must be provided with a white lantern which they must exhibit when necessary. A sailing pilot vessel carries the ordinary lights; also a white light at the masthead which is visible all around the horizon, and must exhibit a flare-up light at intervals of fifteen minutes or less. A steam pilot vessel, in addition to the lights prescribed for steamers, must carry a red light, visible all around the horizon, and placed at a distance of eight feet below the white masthead light. A vessel which is being overtaken by another must exhibit from her stern, where it can best be seen, a white light or flare-up light. A vessel at anchor must carry a white light forward, which must be visible all around the horizon and must not be over twenty feet above the hull; if over one hundred and fifty feet in length she must also carry, at or near the stern and at a height of not more than fifteen feet below the forward light, a white light which is visible all around the horizon. Recognition signal lights may also be carried if duly authorized by proper authority; also flare-up lights to attract attention. All double-ended ferry boats are required to carry white lights, visible all around the horizon, on poles or masts forward and aft. These lights are to be at the same height. Midway between them, at an altitude fifteen feet higher, a white or colored light must be carried. This light must likewise be visible all around the horizon.

LOG SIGNALS. In fog, mist, or falling snow, steamers under way must, at intervals of not more than two minutes, sound a blast of four to six seconds duration on their steam whistles. If the steamer should stop she must sound two such blasts with an interval of about one second. In the inland waters of the United States, steam vessels which are under way must sound their whistle once a minute instead of once in two minutes. A sailing vessel when under way must once every minute sound on her fog horn one blast when on the starboard tack, two blasts when on the port tack, and three blasts when the wind is abaft the beam. A vessel which is towing, laying, or picking up telegraph cable, or under way, but unable to keep out of the way of an approaching vessel through not being under command, or is unable to manœuvre as required by the rules, must, at intervals of not more than two minutes, sound one long blast followed by two short ones. A vessel being towed may sound this signal and must not sound any other. Vessels at anchor must, at intervals of not more than one minute, ring the bell rapidly for about five seconds. Sailing vessels and boats of less than twenty tons gross measurement are not obliged to give the signals prescribed for larger craft, but must make an efficient sound signal once every minute.

STEERING AND SAILING RULES. These are applicable to all conditions. Vessels must, in a fog, mist, or falling snow, go at a moderate speed, having careful regard to the existing circumstances and conditions. It is customary to construe this rule very liberally; fast steamers slow down very little during such weather, but if a vessel hears the whistle of another vessel ahead she should slow down at once until she has been passed.

When two steam vessels are approaching end on or nearly end on so as to involve risk of collision, each must alter her course to starboard (i. e. incline to the right) so that each may pass on the port side of the other. In United States waters vessels approaching nearly end on must alter their courses to starboard and other must give, as a signal of her intention, one short and distinct blast of her whistle which the other must answer with a similar blast. If the courses of such vessels are so far on the starboard side of each other that they would not be considered as meeting end on, either will give as a signal of her intention two short and distinct blasts of her whistle, which the other must answer with two similar blasts; the vessels will then pass on the starboard side of each other.

Where two steam vessels are steering courses which cross each other the vessel which has the other on her own starboard beam must keep out of the way of the other. In United States waters if there is risk of collision the vessel which has the other on her own starboard bow must, if she intends to turn to starboard and pass under the stern of the other, indicate her intention by one blast of her whistle, while if she intends to turn to port she must sound two blasts. These signals must be promptly answered by the other vessel.

In the international rules, when vessels are in sight of one another, a steam vessel which is taking any course authorized by the rules must indicate that course by the following signals on her whistle or siren, namely: One short blast to

indicating "I am directing my course to starboard," two short blasts to indicate "I am directing my course to port;" and three short blasts to indicate "My engines are going full speed astern."

When a steam vessel is overtaking another she must keep out of the way of the other. When the vessels are crossing at an angle such that the overtaking vessel could not see the other's side lights, if at night, the vessel coming up with the other shall be deemed an overtaking vessel.

In narrow channels every steam vessel must, when it is safe and practicable, keep to that side of the fairway or mid-channel which lies on the starboard side of such vessel.

When a steam vessel and a sailing vessel are proceeding on such courses as to involve risk of collision, the steam vessel must keep out of the way of the other. When by any of the rules one of two vessels is required to keep out of the way of the other, the latter must keep her course and speed, but in interpreting the rules regard must be had to all dangers of navigation and to any special circumstances which may render a departure from them necessary to avoid immediate danger, and nothing in any of the rules will exonerate any vessel or her master, owner, proprietor, or crew from the consequences of any neglect to carry lights or signals, or keep a proper lookout, or to take any precaution which may be required by the common practice of seamen or by the special circumstances of the case, and nothing in the rules shall interfere with the operation of a special rule, duly made by local authority, relative to the navigation of any harbor, river, or inland water.

When two sailing vessels are approaching one another so as to involve risk of collision, one of them shall keep out of the way of the other as follows, viz.:

(a) A vessel which is running free shall keep out of the way of one which is close-hauled.

(b) A vessel which is close-hauled on the port tack shall keep out of the way of one which is close-hauled on the starboard tack.

(c) When both vessels are running free, with the wind on different sides, the vessel which has the wind on the port side shall keep out of the way of the other.

(d) When both are running free with the wind on the same side, the vessel which is to windward shall keep out of the way of the one which is to leeward.

(e) A vessel which has the wind aft shall keep out of the way of one which has the wind on some other bearing.

DISTRESS SIGNALS. When a vessel is in distress and requires assistance from other vessels or from the shore, the following shall be the signals to be used or displayed by her, either together or separately, viz.:

In the daytime—(1) A gun or other explosive signal fired at intervals of about a minute. (2) The international code signal of distress indicated by NC. (See Plate with article SIGNALS, MARINE.) (3) The distance signal, consisting of a square flag having either above or below it a ball or anything resembling a ball. (4) A continuous sounding with any fog signal apparatus.

At night—(1) A gun or other explosive signal fired at intervals of about a minute. (2) Flames on the vessel as from a burning tar barrel, oil barrel, etc. (3) Rockets or shells throwing stars of any color or description, fired one

at a time, at short intervals. (4) A continuous sounding with any fog-signal apparatus.

Copies of the complete rules may be obtained free of charge at naval branch Hydrographic Offices and at small expense from most dealers in nautical instruments.

RULING MACHINE. A mechanical device by means of which parallel lines may be ruled on a surface at regular or definitely spaced intervals. The ruling machine employed by engravers is a form of dividing engine (q.v.) and is used in making tinted surfaces on blocks for printing. It consists of a tool that can be given a lateral motion by a screw or other device and a transverse or cutting motion as it is moved across the surface. The term ruling machine is also applied to a device used for ruling the lines in account and other blank books. This machine consists of a series of fountain pens or thread supplied with ink of the desired color, which press against the paper. See DIVIDING ENGINE.

RUM (abbreviation of *rumbullion* or *rumbolze*, the first word being perhaps an extended form of *rumble*, and the latter from *rum*, good, Gypsy *rom*, husband, *Rommuñi*, Gypsy, from Hind. *ḍōm*, *domrā*, from Skt. *ḍōmba*, name of a low caste + *booze*, *bouse*, from MDutch *būsen*, Ger. *bausen*, to guzzle). A spirit made by fermenting and distilling molasses and the refuse which accumulates in making cane sugar. The best rum is made from the pure molasses; a second grade is obtained from the skimmings and other wastes of sugar-making. Fermentation is induced by the use of dunder; molasses is added, in the proportion of 6 to 100, and the fermentation allowed to continue to completion. When new, rum is white and transparent; its color is produced after distillation by adding caramel-color. Rum is greatly improved by age and when very old has a high commercial value. The manufacture was at one time an important industry in New England, but has constantly decreased. The best rum is made in Jamaica. It owes its peculiar flavor to butyric ether, which fact is taken advantage of to produce an artificial rum. Consult Sadtler, *Organic Chemistry* (Philadelphia, 1900). See DISTILLED LIQUORS OR ARDENT SPIRITS AND LIQUORS, FERMENTED AND DISTILLED, STATISTICS OF.

RUMANIA. A kingdom of Europe, the most northeastern country of the Balkan States. It embraces the former principalities of Moldavia and Wallachia (united in 1861) and the district called the Dobrudja, detached from Bulgaria in 1878. The Eastern Carpathians and their westward continuation, the Transylvanian Alps, presenting their convex side to Rumania, are the western and northern barriers separating the kingdom from Hungary. The Danube marks the line between Rumania and Bulgaria on the south, except in the extreme east of the country, where there is an artificial boundary. The Black Sea bounds the country on the east for a distance of about 130 miles. In the extreme north an artificial frontier extends between Rumania and Russia, and the Pruth separates them on the

east. In the extreme west the kingdom touches Serbia, the Danube forming the boundary. Rumania extends from latitude 43° 40' to 48° 47' N. Area, 50,540 square miles, Rumania being the largest Balkan State except Turkey.

TOPOGRAPHY. The surface features comprise the mountain barrier in the west; the mountain forelands and foothills extending into the country for 30 to 40 miles from the Carpathian ranges; the two low plains spreading away everywhere to the east and south of the mountain region; and the higher lands of the Dobruja, the region between the Danube and the Black Sea. The Dobruja has low coasts, but its interior is a steppe-like plateau. The great walls of the Carpathians and the Transylvanian Alps, the latter rising over 8000 feet in several places, slope down to the Rumanian plains in finely wooded declivities, divided by the valleys of many rivers. The Moldavian plain, occupying the eastern part of the country, descends to the south and is deeply trenched by many tributaries of the Danube, the principal being the Sereth. The Wallachian plain occupies the entire south, has a general southeasterly incline, and is traversed by the Aluta, Arjesu, Yalomitsa, and other affluents of the Danube. The Moldo-Wallachian plain is physically a part of the great plain of South Russia. The Danube is the great highway of the kingdom. Before it reaches the delta it divides into many branches, and courses over a flat, marshy, alluvial plain, rather difficult of access.

CLIMATE, FLORA, AND FAUNA. Though in the same latitude as Northern Italy, the land has far greater climatic extremes. Its bitterly cold winters are due to its being exposed to the winds from the Russian steppes; the winds from the Mediterranean subject it to subtropical summer heat. The mercury sometimes rises to above 100° F. in the shade, and at times sinks below —20°. The Danube is usually ice-bound about three months. The annual rainfall ranges from 15 to 20 inches and is unequally distributed. The soils, particularly the black earth of the plains, make Rumania one of the most fertile countries of Europe.

Three zones of vegetation are distinguished: the high Alpine zone in the mountains, the forest zone of the lower mountain slopes and foothills, and the steppe zone of the prairie regions. The mountains are clothed with pines, larches, firs, dwarf junipers, and birches. Firs are the prevailing trees among the foothills. Varieties of oak grow on the plains, beeches, chestnuts, and maples being also planted. The black alder grows on the marshes. The mountains present great stretches of woodlands, but large forest tracts are now rarely met on the plains and a great part of the Dobruja is treeless. The fauna resembles that of Russia (q.v.).

GEOLOGY AND MINERAL RESOURCES. The Carpathians and the Transylvanian Alps consist mainly of crystalline schists with extensive intrusions of Jurassic and chalk beds. Earthquakes, originating among the mountains, seem to show that the process of mountain formation is still in progress. The two great low plains are covered with the black loess of South Russia, with large admixtures of pebbles and clay in the southern plain of Wallachia. This region is traversed by Eocene formations, and by strongly folded Miocene strata, which often contain salt and petroleum. The plain of Moldavia, on the other hand, consists of late

Tertiary formations. The mineral wealth is very great. Gold, silver, iron, lead, quicksilver, copper, manganese, coal, building materials, petroleum, and salt are all found, but only the last three are worked to any great extent. Gold, in particles and scales, is found in some of the rivers. Recent discoveries show quicksilver in large quantities in Wallachia. Marble of excellent quality, and clays and sands suitable for porcelain and glass wares, are abundant. The salt deposits cover an enormous area in Moldavia and Wallachia, and as many of the beds have a thickness of 750 feet or more, Rumania could supply Europe for centuries. The salt industry has been a State monopoly since 1862. The output in 1900 was 101,000 tons, nearly all being exported. The oil-bearing region is very extensive and is beginning to be exploited by foreign capitalists. The product of petroleum in 1900 was 221,387 tons. All the metals are limited, for lack of Rumanian capital and transportation facilities.

AGRICULTURE. Seventy per cent of the people are engaged in agriculture. Rumania is one of the three large granaries of Europe. But agriculture is still very backward; the peasantry, serfs until recently, have made progress slowly, and methods and implements are still primitive, though modern farm machinery is being largely introduced on the estates. Nearly half of the whole surface is under cultivation. Tillage and stock-breeding outweigh all other resources to a greater extent than in most European States. The land is particularly well adapted for cereals. Wheat and maize are the chief crops. The area under wheat in 1900 was nearly 6000 square miles. The area under maize is a fourth greater. The average of barley, oats, and rye together is about half of that of maize. Maize, the chief crop, yielded 116,937,295 bushels in 1901. It is the staple food of the peasantry, and with wheat and barley comprises the bulk of the exports. Tobacco is a State monopoly cultivated wholly under Crown management. In 1901, 10,666 acres were under the crop. Both soil and climate are adapted for the vine, which grows chiefly among the foothills of the mountains overlooking the plains. The vineyards embraced, in 1901, 330,018 acres. Cotnars and Odobesci—dessert wines—vie with the famous vintages of Hungary. Prunes are important in the foreign trade. The kingdom had, in 1900, 864,716 horses, 2,589,000 cattle, 5,644,210 sheep, and 1,709,909 swine. Stock raising is carried on with little skill or method. There are few stables, and most of the animals are exposed without shelter to the rigorous winter. The exports of hog products to Austria-Hungary and Russia is important. Sheepbreeding is carried on everywhere for mutton, cheese (which is in great demand), and wool, but is declining, especially in the hill districts. The rearing of silk worms, once an important horse industry, is reviving under Government patronage. Rumanian streams are well supplied with fish.

MANUFACTURES AND COMMERCE. The house industries supply the peasants with most of their personal needs. Foreign capital is being attracted and industrial development is making considerable progress. Several hundreds of flouring mills turn much of the wheat into flour, which is exported even to England; in 1901 the sugar factories had an output of 25,350 tons,

and there are many other manufactures of different kinds. Expensive freight rates and high customs are the chief hindrances to trade in Rumania. The total volume of the foreign commerce for 1901 was \$129,300,000. Textiles stand far in the lead among the imports, and bread-stuffs are by far the most important item in the exports. Other noteworthy items of the imports are metals and their manufactures, chemicals, drugs, and groceries; and fruits, vegetables, groceries, chemicals, wool and wooden wares, animals, and animal products figure to some extent among the exports. In the Rumanian commerce Belgium, Germany, and Austria-Hungary figure most extensively.

TRANSPORTATION AND COMMUNICATION. The only important ports directly on the Black Sea are Sulina and Kustendje. The latter is a new port, but promises to become important. Far more important at present are the large commercial cities of Galatz and Braïla, at the head of deep-water navigation on the Danube. Braïla is the great wheat-exporting port of the country. In 1901 the vessels entering the ports were 29,296, with 8,187,927 tons. In 1902 the commercial marine of Rumania consisted of 391 vessels, of 75,440 tons, including 72 steamers, of 16,146 tons. A large number of steamboats and sailing vessels ply on the Danube, and much timber and grain is transported to the Danube by steamer, barge, or raft on the Sereth and the Pruth. The State owns all the railroads, of which about 2000 miles were in operation in 1903.

GOVERNMENT AND FINANCE. Rumania is an hereditary constitutional monarchy. The present Constitution, enacted by a Constituent Assembly elected by the people in 1866, was amended in 1879 and again in 1884. According to its provisions the executive department is vested in the King, who has power of suspensive veto, and a Cabinet of eight members, including a Prime Minister. The legislative department is composed of a Senate and Chamber of Deputies, the members of both of which are chosen (in part indirectly) by electoral colleges, made up of all taxable citizens classified according to the amount of taxes paid, property owned, or educational qualifications. The Senate has 120 members, elected for a term of 8 years. The heir apparent, 8 bishops, and 2 representatives selected by the universities of Bucharest and Jassy are members of the Upper House. The Chamber of Deputies has 183 members, chosen for four years. Senators to be eligible must be 40 years of age and have an annual income of about \$1800. Deputies must be 25 years of age. The Code of Napoleon is the basis of the legal system. For its local government, Rumania is divided into 32 districts. The capital of Rumania is Bucharest.

The revenues are derived from the indirect taxes (stamp, legacies, spirits, and beer taxes); direct taxes (real estate, building taxes, road tolls, licenses for the sale of spirits, and registration fees, trades); monopolies (tobacco, salt, matches, playing cards, and cigarette paper); sale of and revenue from public lands; and customs. In 1903-04 the revenue was approximately \$44,000,000, and the expenditure \$42,600,000. The public debt amounted on March 31, 1902, to \$275,601,379.88. More than half had been contracted for public works, mainly railways. The foremost financial institution is the Ru-

manian National Bank, at Bucharest, with branches in the important towns. On December 23, 1900, it had a note circulation of \$23,737,350.

MONEY, WEIGHTS, AND MEASURES. The gold standard was introduced in 1888. As gold coins are minted only in limited quantities, the short supply is widely supplemented by foreign pieces. The gold *leu* (equaling one franc) is the unit of coinage, and the small change is of silver or bronze. The metric system of weights and measures is legalized, but Turkish denominations are used to some extent. For army, see **ARMIES**.

POPULATION. The population of Rumania, by the census of 1899, was 5,912,520, of whom the Rumanians numbered 92.5 per cent. Bucharest had a population in 1899 of 282,071. The next largest town, Jassy, had 78,069 inhabitants.

RELIGION AND EDUCATION. Orthodox Greek is the State religion, but all confessions enjoy full freedom. The State Church is independent of all 'alien prelates,' and the Metropolitan Primate is appointed by the legislative bodies and confirmed by the King. In 1899 there were 5,498,743 members of the Greek Church, 168,275 Catholics and Protestants, 269,015 Jews, and 43,740 Mohammedans. The percentage of illiterates is very high, the census of 1899 showing that 88.4 per cent. of the population could not read or write. Though education is 'free and compulsory,' no schools have as yet been established in many of the village communes. There are two universities—one at Bucharest, with about 80 professors and over 4000 students, and one at Jassy, with about 50 professors and 800 students.

ETHNOLOGY. The Rumanians, or Wallachs, constitute a race whose origin has been much discussed and is still by no means clear. Only about half of the Rumanians inhabit the modern Kingdom of Rumania. The remainder are found in the neighboring regions of Eastern Hungary (mainly Transylvania), Bukowina, Bessarabia, Servia, and Bulgaria, besides scattered groups in other parts of the Balkan Peninsula. These smaller groups are rapidly disappearing among the surrounding peoples. The most important of the detached Rumanian communities is that inhabiting the Mount Pindus districts. These are called Tsintsars or Kutzo-Vlachs by their Macedonian neighbors, but their true name is Aramâni or Arnâni, i. e. 'Romans.' The popular belief and claim of the Rumanians is that they are the direct descendants of the Roman colonists sent into the conquered province of Dacia (the modern Rumania) by the Emperor Trajan. This theory has been severely attacked by Rösler, Hunfalvy, and others, and seems questionable both on historical and linguistic grounds. The Emperor Aurelian (270-275) withdrew the Roman colonists from Dacia to the south side of the Danube, and from that time until the thirteenth century Dacia was given over to the barbarian hordes, who swept over the country repeatedly. During this time the Roman language and culture seem to have disappeared, and the former was first reestablished in its modern form in connection with a northern movement of the Rumanians from the regions south of the Danube. This would seem to support the view that the final area of dispersion was to the south, and possibly in the neighborhood of the Pindus region. Here would also be the seat of the development of the language. Numerous linguistic characteristics seem to support this view.

On the other hand, it is not at all necessary to suppose that all or even a majority of the inhabitants of reorganized Rumania came from the south. The number was probably relatively few. The study of the head form of the modern Rumanians shows dolichocephaly in the east, the breadth of the head increasing to brachycephaly in the west. This eastern dolichocephaly along the Black Sea is regarded by many as a survival from a primitive long-headed race, which formerly occupied almost all Eastern Europe before the Slavic invasions. If this be true, it shows a continuance of race in spite of invasions. It is also noteworthy that in physical type the Rumanians differ but slightly from the Bulgarians, which would seem to show that the mass of the people have been but slightly affected by their conquerors. The Rumanians may then be regarded as a mixture, varying in different regions, of this primitive population with Roman colonists, and Teutonic, Slavic, and Mongol invaders. Consult: Rosny, *Les Romains de l'Orient, aperçu de l'ethnographie de la Roumanie* (Paris, 1885); Humfalvy, *Ethnographie von Ungarn* (Budapest, 1877).

HISTORY. The modern Kingdom of Rumania, which dates in its present political organization only from 1881, was formed by the union of the two kindred principalities of Moldavia and Wallachia (q.v.). These countries form the greater part of the large area conquered by the Emperor Trajan (A.D. 101-106) and made the Roman Province of Dacia (q.v.). The Dacians, according to the Roman accounts, were a warlike race, and under their King, Decebalus, made a vigorous resistance to the conquest. During the reign of Alexander Severus, in the second quarter of the third century, the province began to suffer from the inroads of the Goths, and in the reign of Aurelian (270-275) it was finally abandoned to these Germanic invaders, with whom the Emperor established an honorable alliance. A majority of the inhabitants crossed to the south of the Danube, but many remained among the Goths and introduced the arts of Roman civilization. The Goths were later crowded out by the Huns and the country was overrun by successive barbarian invasions. The present inhabitants are of a much mixed race, their language being a Romance tongue.

In the eleventh century the Cumans, a Turkish people, established themselves for a time in Moldavia, and two centuries later the country fell into the hands of the Nogai Tatars and the people were driven into the forests and mountains. The history of the period of recovery of Wallachia and Moldavia from the barbarians and of their organization into States is very imperfectly known and is not of particular importance.

In the latter part of the thirteenth century we find a Wallach, or Ruman, principality in the region between the Lower Danube and the Transylvanian Alps, which took its place in the map of Europe as Wallachia. A little later by the side of this arose another Wallach principality, which took the name of Moldavia, from the River Moldova, an affluent of the Sereth. Both principalities had to face the tide of Turkish invasion which after the middle of the fourteenth century swept over South-eastern Europe. At the same time they had to contend against the kings of Hungary. By the beginning of the fifteenth century Wallachia had become a vassal State of the Ottoman Empire, being forced to pay regular

tribute; Moldavia held out a century longer. It was long, however, before the Turks succeeded in actually subjecting the principalities to their sway, and more than once they suffered defeat at the hands of the Ruman vojvodes or princes. The rule of the vojvodes of Wallachia and Moldavia presents a dismal and bloody record, vigor and ability on the part of the princes going hand in hand with savagery. For a moment, at the close of the sixteenth century, the Wallach, or Ruman, nationality was brought under the sway of a single monarch, Michael the Brave of Wallachia, who brought Moldavia and Transylvania (inhabited in great part by Wallachs) under his scepter. Michael was assassinated in 1601 and this Great Rumanian unity had, to be revived in the dreams of the Rumanian patriots of to-day, whose aspirations are directed to the establishment of a Dacian realm of which Transylvania shall form a part.

In the seventeenth century the hold of Turkey (then in its decline) upon the principalities was gradually tightened, and at last their independence was practically extinguished. The Rumanian soil, however, was not opened to the Turks for settlement. The onslaughts of Russia upon the Ottoman Empire introduced a new and sinister element into the life of the principalities. In 1710 the vojvodes sought to free their States from the Turkish yoke with the assistance of Peter the Great. (See KAZEMLIK.) The Czar was hemmed in by the Turks on the River Pruth (1711) and escaped only by agreeing to a humiliating peace. After this the Porte ruled Moldavia and Wallachia through hospodars or governors taken from among the Greek Phanariot families (see PHANARIOTS), who, in their greed and lack of sympathy for the inhabitants, exploited the principalities in a merciless manner. Many of the families of the boyars or nobles became allied with the Phanariot houses and Greek became the official language. This tended very much to obscure the national feeling. Again and again the armies of Russia, in her wars with Turkey, traversed and occupied the unhappy provinces. Bukovina, in 1777, and Bessarabia, in 1812, were severed from Moldavia and annexed to Austria and Russia respectively. The ambitious designs of Russia looked to the incorporation of Moldavia and Wallachia in the empire of the Czar. And the fact that their inhabitants belonged to the Greek Church afforded a pretext for interfering in the affairs of the principalities. The outbreak of the Greek struggle for independence, the first episode of which was enacted at Jassy in 1821 (see YPSILANTI, ALEXANDRE), put an end to the Phanariot rule in the two Danubian Principalities and boyars were allowed to choose the hospodars from natives.

The Rumanian language took its place again, and, under the stimulus of the teaching of the history of the people, promoted especially by four Rumanian historians, Sincai, Maion, Asachi, and Logari, a spirit of nationality was developed which looked to independence and gave a new unity to the ideas and purposes of the two States.

In the Treaty of Adrianople of 1829 Turkey was forced to accord to Russia a protectorate over the Danubian Principalities. The hospodars, among whom were some strenuous and enlightened rulers of the family of Ghika (q.v.), were reduced almost to the position of lieutenants of the Czar. But the schemes of Russia around

patriotic opposition, and the unsuccessful issue of the war waged against Turkey and her Western allies (1853-56) deprived Russia of her hold on the Danubian Principalities.

The Congress of Paris in 1856 recognized the need of a modification of the relations of the Porte to the principalities, but would not concede complete independence. They were organized as the United Principalities of Moldavia and Wallachia, each having its own hospodar and government, but with a common commission of sixteen members and a general court of justice. In 1859 both elected the same hospodar, a boyar of Moldavia, Prince Cuza, and in 1861 he was proclaimed Prince of Rumania under the name of Alexander John I. (q.v.). The Sultan recognized the new adjustment, and the long desired union was accomplished. Prince Alexander was deposed in 1866 because of his arbitrary government, and Prince Charles of Hohenzollern was elected as hereditary Prince under a modern constitution, it being found impossible to reach an agreement on any member of the native nobility. An efficient army was organized by Prince Charles on the Prussian model, and when war broke out between Russia and Turkey in April, 1877, Rumania entered into alliance with Russia, giving the armies of the latter free passage through Rumanian territory. On May 21st the Rumanian Parliament declared the country independent. The Rumanian army joined the Russians in the field, and in the operations at Plevna the forces of the principality bore an important and wholly creditable part. (See RUSSO-TURKISH WAR.) The Berlin Congress in 1878 recognized the independence of Rumania, but in spite of the protest of the Rumanian envoys restored to Russia the strip of Bessarabia, touching the Pruth and the Danube, which had been annexed to Moldavia in 1856. Rumania, however, received the Dobrudja. It was further stipulated that difference of religious profession should not disqualify from the exercise of full civil and political rights in Rumania. The last stipulation introduced the Semitic question into the politics of the new State by bringing a quarter of a million Jews into its citizenship, a condition which has never been acquiesced in by the Christians, who have continued to persecute the downtrodden race, many of whom have emigrated to the United States. In 1881 the Government declared Rumania a kingdom, and this was accepted by the Powers. In 1893 King Charles summoned his nephew and heir, Prince Ferdinand, to the kingdom and the latter's son was baptized into the Greek Church.

RUMANIAN LANGUAGE AND LITERATURE. **RUMANIAN LANGUAGE.** A Romance tongue spoken in three dialects, the Daco-Rumanian, in Rumania, Transylvania, Bessarabia, the Hungarian Banat, and Bukowina—that is, in old Dacia, by about 9,000,000 people; the Macedo-Rumanian, in Macedonia, Albania, Thessaly, and Epirus, by several hundred thousand people; and the Istro-Rumanian, in Istria, by about 3000 people. The Daco-Rumanian dialect comprises the Wallachian, Moldavian, Transylvanian, and Banatian sub-dialects. The Rumanian developed from the vulgar Latin spoken in Dacia and Mesia under the influence successively of the Turano-Bulgarian, Albanian, Slavic, Hungarian, Turkish, and Modern Greek. These influences affected little the grammatical structure of the language, but greatly changed its vocabulary. About 3800 words are Slavic, about 2600 come from the vulgar Latin, about 700 are Turkish, 650 Greek, 500 Hungarian, and 50 Albanian.

The spelling of the language is pretty nearly phonetic. Rumanian has two guttural vowel-sounds, the one written *ă*, *ê*, and the other *i*, *â*, *î*. As in Italian, *c* and *g*, when followed by *e* or *i*, have a soft (palatal) sound. There is a post-positive article (*om*, 'man'; *omul*, 'the man'; *oameni*, 'men'; *oamenii*, 'the men'; *frate*, 'brother'; *fratele*, 'the brother'; *frați*, 'brothers'; *frații*, 'the brothers'; *floare*, 'flower'; *floarea*, 'the flower'; *flori*, 'flowers'; *florile*, 'the flowers.' The cardinal numbers from 11 to 19 are formed by means of the word *spre-ou*: *un-spre-zece*, etc.; those from 20 to 90 by means of the plural of *zeci* ('ten': *douăzeci* (20), *treizeci* (30), etc.). The declensions and conjugations are very much like those of Italian. There are three declensions and a neuter gender. Very frequently in nouns the plural differs materially from the singular: *Om* 'man'; *oameni*, 'men'; *cap*, 'head'; *capete*, 'heads'; *soră*, 'sister'; *suroari*, 'sisters.' There are four conjugations. Verbs have two forms in the infinitive, a short and a long one: *lauda*, *laudare*, 'to praise'; *tăce*, *tăcere*, 'to be silent'; *duce*, *ducea*, 'to lead'; *dormi*, *dormire*, 'to sleep.' The future and conditional present are formed with auxiliaries: *voiă fugi*, *as fugi*, 'I shall run,' 'I should run.' The passive is rendered by the third person singular: *lă bat*, *te bate*, *il bate*, 'I am, thou art, he is beaten.' The language is rich in suffixes, especially for the formation of diminutives: *Ioan* (John), *Ionică*, *Ionuță*, *Ionușcu*, *Ianușcu*, *Ionușel*, etc.

RUMANIAN LITERATURE. Unlike other Romance literatures, Rumanian did not grow up under the influence of Occidental civilization, but down to the nineteenth century at least it was influenced by the Orient. It divides itself into three periods:

THE SLAVIC PERIOD (from the middle of the sixteenth century to 1710). The literature of this period is mediæval and religious in character. The old religious literature was written in Slavic. The desire to reach the common people led to

translations of the Scriptures into Rumanian. The oldest extant documents are the Gospel (Kronstadt, 1560-66), the History of the Apostles (1568-70?), and the Psalms (1577), literal translations by Dean Coresi. Of special importance is the translation of the Psalms by Archbishop Dosithen, the author of the remarkable *Vita Sanctorum*, and one of the most prominent literary figures in the second half of the seventeenth century. The first complete translation of the Bible was carried out by Radu Greceanu upon the command of Prince Jean Serban Kantacuzino Basarab (Bucharest, 1688); it is written in the Wallachian dialect, and is the most important literary monument of the entire literature. In 1613 the Rumanian was admitted into State and Church upon an equal footing with the Slavic, but the Slavic language and alphabet persisted, and the important books of devotion continued for a long time in Slavic, the substitution of Rumanian lasting fully two centuries.

Besides the Church literature, the only other branch of literature cultivated was history. Of great importance for the early history is the anonymous *Létopisețul țării Românești și a țării Moldovei* (the chronicle of the Rumanian and Moldavian countries). The Prince D. Cantemier, a famous polyglot (1673-1723), besides a history of the Ottoman Empire, left *Kronikula Moldo-Walhiolos* (the chronicle of the Moldavo-Wallachians), which he wrote in Latin and translated himself into Rumanian. These two chronicles treat of all Rumania. The oldest chronicle of Moldavia is the one of Ureche, from 1359 to 1594. The history of Moldavia before 1359 and after 1594 (down to 1662) was treated in two excellent chronicles by Miron Costin, who also wrote a history of Hungary from 1388 to 1681, and a poem in Polish on the colonization of Dacia and the foundation of the two principalities. His son, Neculai Costin (1660-1712), left a chronicle, in which, beginning with the creation of the world, he brings down Miron Costin's chronicle to 1711. The oldest and most important historical document of Wallachia is a chronicle which covers the period from 1290 to the beginning of the eighteenth century.

THE GREEK PERIOD. From 1710 to 1830 the principalities were governed by Greeks from Constantinople, who bought their thrones from the Porte. The Greek language became a successful rival of Slavic, ultimately prevailing in the State, court, schools, and among the upper classes. Works were now translated or imitated from the Greek. The intellectual labor begun during the Slavic period, far from being checked or even destroyed by the Greek influence, as some critics, biased by patriotic zeal, opine, was continued during this period.

Church literature continued to develop. In Transylvania, owing to the close proximity to the Catholic world, Catholicism exerted a strong influence, and Western ideas and forms gained ascendancy. Instead of Greek and Slavic models, Latin models were followed. Samuel Klain (1745-1808), who revised the Bible, and Peter Maior (1753-1821), two of the most active men of the period, published sermons and funeral orations patterned after Latin models. In Wallachia the rhymed chronicle was flourishing. The history of Moldavia, however, is represented by

one remarkable work, the chronicle written by Nechifora, from 1662 to 1743; it continues that of Ureche, and is excellent both in point of form and contents. In Transylvania, owing to the oppression of the hands of the Hungarians, and to the credulous of the Catholic Propaganda to link the Rumanians to Rome, the Hungarians, stirred by word and patriotic zeal, deemed to open to the national consciousness of the people, and wrote with a view to reconstituting the kinship of the nation with the Latins. In this spirit were written, at the beginning of the nineteenth century: Klain's *Istoria Românească dinainte* (the History of the Rumanians of Dacia), Maior's *Istoria patriei românești* (A History of the Origin of the Rumanians) (1812), and George Șineai's (1754-1826) *Geneza Limbii Române*, printed in 1853, a monumental work based upon most thorough researches of all the sources then accessible in the libraries of Europe.

Toward 1800 Western influence set in, and gradually led to a total transformation of Rumanian literature, which at last cast off its mediæval and religious features, and adopted Western ideas and Western forms of art. Western, especially French, ideas ousted the Slavic and Greek influences from their old strongholds.

Among the notable poetic productions of the end of the Greek period are the *Tiganiada* (the Epic of the Gypsies), by Joan Delacium, a mock-heroic poem replete with wit and irony, and the lyrics of Joan Văcărescu (1800-63), of Constantin Conachi (1777-1849), and especially those of Vasile Carlova (1809-1831), a genuine poet. The most prominent poetic figure, however, though partly belonging to the modern period, was Anton Pann (1797-1854), a Bulgarian by birth, who drew his theme and inspiration from the vast popular literature, both laic and religious, that had accumulated during the two periods. His writings, mostly in verse, exerted great influence upon the middle and lower classes, and are even now widely read by the common people.

THE MODERN PERIOD extends from 1830 to our own day. It is marked by a complete though gradual emancipation from foreign influences. The interval between 1830 and 1848 was, however, yet one of preparation. Greek and French influences still continued. The Latinist movement, which originated in Transylvania, and was there so ably championed by Klain, Șineai, and Maior, crossed the Carpathian Mountains with George Lazăr (1779-1823), who, together with a host of his disciples, chief of whom were G. Asachi (1788-1871) in Moldavia, and the brilliant Joan Eliade-Rădulescu (1802-72) in Wallachia, aimed at the complete Latinization of the language, the last named even attempting to Italianize it. Eliade was, nevertheless, the main factor in the literary revolution. He freed the language from the Slavic alphabet; by insisting upon the close kinship of the nation with the other members of the Latin race he saved it from intellectual isolation and strengthened its national consciousness; and more than any one else he contributed toward the diffusion of the literary master works of Western Europe.

But a national literature in the full sense of the word has existed only since about 1848. In Transylvania we have Andrei Mureșianu (1816-63), a patriotic poet, who composed the national song, "Awake, Rumanian, from thy lethargic sleep!" the philologists Timoteiu Cipariu

(1805-87), and A. T. Laurianu (1810-80), and the historian A. Papiu Hariianu (1828-77). In Wallachia Nicolai Bălcescu (1819-52), a revolutionary of 1848, wrote the *History of the Rumanians Under Michael the Brave*. Dimitrie Bolintineanu (1827-72) was most successful in his national ballads, the subjects of which he borrowed from the old chronicles. Grigorie Alecsandrescu (1812-85), distinguished himself by his patriotic odes and his satires, and won great popularity through his fables. In Moldavia Constantin Negruzzi (1807-68) translated into verse Pushkin and Victor Hugo, and excelled in prose. Mihail Cogălniceanu (1817-91), the greatest orator of the period, published the Moldavian chronicles.

The great names of the modern literature are those of Alecsandri and Hăşden. Vasile Alecsandri (1821-1890), noted as a lyric and dramatic poet especially, succeeded in combining in himself Western culture with national inspiration. He published, in Rumanian and French, popular songs collected by himself from the mouths of the peasants. In 1866, with Negruzzi, he founded the *Convorbiri Literare* (Literary Talks), the most important literary review. In 1878, at the floral games in Montpellier, his *Cîntecul Gîtcîi Latine* (Song of the Latin Race) carried off the prize set for the best poem on the Latin race. B. P. Hăşden (1836-) is a man of encyclopædic erudition. His best literary work is *Răsvan Vodă* (Prince Răsvan) (1867), an historic drama. But his great importance lies in the domain of history and philology. He wrote various works on Rumanian history, and published the vast collection of documents entitled *Historical Archive of Rumania*. Among his philological publications may be mentioned his *Curceni din bătrîni* (1878) (Words from Our Ancestors), and his *Etymologicum Magnum Romanic*, a dictionary of vast compass and still in its initial stage.

V. A. Ureche (1834) published a *History of the Rumanians* (8 vols., 1895), and founded, in 1866, the Academy, which issued the monumental Hurmazache collection of historical documents (15 vols., 1880-95). G. Tocilescu (1846-) wrote a history of Dacia before Trajan, and A. D. Xenopol (1843-) published a very good *History of the Rumanians* which has been translated into French. Of the great number of writers of fiction and poetry may be mentioned: N. Gancea (1835-), Slăviei (1848-), Jacob Negruzzi (1842-), the peasant J. Creangă (1837-), an excellent narrator, P. Ispirescu (1830-87), a collector of folk-tales, A. Odobescu (1834-), an historical novelist, and the women A. Veronica Miclea (1850-) and Matilda Poni (1853-). Next to Alecsandri stands Mihail Eminescu (1849-1889), a lyric poet of genuine inspiration, though strongly pessimistic. Among his poetic followers are Alecsandru Vlăhută (1859-), De la Vrancea (Barbu Ştefanescu) (1858-), Gheorghe din Moldova (Chembach), Arthur Stavrî (1869-), O. Carp (Gh. Proca), Haralamb G. Lecca. A place apart is occupied by George Cosbuc (born 1866 in a small town in Transylvania); his lyrics are hopeful and strong. The drama is ably represented by J. L. Caragiale (1832-), who depicts with much skill and wit and humor the political and social manners of the middle classes of his time. Cara-

giale, Vlăhută, and Cosbuc are the most reputed poets of the day.

The last two decades of the nineteenth century were marked by the small group of writers that gathered about the *Contemporanul*, a review founded (1881) by the Socialist Ioan Nădejde (1850-), who has the culture of the Occident, literary and philologic, historic and scientific. His wife, Sofia Nădejde, who was one of the ablest contributors to the *Contemporanul*, Const. Mille, V. G. Mortzum, and Th. Speranza (1856-) are the better known poets of this group. Its literary theoretician is C. Dobrogeanu-Gherea (1854-), a critic of great ability, who fought with great success against the established æsthetic theories represented by Titu Maiorescu (1840-), the leader of the *Junimea* (Youth), a conservative literary society, which held the field between 1860 and 1880. From a literary standpoint the *Revista Nouă* (The New Review) founded (1887) by B. P. Hăşden, was a successful rival of the *Contemporanul*. The influence upon the youth exerted by Nădejde and his friends was great. The radical thought of Europe, the most modern ideas, the most recent discoveries, the latest intellectual movements, were all brilliantly popularized in the *Contemporanul*. With the activity of Nădejde and his friends was consummated the intellectual revolution begun toward the end of the eighteenth century—to wit, the utter transformation of the old Rumanian society and literature, essentially Oriental, through the diffusion of the best thought of Western Europe.

OLD TEXTS: Capariu, *Crestomatia sau Analecte Literare* (Blasiu, 1858), on the 16th and 17th centuries; Cogălniceanu, *Letopisetiile țării Moldavii* (Jassy, 1841-52); Laurianu (the chronicles) and Bicescu, *Magazin Istoric pentru (for) Dacia* (1845-47); Gaster, *Chrestomatia română* (Leipzig, 1891), with French glossary. FOLK-LORE: Hăşden, *Cărtile poporane ale Românilor în secolul al XVI-lea* (the popular books of the Rumanians in the 16th century) (Bucharest, 1879); Gaster, *Literatura populară română* (ib., 1883); Şaimeanu, *Basmcele române în comparație cu legendele antice clasice și în legătură cu basmele popoarelor romanice* (The Rumanian folk-tales compared with the ancient classic legends and in relation

to the folk-tales of the Romance peoples (ibid., 1895). In Şăineanu's *Istoria plimbătoare* (ibid.) will be found a very good bibliography of folk-lore collections.

RÜMANN, ru'män, WILHELM VON (1850—), A German sculptor, born at Hanover, pupil of the Munich Academy and of Wagner. He received a gold medal in 1892. His principal works include the group of the "Goddess of Victory" at Würth, the Rüdert Monument at Schweinfurt, and the statues of William I. at Stuttgart and at Heilbronn.

RUMBURG, rum'buřk. A town of Bohemia, Austria, 25 miles northwest of Reichenberg, on the Saxon frontier. It has extensive manufactures of linen, cotton, and woolen goods. Population, in 1900, 10,388.

RUMELIA, EASTERN (Turk. *Rumili*, a name originally designating the land of the Greeks). A region under the rule of the Prince of Bulgaria and virtually forming part of the principality. It is bounded by the Balkans on the north and the Black Sea on the east (Map: Balkan Peninsula, E 31). Area, about 13,700 square miles. The central part is occupied by a wide plain intersected in a south-eastern direction by the valley of the Maritza, the principal river of the province. In the southwest are the Rhodope Mountains. The valleys along the tributaries of the Maritza in the Balkan chain are known for their rose gardens. Good tobacco is grown on the northern slopes of the Rhodope. The chief town is Philippopolis. The population of the province in 1900 was 1,091,854, mostly Bulgarians.

The annual sum of \$569,843 is paid by Bulgaria to the Porte as tribute for Eastern Rumelia. For further information, see BULGARIA.

RÜMELIN, ru'mé-lén, GUSTAV (1815-89). A German statistician and author, born at Ravensburg, Württemberg. After studying theology at Tübingen, he devoted himself to teaching, became rector of a Latin school in 1845, and professor at the gymnasium of Heilbronn in 1849, having in the meanwhile been a delegate to the Frankfurt Parliament in 1848. Called to Stuttgart in 1850 to serve in the Board of National Education, he was head of a department in the Ministry of Public Instruction from 1856 to 1861, when he became director of the Statistic-Topographical Bureau. In 1867 he established himself as docent at the University of Tübingen and was appointed its chancellor in 1870. Aside from various statistical and miscellaneous publications, he produced *Shakespeare-Studien* (2d ed. 1874), a much valued contribution to the Shakespeare literature.

RUMFORD, BENJAMIN THOMPSON, Count (1753-1814). An American physicist, born at Woburn, Mass. He entered a merchant's office at Salem at the age of thirteen, at the same time studying medicine and physics. In 1772 he married a rich widow of that place, and was made major of militia by the English Governor. The distrust of the colonists at this period of the outbreak of the American Revolution drove him to Boston, and when Washington compelled the evacuation of Boston, Thompson was sent to England as bearer of dispatches. In London he won the favor of the Government and received an appointment in the Colonial Office and was soon afterwards made Under Secretary of State. Con-

tinuing at the same time his activity in vegetation, he was elected, in 1779, Fellow of the Royal Society. On the re-organization of North's Ministry he returned to America, and fought for the royal cause. At the end of the Revolutionary War he was ordered to pass on from the British to the French, and for military service in Bavaria, 1780-1784. He is settled at Munich as a dele-gate from America, and, to the reigning sovereign, the Emperor, he is a representative of major-general, commander of State, lieutenant-general, Minister of War, and a member of the Council of the Holy Roman Empire, and of the Council of the snow-Council, N. H. G. His scientific career had begun as his official organization. In 1776 he visited London, where he reported on the results of his experience and the records of his labor in Bavaria. Having long and carefully studied the phenomena of heat, he set himself to devise a remedy for the smoky chimneys, which were one of the greatest nuisances at that time in England, and discovered the principle upon which fireplaces and chimneys have since been constructed. In 1799 he retired from Bavarian service and returned to London, where, at his instance, the Royal Institution was founded in the following year. He finally settled in Paris, devoted himself to improvements in artillery and illumination; founded a professorship in Harvard College of the application of science to the arts of living; married the widow of Lavoisier, and died at Autueil, near Paris, after making many important bequests to the Royal Society of London, the American Academy of Sciences, and Harvard University. A memoir of Rumford by George E. Ellis was published, with a complete edition of his works, in 1872 (Boston). Rumford is chiefly remembered for his experiments on the nature of heat. In 1798 he showed that the temperature of a body may be raised without heat being communicated to it as such; that the heat contained, for instance, in a metallic body may be increased by boring. On the basis of this fact he maintained, in his *Essays concerning the Source of Heat which is created by Friction* (read before the Royal Society on January 25, 1798), that heat is not an imponderable substance, as it was generally assumed to be in those days.

RUMINANT (from Lat. *ruminare*, to chew the cud, from *rumin*, throat, gullet; connected with *ructare*, Gk. *ῥέγειν*, *εἰσέχειν*, O. Church Slav. *rygniti*, to belch, Lith. *atimaps*, eructation, AS. *pacethan*, to belch). One of the group of large grazing animals which chew a cud, classified by Cuvier as an order, Ruminantia, but now regarded as a group of the suborder Artiodactyla, the even-footed or even-toed Ungulata (q.v.). The ruminants include all of the cloven-footed herbivores except the swine and hippopotamus, that is the chevrotains, camels, deer, giraffes, cattle, antelopes, sheep, goats, musk ox, and some extinct families. All these are alike in that their digestive and digestive organs are adapted to their peculiar method of mastication called "chewing the cud". Except for camels, they have no incisors in the upper jaw, the front of which is occupied by a callous pad. The grass is collected and rolled together by means of the lower tongue; it is firmly held between the lower cutting teeth and the pad, and then torn and cut off. In the lower jaw there generally appear to

be set in pairs; but the two outer are more proper to be regarded as canines. In front of the central teeth there is a long vacant space (diastema) in both jaws. The molars are six on each side in each jaw; their surface exhibits crescent-shaped ridges of enamel—that is, they are of the solenodont type. See **TEETH**; and illustration of cow's skull, under **CATTLE**.

The stomach is composed of four distinct bags or cavities, except in the chevrotains, where the third is absent. In the camels the stomach is imperfectly divided into four chambers and has special peculiarities. (See **CAMEL**.) In all ruminants the first pouch of the stomach, into which the gullet leads, is, in the mature animal, by far the largest and is called the *paunch* or *rumen*. Into this the food first passes. It is lined with a thick membrane, presenting numerous prominent hard papillæ, secreting a fluid in which the food is soaked. The second cavity is the *honeycomb bag*, or *reticulum*, so called from its being lined with a layer of chambers like those of a honeycomb. The second pouch has also a direct communication with the œsophagus, and fluids pass immediately into it, but sometimes or partly also into the other cavities. The third pouch is the *mampplies* or *psalterium*, so called because its lining membrane forms many deep folds, like the leaves of a book, beset with small, hard tubercles. This also communicates directly with the œsophagus, by a sort of prolongation of it. The fourth pouch, which is of

brought up into the mouth from the rumen or reticulum. It is then chewed steadily for some time until thoroughly mixed with the saliva, when it is reswallowed, but passes by the first two pouches and enters the psalterium, from which it goes on into the abomasum and intestine, which in this group is always long, as also is the cæcum. For an account of the evolution of this apparatus and the ruminant habit, see **ALIMENTARY SYSTEM, EVOLUTION OF**.

The head of the ruminant is elongated, the neck is always of considerable length, the eyes are placed at the side of the head, and the senses of smell and hearing, as well as of sight, are extremely acute. The head in many ruminants is armed with horns, which in some are found in both sexes, in some only in the male, while in others they are entirely wanting. The ruminants are generally gregarious; they are distributed over almost the entire world, even in the coldest regions, but none are natives of Australia and comparatively few occur in America. Africa is the home of most of the species. The group is divisible into three sections: (1) Tragulina, embracing the chevrotains (Tragulidæ), which are the oldest ruminants, going back to the Eocene and Oligocene, and the extinct family Protocebratidæ of the Miocene of America, which resemble the ancestral tragulines; (2) Tylopoda, including the camels; and (3) Pecora, or horned ruminants, composed of the deer (Cervidæ), giraffes (Giraffidæ), pronghorns (Antilocapridæ), cattle, sheep, and goats (Bovidæ), and certain fossil forms. The flesh of most of the ruminants is fit to be used for human food; the fat (tallow) hardens more on cooling than the fat of other animals, and even becomes brittle. The fat, hide, horns, hoofs, hair, bones, entrails, blood, and almost all parts are useful to man.

STOMACH OF A RUMINANT.

a, b, probes in the gullet; *retic.*, reticulum; *psal.*, psalterium; *abom.*, abomasum; *ru*, rumen (paunch); *pylo.*, pylorus.

more elongated form than any of the others, and is second in size, is called the *reed* or *rouet*, or *abomasum*. It is lined with a velvety mucous membrane in longitudinal folds, and here the gastric juice is secreted. In young animals it is the largest of the four cavities, and it is only when they pass from milk to erude vegetable food that the paunch becomes enlarged, and all the parts of the complex stomach come fully into use. The food consumed passes chiefly into the first cavity, but part of it also at once into the second (as the animal wills), and when in a mashed or in a much comminuted state, into the third. When the paunch is well filled and the animal is at rest, it begins the process called *chewing the cud* or *ruminating*. This may occur while the animal is standing, but more commonly when lying down. The first step is a spasmodic movement of the paunch and diaphragm like a hicough and a reversal of the peristaltic movement of the œsophagus, by which a ball of food is

RUMP PARLIAMENT. The name given in English history to the remnant of the Long Parliament after the expulsion of the Presbyterian members by a body of soldiers under Thomas Pride (q.v.), on December 6, 1648. This remnant, fifty or sixty members belonging to the Independent Party, nominated a High Court of Justice of 135 members—of whom one-half refused to serve—to try the King for high treason. After the King's execution, the Rump abolished the House of Lords and established the Commonwealth, itself playing the rôle of Parliament, though it was in no sense representative. It sent Cromwell to establish its authority in Ireland and Scotland, passed the Navigation Act (1651), and began the Dutch war (1652). Cromwell dissolved it by force on April 20, 1653. During the disorders which followed Cromwell's death, the Rump was restored by the army, May 7, 1659, but upon its quarreling with the military leaders, was again dissolved, October 13th, only to be recalled in December of the same year. On February 21, 1660, Monk recalled the Presbyterian members who had been expelled by Pride's Purge, and the Long Parliament, thus restored, issued writs for a new free Parliament and voted its own dissolution on March 16, 1660. See bibliography under **LONG PARLIAMENT**.

RUMSEY. *rūm'zī*. JAMES (1743-92). An American mechanical engineer, born in Maryland. After applying himself to the study of mechanics and machinery, he became an inventor. In 1786, twenty-one years before Fulton built the *Cler-*

mont, Rumsey exhibited on the Potomac, to the presence of Washington, a boat propelled by machinery, in which a pump worked by steam power drove a stream of water from the stern, and thus furnished the motive power. This idea, which originally was proposed by Bernoulli, has since figured in many schemes for propelling vessels. A society was formed to aid his project, of which Franklin was a member. He visited and gave exhibitions in England, and obtained patents for his invention in Great Britain, Holland, and France. His death occurred while he was preparing for further experiments. He also made improvements in mill machinery, and in 1788 published a *Short Treatise on the Application of Steam*.

RUN (AS. *rinnan*, *cornan*, *irnan*, *iernan*, *ginnau*, Goth., OHG. *rinnan*, Ger. *rinnen*, to run). In music, a rapid passage executed on one syllable. A run is merely an embellishment, in no way essential to the melodic outline. Runs are also frequently introduced in instrumental music. See GRACE-NOTES; PASSAGE.

RUNCORN. A river-port in Cheshire, England, on the Mersey, 12 miles southeast of Liverpool (Map: England, D 3). The town is the terminus of the Bridgewater and the Mersey and Irwell canals. It has iron foundries, chemical works, ship-building yards, tanneries, etc. In the vicinity are collieries and slate and freestone quarries. Large quantities of freestone are shipped and it is the greatest centre of canal traffic in England. Its shipping returns are included in those of Manchester. A viaduct 1500 feet long and 95 feet above high water crosses the Mersey here. A castle was built here in 916, and the Runcorn ferry is mentioned in the twelfth century. Population, in 1891, 20,650; in 1901, 16,490.

RUNEBERG, *rööne-lörk*, JOHAN LUDVIG (1804-77). A celebrated Swedish poet of Finland. He graduated at the University of Åbo, and was successively lector in Latin literature at the University of Helsingfors, editor of the *Helsingfors Morgunblad*, and lector at the Borga gymnasium. His first publication was lyric *Dikter* (Poems, 1830), followed by the *Gräfen i Perho* (*The Grace in Perho*, 1831), and by *Elskyttarne* (*The Elk-Hunters*, 1832), the fine epic which confirmed his fame. His further works number *Nadeschda* (1841); *Kung Fjalar* (*King Fjalar*, 1844), an unrhymed epic of ancient Norse times; *Fänrik Ståls Sagor* (*Ensign Ståls Stories*, 1848 and 1860), a series dealing with the war of independence of 1808; and *Kungarne på Salamis* (*The Kings at Salamis*, 1863), a stately tragedy in the true Greek manner. He is classic in simplicity and finish, free from the conventionalities of the time, and not lacking in a certain quaint humor. There is an edition of his collected writings (6 vols., 1873-74), which contains the completest biography yet written.

RUNES (AS. *rūn*, letter, writing, mystery, Goth. *rūna*, OHG. *rūna*, mystery, secret). The earliest alphabet in use among the Germanic peoples. In Old Norse, magic signs, as well as magic charms, are designated as runes. There is nothing in the meaning of the word to have prevented it from being chosen by the primitive Teutons as their designation of the alphabet in general, since the mysterious connection between

spoken sound and written symbol is inherent to justly such a name. The use of runes for incantations and magic formulas is easily explainable. The magic power was easily transferred from the contents of these incantation to the signs themselves. Scandinavia and Anglo-Saxon tradition agree in ascribing the invention of runes, owing to Odin or Woden. The countries in which traces of the use of runes exist include Denmark, Norway, Sweden, Iceland, Germany, Great Britain, France, Spain, and Rumania. They are found carved on rocks, monumental-stones, crosses, and other materials, tools, needles, rings, combs, and other parts of spears, and hilts and blades of swords. Especially important are the runes on the so-called bracteates, thin golden plates, classed on one side, and used as neck wear. The inscriptions on articles of use contain generally the name of, or a brief account of, the maker or owner of the article. Rune inscriptions on stone are found only in Scandinavia and England. The most noteworthy English runes are on a pillar in Ban-castle in Cumberland, on a cross in Rathwell in Dumfriesshire, and on a casket in the British Museum (Franks casket, or Clermont casket).

In the Icelandic sagas the so-called *Revels* or rune staves are mentioned frequently as bearers of epistolary communications. The sagas report further that rune poems were carved on these staves. The oldest and most frequent reports of Norse literature, however, show that runes were carved on staves and utensils for divinations, spells, magic, and incantations. Rune manuscripts occur only in Scandinavia, the oldest of them being as late as the thirteenth century. Under the influence of the Church, Latin script in general supplanted the runes as a literary medium, although they remained in use in Scandinavia among the lower classes, especially in the rune calendars which have survived up to the present day. In the Anglo-Saxon kingdoms of Northumbria, Mercia, and East Anglia, there are traces of rune writing dating from the middle of the seventh to the middle of the tenth century. In Spain rune writing was officially condemned by the Council of Toledo in 1115.

The date of the origin of runes is not known, but it is generally assumed not to be later than the second century A.D. Probably their origin is from a much earlier time, and some suggest a date as early as B.C. 600. The earliest truly historical date, however, is the fourth century A.D., when the Gothic Bishop Ulfilas, copyist, in devising the Gothic alphabet, borrowed his signs for *a* and *o* from the rune alphabet. The question of the source of the rune alphabet is still not altogether settled. The ordinarily accepted view is that of an exclusive derivation of the runes from the Latin alphabet. In 1898 the theory was presented that the runes were invented by Goths in Southeastern Europe a few years after their expedition of 267 into Asia Minor. An alphabet used by Galatian Goths is then regarded as the source, which in turn was based upon the Greek and Latin alphabets. Very much more probable is the view that the runes are based not directly upon the Latin, but on a Western Greek alphabet. It may even be possible that more than one form of Greek writing passed to the Germanic peoples.

The special modifications of the rune alphabet are, partly due to the needs of carving on wood,

and engraving on metal or stone; partly to the difference in the sounds of the Teutonic language and the unlearned primitive rendition of distant models. Some of the sounds have remained obviously Greco-Italic, as

ƿ = F, ʀ = R, ʒ = H, and ʒ = S.

Others deviate more or less, as

↑ = T, ʀ = M, or ʀ = N.

The different systems of runes, about a dozen varieties in all, accord up to a certain point.

They may be classed under three main divisions, German, Norse, and Anglo-Saxon. The Norse runes exhibit an especially marked division into two alphabets, an earlier one of 24 characters, and a later one of 16. These latter correspond to our *f, u, th, a, r, k, h, n, i, a, s, d, b, l, m, y*, but there is no equivalent for various sounds which existed in the language. In consequence of this the sound of *k* was used for *g*, *d* for *t*, *b* for *p*, and *u* and *y* for *v*; *o* was expressed by *au*, and *e* by *ai, i, or iu*. Expedients came, in the course of time, to be employed to obviate the

RUNIC ALPHABET.

deficiency of the system, as the addition of dots and the adoption of new characters. The runic system received a fuller development among the Germans and Anglo-Saxons, particularly the latter, whose alphabet was extended to something like 40 characters, which seem to have embraced more nearly than any modern alphabet, the actual sounds of the language.

The runic signs are arranged in an order apparently quite distinct from that of any other alphabetical system, and have a purely Teutonic nomenclature. Each letter is, as in the Hebrew-Phœnician, derived from the name of some well-known familiar object, with whose initial letter it corresponds. The direction of the writing is both from left to right and from right to left, and occasionally also bou-trophædon (q.v.). The full Old Norse alphabet of 24 signs is divided into three octads, traces of which are found also with other runic alphabets. The alphabet is often called Futhark or Futhore, based on the usual abecedarium of the first five characters. The futhark, in its series *p, z, (r), s, t*, distinctly exhibits the usual alphabetic arrangement. It is probable that *f* and *a* exchanged places owing to the similarity of their signs, while *b* (pronounced something like *r*) and *u* changed places because they were similar in sound. A number of other reasonable assumptions of interchange and displacement bring back the majority of the runes to the order in which they should be expected, since they originate from the common source of alphabets.

In the accompanying table, taken from the monograph of Sievers on the runes in Paul's *Grundriss der germanischen Philologie*, the variations and development of the runic alphabets may be traced.

The Celtic races, from their connection with the Scandinavians, became acquainted with their alphabet and made use of it in writing their own language; hence there are in the western islands of Scotland, and in the Isle of Man, runic inscriptions, not in the Anglo-Saxon, but in the Norse character, with, however, peculiarities. Some of the most perfect runic inscriptions are in Man, others of a similar description exist at Holy Island, in Lamash Bay, Arran, and there is an inscription in the same character on a remarkable brooch, dug up at Hunterston, in Ayrshire.

BIBLIOGRAPHY. The study of the runes may be commenced most handily with the compact treatise of Sievers, *Runen und Runen-Inschriften*, in Paul, *Grundriss der germanischen Philologie* (2d ed., vol. i., Strassburg, 1901). The grammar of the Norse runes is treated by Noreen in the same volume of the *Grundriss*. The standard work on the Norse runes is Wimmer, *Runeskriftens Oprindelse og Udvikling i Norden* (Copenhagen, 1874), German translation by Holthausen, enlarged, *Die Runenschrift* (Berlin, 1887); Stephens, *The Old Northern Runic Monuments of Scandinavia and England* (London, 1866-84), contains the fullest collection of plates, although the explanations are untrustworthy. His *Handbook of the Old Northern Runic Monuments* (London, 1884) is a condensed treatment of the same subject. The first two volumes of Wimmer's work, *De Danske Runeminderne*, to be completed in four volumes, appeared in Copenhagen in 1895 and 1901. The standard treatment

of the Norwegian runes is Bugge, *Norges Indskrifter med de ældre Runer* (Christiana, 1891 et seq.). An important work on the Norse runes is Bang, *Die älteren nordischen Runenschriften* (Berlin, 1880). The principal work on the Continental (German) runes is Benning, *Die deutschen Runenschriften* (Strassburg, 1889). A standard discussion of the most important of the English runes, including a grammar and glossary, is Verner, *Die westsächsischen Runenschriften* (Marburg, 1895). The Manx runes are discussed in Kernick, *Catalogue of the Manx Inscriptions* (2d ed., Ramsay, 1892).

RUNJIT SINGH, (rū'jit-sing'g). A Hindu Maharaja. See RAJAH SINGH.

RUNKLE, (rū'kl), JOHN DANIEL (1822-1902). An American mathematician, born at Road, Montgomery County, N. Y. He graduated in 1851 at the Lawrence Scientific School of Harvard University, from 1849 to 1884 was an assistant in the editorial staff of the *American Ephemeris and Nautical Almanac*, and was professor of mathematics in the Massachusetts Institute of Technology from the opening of the institution in 1865 until his retirement as professor emeritus in 1902. He was also acting president of the Institute in 1867-70 and its president from 1870 to 1878. Manual training was introduced into the Institute curriculum largely at his instance. He founded the *Mathematical Monthly* in 1859, and continued its publication until 1861. His publications include: *The Manual Element in Education* (1882), reprinted from the *Reports of the Massachusetts Board of Education; Report on Industrial Education* (1883); and *Elements of Plane and Solid Analytic Geometry* (1888).

RUNNING SPIDER. A spider of the family Lycosida. They are long-bodied and hairy, but in size are smaller than the trap-door spiders, which they sometimes resemble. Their colors are usually black and white, or brown and gray, and in general simulate the coloring of their surroundings. The females carry their eggs in round cocoons attached to their spinnerets, and the young, after issuing from the eggs, are for a short time carried on the back of the mother. Most of the North American species belong to the genera *Lycosa* and *Pardosa*. Consult Emerton, *The Common Spiders of the United States* (Boston, 1902).

RUNNYMEDE. A pseudonym of Disraeli, in "The Letters of Runnymede" (1839).

RUNNYMEDE, (rū'n'y-mēd), or **RUNNYMEDE**. A long stretch of green meadow, lying along the right bank of the Thames, 20 miles west of London. It is of great historical interest, from the fact that Magna Charta was signed by King John, June 15, 1215, either on this meadow, or on Charter Island, lying a short distance off the shore.

RUPEE (Hind. *rūpīa*, *rūpīa*, from *rūpa*, silver, from Skt. *rūpa*, silver, from *rūpa*, natural state, form, beauty). A silver coin, the general unit of value in India. Rupees were first coined in 1542. The fineness and value have varied at various times and in the different portions of the country. The Madras rupee of 11664 grammes of fine was adopted in the Presidency of Bombay soon after 1818 as the 'Company's rupee.' The value of the rupee in 1903 was

about 32 cents, the coin passing in India at 15 to the pound sterling. The rupee is legally divided into 16 annas of 12 pies, but various other divisions are still current throughout the country. In addition to the one-rupee pieces, half, quarter, and eighth rupees are coined.

RUPERT (or RUPRECHT), SAINT (?-717). 'The apostle of the Bavarians,' a descendant of the royal family of Franks. In 694, when he was bishop of Worms, he was invited by Theodor II. to preach in Bavaria, and he baptized Theodor and many other nobles. He settled afterwards in Salzburg, where he built an episcopal residence. The Church celebrates both the day of his death, March 27th, and that of the transportation of his relics, September 24th. The oldest biography of Rupert, written in the tenth century, *Gesta Sancti Hrodoberti Confessoris*, is still preserved in the University library of Gratz. It was published in the *Archiv für österreichische Geschichte* (1882, vol. lxxiii).

RUPERT, PRINCE (1619-82). A nephew of Charles I. of England, and his ablest cavalry leader in the Civil War. He was born at Prague, December 17, 1619, the son of the Elector Palatine Frederick V., who had been crowned King of Bohemia, and his wife, Elizabeth, the daughter of King James I. of England. He served in the Thirty Years' War on the Protestant side in the Netherlands and in Westphalia, and in 1638 he was taken prisoner, but secured his release in 1642 in time to take service under Charles I. at Nottingham. He was given command of the cavalry, at that time the most important arm of the royal service, and he fought impetuously and successfully at Worcester, Edgehill, and Brentford in 1642. In 1643 he made himself master of Bristol. He took part in the disastrous battles of Marston Moor (1644) and Naseby (1645). His petulant disregard of orders, and his surrender of Bristol in September, 1645, so angered the King that he was deprived of his command and requested to leave England without delay. He declined to do so and submitted to a court-martial, which only partially acquitted him. After Charles's cause became hopeless Rupert entered the French service, but in 1648 received the command of the English Royalist fleet. In this new position he acquitted himself with considerable credit, and for nearly three years he kept his ships afloat, escaping the blockade in which he had been held off the Irish coast by Blake, the great admiral of Parliament. In January, 1651, however, the latter attacked the Prince's squadron at Malaga and burned or sank most of his ships. With the few vessels still remaining to him, Rupert escaped to the West Indies, where, together with his brother Maurice, he led a buccaneering life. After the loss of his brother at sea, Rupert went again in 1653 to France, and spent his time in that country and in Germany until the Restoration in 1660, when he returned to England and served on sea against the Dutch in the wars of that period. He died on November 29, 1682. The last ten years of his life were spent in retirement in the pursuit of chemical and other researches, for which he evinced considerable aptitude. Although it is certain that he did not discover the art of engraving in mezzotint—the real inventor of which appears to have been a German, Von

Siegen—Rupert did much to make the art widely known. Consult: Warburton, *Memoirs of Prince Rupert and the Cavaliers* (London, 1849); Gower, *Rupert of the Rhine* (ib., 1890); Scott, *Rupert, Prince Palatine* (Westminster, 1899).

RUPERT'S DROP. See PRINCE RUPERT'S DROPS.

RUPERT'S LAND. A name formerly applied to the Canadian territory lying around Hudson Bay. The region was named in honor of Prince Rupert (q.v.), the first Governor of the Hudson Bay Company, to whom it was granted by his cousin, Charles II.

RUPIA (Neo-Lat., from Gk. ῥύπος, *rhypos*, dirt, filth). A severe skin disease of chronic type characterized by flat, discrete blebs about an inch in diameter, containing serous, purulent, or bloody fluid, which finally dry into thick scabs. The scabs separate and fall off, and new crops appear. The disease usually attacks the loins, buttocks, and extremities. It is not contagious. It usually appears in the aged, feeble, or depleted, and often occurs as a sequel of one of the exanthemata. Tonics, iodides, mineral acids, and quinine are efficacious, together with nitrate of silver applied topically. In spite of all treatment the disease is of long duration.

RUPP, RUP, JULIUS AUGUSTUS LEOPOLD (1809-89). A German theologian and one of the founders of the 'free congregations' (q.v.). He was born at Königsberg and studied theology there. In 1830 he was appointed to lecture on philosophy at the university of his native town, and for several years was preacher at the Royal Chapel in Königsberg. His liberal spirit involved him in trouble with the Consistory, and as a result of these differences Rupp became leader of the free Church movement, the programme of which he published in his *Der Symbolzwang und die protestantische Gewissens- und Lehrfreiheit* (1843). For a sermon against the Symbolum Athanasianum, he was deprived of his benefice by the Consistory, and when elected preacher by the German Reformed Church in Königsberg, the royal confirmation was refused. This led him to form at Königsberg in 1846 a 'free congregation,' the leader of which he continued to be till he retired from public life. Rupp wrote, among other works, *Gregors, des Bischofs von Nyssa Leben und Meinungen* (1834).

RÜPPELL, RUP'PEL, EDUARD (1794-1884). A German naturalist and explorer, born at Frankfurt-on-the-Main. Under the auspices of the Senckenberg Museum he explored Northeast Africa in 1822-27, and Abyssinia in 1830-34. His *Reise in Abyssinien* (1838-40) was a valuable contribution to African geography and won a gold medal from the London Geographical Society.

RUPTURE. See HERNIA.

RURAL DEAN (Lat. *ruralis*, relating to the country, from *rus*, country). The title of an ecclesiastical officer, such as was known in the early ages of the Church as an archipresbyter, whose duty it is to exercise a certain oversight, under the bishop, within a small subdivision of a diocese. He obtained his title of Decanus Ruralis about the time of Charlemagne. The office was introduced into England about the year 1052, and developed as need arose. Archbishop Ussher in his scheme for a 'moderate episco-

paey' in England, published just before the great rebellion (1640), advocated a plan for making the rural deans a sort of subordinate bishops, analogous to the *chorpiscopi* of earlier times. The office was revived in England during the nineteenth century, and its holders charged with inspection of church work and organization as deputies of the archdeacon or bishop. Some of the dioceses of the Protestant Episcopal Church in the United States have developed a system of rural deaneries in which the clergy meet at stated times in convocation. Similar officials in the modern Roman Catholic Church are sometimes known as rural deans, sometimes as *vicarii foranei*.

RUR'IK. According to Nestor, the earliest Russian chronicler, the leader of a band of Northmen or Varangians, who, in response to an invitation extended by the Slavs of Novgorod, settled in that city in 862. Subsequently, Rurik established himself on Lake Ladoga, while his brothers, Sineus and Truvor, made themselves masters of the country around Lake Peipus and Bielo-ozero. On their death Rurik united the Varangian possessions under his rule. He died in 879 and was succeeded by his son Igor, whose descendants ruled in Russia till 1598, when the royal House of Rurik became extinct in the person of Feodor, son of Ivan IV., and was succeeded by that of Romanoff. Many noble families in Russia still claim descent from Rurik. See RUSSIA.

RUSH, FRIAR. A household sprite, somewhat resembling Robin Goodfellow, in the form of a mischievous demon, who once took service as scullion at a monastery and led the monks into evil ways. The German form of the name, Rausch, meaning intoxication, accounts for his characteristics. In *L'Allegro* and *Marmion* he is confused with Will o' the Wisp.

RUSH, BENJAMIN (1745-1813). An American physician and patriot, born at Byberry (now included in Philadelphia), Pa. He graduated at Princeton, 1760; received his medical degree abroad, and after studying in Edinburgh, London, and Paris was appointed professor of chemistry in the Philadelphia Medical College (now the medical department of the University of Pennsylvania) in 1769. He was elected a member of the Continental Congress, and was a signer of the Declaration of Independence. He founded the Philadelphia Dispensary in 1785; and also, it is said, the "College of Physicians," which seems to have been consolidated with the University of Pennsylvania. He took part in 1780 in the formation of the new State Constitution, and was a member of the Pennsylvania convention for the ratification of the Federal Constitution. In 1789 he resigned his chair in the medical college for that of the theory and practice of medicine. He did efficient work during the yellow fever epidemic of 1793, for which services he received testimonials from European sovereigns. He was appointed treasurer of the United States Mint at Philadelphia in 1799, and retained this position till his death. Rush was a founder of Dickinson College, vice-president of the Philadelphia Bible Society and of the American Philosophical Society, and president of the Philadelphia Medical Society, as well as of the Society for the Abolition of Slavery. He wrote much on medical topics.

RUSH, RICHARD (1780-1859). An American lawyer, statesman, and diplomat, born in Philadelphia, a son of Dr. Benjamin Rush. He graduated at Princeton in 1797, studied law, and was admitted to the bar in 1800. In 1811 he was made Attorney General of Pennsylvania, in the same year was appointed Comptroller of the United States Treasury, and in 1814 became Attorney General of the United States. In 1817, after being for a short time Secretary of State, he was sent as Minister to England, where he negotiated a number of important treaties. He returned to the United States in 1825 to become Secretary of the Treasury. Three years later he was a candidate for the Vice Presidency on the ticket with John Quincy Adams, but was defeated. He became a Democrat in the early thirties, opposed the United States Bank, and ultimately gained considerable influence in the party. In 1855 he assisted in adjusting the boundary dispute between Michigan and Ohio, and next year was sent by President Jackson to England to get the legacy left by James Smith, son for the building of the Smithsonian Institution. From 1847 to 1851 he was Minister to France, and he was the first foreign representative to recognize the Republic of 1848. Rush superintended the publication of *The Lives of the Nation* (5 vols., 1815), and wrote: *Narrative of a Residence at the Court of London from 1817 till 1825* (1833); a second volume on the same work, "comprising incidents, official and personal, from 1819 till 1825" (1845; 3d ed., 1873); and *Washington in Domestic Life* (1857).

RUSH'DEN. A manufacturing town in Northamptonshire, England, 4½ miles southeast of Wellingborough (Map: England, F 4). Population, in 1891, 7,450; in 1901, 12,460.

RUSHVILLE. The county-seat of Rush County, Ind., 40 miles southeast of Indianapolis; on Flat Rock Creek, and on the Cincinnati, Hamilton and Dayton, the Cleveland, Cincinnati, Chicago and St. Louis, the Lake Erie and Western, and other railroads (Map: Indiana, D 3). It has a public library and a handsome court house. The city is in an agricultural and horse-breeding section; manufactures furniture, carriages, flour, and lumber products; and carries on considerable trade in grain. The water works and electric light plant are owned and operated by the municipality. Rushville was settled in 1820 and was chartered as a city in 1883. Population, in 1890, 3,175; in 1900, 4,511.

RUSHWORTH, JOHN (c.1612-90). An English historian. He was educated, according to Wood, at Oxford, and was called to the bar at Lincoln's Inn in 1647. He spent much time for many years in attending the Star Chamber, the Court of Honour, the Exchequer Chamber, and Parliament, and in making short-hand notes of the proceedings. He performed many important services during the Civil War, the Commonwealth, and the Protectorate; was secretary to Lord Fairfax (1645-48); sat in five Parliaments for Berwick; became secretary (1667) to Sir Orlando Bridgeman, the Lord Keeper, late in life his affairs became embarrassed, and he spent his last six years in the King's Bench Prison. South-wark. Rushworth is known for his *Historical Collections of Private Passages of State, Weighty Matters of Law, Remarkable Proceedings in Five Parliaments*, covering the period from 1618 to

1648. The work, comprising eight volumes, appeared in four installments (1659, 1680, 1692, 1701). Its historical value was long overestimated; of most value are the shorthand notes taken by Rushworth himself.

RUSK, JEREMIAH McCLEIN (1830-93). An American farmer, soldier, and political leader, born in Morgan County, O. He was brought up on a farm, received a common school education, and in 1853 removed to Vernon County, Wis. When the war broke out, he raised a regiment to fight for the Union, and, though offered the colonelcy, he refused to accept a higher grade than that of major. His first service was performed against the Minnesota Indians. He then took part in the campaign against Vicksburg, and in August, 1863, was promoted lieutenant-colonel. He was with Sherman in the Meridian campaign, displayed great gallantry in the battles around Atlanta, and for his services at the battle of Salkehatchie, where he led a brigade, was brevetted brigadier-general. He was a member of Congress from 1871 to 1877, and was Governor of Wisconsin from 1882 to 1889. At the Republican National Convention in 1888 he was an unsuccessful candidate for the Presidential nomination. In the following year President Harrison appointed him to the Secretaryship of Agriculture, which had just been made a Cabinet portfolio. He held that position until 1893, and performed his duties with great ability.

RUSK, THOMAS JEFFERSON (1802-56). An American soldier and politician, born in Camden, S. C. He studied law under Calhoun, began practice in Georgia, and in 1834 removed to Texas, where he was a member of the convention which declared Texas independent (1836), acted as Secretary of War, and succeeded Houston in command of the Texan army. From 1838 to 1842 he was justice of the Supreme Court of Texas. He took a prominent part in bringing about annexation, and in 1846 was elected to the United States Senate. He committed suicide during a temporary mental aberration.

RUSK, WILLIAM (1756-1833). An American sculptor, born in Philadelphia. He was the son of a ship carpenter, and at first carved figure heads for vessels. His figureheads done for the American frigates *United States* and *Constitution*, and for other vessels, attracted much attention, and are excellent pieces of modeling. He exhibited several statues at the Pennsylvania Academy in 1812. Two of these, "Exultation" and "Praise," are in Old Saint Paul's Church, Philadelphia. His most meritorious work was a full-length statue of Washington (1814), for Independence Hall, Philadelphia.

RUSKIN, JOHN (1819-1900). An English author, art critic, and reformer, born in London, February 8, 1819. His boyhood and youth he depicted with great charm in *Praterita*. His father, John James Ruskin, a shrewd and artistic Scotchman, was then settled in London, where he prospered as a wine merchant, eventually amassing a fortune of £200,000. The boy was educated at home by his mother. Private tutors taught him Latin, Greek, and French. He studied drawing under Runciman, Copley Fielding, and later with Harding. In verse his masters were Rogers, Byron, and Shelley. He accompanied his father and mother on many tours through England, visiting the lakes, read and wrote verse,

sketched, and in 1835 saw the Alps and Italy. Having already published prose and verse in magazines and annuals, he entered Christ Church, Oxford, in 1837. His university course was interrupted by illness. Threatened with consumption, he traveled with his parents in England and on the Continent. At Oxford, where he graduated B. A. in 1842, he won the Newdigate prize with a poem entitled *Salsotto and Elephanta* (1839). In 1843 appeared the first volume of *Modern Painters*, the primary design of which was to prove the superiority of modern landscape painters, especially Turner, to the old masters; but in the later volumes (ii., 1846; iii. and iv., 1856; v., 1860) the work expanded into a vast discursive treatise on the principles of art, interspersed with artistic and symbolical descriptions of nature, more elaborate and imaginative than any writer had ever before attempted. *Modern Painters* was revolutionary in its spirit and aim, and naturally excited the aversion and hostility of conservatives. Ruskin's advice to young artists was this: "They should go to Nature in all singleness of heart, and walk with her laboriously and trustingly, having no other thought but how best to penetrate her meaning; rejecting nothing, selecting nothing, and scorning nothing." The immense influence of this great work on art is proved by the fact that the advice to-day would be the merest commonplace.

The first artists to accept Ruskin were a group of young men known as the Pre-Raphaelites (q.v.). Convincing and memorable is his defense of them against popular ridicule in his essay entitled *Pre-Raphaelitism* (1851). To the charge that the brotherhood had no system of light and shade, he replied: "Their system of light and shade is exactly the same as the sun's, which is, I believe, likely to outlast that of the Renaissance, however brilliant." While *Modern Painters* was in progress, Ruskin published other books on art: *The Seven Lamps of Architecture* (1849), *The Stones of Venice* (vol. i., 1851; vols. ii. and iii., 1853), both of which aimed to introduce a new and loftier conception of the significance of architecture. Like the later volumes of *Modern Painters*, they were illustrated by Ruskin himself, an accomplished draughtsman. Still other works on art flowed from his pen: *Lectures on Architecture and Painting* (1854), *Elements of Drawing* (1857), *Political Economy of Art* (1857), and annual notes on the Royal Academy. Meanwhile he had also published *Pocms* (1850), the beautiful fairy tale *The King of the Golden River* (1851), and *Notes on the Construction of Sheepfolds* (1851), in which he brought forward a plan for Church unity in England.

However varied Ruskin's writings had been hitherto, they bore a close relation to art. Even his plea for one common Christian fold was inspired by a desire to bring about a spirit favorable to art. But in *Unto This Last* (*Cornhill Magazine*, 1860) the artistic purpose, though present, is less apparent. Here Ruskin began his attack on the "dismal science" called political economy, to be continued in *Munera Pulveris* (1862-63), *Time and Tide* (1867), and *Fors Clavigera* (1871-84), a series of letters to the workmen of England, far above their heads. To this later period belong also *Sesame and Lilies* (1865), charming essays on literature and other subjects; *Ethics of the Dust* (1866); *The Crown*

of *Wild Olive* (1866; complete, 1873); lectures on work, traffic, and the future of England, with an eloquent introduction; *The Queen of the Air* (1869), a study of Greek myths of cloud and storm; *Aratra Pentelici* (1872), on sculpture; *Loce's Minnie* (1873), on birds; *Ariadne Phoenicia* (1873), on wood and metal engraving; *Vol d'Arno* (1874), on Florentine art of the thirteenth century; *Mornings in Florence* (1875-77), further studies in Italian art; *Proserpina* (1875-86), studies of wayside flowers; *Deuolion* (1875-83), on rocks; *St. Mark's Rest* (1877-81), a manual on Venetian art; *The Bible of Amiens* (1880-85), intended as the first volume of a history of Christendom for boys and girls; *The Art of England* (1883); *Præterita* (1885-89), a review of his life; a volume of collected poems in 1891; and a large body of other essays. It was his usual custom to publish in parts or to make up his volumes from contributions to the magazines. A famous reprint is *On the Old Road* (1885). For many years Ruskin lectured before large audiences in London, Oxford, Cambridge, Edinburgh, and other places. From 1870 to 1879 he was Slade professor of art at Oxford; in 1883 he was reelected to the chair, but resigned the next year, owing to ill health. With his fortune, Ruskin reclaimed from squalor several London tenement houses, left him by his father; cleaned the streets between the British Museum and Saint Giles's; opened a tea shop to show that retail trade might be pursued honestly; gave an endowment for a master of drawing at Oxford; founded (1876) Saint George's Guild, a land-owning society, with a museum for workmen, at Walkley, near Sheffield (transferred to Sheffield itself, 1890). In these and numerous other charities his fortune dwindled away until his only income was from the sale of his books. This, however, was large, amounting, from 1890 to 1900, to about £4000 a year. He long made his home at Denmark Hill, near London. In 1871 he bought Brantwood, a small estate by Coniston Lake, where he passed his last years, and died January 20, 1900.

As an art critic Ruskin was not generally accepted by artists. In this field his service was rather to awaken in his generation a sense for the beautiful. Of strong ethical temperament, he always insisted that beauty should not be divorced from righteousness. His political economy, tending to socialism, has been attacked by the learned. With all its vagaries, it was a noble plea for the higher things of the mind against utilitarianism. Against railways and factories marring the beauty of English landscape he took a firm stand, and for his age he discovered the beauties of river, cloud, and mountain. In the development of English prose he is likely to have a place as the one who moved prose toward verse without passing the boundary line. Of this new prose no better example could be cited than the "Introduction" to the *Crown of Wild Olive*, with its assonances and grand rhythms.

RUSS, JAMES DEWEESON (1801-84). An American philanthropist, born at Concord, Mass., Essex County, Mass. He graduated at Yale in 1823, studied medicine in America and abroad, and in 1826 began to practice in New York City. In 1827 he took part in the movement in aid of the Greek revolutionists, went to Greece in charge of the brig *Spartan*, conveying supplies, and established at Patras a hospital which he directed during part of the following year. Subsequently he established a larger hospital at Aexamelia, on the Isthmus of Corinth. In 1830, after making himself so useful to the Greek cause that a price of twenty thousand piastres was placed upon his head by Turkish authority, he returned to the United States. In 1832 he began the first systematic instruction of the blind undertaken in the United States, and in that year the New York Institution for the Blind, of which he had been a founder in 1831, began its work largely through his efforts. He invented for the use of the blind a phonetic alphabet, consisting of forty-one characters with twenty-three prefixes and suffixes, and afterwards much improved; a series of mathematical characters, numbering four, instead of the previously existing ten; and maps in raised design. The alphabetic and mathematical characters were not widely used and were soon superseded, but the maps found very extensive application. In 1843 he assisted in the organization of the New York Prison Association. He drafted in 1851 the act of incorporation of the New York Juvenile Asylum, of which he was superintendent in 1851-58.

RUSS, ROS, RUDOLF (1847-). An Austrian landscape painter, born in Vienna. He studied at the academy there, more especially under Albert Zimmerman, adopting, however, in deviation from his master's tendency, a realistic treatment of his subjects. His principal paintings, executed with remarkable technical skill, include "Court of Fürstenburg, Near Bregenz" (Vienna Museum), "After the Cloudburst" (1883, Rudolphinum, Prague), "Thunderstorm in the Alps" (1889), and "Harbor at Biva" (1896).

RUSSELL, HENRY (or). A famous English family said to derive its descent from Olaf, the sharp-eyed King of Berik, in the sixth century, one of whose descendants, Einstein, a Scandinavian jarl, settled in Normandy on its conquest by the Normans, and became possessed of the barony of Briquebec, and the castle of Bozell, near Cherbourg. JOHN RUSSELL, first Earl of Bedford (1486-1555), in 1538, was elevated in the peerage by Henry VIII. under the title of Baron Russell of Cheyneys, Buckingham. His son, the second Earl, was a person of eminence in Queen Elizabeth's reign, and, like his father, a Knight of the Garter. Another notable member of the family was EDWARD RUSSELL, Earl of Or-

ford (1653-1727). He was bred to the sea, and was groom of the bedchamber to the Duke of York, afterwards James II., but retired from court upon the judicial murder of his cousin Lord William Russell (q.v.). Strenuously supporting the Revolution, he obtained high naval commands from William III., and distinguished himself particularly by his victory over the French fleet at La Hogue in 1692. Of recent members of the family the most celebrated is Lord John Russell (q.v.) (1792-1878).

RUSSELL, BENJAMIN (1761-1845). An American journalist. He was born in Boston, and was apprenticed to a printer, but before completing his term enlisted in the Revolutionary Army, where he rose to the rank of major. During his service he contributed war news to the *Worcester Spy*. After the war he began the publication of a semi-weekly journal, *The Columbian Sentinel*. This paper he controlled for forty years, and, assisted by Ames, Pickering, Lowell, Higginson, and Cabot as contributors, made it one of the most influential organs of the Federalist Party. He was one of the aldermen of Boston; was a representative to the General Court; State Senator for a number of years; was one of the Governor's Council; and in 1820 was a member of the constitutional convention. He retired from the editorship of the *Sentinel* in 1828, but from 1795 to 1830 published another Federalist paper, the *Gazette*, which also exerted a marked influence on the public opinion of the time.

RUSSELL, SIR CHARLES ARTHUR, Baron Killowen (1832-1900). Lord Chief Justice of England, born at Newry, Killowen, County Down, Ireland. He was educated at Trinity College, Dublin, studied law in Lincoln's Inn, was admitted to the bar in 1859, and began practice on the Northern circuit. He won early recognition as an able advocate, and in 1872 became a bencher of Lincoln's Inn and a Queen's commissioner. In 1886 he became Attorney-General in the Gladstone Cabinet, and again held that office from 1892 to 1894. He was counsel for the British claims before the Bering Sea Commission in 1893. Early in the following year (1894) he was made Lord of Appeal in Ordinary and created a life peer with the title of Baron Killowen, and before the close of the year succeeded Lord Coleridge as Chief Justice, being the first Roman Catholic to hold that office since the Reformation. He was one of the strongest advocates of international arbitration, and delivered a remarkable address on that subject before the American Bar Association in 1896. In 1899 he was a member of the Venezuelan Boundary Arbitration Tribunal. For two decades before his death, he was regarded as one of the ablest lawyers in Great Britain, and in an unofficial capacity was known in his conduct of the case of his friend, Charles Stewart Parnell, before the Parliamentary Commission, in which he played a part in exposing the notorious Pigott forgeries published in the *Times*.

RUSSELL, CHARLES WILLIAM (1812-80). A Roman Catholic theologian and educator. He was born at Killough, County Down, Ireland; educated at Maynooth College, where he became professor of ecclesiastical history (1845), and president (1857). He wrote *The Life of Cardinal Mezzofanti* (1858); translated Leibnitz's *Sys-*

tem of Theology (1850); compiled with J. P. Prendergast the *Calendar of the State Papers, Relating to Ireland, of the Reign of James I.* (1872-77). He was made a member of the Historical Manuscripts Commission in 1869 and with Prendergast reported on the Thomas Carte manuscripts in the Bodleian Library (8 vols., 1871). Cardinal Newman in his *Apologia* attributes to him the chief share in his conversion to the Roman Obedience.

RUSSELL, DAVID ALLEN (1820-64). An American soldier, born at Salem, N. Y. He graduated at West Point in 1845, and fought in the Mexican War. At the beginning of the Civil War he entered the volunteer service as colonel of the Seventh Massachusetts Volunteers, which he led through the Peninsular campaign. In 1862 he became a brigadier-general of volunteers, and during the Rappahannock campaign was in command of a brigade of the Sixth Army Corps. He participated in the battles of the Wilderness and Spottsylvania. In 1864 he received the brevet of brigadier-general, and later was active in the operations before Petersburg. He commanded his division in the Shenandoah campaign, was brevetted major-general, and was killed in the battle of Opequan, Va.

RUSSELL, HENRY (1813-1900). An English vocalist and song composer, the father of W. Clark Russell. He was born at Sheerness, Kent. In 1833-41 he traveled in the United States and Canada, and gave a series of recitals which became very popular. In 1841 he returned to England, and after a series of successful recitals, began the presentation of an entertainment called "The Far West, or The Emigrant's Progress from the Old World to the New," which did much to stimulate emigration to America. He composed about 800 songs, the most famous of which are "Cheer, Boys, Cheer," "There's a Good Time Coming, Boys," "A Life on the Ocean Wave," "To the West," and "O Woodman, Spare that Tree."

RUSSELL, IRWIN (1853-79). An American poet, born in Port Gibson, Miss. He was among the first to turn negro character to literary account. Russell wrote both in correct English and in dialect, and possessed distinct powers of humor and pathos. His verses were collected after his death in *Poems* (1888).

RUSSELL, ISRAEL COOK (1852-). An American geologist, born near Garratsville, N. Y. He graduated at New York University in 1872 and studied for two years at the School of Mines of Columbia University. He was assistant professor of geology at the Columbia University School of Mines from 1875 to 1878, and in the latter year was assistant geologist to the United States Geological Survey west of the 100th meridian. In 1880 he was appointed geologist of the United States Geological Survey. In that capacity he made numerous explorations and surveys in the southern portion of the Appalachians, west of the Rocky Mountains, and in Alaska. In 1890-91 he conducted to the Mount Saint Elias region expeditions which made valuable contributions both to geography and geology. He was appointed to the chair of geology in the University of Michigan in 1892. His more important works include: *Geological History of Lake Lahontan* (1885); *Lakes of North America* (1895); *Gla-*

ciers of North America (1897); and *Rebels of North America* (1898).

RUSSELL, JAMES EARL (1864—). An American educator, born in Hamden, N. Y. He graduated at Cornell in 1887, and studied in Germany. After two years as professor of pedagogy and philosophy in the University of Colorado, he became in 1897 professor of the history of education in the New York Teachers' College, of which he was made president in 1898. On the work of this institution he made a special report to the Education Board of Great Britain (1902). His other publications include *The Extension of University Teaching in England and America* (1895; Ger. trans. 1895) and *The History, Organization, and Methods of Secondary Education in Germany* (1899).

RUSSELL, JOHN (1745-1806). An English portrait painter, born in Guildford, Surrey. He studied under Francis Cotes, and remained with him until 1767. In the meantime he had been converted to Methodism and was such a militant reformer that he is said to have attempted to convert his sitters. He settled in London about 1768, and became a well-known worker in crayon although he occasionally painted in oils. His subjects included Philip Stanhope, son of Lord Chesterfield, Bartolozzi, Cowper, Willibronce, The Rev. Dr. Todd, and Sheridan. He published *The Elements of Painting with Crayons* (1772-1777).

RUSSELL, Lord JOHN, first Earl Russell (1792-1878). An English statesman, born in Westminster, August 18, 1792. He was the third son of the sixth Duke of Bedford. He was educated at Westminster School and at Edinburgh University. In July, 1813, he was returned to Parliament for the borough of Tavistock, and, according to the family traditions, he entered the ranks of the Whigs. Russell's real political life began in 1820 when he was returned to Parliament from Huntingdonshire. He became an ardent advocate of Parliamentary reform. He also interested himself in the repeal of the Test and Corporation Acts, which he carried in 1828 against the united efforts of Peel, Huskisson, and Palmerston. He cordially supported the Catholic Emancipation Act, which was passed in 1829. In 1830 the question of Parliamentary reform became crucial and caused the resignation of Wellington's Tory Government. Earl Grey followed the Duke as Premier, and took Russell into the Ministry as Paymaster-General of the forces. Lord John at once rose into great prominence through his part in the Reform Bill of 1832, the first reading of which he moved in the Commons. (See PARLIAMENT.) He subsequently took part in the agitation against the Corn Laws. On the resignation of Peel, in December, 1845, Russell was summoned to form a Ministry, but was unable to do so, and Peel resumed office and brought about the repeal of the Corn Laws (q.v.). He was soon forced out on the question of Irish coercion. Again Russell was called upon to form a Ministry, and this time he succeeded (July, 1846).

Russell continued as Premier for nearly six years. The usual Irish discontent had been greatly augmented by the famine, and all Ireland was ripe for rebellion. Russell handled the matter with much skill. Relief measures went hand in hand with coercive measures, and in a

few months Ireland was quieter than it had been for years. The most important act in this connection was the Emancipated Estates Act. (See IRISH LAND LAWS.) This administration also saw the end of the Chartist movement. (See CHARTISM.) In 1851, as a result of the Pope's attempt to reestablish the Catholic hierarchy in England, the Ecclesiastical Titles Assumption Act (q.v.) was passed. In December, 1851, when the Foreign Secretary, Palmerston, without consulting his colleagues, recognized the Government formed by Louis Napoleon after his coup d'état of December 24, Russell demanded his resignation. Palmerston soon brought about the downfall of the Government. Russell resigned and Lord Derby came in with the extreme Tories. Derby, however, had no majority, and in turn resigned after a brief term in office. A coalition Ministry of Whigs and Peelites was then formed (December, 1852) under Lord Aberdeen, in which Russell appeared as Secretary for Foreign Affairs. The mismanagement exhibited in the operations of the Crimean War, and the great loss of life incurred, brought about a motion in the House of Commons, for an inquiry into the conduct of the war. Russell was ill-prepared to resist this and resigned. He then supported the motion and Aberdeen resigned. Derby and Russell each attempted to form a Ministry, but without success. Palmerston was then called upon and succeeded. Russell was asked to join, but refused. He was then sent as plenipotentiary to the conference at Vienna, which it was hoped would bring about peace. Meanwhile the Peelites had withdrawn from the Ministry and Russell in March, 1855, very reluctantly entered the Ministry, though he still remained at the conference. On his return the opposition in Parliament raised a great outcry in regard to his proceedings at Vienna, and being unable, by reasons of State, to account in full detail for his course, Russell resigned. In 1859 he again appeared as Foreign Secretary under Palmerston. The Italian War of Liberation and the American Civil War were the most difficult questions he had to meet. To the Italians he gave his most ardent support. His conduct in regard to the American War has been defended and criticised, some claiming that he ably preserved British neutrality, others contending that the cases of the *Alabama*, *Florida*, etc., prove the contrary. In 1861 he was created Earl Russell. In 1865, on the death of Palmerston, Russell again became Premier. The new Ministry now brought forward a Parliamentary reform bill. The Liberals, however, did not give hearty support to the bill, and it was defeated. Russell at once resigned and never took office again. His last years were spent chiefly in literary work. He died on May 28, 1878. Consult: Walpole, *Life of Lord John Russell* (London, 1889); Reid, *Lord John Russell* (ib., 1895); Walpole, *Historical Sketches* (ib., 1878-80).

RUSSELL, GUY SCOTT (1808-82). A British novelist, born at Parthead, near Glasgow. He studied at the Universities of Edinburgh, Saint Andrews, and Glasgow, and in 1832 was elected to the chair of natural philosophy at Edinburgh, and filled a temporary vacancy. A paper which he read before the British Association on the nature of waves led to the appointment of a committee to make experiments and these resulted

and his discovery of the wave of translation of the development of the wave-line system of ship-building. Another paper *On the Laws by which Water Opposes Resistance to the Motion of Floating Bodies*, which he read before the Royal Society of Edinburgh in 1837, earned him the society's large gold medal. For a number of years he was manager of a ship-building plant at Greenock. In 1844 he removed to London, where he began to build vessels of the largest sizes. His two most famous ventures were the *Great Eastern*, the subsequent failure of which forced him to abandon ship-building, and the armored frigate *Warrior*, the first seagoing vessel of its kind. He was one of the founders of the Institution of Naval Architects, was for some time its vice-president, and contributed frequently to its *Transactions*. He also contributed to the seventh edition of the *Encyclopædia Britannica* (1841), and wrote a number of works on naval architecture.

RUSSELL, ODO WILLIAM LEOPOLD, first Baron Amthill (1829-84). An English diplomatist. He was born at Florence, was privately educated, and entered upon a diplomatic career as attaché of the English embassy at Vienna. From 1850 to 1852 he was under Lord Palmerston in the English Foreign Office. He was subsequently in diplomatic service at Paris, Vienna, Constantinople, Washington, and Florence, and from 1860 to 1870 was acting Minister at the Vatican. In 1871 he was appointed Ambassador at Berlin, where he did much to promote cordial relations between England and Germany.

RUSSELL, SOL SMITH (1848-1902). An American actor. He was born at Brunswick, Me. He served as a drummer boy in the Union Army, and in 1864 he became connected with a theatre at Cairo, Ill. For several years he devoted himself largely to monologues and musical performances, till he won a recognized place as a 'lyceum' entertainer. He went to New York City in 1871 and in 1874 became a member of Daly's company. He began as a regular star in 1880 with a play called *Edgewood Folks*. In this and in his subsequent productions, such as *Peaceful Valley*, *A Poor Relation*, *A Bachelor's Romance*, and *The Hon. John Grigsby*, the evenness and finish of his acting, his peculiarly quaint and gentle humor, and the truth and delicacy of his pathos won for him real and lasting popularity throughout the country. In 1900 ill health compelled him to retire. Consult: McKay and Wingate, *Famous American Actors of To-Day* (New York, 1896); Strang, *Famous Actors of the Day in America* (Boston, 1900).

RUSSELL, WILLIAM, Lord (1639-83). An English Whig Parliamentarian. He was the third son of William, fifth Earl Russell, and was educated at Cambridge. From 1660 to 1678 he was member of Parliament for Tavistock; in 1674 he inveighed against the corruption of the Cabal, the influence of France, the dishonorable commencement of the war with Holland, and the fraud practiced upon the bankers, and was afterwards conspicuous wherever the cause of constitutional liberty could be befriended. In 1680, at the head of more than two hundred members of the Commons, he carried to the House of Lords the Bill of Exclusion, directed against the Duke of York's succession to the throne. The King and the Duke determined to be revenged upon Russell

and to crush the leaders of the Whig Party. Charged as participators in the Rye House plot (q.v.), Lord Russell and Algernon Sidney were arrested, arraigned for high treason, and by the aid of perjured witnesses and a packed jury were sentenced to death. Charles II. was disposed to show mercy, but the Duke of York insisted upon the prisoners' death. The unconstitutional murder of Russell, followed by that of Sidney, led, in the next reign, to the overthrow of the Stuart régime. Consult Russell, *Life of William, Lord Russell* (London, 1820).

RUSSELL, WILLIAM CLARK (1844—). An English novelist. He was born in New York City of English parentage, was educated in England and in France, and in 1857 shipped as a midshipman on an English merchantman. He followed the sea until 1865, when he settled in London, and turned his attention to writing. In 1874 he brought out his first sea story, *John Holdsworth, Chief Mate*, and from that time on his success was assured, and stories drawn from his experience and knowledge of the seafaring life followed one another in quick succession. His stories are written in a clear picturesque style, display considerable dramatic skill, and are said by seamen to be the most faithful portrayals of life on the sea ever written. Among his published works are: *The Wreck of the Grosvenor* (1875); *The Lady Maud* (1876); *A Sailor's Sweetheart* (1877); *An Ocean Fre lance* (1878); *My Shipmate Louise* (1882); *The Ship; Her Story* (1894); *The Convict Ship* (1894); *What Cheer!* (1895); *Rose Ireland* (1896); *The Last Entry* (1897); *The Two Captains* (1897); *The Romance of a Midshipman* (1898); *The Ship's Adventure* (1899); and lives of *Lord Collingwood* (1891) and *Admiral Nelson* (1897).

RUSSELL, WILLIAM EUSTIS (1857-96). An American lawyer and Governor, born in Cambridge, Mass. He was educated at Harvard and at the Boston University Law School. In 1880 he became a member of the Boston law firm of Russell & Russell, of which his father and two brothers were already members. In 1885 he was chosen Mayor of his native city, and for two succeeding years was reelected with no opposition. His effective administration of the city's affairs, particularly in the enforcement of the local-option law, attracted wide attention. At his third nomination for the office of Governor in 1890 he was elected, and was reelected in 1891 and 1892, in each case his victory being largely a personal one. His administration was marked by impartiality and lack of partisanship. In 1893 he resumed his law practice. Early in 1896 a strong movement became apparent in the Eastern States to nominate him for the Presidency, but his strong and freely expressed views in favor of a gold standard rendered its success impossible. A movement to name him for the Presidency on a Democratic gold-standard platform was checked by his sudden death in his camp in the Nova Scotia woods a week after the Chicago convention of that year.

RUSSELL, SIR WILLIAM HOWARD (1820—). A British journalist, born in Ireland. He was educated at Trinity College, Dublin. He wrote for the London *Times* in 1841, and became attached to the Parliamentary corps of that paper in 1843. His first important expedition as a correspondent was in 1854, when he was sent by

the *Times* to the seat of the Crimean War, in the description of which he established a high reputation for brilliancy of diction and graphic representation. He visited Moscow in 1856, and described in the *Times* the coronation of the Czar. In 1856 he was sent to India on the occasion of the mutiny, and was with Lord Clyde from the capture of Lucknow until the close of the mutiny. In 1858 he returned to England, and established the *Army and Navy Gazette* (1860), which he continued to edit. In 1861 he was sent by the *Times* as war correspondent to the United States, but returned after the first battle of Bull Run, when he rendered himself obnoxious to the Union leaders. In 1866 he was present at the battle of Königgrätz or Sadowa; in 1870 at the battles of Sedan and the siege and fall of Paris; in 1879-80, in South Africa; and in 1883-84, in Egypt. He published: *Letters from the Crimea*; *Diary in India*; *My Diary North and South*; *The Primer of Wales's Tour*, etc. He was knighted in 1895.

RUSSELLVILLE. The county-seat of Logan County, Ky., 30 miles southwest of Bowling Green, on the Louisville and Nashville Railroad (Map: Kentucky, E 4). It is the seat of Bethel College (Baptist), opened in 1854, and of the Logan Female College (Methodist Episcopal, South), opened in 1856. The city manufactures flour and leather. Five miles northeast of Russellville is an extensive asphalt mine. Population, in 1890, 2,253; in 1900, 2,591.

RUSSEL'S VIPER. See VIPER.

RUSSIA, rŭsh'ĭa. An empire embracing one-sixth of the land surface of the earth. With an area of about 8,650,000 square miles, it is nearly three times as large as the United States, exclusive of Alaska. It includes more than one-half of Europe and the whole of Northern Asia, and has the largest continuous area of any realm in the world. It roughly presents the form of a rectangle whose length is twice its width. Its vast coast line is washed by the Arctic Ocean on the north and the Pacific Ocean on the east. The southern frontier, dividing it from the Chinese Empire, Afghanistan, Persia, and various native States under the protection either of Russia or Great Britain, is mainly marked by great natural features, such as the Amur River, and the mountain ramparts of Sayan, Tian-Shan, and Alai-tagh, which overlook the widespread grassy steppes or sandy wastes of Central Asia. In Western Asia, however, the plains of Siberia merge with the steppes of Russian Turkestan, where nature interposed no obstacles to the easy conquests of Russia, which has here pushed its frontier farthest south in Asia. In the north-west and southwest the empire touches the Baltic and Black seas, but elsewhere in the west it merges with the States of Western Europe—Rumania and Austria-Hungary in the south, Prussia in the centre, and Sweden and Norway in the extreme north. The Imperial territory was extended in 1899 by the formation of the Province of Kwang-tung, leased from China and including Port Arthur, Ta-lien-wan, and the adjacent seas and territory to the north. This new possession is already connected with Saint Petersburg by a branch of the Trans-Siberian Railroad.

The empire may be divided into five parts: (1) Russia in Europe (with Poland and the Grand Duchy of Finland); (2) the Caucasus

Northern Caucasia, or Ciscaucasia, and Transcaucasia; (3) Siberia; (4) Russian Central Asia; (5) Kwang-tung. The heart of this enormous State is Russia in Europe, or Russia proper. This article will deal especially with Russia in Europe, and with the Asiatic domain of the empire only in its relation to the empire as a whole. For a treatment of the political divisions of Asiatic Russia the reader is referred to the appropriate headings. The mainland of Russia in Europe lies between 44° 30' and 70° N. latitude and between 17° 30' and 65° 30' E. longitude. Its area is 2,000,040 square miles, or a little more than two-thirds that of the United States, exclusive of Alaska. It is separated from Northern Siberia by the Northern Ural Mountains, south of which the boundary is arbitrarily fixed to the east and south of the Urals to include within the domain of Russia proper all of the mountain-making districts. The valley of the Mamech between the Caspian and the Sea of Azov invades it from Caucasia and is generally accepted as the southern limit of Europe in that quarter. The Black Sea, the Sea of Azov, and the northern edge of the Danube delta complete its southern boundary, and its western and northern limits are those of the empire as given above. The largest islands belonging to European Russia are the two called collectively *Novaya Zemlya* (Nova Zembla), in the Arctic Ocean.

TOPOGRAPHY. In its surface features Russia is in striking contrast with the smaller part of Europe west of it. Though it has about 5000 miles of coast line, it has few of the large gulfs, inlets, and peninsulas that broke Western Europe into detached masses and destined it to develop great, independent nationalities. The coasts of Russia leave it a compact mass, irregularly quadrilateral in form; and the geographic unity of this great land mass is completed by the fact that it wholly lacks the great diversity of plains, plateaus, highlands, deep valleys, and declivities which give endless variety to the surface features of Western Europe. As a whole Russia is a great plain stretching away in endless monotony from its western confines and the ice ocean on the north; and the plain is not limited by the European domain of the empire, but extends beyond the Urals to Bering Sea in the extreme northeast and across the Turkestan steppes to Persia and Afghanistan in the south. Thus the plains of the empire are far more extensive in Asia than in Europe. It was this plain that gave unrivaled opportunity for and direction to the vast territorial expansion of Russia. The empire may be crossed to every ocean that touches it without leaving these vast low tracts where the horizon drops around the traveler as on a voyage at sea. The plain of European Russia in its general level is from 200 to 600 feet above the sea. A few areas, conspicuous only because of the monotonous uniformity of most of the country, rise to a height of over 1000 feet.

The higher altitudes of the interior of Russia are chiefly disposed in two masses, extending north and south. They have been designated under the names of the Heights of Central Russia and the Heights of the Volga. The Heights of Central Russia culminate in the plateau of Valdai (1150 feet high). (See **VALDAI HILLS**.) It very clearly separates the low plains that border the Baltic from the low plains of the

Upper Volga. Widely separated from this area of elevation by the Valley of the Donetz are the so-called Mountains of the Donetz, extending east and west, rising to 1225 feet and extending as an ensemble of elevations almost to the Sea of Azov. The Heights of the Volga have a direction roughly parallel to those of Central Russia. They extend on the right bank of the river from Nizhni-Novgorod and Kazan to Tsaritsin, a distance north and south of 730 miles, attaining 1121 feet near Samara and 1314 feet to the west of Saratov. The greatest width of this area of elevation is about 230 miles. Farther east, on the edge of Asia, the Ural Mountains (q.v.) break the monotony of the plains. They are broken by deep gaps dividing them into three main sections known as the Northern, Central, or Permian (from the Province of Perm), and Southern Urals. The Urals extend from north to south approximately along the meridian of 60° E. for 1500 miles, rising in the north and south to upward of 5000 feet, with gentle slopes on their European face and more abrupt descents on the Asiatic side. The Central Urals, where the rainfall is much heavier than in its other sections, have on this account been more deeply denuded, are low in elevation, and the detritus has been scattered far over the plain on both sides of the range to a depth of 500 feet. The traveler approaching from the west observes nothing suggestive of mountains till he passes the water divide and looks down upon the plains of Siberia. With the exception of the south coast of the Crimea, where the Yaila Mountains and their spurs descend steeply to the sea, there are no other prominent elevations in Russia proper. The most unique feature of the topography of Russia is the area of depression below the sea level in the southeast part of the country along the coasts of the Caspian, a region of sunken plains that is larger than all other depressions below sea level in the world. While the dominant character of the plain of Russia is monotony, and this feature is maintained throughout the empire over wide expanses of flat and low lands, the new parts of the empire have manifold topographic aspects, so that the Russian domain as a whole has many varieties of land and scenery, from the tundras, plains, and low plateaus of Russia in Europe to the steppes both high and low in Asia, and the lofty and wild mountain chains of Caucasia, and the many parallel belts of mountains, gridironed with transverse ranges and spurs, which fill Eastern Siberia and terminate in Kamchatka.

HYDROGRAPHY. The river system of the great plain of Russia serves most to distinguish it from all other plains. The vast extent of these lowlands favored the development of the largest river systems of Europe (the Danube alone excepted), and all these rivers have reached the advanced stage of mature adjustment to the land, have drained their ancient lakes, established their individuality, and deepened their channels in many cases sufficiently to extend navigation for light draught vessels almost to their sources. It is the streams flowing from the low plateau known as the Heights of Central Russia which give birth to most of the more important rivers of the country. The chief rivers may be classified according to their respective basins:

BASIN OF THE CASPIAN SEA. The Volga (q.v.), the largest river in Europe, is continuously navi-

gable for 1800 miles. Two of the Volga's tributaries are especially prominent in commerce. The Oka (q.v.), entering the river from the south at Nizhni-Novgorod, waters the most fertile part of South Central Russia. The Kama (q.v.) drains the western slope of the Central Urals and its basin embraces an area larger than that of Great Britain. The Ural (q.v.) is shallow and chiefly noted for its prolific fisheries and its enormous fleets of small fishing boats.

BASIN OF THE SEA OF AZOV. The Sea of Azov receives the Don, the third longest river of European Russia. This stream is greatly impaired for navigation by the irregularity of its flow. It is one of the great highways to the sea of the wheat of the eastern black soil region. Its chief tributary is the Donetz, navigable only in its lower course.

BASIN OF THE BLACK SEA. The basin of the Dnieper, Russia's second longest river, is as large as France. Among its several important tributaries the Pripet is the most noteworthy. The Bug and the Dniester are the only navigable rivers west of the Dnieper.

BASIN OF THE BALTIC. The Vistula (q.v.) is Polish throughout its course in the domain of Russia, the great highway being used by the Poles to ship their cereals, timber, and other export products to the Prussian port of Danzig. Its principal tributary is the Northern Bug, which receives the Narev. The Düna or Western Dvina is another large river entering the Baltic. It is navigable almost from the Heights of Central Russia, where it rises, to the Gulf of Riga, into which it empties, but navigation is rendered difficult by rapids in one part of its course. Still another affluent of the Baltic is the Niemen, which takes the name of Memel on entering Prussia. The Narova carries the waters of Lake Peipus through a series of rapids to the Gulf of Finland, the great eastern arm of the Baltic; and the Neva, the outlet of Lake Ladoga, likewise emptying into the Gulf of Finland, though only 43 miles long, discharges more water into the sea than any river of Europe outside of Russia, excepting the Danube.

BASIN OF THE ARCTIC. The most important rivers tributary to the Arctic Ocean are the Petchora, rising among the Northern Urals; the Northern Dvina, a mighty stream; the Dvina, emptying into the White Sea at Archangel; and the Omega, which drains Lake Bielo-Ozero to the White Sea.

Russia is extraordinarily rich in lakes. Finland and the northwestern provinces of Olonetz, Novgorod, Saint Petersburg, and Pskov contain thousands of them. The largest of these lakes is Ladoga, with an area of more than 7000 square miles (about equal to that of Lake Ontario), Omega, about half as large, and Peipus. Most of the lakes throughout the whole region near the Baltic, where they are clustered, are connected with one another; and between them and the Arctic Ocean great expanses of moorland and swamp cover the low flat country. The lakes are a large element in the interior navigation. In the middle and south of European Russia there are few lakes excepting the small bodies of salt water on the sterile steppes of the southeast.

CLIMATE AND SOIL. As Russia has a distinctly continental climate, the winters are colder and the summers hotter than in Western Europe in

the same latitudes. The mean annual temperature, corrected for altitude, is a little lower as one goes from west to east; and this tendency holds to the Pacific coast of Asia. There is naturally a great diversity of temperature as one proceeds from north to south, since Russia reaches into the Arctic Zone and extends as far south as the latitude of Lombardy. Frozen swamps skirt the north coasts and the vine and the olive thrive in the Crimea. All of the extreme north has severely cold weather or hard frosts from 6 to 8 months in the year. The mean temperature of January at Saint Petersburg is about 15° F. and of July about 64°. Moscow, although much farther south than Saint Petersburg, has a still more rigorous winter climate, owing to its inland location. The mean temperature of Odessa in summer and in winter is about the same as that of Boston. On the whole the climate is very uniform considering the size of the country. As the Russian plain is low, atmospheric disturbances are easily propagated over the entire surface. No mountain ranges obstruct the cold north wind that sweeps from the Arctic Ocean to the Black Sea. The warm southern breezes are felt along the slopes of the Urals to the mouth of the Petchora and to Archangel. In the greater part of Russia proper the winters are long and severe and the summers are hot and sultry. In the Baltic Provinces the winters are less severe than in the interior. The rainfall of European Russia is less than that of Western Europe; but though the average precipitation is not over 20 inches a year, it is usually sufficient to insure good crops. The rainfall decreases from northwest to southeast, being smallest around the northern shores of the Caspian Sea. At Saint Petersburg the annual precipitation is 48 inches, at Kazan 44, and at Astrakhan 4.8 inches. Nearly the whole of Russia is covered for months in winter with a thick mantle of snow, which contributes greatly to the fertility of the soil when the spring thaw sets in. Snow covers the ground at Odessa for 80 days and at Moscow 120 days. The rivers throughout the empire freeze in winter. The coldest winds of the country are the moist north and the dry east winds.

The mixed clays and sands spread over the surface of nearly the entire northern half of the country in the glacial epoch form soils of fair average fertility, on which grow vast expanses of forests and large areas of flax, hemp, and cereals. The region of unsurpassed fertility, however, is the black earth lands between the glacier-swept area and the steppes of the extreme south, covered with deep, rich humus, now considerably impoverished, owing to many years of over-cropping without fertilizers. The only unfertile region in the warmer areas is the salt steppes of the southeast, whose unproductivity is due more to the lack of rain than to the failure of plant-food in the soil.

FLORA. The five areas into which the vegetation of European Russia may be divided correspond roughly to so many climatic zones. In the north, between the Arctic Circle and the ice ocean, is a treeless land (tundra), covered with vast marshy moors, interrupted by boulder-strewn plains, solidly frozen much of the year, and producing nothing but reindeer and other mosses, lichens, and stunted shrubs. South of

the tundra is the forest region, the third largest in the temperate zones, covering more than a third of Russia, and embracing the north and a part of the central regions. The low forests forming the northern belt of the forest zone consist of birch, larch, silver fir, and some other hardy trees. They are succeeded by the high forests of splendid arboreal vegetation, mostly conifers, pine and fir, yielding great supplies of soft timber and resin, turpentine, and tar. The conifers are succeeded by the great deciduous forests of Central Russia, oak, maple, ash, and other trees, which form the southern belt of the forest zone. Agriculture has pushed northward into this zone, and large areas of the flax, hemp, and rye fields occupy cleared lands. South of the forest zone and roughly bounded on the north by the Volga is Russia's greatest source of wealth—the black earth region (*Chernozem*), the granary of Russia, with boundless fields of wheat and other cereals, and with an abundance of grasses, but with an absence of trees. This broad zone extends into Rumania on the west and passes around the Southern Urals into Siberia on the east. Still farther to the south, skirting the Black and Caspian seas, lie the steppes. The River Don, traversing the steppes, divides them into two parts of very different character. The western and well-watered half is a populous pastoral district, rich in nutritious grasses, on which many millions of cattle, horses, and sheep are fed and fattened; the eastern half, arid and inhabited only by wandering tribes of Kalmycks and Cossacks, is occupied by bleak plains, salt marshes and lakes, and sandy deserts. Bessarabia and the Crimea form a southern zone beyond the steppes, where maize thrives, the wines of Russia are produced, and the olive ripens.

FAUNA. The Arctic fox and polar bear, reindeer, and seals are found along the northern coasts or on the lands north of the Arctic Circle. The forests formerly made Russia the great source of the fur and skin trade of Eurasia, but this commerce has been largely reduced by the over-destruction of fur animals, and Russia has for years given way to Siberia as the chief source of the empire's fur trade. The fox, hare, brown and other bears, wolf, lynx, elk and other deer, wild bear, and gibbon still abound in the forests. The beaver is now found only in the Government of Minsk. Most of the carnivora of the forest belt and also squirrels, weasels, and hares are found in the black earth region, but the most distinctive animals of this agricultural area are the musk and the baibak, which are the pests of the grain fields. Birds, most numerous in the forests, include the grouse, hazel hen, and partridge. The north-western coast waters, warmed by the Atlantic drift, abound with cod, salmon, and other highly prized fish, and not only the coast but also the river fisheries are highly important. The most remarkable fishing grounds are situated near the mouths of the Don, Volga, and Ural, where herring, sheat fish (10 to 12 feet long; weight over 900 pounds), and sturgeon are caught in incredible numbers. A large catch of the enormous value of the Russian fisheries is yielded by the Caspian Sea. GEOLOGY AND MINERAL RESOURCES. Russia proper is a geological world apart from the rest of Europe. The endless variety of structure that is seen in Western Europe gives place in Russia to almost horizontal layers, rising and falling only

here. There are gentle undulations and covering by thousands of thousands of square miles, with nearly the same outward aspect and the same interior structure. The great zones of Paleozoic and Carboniferous rocks that cover Russia stretch away east and south to the very heart of Central Asia. Along the base of the Urals, between the Arctic and the steppes of the Caspian, extend the new red sandstones, the Permian formations deriving their name from the Government of Perm, which are generally regarded as marking the close of the Paleozoic era. There are also some rocks of more recent ages. Jurassic strata skirt the Permian southward and overlap them in the centre, forming a rough triangle which tapers from the Arctic to the Volga; and farther south, chalk, Tertiary and more recent rocks skirt a granitic tableland that obliquely crosses the steppes in the extreme south; granites are also predominant in Finland. In the southwest of Poland the highlands contrast forcibly with the great plain in the variety of their formations, which include chalks and Jurassic, Triassic, Carboniferous, and Devonian rocks, many minerals being mined in this hilly region. The Urals form geologically one system throughout of crystalline rocks. The gold of the Middle Urals is not sought in the granitic and serpentine rocks, but in the detritus that covers a large area at the base of the mountains. The mountains that cross the south side of the Crimea are of limestone and are mere fragments of the former ranges.

The whole of North Russia, with the exception of that portion of the plain along the Urals, was buried during the glacial period under the ice masses which invaded it from the Scandinavian peninsula, covering the land with morasses and erratic boulders, and leaving thousands of glacial lakes among the evidences of the various advances and retreats of the ice sheet. No region of Europe is more thickly sprinkled with erratic boulders, many of enormous size, than Finland. In the southern part of Russia, on the other hand, no erratic boulders are found to the south of Tula, Ryazan, and Kazan. All traces of the ancient glaciers disappear where the black earth lands begin. The great region of salt lakes, marshes, and steppes which forms the southeastern steppe region of Russia is a remnant of the old Caspian basin.

In its mineral wealth Russia is one of the most richly endowed countries of Europe. Gold, silver, platinum, iron, copper, zinc, salt, and coal are the principal minerals worked. Defective means of communication and dearth of fuel have hitherto prevented the mining industry from attaining full development. The only regions where coal and iron in juxtaposition are largely mined are in the Donetz coal basin and Poland. Between 1887 and 1897 Russia tripled its production of iron and steel. Iron ore is found in Perm and Vyatka (Urals), in a mining region around Moscow (Central Russia), in the Donetz basin (South Russia), Poland, Finland, and to a small extent in some other regions. Magnetic ironstone, the most valuable iron ore, is mined along a large part of the Urals.

The production of pig iron has ranged since 1898 from 2,200,000 tons to 2,850,000 tons a year. South Russia has supplied about one-half, the Urals about one-fourth, and Poland one-ninth. The production of steel in 1899 was

1,318,000 tons, the rolled iron product being only about one-third as large as the steel output. Russia supplies about four-fifths of all the coal and pig iron consumed in the country and nearly all of the steel. Coal exists in much greater quantities than was formerly supposed. The best coal (partly anthracite) is obtained in South Russia near the Donetz River, and these mines and those of Poland yield two-thirds of the output. The mines of Poland are a continuation of the Silesian coal measures. The central coal field south of Moscow is also important. It is somewhat difficult to work the Russian coal deposits, and, though the total annual yield has steadily increased (298,500 tons in 1860, 695,400 in 1870, 3,280,000 in 1880, 6,022,000 in 1890, and over 12,000,000 tons in 1899), the supply falls short of the quantity required. The imports, chiefly from England, are large in spite of the tariff. The chief sources of gold are Siberia (28,276 kilograms in 1899) and the Ural Mountains (10,465 kilograms), about one-fourth of the product being obtained from auriferous veins.

Copper (8000 tons in 1901) comes chiefly from the Urals and Caucasus and to a lesser extent from Poland and Finland. About 90 per cent. of the world's supply of platinum comes from the west side of the Urals (6223 kilograms in 1901). Zinc (6000 tons in 1901) is a product of Poland. Mercury (357 tons in 1899) comes from Ekaterinograd in South Russia and Caucasia. Salt is found in Russia in inexhaustible abundance. The rich beds of rock salt in the Donetz basin yielded 789,800 tons in 1899; 333,600 tons came from Astrakhan, and 315,500 from Perm. The total product in 1899 was 1,643,000 tons. The lakes of the southeastern steppes yield abundant salt and some of them are filled with a saturated solution of salt. Many lakes also yield soda. Iridium (solid), malachite (in large blocks), lapis lazuli, emeralds, diamonds, topazes, and onyxes are found in the Urals, and amber on the Baltic coasts. Russia is deficient in building stone, but colossal blocks of granite occur in Finland. Porcelain clay and meerschaum are found in the Crimea. Marble is quarried in Finland and the Crimea. There are numerous chalybeate, sulphur, and saline springs. Peat moors on the Baltic coast and near Moscow are a source of fuel. The Baku petroleum fields in Transcaucasia are one of the greatest sources of mineral oil in the world. The total production of crude oil in 1901 was 85,168,556 barrels. A pipe line with pumping stations over the mountains from Baku to Batum to facilitate transportation by Black Sea routes was nearing completion in 1903. Two-thirds of Russia's contribution to the world's gold output comes from Siberia.

The world receives its chief supply of manganese from the Caucasian mines in the Government of Koutais, where there is a vast bedded deposit nearly seven feet thick, lying practically level. The production in 1899 was 416,340 long tons.

AGRICULTURE. Russia is preëminently an agricultural State. It pays for its imports with farm produce, and four-fifths of the population subsist by husbandry. One-fifth of the surface, however—the tundras in the north and the salt steppes in the southeast—is entirely incapable of cultivation. There are also about 15,000,000 acres of unproductive swamp lands in West Russia, but

drainage works are gradually reclaiming them. About 38 per cent. of the cultivable area is occupied by forests, and about 16 per cent. by pastures and meadows. About 900,000,000 acres are cultivable, of which 225,000,000 consist of the celebrated black earth, which is naturally the richest wheat land in the world. Owing to the small density of the population, however, only about 215,000,000 acres are usually under crop.

Some of the evils to which farming in Russia is subject are only partly remediable. The long winters and short, hot summers force grain rapidly to maturity and compress into a few weeks an amount of work to which the farmers of Western Europe can give as many months. Thus more men and horses are needed in a few critical weeks than can be utilized at other periods of the year. The scanty rainfall also is in some years more meagre than in others, and periods of drought and severe famine ensue, the evil being intensified by the fact that most of the peasants are poor and do not carry reserve supplies of food over from one year to another. The Government in 1899 adopted new regulations for the more thorough distribution of relief supplies in these periods of distress. Farming is still generally conducted by very primitive methods. English farmers raise from two to four times as much grain to the acre as Russian farmers. The tenant system on the enormous estates of the great landowners results in wasteful and careless methods of tillage. There are no well-cultivated detached small farms, most of the peasantry living in communes (*mir*s) going out to till lands that are not theirs, but are owned by the community, though the product belongs to the individual cultivator. (See *MIR*.) Landownership among the peasantry is, however, rapidly increasing. Agricultural development is also hindered, of course, by the ignorance of the lower classes, a difficulty which the Government is trying to remedy by the opening of schools of husbandry and model farms. Agricultural machinery is scarcely employed excepting on the large estates. In spite of these drawbacks, however, European Russia produces about two-thirds of the oats and half the rye of Europe, and more barley than any other European State; is surpassed only by the United States in its wheat crop; and raises more flax and hemp than any other country in the world. These cereal and fibre crops, together with potatoes, beet root, and tobacco, are the great agricultural products of Russia.

The chief place is taken by cereals. Rye (representing over one-third of the ground sown) is the best crop. It is the leading breadstuff for home consumption and the quantity raised is more than double that of wheat. But wheat is the most important export crop, being grown chiefly in the black earth region of South Russia. In good seasons Russia exports about 100,000,000 bushels, being second only to the United States as a seller of this cereal, and supplying three-fourths of the export wheat of Europe. The yield is on an average only about 9 bushels to the acre, or only about two-thirds of that in the United States. Oats, barley, and rye are raised chiefly north of the great wheat area, and maize is grown in the southwest. Until 1877 Russia surpassed the United States in the production of cereals. The average annual output of cereals for five years from 1896 to 1900, inclusive, for

the empire (including Poland, the Caucasus, Siberia, and Central Asia) was (in bushels): wheat, 419,000,000; rye, 802,000,000; oats, 800,000,000; barley, 252,400,000.

Rice is an increasing crop in the Caucasus, Siberia (Transbaikalia), and Turkestan, and is now largely used by the peasants throughout the empire. The crop of Transcaucasia alone amounts to about 50,000 tons a year and is shipped all over Russia through the Volga and Black Sea ports. The beet industry is one of the most important branches of agriculture and manufacture in Russia. Domestic beet sugar supplies the entire demand of the empire, and furnishes enormous quantities for export, Russia being the chief source of sugar for all the Black Sea territory and Persia. The excess over the home demand is forced out of the country and sold abroad at a price below that prevailing at home. More than 1,000,000 acres, mainly in the black earth region and South Poland, are given to sugar-beet culture.

In 1899 4,004,642 acres in European Russia, including Poland, were in flax and yielded 357,369 tons of fibre and 17,304,357 bushels of linseed. Russia supplies nearly four fifths of the flax tow consumed by all countries. The product is not of superior quality, but its export is a source of great wealth. It is grown in Poland, the Baltic Provinces and the region of the Upper Volga for tow and in the more fertile black-earth lands for linseed. Hemp is grown in the same districts and also in the central governments of Orel, Tula, Kaluga, and others. In 1899 the crop yielded 217,380 tons of fibre and 19,675,262 bushels of hempseed from 1,813,034 acres. Next to grain, flax and hemp form the principal exports of Russia. The cotton-raising districts of the empire are in Russian Turkestan and Transcaucasia, the largest supply, averaging about 800,000,000 pounds annually, coming from Ferghana, most of it raised from seed of American upland. The cultivation of potatoes has doubled in the past quarter of a century and the tubers are largely used in the manufacture of spirits. Russia ranks after Germany and Austria-Hungary in tobacco culture, producing about 100,000,000 pounds a year in Bessarabia, Little Russia, and South Russia, much of it of superior quality. Transcaucasia adds to the supply. Viticulture has made much progress in the southwest and south (Bessarabia, Kherson, Podolia, and the Crimea). Bessarabia has about 200,000 acres of vineyards. The best red wines now compare favorably with good French wines and are cheaper, and the champagnes of Odessa compete successfully in Russia with the French vintage. Fruit is grown in the south.

FORESTS. Wood is used in Russia in a most wasteful and extravagant scale both for industrial purposes and as fuel. Though the wealth of European Russia in timber alone is surpassed only by the forests of Canada and the United States, and the forests of the empire probably surpass those of any other country in extent, the science of forestry is almost non-existent. In parts of the north the superabundant woods are utilized only to produce potash, resin, tar, and turpentine, while the south suffers for want of timber. Russia exports timber to the value of from 830,000,000 to 850,000,000 a year. The forests in Russia proper cover an area of about 475,000,000

in Finland, 50,000,000; and in Poland, 60,000,000.

STOCK RAISING. In its live-stock interests Russia generally surpasses any other country of Europe. Nearly half the horses of the Continent are raised in Russia; it leads all the other countries in cattle, sheep, and goats, and is inferior only to Germany in the number of hogs. In proportion to the population, however, Russia's wealth in live stock is not remarkable. The industry is largest on the broad southwestern steppe, where the animals spend the whole year in the open air. Farther north, however, animals must be fed under cover for 100 to 200 days in the year, and this is a great region of hay-making. The breeding of domestic animals is not skillfully conducted except as to horses, the 3000 stud farms by which the Government is promoting this industry having been so successful that Russia now has not only the best, but also the best horses in Europe. Meat, tallow, and hides are the main objects of cattle-raising, dairy interests being neglected. Next to Great Britain, Russia yields the largest quantity of wool in Europe, all of which is utilized in the Russian wool factories, most of it being sold in the great wool markets of Warsaw, Kharkov, Nizhni-Novgorod, and Rostov. Bristles are the chief article of hog products exported. Camels are bred in the southeast, and reindeer form the wealth of the Laplanders and the inhabitants of Northeast Siberia. The number of domestic animals in the empire in 1900 was: Horses, 25,961,700; cattle, 43,586,900; sheep and goats, 79,647,300; hogs, 13,924,500. Perhaps in no other country are fish so important in domestic economy as in Russia. On account of the numerous fast-days, fish are indispensable to the whole nation; and though the value of the home fisheries is in some years as high as \$50,000,000, large imports are necessary, and isinglass and caviare are the only fishery produce exported.

MANUFACTURES. The Government protects home industries by imposing a very high tariff on imports, averaging about 35 per cent. of their value. Until about 1820 Russia was almost completely dependent upon other nations for manufactured goods. Manufactures have wonderfully developed under the protective tariff, but the hardships of excessive protection have forced the Government recently to abolish some of the import duties, notably those on iron and steel. Industries have been greatly promoted by the variety of raw material which the empire affords, as well as by the abundance of capital (much of it from foreign countries, attracted into the empire by high protection) and the large dividends which enterprises in Russia have yielded. Trained talent and highly skilled labor from foreign countries are largely employed. The superintendents, chemists, engineers, and mechanics in the factories are generally foreigners.

The industrial system differs much from those of more western countries. The larger part of the Russian factories are very small and are situated in the country, not, as in the United States and England, in the towns. The majority of the work people are engaged in agriculture in summer, but devote the long winters to various manufactures, either in their own homes, or in towns, whither they repair for employment. Moscow, Saint Petersburg, Warsaw, Lodz, and Bialy-tok have

a permanent manufacturing population. Many other cities attract to their factories in winter thousands of work people from the farms; and a large part of the factory hands in all the larger centres are those who have abandoned agriculture for manufacturing pursuits. The manufacture of linen, woolen goods, leather, house utensils, earthenware, hats, and many other articles is still very largely in the hands of peasant work people (Kustari), who produce their wares in their own homes or village shops. Their work is highly skilled, for the division of labor is often carried to a very great length. There are more than 100,000 of these small factories and home workshops, most of which were not included in the enumeration of manufactories (including mining industries) in Russia proper in 1897, when the number of establishments was given as 39,029, employing 2,098,262 work people, and with a total product valued at \$1,462,159,160. The chief branches of industry, with the number of people employed and value of production, were, in 1897:

	People employed	Production
Articles of food.....	255,357	\$333,779,740
Textiles.....	642,520	487,342,440
Leather.....	64,418	68,009,870
Wood.....	86,273	52,991,955
Chemicals.....	35,324	30,670,825
Paper and cardboard.....	46,100	23,427,350
Metals.....	758,644	362,753,125
Ceramics.....	143,291	42,533,850
Other.....	66,249	60,650,005
Total.....	2,098,262	\$1,462,159,160

In 1898 the capital invested in the leading financial, manufacturing, industrial, steamship, and other Russian enterprises, numbering 1181, was estimated at \$894,480,840, nearly 20 per cent. of which was supplied by foreign companies. Moscow is the greatest industrial centre.

The output of the textile industries is of greater value than that of any branch of manufactures. Only imported cotton goods were worn before 1840, but there are now nearly 5,000,000 cotton spindles, and Russia is surpassed in amount of cotton spinning only by Great Britain and the United States. The product of the cotton industry was valued in 1897 at 430,218,000 rubles, or about half the value of the entire textile output. The product not only meets almost the entire domestic demand, but there is also a surplus for export to Asia and Rumania. Russian cotton goods cannot compete in the markets of Central and Western Europe; neither is there any market in Russia for any Western cotton products excepting the finer fabrics which are not yet produced at home. The chief cotton-manufacturing centres are the Moscow district, with large dyeing and printing works, Vladimir, Ivanovna, Tver, Shuya, Saint Petersburg, Warsaw, and Lodz, which last produces seven-eighths of all the cotton cloth made in Poland and one-tenth of the cotton yarn spun in Russia. The woolen industry also has greatly expanded, especially in the manufacture of cloth, the Moscow district leading. The carpets of Vassiljevka, near Moscow, are noteworthy. The value of the flax and hempen goods, produced chiefly in the households and in the factories of the central governments, averages about \$125,000,000 a year. The silk industry, centred almost wholly in the Moscow district, consumes

over \$6,000,000 of raw silk and yarn a year, purchased in Italy, China, and Persia. Efforts are being made to extend silk-culture in Transcaucasia and Turkestan in order to reduce the foreign imports. The distillation of spirits ranks next to textiles in value of output, the consumption of spirits being nearly two gallons per capita a year. In 1899 there were 1769 distilleries in European Russia, producing 171,291,204 gallons by distillation, and the brewing business is also large. Esthonia, south of the Gulf of Finland, is the largest centre of production. The Government, with a view to restricting intemperance among the peasantry, now controls the production and sale of spirituous beverages (not including wine and beer) throughout European Russia.

The native metal industry is of great importance, though it has suffered greatly from defective communications and lack of fuel. The manufactories of machinery are located in the central and particularly the southern industrial region. Many factories supply agricultural machines and implements, the value of the output having risen from \$1,112,500 in 1867 to nearly \$5,000,000 in 1897. This business is yet in its infancy and Russia is still dependent upon other nations for its best metal goods in all lines, machinery coming from the United States, England, and Germany. Still the metal industries employ a vast number of workmen (646,000 in the mining and working of metals in 1899). The railroads are supplied with home-made rails. Iron and steel goods of many kinds are produced. Moscow and Saint Petersburg manufacture gold and silver articles, watches, and musical and astronomical instruments. The output of refined sugar from 277 sugar works was 880,497 tons in 1901, most of the mills and refineries being in Poland (chiefly near Warsaw) and Little Russia (especially in the Government of Kiev). The tobacco factories (Saint Petersburg, Moscow, Kherson, Finland) manufactured 85,220 tons of tobacco, cigars, and cigarettes in 1898, cigarettes being an article of export. Russian leather manufactures, long famous, are carried on in all parts of the empire. The well-known Russian leather is made chiefly in the centre and north. Turkey leather in the east and south. Ships are built at all the seaports and on the Volga, Oka, and Kama. Chemical factories are found all over the empire, but chiefly in the Government of Moscow (saltpetre, potash, and albuminous substances). There are nearly 4000 flour mills. Saint Petersburg's manufactories of malachite are famous, and the glass and porcelain made in the Imperial factory at the capital are of a very high class. The production of these articles and also of paper, furniture, and fancy goods falls below the domestic demand.

COMMERCE. It is not easy in countries like Russia, where the means of communication are poor, for merchants to inspect all the varieties of goods they may wish to sell unless great col-

lections of goods are brought together at fixed fairs and at central places. This is the reason why large fairs are still held in Russia. The seven principal fairs are at Moscow, Kharkov, Peltava (where horses, sheep, and wool are dealt in on a large scale), Yelizavetgrad, Kursk, Irbat, and Nizhni Novgorod. Since 1817 the fair at Nizhni Novgorod, at the junction of the Volga and Oka, has been the largest in the empire, and it is without a rival in any country for the great quantity and variety of goods offered for sale. Here Europe and Asia exchange their goods. Wares and raw materials from China and as far west as Paris are displayed and the annual sales amount to about \$85,000,000. Though railroads and the employment of commercial travelers and other conveniences of modern trade are making rapid headway, little change in the volume of business at the great fair is observed. The fair at Irbat, in the Government of Perm, is the great market for Siberian goods.

The trade relations of Russia with the countries west and east of it are very different. Russia is to Turkestan and all Asiatic countries a manufacturing State, sending to them the product of its mills and shops, and buying their cotton and other raw materials; but to the Western nations Russia is an agricultural State, sending them its grain, flax, and hemp, and buying their manufactures. Thus Russia forms an important connecting link between two quarters of the globe, though the great bulk of its trade is with Europe. The volume of foreign trade is small considering the vast resources of European Russia and its enormous population. Though it is more populous than the United States, its general merchandise trade with foreign countries is less than that of the small State of Belgium. A large part of the foreign trade is in the hands of English, German, French, and other foreigners established at the seaports. The following is a statement of the average annual trade of the country in millions of dollars:

	1881-85	1891-95	1899	1900	1901
Imports	275.0	234.5	306.1	322.7	309.5
Exports	200.0	314.0	302.7	309.2	375.7

The above table includes only the trade across the European boundary or through the ports connecting with the Atlantic; in other words, it includes very little of the Asiatic trade, nearly all of which crosses the Asiatic land boundary. The average exports through the Asiatic frontier for the ten years ending in 1900 were \$11,220,000 a year; the average imports across the Asiatic frontier in the same period were \$23,975,100. These figures include only the trade in general merchandise. The trade of Russia, exclusive of Finland, with the principal countries in 1900 and 1901 was:

	Imports from (1900)	Imports from (1901)	Exports to (1900)	Exports to (1901)
Germany	\$11,931,405	\$10,112,270	\$66,120,025	\$92,397,695
United Kingdom	45,470,330	51,157,785	54,971,040	89,592,740
France	16,265,595	14,825,750	23,796,270	31,718,000
Austria-Hungary	13,886,400	12,097,775	11,924,300	15,561,400
Turkey	3,725,870	3,701,115	9,104,415	10,294,745
United States	27,239,310	17,861,120	1,790,785	2,052,730
China	8,447,795	11,621,000	589,075	1,872,025
Finland	10,308,240	11,551,265	21,132,510	19,004,750

The leading imports are raw and half-manufactured articles, about one-half of the total (cotton, metals, coal, wool, silk, leather, hides, skins, cereals, etc.); manufactured goods (machinery, metal goods, some textiles, etc.); articles of food (tea, fish, beverages, fruits, coffee, and tobacco). The leading exports are cereals and flour (more than half of the total), timber, naphtha and naphtha oils, flax and hemp, oil cake, oil grains, and other raw and half-manufactured articles.

The growth of the export trade of the United States in 1901 and 1902 was chiefly due to the removal of the Russian tariff tax on some kinds of agricultural machinery. American sales of cotton and machinery are important. The United States purchases from Russia manganese ore, licorice, and some other commodities, but its imports are comparatively small because the United States produces in very large quantities most of the things that Russia has to sell. It may be observed that Russia's trade with its neighbors Austria-Hungary and Rumania is comparatively small because the products of the three countries are much the same. The trade of Finland is not included in the trade statistics of European Russia, as it forms a customs district by itself.

TRANSPORTATION AND COMMUNICATION. The wagon roads are generally in a very bad condition, especially in spring and autumn. In winter, however, when the whole plain of Russia is covered with snow, sledging is universal, and the land transport of goods is facilitated. The rivers and canals carry enormous commerce, and are the cheapest means of communication, in spite of the fact that they have natural disadvantages as highways. They are closed by ice from three to seven months in the year, and the southern rivers, most notably the Don, are much reduced in depth by the dryness of the summer. There are about 50,000 miles of navigation on rivers, lakes, and canals in European Russia. Over 1700 steamers ply on the Volga and its tributaries. There is direct water connection by river and canal between the Caspian Sea and the Arctic Ocean (2 routes); between the Caspian Sea and the Baltic (3 routes); and between the Black Sea and the Baltic (3 routes).

In 1902 the empire had 36,496 miles of railroad, of which 29,788 miles were in European Russia, 1762 miles in Finland, and 4545 miles in Asiatic Russia. The Government owns and operates nearly two-thirds of the mileage and has connected the extremities of the empire by rail. (See SIBERIA.) The freight carried by the Russian lines in 1900 was 146,543,000 tons; passengers, 101,570,000. In 1900 the freight carried by the Asiatic lines (Transcaspian, Trans-Siberian, and Ussuri River railroads) was 4517,795 tons; passengers were 2,741,694.

The chief seaports are on the Baltic and Black seas. They are blocked by ice, except Odessa, Sebastopol, and Novorossisk on the Black Sea, and Hangö on the Baltic, from 2 to 5 months, but ice-breakers are mitigating this inconvenience. The Black Sea ports are the main outlets for agricultural produce. Most of the sea trade with North and Central Europe and the United States is through the Baltic ports. Odessa has the largest shipping trade, is the chief depot for the produce of South Russia (wheat, tallow, wool and linseed), and has regular connection with all Black Sea ports, the chief Mediterranean and Atlantic ports of Europe, and

the Pacific ports of Vladivostok and Dalny (the new port of the Province of Kwang-tung). Taganrog, Rostov, Berdiansk, and Mariupol are grain ports on the Sea of Azov, and Astrakhan on the Volga delta is the central point of the Caspian Sea trade. Saint Petersburg is the leading port of the Baltic. Riga is the most important shipping point in Western Russia for flax, hemp, and timber. Archangel, on the White Sea, has an important export trade in timber, tar, pitch, grain, and furs. Åbo, Hangö, Helsingfors, Revel, Liban, and some other ports are also important. The coasting trade is very large, and since January, 1900, only vessels sailing under the Russian flag can engage in it. The mercantile marine of Russia in 1901 consisted of 3038 vessels, of 633,819 tons, of which 745 were steamers, of 364,360 tons. In 1901 the total number of merchant vessels that cleared from the ports of European Russia in the foreign trade was 8,790, of 7,536,000 tons, of which only 1349 were Russian, of 713,000 tons. The number of vessels in the coasting trade clearing from the White, Baltic, Black, and Azov seas was 10,039, of 8,582,000 tons.

BANKING. The Bank of Russia is the State bank and also a commercial bank. It has 113 branches throughout the empire. It issues the paper currency of Russia as necessity occurs. If the amount of the paper currency does not exceed 600,000,000 rubles, the bank guarantees it by half of that sum in gold. Every issue above 600,000,000 rubles must be guaranteed to the full amount in gold deposited in the bank. The total amount of the paper currency on January 14, 1903, was 630,000,000 rubles, and the guarantee fund in gold to cover the currency was 927,500,000 rubles, or sufficient to cover a much larger issue of paper money.

The number of State, municipal, and postal savings banks on January 1, 1902, was 5,629; depositors, 3,935,773; deposits, 722,982,000 rubles. The State banks for mortgage loans to the nobility had outstanding loans amounting to 902,811,500 rubles on January 1, 1900. The land bank for the purchase of land by the peasants up to January 1, 1902, had lent money to 630,922 householders and 1,969,019 individuals, who had bought 11,296,800 acres, valued at 244,056,483 rubles, of which 191,588,006 rubles were lent by the bank and 52,468,427 were paid by the buyers. The 47 mortgage banks, on January 1, 1901, had 1,550,658,046 rubles in loans on landed estates and 446,115,772 on town properties. The assets and liabilities of 42 private banks balanced at 1,425,053,000 rubles; of 133 societies of mutual credit at 268,884,300 rubles; and of 241 municipal banks at 145,114,429 rubles.

GOVERNMENT. The government of Russia is an absolute hereditary monarchy. There is neither a written constitution nor a representative legislative body. The whole legislative, executive, and judicial power is vested in the Czar alone. He bears the title of Autocrat of All the Russias, and, as the title indicates, there are no legal limitations whatever upon his authority. There are, however, certain rules, for the most part relating to the law of succession, which the Czar regards as binding upon himself. He exercises the legislative and administrative power through the aid of certain great councils of State composed of functionaries appointed by himself and responsible to him alone for their conduct. The first of

these bodies is the Council of the Empire, a purely consultative assembly established as early as 1801 and consisting of a president and over 80 members, exclusive of the ministers, who are *ex-officio* members, and four princes of the royal blood. For the dispatch of business the Council is divided into four sections or departments, each vested with the control respectively of legislation, civil and ecclesiastical administration, finance and commerce, industry and science. By one or the other of these sections legislative measures are drawn up, the laws interpreted in certain contingencies, the budget prepared, financial measures devised, accounts examined, administrative controversies settled, and political questions discussed. Each section has its own president, and ordinarily the sittings are separate, but joint meetings are held for certain purposes.

Another great body of State through which the Emperor governs is the Senate, which was created by Peter the Great in 1711 and reorganized in 1802. It is divided into six departments or sections. Two of these act as courts of cassation. Their members, like the other Senators, are appointed by the Emperor, but, by reason of their judicial functions, are regarded as irremovable. Another section is charged with the promulgation and execution of the laws. Other sections divide among themselves the business of supervising the collection of the taxes, the use of the public funds, the preservation of the archives, the appointment of officers, and the maintenance of order. As a whole, the Senate is the final supreme court of appeal in civil and criminal cases for the empire, a supreme administrative court, and a disciplinary tribunal for the trial of public officers. A third administrative body is the Holy Synod, charged with the supervision of ecclesiastical affairs. It is composed mostly of ecclesiastics, viz.: The three metropolitans of Saint Petersburg, Moscow, and Kiev, the archbishops of Georgia (Caucasus) and of Poland, and several bishops. There is one lay functionary with the title of Procurator-General, who is also a member. All the members are appointed by the Emperor. The Synod cannot introduce innovations into the Church, but it exercises control over the Church in matters of discipline and superintends its higher administration. Its decisions are made in the name of the Emperor and have no force until approved by him. The fourth great organ of Imperial administration is the Council of Ministers, which dates from the year 1802. The ministers, thirteen in number, are appointed by the Emperor, and are responsible to him alone. Besides the Ministry, the Czar has his private Chancelleries, charged mainly with the administration of public charities and certain branches of public education, the examination and publication of the laws, and the control of certain branches of the police service.

For the government of Poland and Finland special arrangements are made. In Poland the chief representative, or lieutenant, of the Emperor is the Governor-General, who is assisted by a council. He is also the president of a deliberative assembly, composed of permanent and temporary members, all appointed by the Emperor. (For the government of Finland, see FINLAND.) The Russian Empire is divided for administrative purposes into governments and provinces and one district. At present there are 96 governments

and provinces and one district, for a list of which see table below under POPULATION.

The provinces altogether number 48, all of which are in Asia and the Caucasus. Several of the governments are united under the rule of a Governor-General. In each single government there are a deliberative assembly and a civil governor, while in a number there is also a military governor. Each government is divided into districts numbering from 5 to 15. In each district is also a deliberative assembly (*Zemstvo*) elected by three classes of voters, viz. proprietors, burghers, and inhabitants of the rural communes who are 25 years of age and possess a certain amount of property, or who are engaged in businesses of a certain importance. Members of the district assemblies are chosen for three years and receive no compensation. Their duties include the construction of public works, administration of charity, public health, public education, and other matters of local concern. The administration of the municipalities is vested in a mayor (*Golova*) and an elected council or deliberative assembly (*Duma*). The members of the council are chosen by property owners, who are divided into three classes, each class choosing an equal number of members. Its duties include the maintenance of the public health and security, the care of markets, ports, charitable institutions, hospitals, and libraries, and the general supervision of municipal affairs. A law of 1894 has materially reduced the power of the municipal government and placed it largely under the control of the Imperial Government.

The lowest administrative unit is the commune, of which there are over 107,000 in European Russia. The chief executive officer of the commune is the *Starosta*. Other officers are the tax collector, the treasurer, school trustees, hospital inspectors, etc. They are elected by the communal assembly (*mir*). This is a popular meeting of all the householders in the commune. It has many elements in common with the New England town meeting. Its duties include the regulation of all local affairs of communal interest. Among these may be mentioned the preparation of the communal budget, the voting of the taxes and the apportionment of those taxes due the empire, and the periodical division of the land (which is generally held in common) among the families comprised in the commune. It grants permission to peasants who wish to change their residences, passes upon the admission of new members to the commune, appoints guardians for minors, tries petty criminal cases, and imposes penalties. Usually a majority vote is sufficient to validate any action of the *mir*, though in some cases a two thirds vote is required. The *Starosta* serves as moderator of the assembly. He supervises the execution of its resolutions, has control of the police, and has charge of the disbursement of the communal funds. Several communes grouped together form a *canton* or *volost*, of which there are over 19,000 in European Russia. Each is presided over by an elder (*Star-shina*) elected by the cantonal assembly composed of representatives of the communes on the basis of one member to every ten families. It discharges the same duty for the canton that the *mir* does for the commune. It meets in the most important or the most central village of the commune. The *Star-shina* is assisted by a council. His term of ser-

years, and is obligatory unless the individual is 60 years of age or has serious infirmities. Another judicial institution is a court consisting of from 4 to 12 judges elected by the provincial assembly. It has jurisdiction of misdemeanors and disputes among the peasants concerning property where not more than 500 rubles in value are involved. The capital of the Russian Empire is Saint Petersburg.

FINANCE. The revenue and expenditure of the State are classed under the heads of ordinary and extraordinary revenue and expenditure. The revenue and expenditure for the years 1900 and 1901 were as follows, in rubles:

	Ordinary		Extraordinary	
	Revenue	Expenditure	Revenue	Expenditure
1900	1,504,128,506	1,555,427,622	32,568,983	333,788,515
1901	1,799,457,155	1,694,887,251	163,915,915	209,369,808

The ordinary revenues are in 9 classifications. The receipts under each heading in 1900 are here given:

(1) Direct taxes, 130,890,050 rubles (from taxes on land, forests, and capital, and sale of trade licenses). (2) Indirect taxes, 686,630,944 (from customs duties and imposts on spirits, tobacco, sugar, matches, and naphtha). (3) Duties, 94,021,466 (from stamp duties, passports, railroad taxes, etc.). (4) State monopolies, 223,394,391 (mining, mint, posts, telegraphs and telephones, and sale of spirits). (5) State domains, 493,764,570 (rentals from crown lands, forests, and mines, net earnings of State railroads, interest on crown capital, etc.). (6) Sales of domains, 741,208. (7) Redemption of land, 89,970,491 (payments made on land purchased by liberated serfs and crown peasants). (8) Miscellaneous, 71,905,642 (payments on railroad and crown debts, aid from municipalities, military contribution, etc.). (9) Various, 7,538,393. The extraordinary revenue was derived from interest on the perpetual deposits in the Bank of Russia, interest on State loans, and various other sources, making a total of 163,915,915, or a grand total of 1,963,373,070 rubles. The balance of ordinary revenue from previous years was 35,350,365 rubles and from extraordinary revenue, 184,373,631 rubles, bringing the total up to 2,019,181,151 rubles, showing a surplus of 144,924,092 rubles over the total expenditures for the year.

The expenditures ordinary and extraordinary in 1901 were as follows:

A. Ordinary: State debt, 276,550,025 rubles; higher institutions of State, 3,305,445; Holy Synod, 24,070,702; Ministries; Imperial House, 12,924,491; foreign affairs, 5,374,877; war, 334,606,006; navy, 93,046,114; finances, 308,490,229; agriculture and State domains, 41,137,269; interior, 87,832,526; public instruction, 33,441,370; ways of communication, 388,551,405; justice, 46,958,216; State's comptrol, 7,112,677; State's studs, 1,585,899; various, 800,000. Total ordinary, 1,664,887,251.

B. Extraordinary: Building of new railways, 37,369,979 rubles; payment of consolidated railway bonds, 82,000,000; China war, 43,675,441; various, 46,324,388. Total extraordinary expenditure, 209,369,808. Grand total, 1,874,257,059. The national debt on January 1, 1902, amounted to 6684,591,661; net interest, £30,288,917.

WEIGHTS, MEASURES, AND MONEY. The unit of coinage is the silver ruble of 100 kopecks, of the average value of 51 cents. The imperial and half imperial are gold coins of 15 and 7.5 rubles. Gold pieces of 10 and 5 rubles are now coined. Legal-tender credit notes (100, 25, 10, 5, and 3 rubles and 1 ruble) are also issued. The unit of measurement is the arshin (28 inches). The verst equals 3500 feet, or two-thirds of a statute mile. The unit of weight is the pound (funt), equating 9-10ths of a pound avoirdupois. The pood is equivalent to 40 Russian or 36 American pounds. The meter, kilogram, and their subdivisions may legally be used.

ARMY AND NAVY. See ARMIES; NAVIES.

POPULATION. The population of the Russian Empire according to the census of 1897 was 129,562,718. The growth of population has been remarkably rapid, the large natural increase going hand in hand with the enormous widening of the bounds of the empire. The population in 1722 was about 14,000,000; in 1815, 45,000,000; in 1851, 68,000,000; and in 1903 it was estimated at 141,000,000.

The following is a table of the Russian governments, provinces, and territories, with their areas, populations, and capitals (in some cases only estimates being obtainable):

EUROPEAN RUSSIA (PROPER) GOVERNMENTS	Area, sq. miles	Population (1897)	Capital
Archangel or Arkhangel'sk	326,500	347,589	Archangel

The average increase of the population of the empire (exclusive of Finland) through excess of births over deaths in the five years 1895-99 was 1,968,897 a year. In recent years there has been a large emigration to the United States, made up in great part of Jews. In the 28 years ending in 1900 this emigration reached a total of 839,364. The empire has only seven cities of over 200,000 inhabitants, viz.: Saint Petersburg, with an estimated population at the beginning of 1902 of 1,489,570; Moscow, 1,147,245; Warsaw, 641,936; Odessa, 411,218; Lodz, 316,145; Riga, 269,717; and Kiev, 255,699.

EDUCATION. Russia is much behind most of the nations of Western Europe in education. The efforts of Peter the Great and his successors were entirely concerned with the upper classes and higher education. The continuous exertions of the Government are the source of the refined culture of the upper classes, of the numerous scientific institutions, the multiplication and improvement of universities and middle schools, and the better training of the clergy. But, in consequence of the existence of serfdom, no account was taken of the masses of the people till Alexander II. aimed at universal popular education. Since that time great progress has been made, but, owing to the sparsity of the population and the differing levels of civilization throughout the empire, it will be long before a high average of education is attained. Not half of the children of school age actually attend school. Most of the schools of the empire are under the Ministry of Public Instruction and the entire empire is divided into 15 educational districts. Many normal, technical, and other special schools are supported by one or another department of the Government or the Holy Synod or are conducted as private institutions. The university students numbered 17,299 in 1902.

RELIGION. The orthodox Greek faith is the established religion of the empire, and according to official estimates its adherents are about 70 per cent. of the entire population. The adherents of the various faiths number approximately (1903):

Orthodox Greek (including dissidents).....	100,000,000
Catholics.....	12,000,000
Protestants.....	6,000,000
Other Christians.....	1,000,000
Mohammedans.....	11,000,000
Jews.....	5,000,000

To this must be added some millions of Buddhists and pagans. The Jews are placed under grievous restrictions, and various sects of dissenters from the established faith and the followers of certain new creeds, some of them extremely fanatical, have been subjected to severe restraints and even to persecution. Roman Catholics are most numerous in Poland. Lutherans in the Baltic Provinces, Mohammedans in the eastern and southern part of the empire, and the Jews in the towns and cities of the western and south-western provinces. The Greek churches in the empire numbered 66,116 in 1898 (including 718 cathedrals). The empire is divided into 64 bishoprics, which are under 3 metropolitans, 14 archbishops, and 18 bishops. The monasteries number 785 (including 289 nunneries), with about 8000 monks and 9000 nuns. The clergy exercise very great influence over the mass of the people. See GREEK CHURCH.

PHYSIOLOGY. The Russian Empire is populated principally by a Slav group of the Caucasian stock, belonging to the Alpine or brachycephalic type. The Great Russians constitute nearly three-fourths of the population of Russia in Europe, the rest being Letto-Lithuanians, Poles, Jews, Finns, Turco-Tatars, Mongols, and Germans. The true Russians are divided into three groups: (1) Great Russians or Muscovites, about 60,000,000, occupy the entire centre of European Russia and form two-thirds to three-fourths of the population in the north and east. (2) The Little Russians or Malo-Russians, otherwise called Ukrainians or Ruthenians, about 18,000,000, are in the southwest. The Cossacks are Little Russians in speech. They are settled in a compact body in Little Russia, whence they have thrown off colonies to the southeast. (3) The White Russians number 5,000,000 in four governments in the west. There are upward of 6,000,000 Russians in Asiatic Russia. See Colored Plate with EUROPE, PEOPLES OF.

Other peoples living in the Russian Empire are as follows: *Slavic:* Poles, about 8,000,000, about three-fourths of them in Poland, the bulk of the remainder being in the western governments of Russia proper; about 200,000 Bulgarians, and a few Czechs and Serbs. *Toutonic:* Germans, about 2,000,000, mainly in the Baltic Provinces, Poland, and in colonies in South Russia; Swedes, 300,000, mainly in Finland. *Finnic:* Finns and Karelians, about 2,500,000 in Finland and the neighboring parts of Russia proper; Esthonians, about 650,000 in the Baltic regions; Mordvins, Votyaks, Tcheremisses, and other kindred peoples scattered over a large area in Northern and Eastern Russia, about 1,500,000; Lapps, in Lapland, and Samoyeds in the extreme northern parts of Russia and Siberia. *Letto-Lithuanian:* Letts and Lithuanians, about 3,500,000, the former in the Baltic region, the latter in the western governments and Poland. *Iranian:* Armenians, Kurds, and Persians and other tribes, 1,300,000, principally in the Caucasus. *Daco-Roman:* Rumanians, 1,000,000, in Southwest Russia. *Semitic:* Jews, about 5,000,000, in Western and South-western Russia and Poland. *Caucasus Aborigines:* Georgians, Mingrelians, Lezhghians, etc. *Turco-Tatar:* Tatars, Uzbeqs, Bashkirs, Kirghiz, Turkomans, etc., in all about 9,000,000. *Mongol:* Kalmecks, in Russia and Central Asia; Buriats, Tunguses, etc., in Siberia. The Mongols, not reckoning the inhabitants in the portion of Manchuria recently occupied by Russia, number less than 1,000,000. Besides these there are in Russia 1,000,000 Europeans of various nationalities and a considerable number of Gypsies.

There is an almost inexhaustible literature on the archeology, ethnology, and languages of Russia. For the general reader it is practically inaccessible, being locked up in the native language. A list of the principal works will be found in the supplement to Ripley's *Races of Europe*. See also: Smirnov, *Ethnographie préhistorique de la Russie centrale et du nord-est* (Moscow, 1892); Sergi, "Varietà umane della Russia e del Mediterraneo" (*Atti Soc. Romana de Antrop.*, vol. i., 1893; also vol. x., 1897); Zeuss, *Les peuples de la Russie* (Moscow, 1892); Zograf, *Les peuples de la Russie* (Moscow, 1895); Bonmariage, *La Russie d'Europe* (Brussels, 1903).

History. In ancient times the Russian plains were for the most part outside of the known

world and were spoken of as inhabited by wild Seythian and Sarmatian tribes and, farther away, in the unknown, by those to whom the ancients gave the name of Hyperboreans. Later the Slavs from the Baltic and the banks of the Elbe and the Danube spread over the plains to the eastward. Their organization was tribal and there was among them no capacity for unified systems to moderate their tribal conflicts. There were centres like Novgorod and Kiev that assumed, by the ninth century, a certain importance, but there was no national unity. About the middle of the ninth century, a Scandinavian leader, Rurik, came to Novgorod with a band of warlike followers in response to an invitation to establish order and unity. From this event the Russian historians date the beginning of the Russian Empire, the foundation of which they place in the year 862. To the Slavs the Scandinavians (Norsemen) were known as Varangians. According to one theory the followers of Rurik bore the name of Russians, which was grafted upon the Slavic people in whose nationality they were soon absorbed. Others maintain that the name existed before this time as the designation of the inhabitants of the plains about Kiev. Some of the Varangians went on and established themselves at Kiev. Oleg (879-912), acting as regent for Igor, son of Rurik, made Kiev the capital of the embryo empire, subduing the neighboring tribes, and even made a successful raid against Constantinople. Igor (912-945) was succeeded by his widow Olga (945-957), who was baptized in 955 by the Patriarch of Constantinople, and abdicated soon after in favor of her son, Sviatoslaff (957-972), a warlike pagan, who was treacherously murdered. The principality was then divided among his three sons, and the quarrels usual in such cases followed, continuing till Vladimir the Great (980-1015), the youngest son, became sole ruler. The Varangians now became amalgamated definitely with the Slavic race. Vladimir's successful wars extended the boundaries of Russia to Lake Ilmen on the north, to the mouth of the Oka on the east, to the falls of the Dnieper on the south, and to the sources of the Vistula on the west. He became a convert to Greek Christianity, and in 988 was baptized with his followers. The nation soon adopted its ruler's religion and a metropolitan, subject to the Patriarch of Constantinople, was established at Kiev. Vladimir followed the evil example of his father in dividing his dominions. After his death dissensions broke out among his sons. For a time Sviatopulk (1015-19) ruled as Grand Prince of Kiev, but he was overthrown by his brother, Yaroslaff, who held the mastery over Kiev till his death in 1054. Under this prince the first code of Russian laws, the *Ruskaya Pravda*, was compiled. Yaroslaff's sons shared the principality among them. Each of these princes in turn divided his portion of territory among his sons, till the realm became an agglomeration of petty States. A state of anarchy, confusion, and petty warfare was perpetuated and ceased only after a lapse of four centuries.

The principal subdivisions of Russia during this period were: Susdal, in the upper and central parts of the basin of the Volga, from which, in the beginning of the thirteenth century, grew the principalities of Tver, Rostov, and Vladimir; Tchernigov and Seversk, which occupied the

basin of the Desna (an affluent of the Dnieper), extending nearly to the sources of the Oka: Ryazan and Murom, along the Oka basin and about the sources of the Don; Polotsk, including the basins of the Western Dvina and the Beresina; Smolensk, occupying the upper parts of the basins of the Western Dvina and the Dnieper; Volyhna and Galicia (Halicz), the first in the basin of the Pripiet (an affluent of the Dnieper), the second lying on the northeast slope of the Carpathian Mountains; Novgorod, by far the largest of all, occupying the immense tract bounded by the Gulf of Finland, Lake Peipus, the upper parts of the Volga, the White Sea, and the Northern Dvina; and the Grand Principality of Kiev, which, from its having been formerly the seat of the central power, exercised a sort of supremacy over the others. Novgorod (q.v.), from its position, became a flourishing commercial State, which rose to great power. The citizens chose their own princes, archbishops, and, in general, all their dignitaries. One of the chief factories of the Hanseatic League was established in Novgorod in the thirteenth century. The people of these various principalities enjoyed considerable liberty through the influence of the common council or *vyetch*, without which the Prince was almost powerless.

In 1163 the ruler of the Principality of Vladimir took possession of Kiev and proclaimed himself Grand Prince. In 1222 the Mongol tide of invasion, sweeping westward from Asia, reached the Polovtses, a nomadic tribe who ranged over the steppes between the Black Sea and the Don, and whose urgent prayers for aid were promptly answered by the Russian princes; but in a great battle, fought (1224) on the banks of the Kalka (a tributary of the Sea of Azov), the Russians were totally routed by Genghis Khan (q.v.). The Mongols did not follow up their victory for some time, but in 1237-38 Batu Khan (q.v.), at the head of a vast horde, conquered Eastern Russia, destroying Ryazan, Moscow, Vladimir, and other towns. The heroic resistance of Prince George of Vladimir cost the lives of himself and his whole army on the banks of the Siti (1238). The Mongol conqueror's career was arrested by the forests and marshes south of Novgorod, and he was forced to return to the Volga. In 1240 he swept over the southwest, destroying Tchernigov and Kiev; ravaged Poland and Hungary, defeating the Poles, Silesians, and Teutonic Knights on the field of the Wahlstatt (1241) and the Hungarians on the Sajó; but being checked in Moravia, and receiving at the same time the news of the Khan's death, he retired to Sarai, on the Akhtuba (a tributary of the Volga), which became the capital of the great khanate of Kiptchak (q.v.). The Mongol invasion destroyed the elements of self-government, which had already attained a considerable degree of development in Russia, arrested the progress of industry, literature, and the other elements of civilization, and threw the country more than two hundred years behind the other States of Europe. Oriental customs and methods became fixed among the people, separating Russia more and more with each generation from Western Europe. The principalities of Kiev and Tchernigov never recovered, and the seat of the metropolitan was removed to Vladimir. The dismal annals of this period were illumined for a short space by the deeds of Alexander Nevski (q.v.), Prince of Nov-

gorod and Grand Prince of Vladimir (died 1263). In his time, however, even Novgorod was forced to submit to the Mongol domination. In the early part of the fourteenth century extensive territories, including Volyhna and Kiev, were conquered by the Lithuanians. At this time Eastern Russia consisted of the principalities of Suzdal, Nizhni Novgorod, Iver, Ryazan, and Moscow, and long and bloody contests took place between the two most powerful of these, Iver and Moscow, for the supremacy. Under Ivan Kalita (1328-49), the founder of the system of administrative centralization which prevailed down to the time of Peter the Great, Moscow became the paramount grand principality. Ivan's son and successor, Simon the Proud (1340-53), followed in his father's footsteps. The Grand Prince Dmitri IV. (1362-89) profited by the weakness of the Mongol Khanate to make the first attempt to shake off the foreign yoke under which the Russians had groined so long. His brilliant victory over the Khan Mamai on the banks of the Don (1380), which gave him the surname of Donskoi, was the first step to liberation. Nevertheless, the Mongols succeeded in taking Moscow, exacted a heavy tribute from the people, and riveted their bonds more firmly than ever. Vassili (Basil) II. (1389-1425) conquered Rostov and Murom. Vassili III., the Blind (1425-62), reigned during a period of wars waged by various princes for the grand ducal throne; but from this period the division of power in Eastern Russia rapidly disappeared, internal troubles ceased, and the reunited realm acquired from union the power to cast off the Tatar yoke.

These results were achieved by Ivan III. (1462-1505), surnamed "the Great," who availed himself of every opportunity for suppressing the principalities which owed him allegiance as Grand Prince. The Republic of Novgorod, the last of the native Russian States, was added to the empire of Ivan in 1478. He then took advantage of the dissensions between Achmet, Khan of the Golden Horde, and Mengli-Gherai, Khan of the Crimean Horde, to deliver Russia by uniting with the latter. This coalition destroyed the power of the Golden Horde in 1480, and the yoke of the Mongols was broken. Ivan next turned his attention to the western provinces, which had formerly belonged to the descendants of Saint Vladimir (the Great), but were now in the hands of the Lithuanians. The adherents of the Greek Church were oppressed by the Catholics, and hailed the advance of Ivan's army as a deliverance from persecution. Ivan won a battle, but it was followed by no results of importance. Ivan married (1472) Sophia, a niece of Constantine Paleologus, the last Byzantine Emperor. He introduced into his Court the splendor of Byzantine, adopted the Byzantine Imperial eagles, and united the existing edicts into a body of laws, the *Sudbook*. Vassili IV. (1505-33) followed closely his father's policy, made war upon the Lithuanians, from whom he took Smolensk, and incorporated with his dominions the remainder of the small tributary principalities. His son, Ivan IV. (1533-84), surnamed "the Terrible," became monarch at the age of three years, and the country during his long minority was distracted by the contentions of the factious nobility or boyars (q.v.) who strove for power. On his attaining his majority, however, in 1547,

in 1689 he assumed the title of Czar, he was supported by wise and prudent counselors, Silvester I. (q.v.), and Belled, who, with his queen, Anastasia (q.v.), exercised over him a most beneficial influence. Ivan's arms were everywhere victorious; the fortified city of Kazan was captured in 1552, the Khanate, of which it was the capital, was annexed to his empire, and the Khanate of Astrakhan shared the same fate soon after (1554). The marauding Tatars of the Crimea were held in check, and the Knights of the Sword were driven from Livonia and Esthonia. Many internal improvements were made, and the commerce between England and Russia by way of the White Sea was inaugurated. The latter part of Ivan's reign, following the death of his wife, was marked by savage cruelty. Stephen Báthory, King of Poland, wrested Livonia from him, and the Crim-Tatars, in 1571, invaded Russia, and burned Moscow. It was during the reign of this monarch that Western Siberia was conquered for Russia by the Cossack Yermak. (See SIBERIA.) Ivan's son, Feodor (1584-98), was a feeble prince, who intrusted his brother-in-law, Boris Godunoff (q.v.), with the management of affairs. Feodor was the last reigning monarch of the House of Rurik. He died childless, and his only brother, Dmitri, was murdered, in 1591, by order of Godunoff, according to popular rumor. After the death of Feodor representatives of all classes were convoked at Moscow to elect a new sovereign, and their choice fell on Boris Godunoff (1598-1605). The mysterious death of Dmitri favored the appearance of pretenders to his name and rank, the first of whom (see DEMETRIUS), on the sudden death of Boris Godunoff, was crowned in 1605. A revolt, headed by Prince Vassili Shuiski (1606-10), soon broke out, the Czar was murdered, and Shuiski was elevated to the vacant throne as Vassili V. But a second false Dmitri now appeared, and Sigismund of Poland, whose son, Ladislas, had been elected Czar by the boyars, invaded Russia, and took possession of Moscow (1610). At the same time hordes of Tatars and bands of Poles and robbers devastated the provinces. There followed a national uprising under Minin Pozharsky, who retook the capital, drove the Poles out of Russia, and convoked an assembly of representatives, who unanimously chose for their Czar Michael Feodorovitch Romanoff (1613-45). See ROMANOFF.

The new monarch put an end to the revolt of the Don Cossacks, and to the depredations of the robber gangs in the southwest. In 1618 and 1634 he purchased peace from the Poles at the cost of Smolensk and a portion of Seversk. Alexis (Alexei) (1645-76), Michael's son and successor, being a minor, the nobles seized the opportunity of increasing their power and exercising oppression and extortion over their subjects, till rebellion broke out in various districts. The changes and corrections in the books and liturgy of the Church introduced by the Patriarch Nikon brought about the rise of a dissident sect. (See RASKOLNIKS.) Little Russia was acquired by the voluntary submission of the Cossacks (see POZANSKI, who had revolted against the oppression of the Polish magnates. In the war with Poland which followed, Russia acquired Smolensk with part of White Russia, and all of the Ukraine east of the Dnieper, together with Kiev. Alexis

was succeeded by his son Feodor (1676-82), under whom the first war between Russians and Turks was brought to a successful issue. After Feodor's death, the general council, in accordance with his wishes and their own, chose his half-brother Peter as Czar, but his half-sister Sophia, an able and ambitious princess, succeeded in obtaining the reins of power as Princess Regent and in having her own brother, the half-witted Ivan, proclaimed co-ruler with Peter. After an attempt to deprive Peter of the throne, she was forced to resign all power and retire to a convent. Her accomplices were executed, and Peter (1689-1725) became sole ruler, although Ivan was allowed to retain the empty title of Czar until his death in 1696. The history of Russia under Peter I., the Great, is a biography of that monarch. (See PETER I.) His reign was one of tremendous energy and national development, although much of his work was ill-timed. He attempted to transform the semi-Oriental society of Russia, by main force of autoeracy, into an Occidental society, and to make Russia a European power. This was done without consulting the national character or the natural conditions of the country, and produced that sharp conflict of opposing elements which has since been a source both of weakness and of strength to Russia. Peter's schemes for the territorial aggrandizement of the empire, as continued by his successors, were carried out in turn at the expense of Sweden, Poland, and the Turks. The Russians were decisively defeated by Charles XII. at Narva in 1700, but Peter nevertheless succeeded in making himself master of Ingermanland, on the Gulf of Finland, and parts of Esthonia and Livonia, and in 1703 laid the foundations of his new capital, Saint Petersburg, on the banks of the Neva. Profiting by defeat, he brought into being a well-disciplined army with which he crushed the Swedish King at Poltava (q.v.) in 1709. By the Peace of Nystad (1721) Russia was confirmed in possession of Livonia, Esthonia, Karelia, and Ingermanland. Azov had been taken from the Turks in 1696 and transformed into a base for the naval power which Peter hoped to establish on the Black Sea, but as a result of the Czar's unfortunate campaign beyond the Pruth, it was retroceded to the Sultan by the Treaty of Hush (1711).

Peter's only son, Alexei, had shown himself inimical to his father's political schemes and had met a premature death in 1718 (see ALEXEI PETROVITCH), and the crown passed by will to Peter's wife, Catharine I. Her short reign of two years was followed by that of the unfortunate Alexei's son, Peter II. (1727-30), who was entirely under the influence of the powerful family of the Dolgoruki. Upon his death the privy council, setting aside the other descendants of Peter the Great, bestowed the crown on Anna, the daughter of his imbecile brother, Ivan. Anna Ivanovna (1730-40) freed herself from the domination of the Dolgoruki and the Gollitzin, but was entirely under the influence of the German party, chief among whom were her favorite Biron (q.v.), Marshal Miinnich, and the Chancellor Ostermann. From 1736 to 1739 war was carried on against the Turks, and the Russians, under Miinnich, took Azov, overran the Crimea, and advanced to the mouth of the Dnieper. Deserted by its ally, Austria, Russia derived little profit from these conquests outside of the recovery of Azov. Anna

Ivanovna was succeeded by Ivan (1740-11), the infant son of her niece, Anna Karlovna (q.v.), under the regency of Biron. Biron was speedily overthrown and Anna Karlovna assumed the regency, but only to succumb to a palace conspiracy, which placed on the throne Elizabeth Petrovna, the daughter of Peter the Great. Elizabeth (1741-62) joined Austria against Prussia in the Seven Years' War (q.v.) and showed herself the relentless foe of Frederick the Great. The Russian armies gained victories over the Prussians at Grossjägerndorf (1757) and Kunersdorf (1759), and for a moment Berlin itself beheld the presence of Russian troops (1760). The death of Elizabeth (1762) saved Frederick in his desperate straits, for her successor, Duke Peter of Holstein-Gottorp, a son of Peter the Great's second daughter, Anna Petrovna, was a fervent admirer of the Prussian monarch, with whom he entered into an alliance. In July, 1762, Peter III. was dethroned as the result of a conspiracy headed by his wife, a princess of Anhalt-Zerbst; some days afterwards he was murdered and his wife ascended the throne as Catharine II. (1762-96).

Catharine's talents were on the same scale as her vices. She furthered the spread of Western civilization in Russia, introduced important administrative changes in the government, enacted laws favorable to the development of commerce and industry, founded schools and charitable institutions, and granted religious liberty to the Ras-kolniks. Abroad Catharine carried out with striking success her ambitious schemes for the aggrandizement of Russia. She was the guiding spirit in the spoliation of Poland (q.v.), in the three partitions of which (1772, 1793, 1795) Russia gained 180,000 square miles of territory with 6,000,000 inhabitants. Two successful wars were carried on against the Turks, the first of which (1768-74) was terminated by the Peace of Kutchuk-Kainardji, in which Turkey renounced her suzerainty over the Crimea and other Tatar regions. The Crimea was incorporated with Russia in 1783. The second war (1787-92) was concluded by the Peace of Jassy, which advanced the Russian frontier to the Dniester, Paul I. (1796-1801), son and successor of Catharine, was engaged continually in a struggle with the aristocracy, by whom he was cordially hated. His alternating rigor and indulgence alienated all the influential classes. He placed the press under a severe censorship and established a system of secret police. He joined the coalition against France and then withdrew from it and was preparing to make war against England when he was assassinated by conspirators.

Alexander I. (1801-25) was a lover of peace and largely imbued with the humanitarian ideas of the eighteenth century. He began his reign auspiciously by abolishing serfdom in the Baltic Provinces and establishing a number of ministries for the more efficient administration of the empire. He joined the third coalition against France, and his share in the defeat at Austerlitz (1805) did not deter him from allying himself with Prussia in the following year. The indecisive slaughter at Eylau (q.v.) and the crushing defeat of the Russians at Friedland (June 14, 1807) led to the famous meeting between Napoleon and Alexander at Tilsit, where the Russian Emperor, in return for entering into Napoleon's schemes, was

allowed a free hand in Sweden and Turkey. From the former Finland and the Aland Islands were wrested in 1809. Turkey, after a six years' contest, was compelled in the Treaty of Bucharest (May 28, 1812) to cede the land between the Dniester and the Pruth. Alexander's abandonment of the continental system was followed by the invasion of Russia by the French (1812). Upon the disastrous termination of the campaign the Russian Emperor became the leading spirit in the alliance which carried the war into Germany and France and brought about the overthrow of Napoleon. (See NAPOLEON.) By the Congress of Vienna, in 1815, the bulk of the Duchy of Warsaw, which Napoleon had created in 1807 out of the dominions acquired by Prussia in the spoiliations of Poland, was erected into the new Kingdom of Poland, which was placed under the sceptre of Russia. In the meanwhile the establishment of Russian dominion in the region of the Caucasus was proceeding rapidly. In 1801 Georgia was annexed, and in 1813 Daghestan, Baku, and Shirvan were acquired from Persia. The last ten years of Alexander's reign were a period of disillusionment for those who had expected the introduction of a liberal regime in Russia. The reign of Alexander's youngest brother, Nicholas I. (1825-55), opened with a rebellion on the part of the liberal element in behalf of his elder brother Constantine, who had renounced his title to the throne. Nicholas did not consent to assume the crown until it was evident that Constantine would not, and the imminent revolt demanded prompt action and a recognized sovereign. The rebellion, known as the rising of the Decembrists or Dekabrists, was crushed and the ringleaders were summarily dealt with. Soon after the accession of Nicholas, war with Persia broke out (1826), marked by a successful invasion of that country by Paskevitch (q.v.). The Treaty of Turkmanchah (February 22, 1828) gave part of Armenia to Russia. Russia took part in the destruction of the Turkish-Egyptian fleet at Navarino (1827), which event virtually secured the liberation of Greece. In 1828 Russia made a fresh onslaught upon Turkey. The victories of Wittgenstein, Paskevitch, and Diebitsch led to the Treaty of Adrianople (q.v.) in 1829, in which Turkey transferred to Russia the suzerainty over the tribes of the Caucasus, accorded to the Czar a protectorate over Moldavia and Wallachia, and agreed to recognize the independence of Greece. In 1830 the Poles revolted, drove out the Grand Duke Constantine, and organized a provisional government. They carried on a brilliant and aggressive campaign against the Russian forces until May, 1831, when the strength of Russia began gradually to overwhelm them. Warsaw capitulated on September 8th. On February 26, 1832, a new statute was promulgated by Nicholas I. treating Poland as a conquered State. (See POLAND.) In 1834 the conquest of the Caucasus, which occupied Russia for thirty years, was begun. In 1848-49 the Austrian Imperial Government, unable to suppress the Hungarian revolt, asked Russia for assistance. This was readily granted, because of the intimate connection of the Poles with the Hungarian movement, the success of which would have encouraged a new Polish insurrection. (See HUNGARY.) In 1853 Nicholas again made war upon the Ottoman Empire.

France and Great Britain, later joined by Sar-
dinia, interfered, and the Crimea became the
scene of a bloody conflict. Sebastopol fell in
September, 1855, six months after the death of
Nicholas. The Treaty of Paris closed the struggle
in 1856. Russia was compelled to part with a
strip of Bessarabia, the Black Sea was neutral-
ized, and the Russian protectorate over the Danu-
bian principalities was abolished. See CRIMEAN
WAR; EASTERN QUESTION.

The accession of the son of Nicholas, Alexander
II. (1855-81), introduced a new era of internal
reforms. The abolition of serfdom in 1861 created
more than twenty millions of freemen, whom a
system of State loans enabled to secure small farms
on an installment plan of payment. Corporal pun-
ishment and the farming of the taxes were abolished.
There were nominal reforms in the judiciary,
separating judicial from administrative functions,
but in fact this has not worked successfully. In
the face of revolutionary agitation (see Nihilism)
the earlier reform tendencies of this reign gave
way to a reactionary policy. The last Polish in-
surrection broke out in 1863 and was suppressed
with extreme severity. By a succession of ukases
the Kingdom of Poland was in the course of a
few years incorporated in the Russian Empire.
(See POLAND.) The administration of the Bal-
tic Provinces was assimilated to that of the rest
of the empire. Vast accessions were made to the
dominions of Russia. In 1858 the Amur Land
was formally made over to the Czar by China.
The subjugation of the Caucasus was completed
between 1859 and 1864. The establishment of
Russian supremacy in Central Asia, which was
begun under Peter the Great, was completed
in this reign. In 1868 Samarkand was occupied
and the Khan of Bokhara became a vassal of Russia.
In 1873 Khiva became a subject State. In 1876
Khokand (Ferghana) was annexed. Skobelev's
capture of the Tekke fortress of Geok-Tepe in
1881 practically completed the conquest of the
trans-Caspian country. Since that time Russia
has been steadily organizing these provinces and
providing for their settlement and strategic de-
velopment by her great railway system. Russia
had always been restive under the provision of
the Treaty of Paris relating to the navigation of
the Black Sea, and in 1870, upon the fall of the
Emperor Napoleon III., who had been the chief
sponsor for the treaty, the Russian Government
intimated that it felt no longer bound by the
provisions of the treaty. At the London con-
ference of 1871 this claim was admitted by the
powers. This was the beginning of a resump-
tion of the aggressive attitude toward Turkey.
The Porte's maltreatment of its Christian sub-
jects and the Turkish atrocities in Bulgaria
(q.v.) in 1876 led to a conference of the powers
at Constantinople. This conference made certain
proposals looking toward a reform in the Tur-
kish administration. Upon the rejection of these
proposals by Turkey Russia undertook to enforce
them, and in April, 1877, declared war. The war
was conducted with great energy by Russia, and
in January, 1878, the Russian forces were in the
vicinity of Constantinople. The war was closed
by the Treaty of San Stefano (March 3, 1878),
which was materially modified by the interven-
tion of the powers through the Congress of Ber-
lin. (See RUSSO-TURKISH WAR; BERLIN CON-
GRESS OF.) In 1867 Russia gave up her vast pos-

sessions in Arctic America, transferring Alaska
by sale to the United States.

There had for some time been increasing
discontent among the people tending toward
revolution. Nihilism only increased in con-
sequence of the Government's repressive meas-
ures. There were numerous outbreaks, but in
1880 Alexander seemed to have returned in a
measure to his earlier liberalism. The secret
police was abolished, and Loris-Melikoff (q.v.),
in whom there was general confidence, was ap-
pointed as Chief Minister with extraordinary
powers. This seemed for a time to quiet the
disorders, and as it was known that marked re-
forms were to be proposed, it was confidently
hoped that agitation would cease altogether, but on
March 13, 1881, the Emperor, while on his way
to the Winter Palace in Saint Petersburg, was
killed by the explosion of a bomb thrown by one
of a group of revolutionary conspirators.

Alexander III. (1881-94), influenced no doubt
by the reaction due to his father's assassination,
took for his advisers the leaders of the extreme
Russian and autocratic party. His policy was one
of peace in Europe, though the advance of Russia
in Central Asia continued to arouse concern in
England. The acquisition of Merv in 1884
brought Russia close to Herat, the key to Af-
ghanistan, the Buffer State of British India. For
a moment, in 1885, war between Russia and
England seemed imminent, but the difficulties
were settled by the appointment of a joint com-
mission, which adjusted the Afghan boundary. In
1891 the construction of the trans-Siberian rail-
way was begun. Since 1887 close relations with
France have been established and maintained, as
an offset to the Triple Alliance of Austria, Ger-
many, and Italy. The anti-Semitic agitation
which began to affect Europe about 1880 started
in Russia a legal and extra-legal persecution
of the Jews, which has been continued, and mod-
ified only when its severity has brought forth
protests from the other civilized peoples that
could not be ignored. The Jews are confined
by law to the Pale of Settlement, a belt ex-
tending from the Baltic to the Black Sea,
chiefly through the Polish and adjoining prov-
inces. Successive acts have expelled them from
other parts of the empire, and they can only live
outside the Pale by special privilege. Prohibited
from acquiring real property, and thus prevented
from becoming farmers, the Jews were forced to
crowd into the towns, where they became artisans
or engaged in mercantile pursuits. Great masses
of them, unable to do anything in any of the
fields left open to them, sank into poverty. With
legal restrictions have come physical persecutions,
at different times taking the form of riot and
massacre. The most notable instance of this kind
occurred in May, 1903, at Kishinev, the capital
of the Government of Bessarabia, when more than
fifty Jews were killed and the hospitals were
filled with the wounded.

Alexander III. died November 1, 1894, and
was succeeded by his son, Nicholas II. (q.v.).
As Czarevitch, Nicholas had traveled in the Far
East and through Siberia and acquired a better
knowledge than any of his predecessors of the
needs and possibilities of those regions. In his
reign the development of Asiatic Russia by rail-
ways has been pushed steadily forward. After the
intervention of Russia, with the other powers,

at the close of the China-Japan War of 1894-95, Russia was able to obtain from China a lease (March 27, 1898) for twenty-five years of the Kwang-tung Peninsula, which was made a province. Here are the strong naval station of Port Arthur and the new port of Dalny, built by Russia. By the treaty with China providing for the construction of the Manchurian Railway, which is really a part of the great Siberian system, Russia maintains a military occupancy of Manchuria. After the Boxer troubles in China in 1900, this occupation, the original pretext of which was the protection of the railway, was so strengthened as to cause apprehension on the part of other nations that Russia was about to carry out in Manchuria her traditional Asiatic policy of absorption of such provinces belonging to weaker powers as might be available. In reply to the protests of the powers the Russian Government denied any such intention and asserted that the Russian troops would retire as soon as the state of the country would permit, but at the close of 1903 it had become evident that the Russian occupation of Manchuria was to be a permanency. This aggressive advance of Russia has caused strained relations with Japan. In recent years Russia has succeeded in great measure in bringing Persia under her influence. While thus extending the scope of her activities in Asia, Russia has not lost sight of her traditional policy of enlarging her possessions in Europe. It is the dream of Russian patriots to bring the whole Slavic world under the sceptre of the Czar (see PANSLAVISM) and to make good the claim of Russia as successor to the Byzantine or Greek Empire, in her capacity as the great Greek Christian power, by the occupation of Constantinople. In the internal affairs of the country the Russian nationalists have continued to be dominant, and the Russianizing of Poland, Finland, and other provinces has been pushed forward unsparingly. The liberal agitation, which has its centre and strongest impulse in the universities and which was supposed for a few years to have become dormant, has reawakened since the opening of the twentieth century and assumed an insistent attitude which renews the uncertainty as to the future of the Russian autocracy. In 1899 an order of the Czar created a commission to abolish transportation of criminals and substitute punishment by the courts, and to reform the whole system of punishment for crime. In 1898 a rescript of the Czar to the governments of the civilized powers on the subject of international peace led to the assembling in 1899 of the Hague Peace Conference (q.v.).

RUSSIAN ARCHITECTURE. The indigenous architecture of Russia is a development of the Byzantine (q.v.). It is similar to that of Armenia, to that of the Caucasian region, and to that of Moldavia. The great peculiarity of the Russian style—that which makes it at once remarkable and recognized among other styles of building—is in the great extension given to the idea of the cupola or lantern, which in one form or another forms the principal roof of nearly all the churches in the land. For all these buildings are of the 'central type,' in contradistinction to the 'basilica type,' that is, they are arranged around a chosen centre which may be the sanctuary or the chief place for the congregation, and they are not drawn out into long parallel lines. Such a church, then, generally square, or nearly so in its main outlines, will be roofed by a central cupola covering the whole nave, which is nearly square, and at least four minor cupolas covering four chapels at the corners, while the aisles and porches between have minor roofs on a much lower level; or, as in the case of some of the large wooden churches, the rounded cupola will be replaced by a blunt spire built of timber and covered with plank, with four or eight sloping sides, while this pyramid may or may not terminate in a very small cupola, apparently studied from Persian design. The wooden churches are generally in the far north, and these share that peculiarity of Norwegian buildings of the same class, in being almost wholly without window openings. To keep out the cold wind of winter and to facilitate the warming by means of stoves, the worshippers are satisfied to use the light of lamps almost exclusively. The masonry churches of the centre and south are very like those of Athens and other places in Greece in their compact plan and generally in their small size, though none are quite as minute as well-known Grecian examples.

The official architecture of the empire, since the time of Peter the Great, has been largely a rather unsuccessful imitation of the supposed grand style of the eighteenth century. The massive Cathedral of Saint Isaac in Saint Petersburg is a marvellous structure in which use has been made of the exceptionally fine granite quarries of Northern Russia to produce monolithic columns of unexampled size; but there is little in the design to please the student of mere classic art. The porticoes are splendid because they could be closely copied from Roman examples, and their gigantic monolithic columns with gilt-bronze capitals suffice to give them splendor,

but the design of the mass and the application of the cupola to it are of little value. A finer church is that of Our Lady of Kazan in Saint Petersburg, with a great portico where curved wings project on both sides, somewhat in imitation of the Piazza di San Pietro in Rome. Consult: Rikhter, *Monuments of Ancient Russian Architecture*, translated (1850); Souzlow, *Monuments de l'ancienne architecture russe* (Leipzig, 1895-1901); Martinoff, *Ancient monuments des environs de Moscou* (Moscow, 1889); Montferand, *Eglise cathédrale de Saint-Isaac* (Saint Petersburg, 1845).

RUSSIAN CHURCH. See GREEK CHURCH.

RUSSIAN LANGUAGE, THE. The most important of the Slavic languages (q.v.), with respect to the number of its speakers and its literature. It is spoken by about 90,000,000 people throughout the Russian Empire, and by about 4,000,000 Ruthenians in Galicia, Bukowina, and Hungary. It is also heard in Alaska. Though the language of a Bohemian sounds quite foreign to a Russian, yet the latter can, with a little effort, understand a Servian, a Bulgarian, or a Pole, and finds only a few difficult words and forms. In the tenth and eleventh centuries the difference was still slighter, yet even then Russian had a pronounced individuality and a number of well-defined dialects. The chief influence on Russian was exercised by the Slavonic of the ecclesiastical books, the contributions from the Tatar (quite few), Polish, German, and French being mainly limited to additions to the vocabulary. About the sixteenth century the Russian language reached its present state as far as the main features of it, in sound and form, are concerned. After Peter had introduced the present 'civil' alphabet, Lomonosoff (q.v.) gave the Russian its modern aspect by means of his many grammatical and philological works. At present, there are three distinct dialects of the Russian language:

(1) *Great Russian* found in its purest form about Moscow. This is the basis of literary Russian. It is used by about two-thirds of the Russian-speaking population, or about 60,000,000 people. Broadly speaking, it is heard in the north, centre, and east of Russia, having two subdivisions: (a) North Great Russian and (b) South Great Russian.

(2) *Little Russian*, spoken by about one-fourth of the Russian-speaking population, or over 20,000,000 people, in the south and southwest of Russia, and by the Ruthenians in Austria-Hungary. It possesses quite a literature of its own, the works of Shchchenko being its finest specimens, although in Russia the dialect is under official ban. It possesses three varieties: (a) North Little Russian, (b) South Little Russian, and (c) Red (Ruthenian) Russian (heard in Volhynia, Podolia, and Galicia).

(3) *White Russian*, spoken by about 5,000,000 people, in the western part of Russia, chiefly in Lithuania. The spelling is rather historical than phonetic, e.g. *paŭni* (we sing) is pronounced *paŭni* in the Moscow dialect, but a pronunciation more phonetic is quite common.

Among the formal characteristics of the Russian language may be noted: (1) Seven cases, nominative, genitive, dative, accusative, vocative, ablative (instrumental), and preposition-

al: (2) three genders in nouns, adjectives, and past tenses of verbs; (3) two terminations for adjectives: (a) 'complete,' or purely adjectival, (b) 'clipped,' or predicative; (4) two varieties of participles: (a) adjectival and (b) adverbial; Fr. gérondif; (5) only three tenses, but a great variety of 'aspects,' whereby a verb can be made to express the finest subtleties and shades of the Latin frequentatives, inchoatives, etc.; in general, through composition with a preposition, every present becomes a future, every imperfect a perfect: thus, e.g. *stoy-u* (= *stay*); *postoy-u* (= *stabo*); *stoy-al* (= *stabanu*); *postoy-al* (= *steti*); (6) a great variety of diminutives and augmentatives: *syn* (son); *synishche* (a strapping son); *synok* (a little son); *syn-otchek* (a dear little son); *synishetikka* (a dear little mite of a son); and (7) finally, the disuse of the copula in the present tense, the absence of the article, and the personal endings of the verb, which allow the omission of the pronouns when desired for rhetorical purposes. The capacity for compounds and derivatives is so great that thousands of words belong to the same root. The arrangement of words is almost entirely free, as the grammatical inflexions obviate misunderstanding. This elasticity gives to the Russian tongue an incisiveness and perspicuity that most modern languages lack. On the other hand, the freedom of accent (there are Russian words with the accent on the seventh syllable from the end) and the variety of vowels from the *y* (broader than English *i*) to *i* (softer than Italian *i*) allow of such a variety of cadences and poetic effects as are given only to several other modern languages combined. Thanks to these qualities, works of such varied character as the epics of Homer, the tragedies of Æschylus and Shakespeare, the sonnets of Petrarch, and the musical lyrics of Verlaine can be and have been translated into Russian with unsurpassable fidelity to the form and spirit of the originals.

The *Dictionary of the Church Slavonic and Russian Languages*, containing about 115,000 words, was published by the Second Section of the Imperial Academy of Sciences in 1847, but was very far from completeness. A new edition, the *Academic Dictionary of the Russian Language*, now in course of publication, embraces only nine or ten letters of the alphabet. The other standard work, V. Dahl's *Explanatory Dictionary of the Living Great Russian Language* (5th ed., Saint Petersburg, 1880-82), is the storehouse of current forms and expressions. The *Essay of a Provincial Great Russian Dictionary* (Saint Petersburg, 1852), with *Supplement* (1858), is of great value. The most important grammatical treatises are: Busslayeff, *Historical Grammar of the Russian Language* (5th ed., Moscow, 1881); Brandt, *Lectures on the Historical Grammar of the Russian Language* (vol. i., Saint Petersburg, 1892); Solovievski, *Lectures on the History of the Russian Language* (2d ed., Saint Petersburg, 1891); and *The Old Church Slavonic Tongue, Phonetics* (Moscow, 1891).

The best books for foreigners are: DICTIONARIES: Alexandroff, *Complete Russian-English* (3d ed., 1899), and *Complete English-Russian* (2d ed., 1897); Makaroff, *Dictionnaire Français-Russe* (7th ed., 1892), and *Russe-Français complet* (6th ed., 1893); Pavlovsky, *Russisch-Deutschches und Deutsch-Russisches Wörterbuch* (3d ed., Riga, 1886), a monumental work of its kind.

GRAMMARS: Alexandroff, *A Practical Method of the Russian Language* (London, 1892); Koala, *How to Learn Russian and Why* (ibid., 1878); Manassevitch, *Die Kunst die russische Sprache zu erlernen* (Vienna, Pest, Leipzig); Alsch, *Die Haupttheorie der russischen Sprache* (Leipzig, 1897); and Kerner, *Ausführliches Lehrbuch der russischen Sprache* (Sonderhausen, 1892).

RUSSIAN LITERATURE. The literature of Russia presents an interesting phenomenon by the side of the other European literatures. Although it possesses a remarkable wealth of genuine folk-poetry, both epic and lyric, Russian written literature developed independently of the purely national literature, and with the exception of the famous *Song of Igor* (Bard in the twelfth century; see Ivan's BYZAN, SOUV. OR.), until modern times there was no artistic work on these national themes. For practical purposes Russian literature may be divided into four periods:

(1) PERIOD OF BYZANTINE GREEK INFLUENCE. As in many other countries, the beginning of literature are found in translations from Old Church Slavonic (q.v.) of the Bible and books for church service. Even when copying the Old Church Slavonic books of worship, the scribes frequently modified the original texts to Russian, most often inadvertently, but also sometimes purposely to make the text more intelligible to Russian readers. Thus drawing upon Greek models, the Russians gradually came to write also independently. The most original writers of this period are Ilarion, the first Russian Metropolitan (1051-54), and Kyril Turovski, both representatives of genuine oratory; Daniel the Exile (thirteenth century), whose *Prayer* was intended to soften the heart of Yaroslaf Vsevoloditch, who imprisoned him on Lake Lache; the Abbot Daniel, whose *Journey to Jerusalem* (1166-68) is important for its topographical information concerning Palestine, and as throwing some light on the subsequent final schism of the Greek and Roman Catholic Church; and finally Nestor (q.v.), the author of the *Chronicle*. Furthermore, almost every principality of any account had its annalist, so that numerous chronicles are extant. Mention must also be made of Yaroslaf's Code, *Russian Right* (1054), and of Prince Vladimir Monomach's (1113-25) *Precepts to My Children*, a vade mecum of practical advice reinforced by examples drawn from his own life.

(2) PERIOD OF DARKNESS AND STAGNATION (from the thirteenth to the seventeenth century inclusive). The Tatar invasion under Baty (1224-1237) almost annihilated Russian literature. However, a few works of some merit belonging to this period have been preserved. Chief among these are the *Journeys* of Antony, Archbishop of Novgorod to Constantinople (1200); of the monk Simeon and the Susdal Bishop Avraamii, who accompanied the Moscow Metropolitan Isidor to the Florentine Council (1439); and of Afanasy Nikitin, a merchant of Tver who journeyed to India (1466-72). Then follow the Apocryphal Tales about Solomon, taken from the Greek, Chronographs and Palms, and the famous battle on the field of Kulikovo (1380), where the Tatars were routed, moved an unknown author to write *Zadonshtchina*, "Events

the 'Don,' a rehashing of an earlier work, with senseless additions from the *Song of Igor's Band*. On the fall of the South Slavic kingdoms in the fourteenth century, the scholars of the south began to migrate into Russia. For almost two centuries there was, however, practically no revival of literature. At a council held at Moscow in 1557 at the command of Ivan IV., the first Czar of Russia, it was enacted that only revised books were henceforth to be used in the church. As no one in Russia was capable of undertaking the task of redaction, Maxim the Greek (1480-1556) was intrusted with the work. Perhaps the most important monument of this period is the famous *Domostroy*, "Household Regulation," of the priest Sylvester, adviser of Ivan IV. (1547-1560). Written for his son, it comprises a mass of regulations concerning every phase of life, from questions of morality and religion to the minutest details of cuisine. The polemic of five letters from Prince Kurbski (1528-87) in Poland to Ivan is remarkable for the literary contrast between the style of the learned and gifted Kurbski and that of the Czar, equally gifted, biting, and well read, though possessing no systematic education. His other work, a *History of the Muscovite Czar*, is a logical, though partisan, recital of the development of Ivan the Terrible's character. The seventeenth century brought with it new ideals, and the writers of that century, Yuri Krizhanitch, the Servian, in his *Polity*, and Grigori Kotoshikhin (1630-67), in his *Russia in the Reign of Alexei Mikhailovitch*, appeal for education, the greatest need of the young State. Other important literary events of Alexei's reign (1645-76) were the establishment and publication of the first Russian newspaper, although in manuscript form, and the foundation of the theatre at Moscow.

(3) PERIOD OF WESTERN EUROPEAN INFLUENCE (eighteenth century). The connection between Russia, wrapped up in her Greek orthodox faith, and Western Europe was very slight during the Tatar domination. Only after the return of Peter the Great in 1698 did Russia become again a European State, and her literature more or less a replica of the theories and views current in Western Europe. Peter's reforms encompassed even the simplification of the alphabet in conformity with Roman characters; new words were introduced, constructions were modeled upon the French and German, and liberal rewards were paid for translations of useful books into Russian. In his labors the Czar was assisted by the Bishop Feofan Prokopovitch, an erudite writer and man of great political sagacity. Kantemir (q.v.), an ambassador in Western Europe, with his satires represents a great step forward. They were the first germ of modern Russian realism. Trediakovski (1703-69), through a study of the Russian national poetry, discovered its tonic metre, though his verse was clumsy. The great name of Russian literature in the eighteenth century is Lomonosoff (1711-65). His works on rhetoric, grammar, and versification laid the permanent basis of modern Russian literature by limiting the use of Old Church Slavie forms in literary language. His contemporary, Sumarokoff (1718-77), established the pseudo-classical tragedy, with his dramas written in servile imitation of Corneille, Racine, and Voltaire. But

the real elements of progress for Russian letters lay in his comedies and fables and satires, where much genuine native wit and humor is displayed. His greater successor, Fonvizin (1745-92), wrote two comedies, *The Brigadier* and *Agedorosl*, "The Minor," in which he ridiculed the deeply rooted ignorance that lay concealed under the thin veneer of education obtained from foreign tutors. The reign of Catharine II. found a spirited panegyrist in Derzhavin (q.v.), whose lyrics and odes are characterized by strong imagery and vigorously plastic form. The Academy established at Saint Petersburg (1726) and the first Russian university at Moscow (1755) produced a number of native scholars. A taste for literature, intensified by the vogue of Bogdanovitch's *Dushenka*, was growing up. The opportunity was seized by Novikov (1744-1818), a man of letters and a publisher of popular literary magazines.

The end of the century witnessed the rise of sentimentalism in Russia, as in the rest of Europe. This movement found immediate response in Russia. Here belongs the work of Karamzin (q.v.). His short stories, imitations of 'family novels,' and his *Letters of a Russian Traveler*, modeled after Sterne's *Sentimental Journey*, created a demand for literature, and his *History* was an event in Russian letters.

(4) THE NINETEENTH CENTURY ROMANTICISM. In Russia the romantic movement found representatives in Zhukovski (1783-1852), a gifted poet, famous for his remarkable translations of Goethe, Schiller, Byron, Tasso, and Homer (*Odyssey*), and Batyushkoff (1787-1855), who worked in similar fields. The exclusive domination of French models in Russian literature was broken. The Russian verse as perfected by Zhukovski and Batyushkoff was awaiting a great master to take advantage of its technical perfection for original work. That master was Pushkin (q.v.) (1799-1837). His epic *Ruslan and Lyudmila* (1820) was the first successful attempt to draw material from Russian antiquity and popular legends. He sounded genuine national notes in his drama *Boris Godunoff* (1825), written under the influence of Shakespeare, and in his *Yevgen Onegin* (1825-32). After Pushkin Russian literature becomes an independent branch of European literature. Besides the circle of his literary disciples and colleagues, like Ryleyeff, Baratynski, Prince Odoyevski, Prince Vyazemski, Bestuzheff, and others, two great names are prominent—Lermontoff (1814-41) and Koltsoff (1808-42). Lermontoff, strongly tinged with Byronism, was Pushkin's direct disciple, but his individuality marks him as an independent poet, second only to his teacher. In his novel, *A Hero of Our Time*, he produced a masterpiece fully equal to Pushkin's *Yevgen Onegin*. Koltsoff created the art-song, all the motives and themes being those of the people, and invested it with perfect artistic form. Gribovoff's (1795-1829) remarkable comedy-satire, *The Misfortune of Being Too Clever*, ridiculed society for aping the fads and fashions of Europe and disdaining the old native simplicity. Another great poet was the fabulist Kryloff (q.v.) (1768-1846), who cast into the shade his predecessors Khenimser (1745-1784), Dmitriyeff (1760-1837), and Sumarokoff. Though he wrote much in other lines, his fame rests on his fables, which are

among the best of their kind in the whole range of literature.

THE PERIOD OF NATURALISM IN RUSSIAN LITERATURE. The first prose-writer in Russia to give the novel the important position it now enjoys in literature was Gogol (q.v.) (1809-52). Pushkin's devoted admirer and friend. In his comedy *Revizor* and his unfinished novel *Dead Souls*, he brought to the front the humorous side of Russian officialdom, which he held up to ridicule with amazing power. This period marks an epoch in the history of Russian literature.

SLAVOPHILES AND WESTERNERS. Both parties saw in Russia the 'elect nation,' the future regenerator. But the Slavophiles found that regenerative force in Russia's past with her historical traditions, while the Westerners saw the special fitness of Russia to play the rôle of universal regenerator in the very absence of historical traditions. However great the differences in their political views, both camps were inspired by the same sincere love for the people, in whom alone they saw the future of Russia, for whom alone they pursued their labor of love and life. In this literary war the Westerners had the advantage of literary and artistic superiority. Around the coterie of Herzen, Bakunin, Byelinski, Stankovitch, and Granovski clustered a number of rising authors, with higher education, all eagerly listening to their prophet, Byelinski. Turgeneff, Tolstoy, Dostoyevski, Grigorovitch, Gontcharoff, Shtchedrin, Sheftchenko, Nekrasoff, and even Gogol, more or less, were products of Byelinski's school, whose tenets were the attainment of the social and ethical ideals of society. This school laid the foundation of the Liberal Russian movements.

EPOCH OF GREAT REFORMS (1855-62). On the accession of Alexander II, the writers who had been exiled for their reformatory endeavors were allowed to return to the capital. The periodicals tried to revive the liberal ideas of Byelinski, apparently forgotten since his death. Two great critics were molding public opinion, and directing it in the line of reform: Tchernyshevski (q.v.) (1828-89), choosing his themes in connection with the questions of the day, established positivist principles instead of the misty Hegelianism of the forties. His pupil and successor, Dobrolyuboff (1836-61), a progressist *par excellence*, introduced criticism of public affairs into Russian literature. A literary production was henceforth esteemed in proportion as it advocated social progress. Aksakoff's *Chronicle*; Turgeneff's *Rudin*, *Noblemen's Nest*, *On the Eve*, *Fathers and Sons*; Gontcharoff's *Oblomoff*; Ostrovski's *Storm*; Shtchedrin's *Governmental Sketches*; Pisemski's *Thousand Souls and Bitter Lot*; Dostoyevski's *Memoirs from a Dead House*; Tolstoy's *Sevastopol Tales*; and A. Tolstoy's *Trilogy*—all these were created during the first years of this period of intensity in literature.

REACTION AND THE EPOCH OF NIHILISM. The peasant riots of 1862-63, on the morrow of liberation, the disturbances among the students, and especially the Polish insurrection of 1862-63, gave the reactionaries in the Slavophil camp an opportunity long awaited. The cry of nihilism went up, and Katkoff, a Slavophil constitutionalist, now became the leader of Slavophilism in its new spirit of devotion to absolutism and throne, and advocacy of Russia for the Russians. Herzen and the 'nihilists' were pointed at as the

only causes of the disturbances, and restrictions were loudly demanded. The liberal writers transferred their dissatisfaction to their works of art. Shtchedrin was unmerciful with his satire; Turgeneff pleaded in his pessimistic vein; Dostoyevski and Pisenski openly went over to the side of the reactionaries; Gontcharoff was at all events not in sympathy with the liberals. On the other hand, Katkoff's *Russians Messenger* and *Moscow Gazette* were stocked with 'anti nihilistic' fiction; Pisenski's *Turbulent Sea*, Klyushnikoff's *Wagon*, a series of novels by Lyeskoff and Vsyevolod-Krestovski, depicted nihilists as the very dregs of society.

Simultaneously, interest in the peasants created the 'muzhik literature' so prominent in the next decade. The comic sketches of the peasants by N. Uspenski and Slyeptsoff (in the fifties) were succeeded by the serious sociological studies of Ryeshetnikoff, Levitoff, and Naumoff. Yakushkin spent all his life wandering over Russia, bundle in hand, collecting tales and songs. Commissioned by the Government, Maksimoff traversed Siberia and embodied his observations in the famous *A Year in the North*. Together with Danilevski's studies of South Russian peasant life and Melnikoff's studies of the life of the Raskolniks, these gave a true conception of the life of the lower classes.

THE SEVENTIES—'PEASANTISM.' The interest in social sciences expounded by the brilliant sociologist and critic Mikhailovskii was at its height; his path was prepared by Pisareff (1846-88), who had established utilitarianism and real notions of individual rights in Russia. The liberals came to the conclusion that the only way to help the people was to enter among them and there spread knowledge and enlightenment. Thousands of young people donned the peasant's garb, foregoing the comforts of culture and city life. The period was not favorable to new names—altruistic action consumed the flower of the generation—but the old talents developed to the highest point. Shtchedrin wrote his *Missionary Golovnyeff* (the crowning work of his literary career). Tolstoy, too, turned to altruistic love in his 'famine letter' (1873) and *Anna Karolina*. All the new literary talents directed their efforts to *muzhik* fiction. Among these writers the names of Glyeb Uspenski and Zlatovratski stand out in bold relief. Toward the end of the seventies pessimistic views begin to be reflected in the new authors. Such were Novodvorskii, Yasinski, Petropavlovskii, Ertel, and particularly Garshin. However, in others, notably Potapenko and Korolenko, an optimistic note is heard.

THE EIGHTHS AND NINTHS (EPOCH OF GRIPPING FOR NEW IDEALS). Alexander III, instituted on his accession in 1881 a system of rigor and reprisals. In literature only 'pure art' and productions inculcating the 'underminers of the foundations' were left undisturbed. A new school, ultra Chauvinist and of the boulevardier type, cropped up. Katkoff is the great leader of the absolutist party; another is Prince Meshcherski, editor of the *Citizen*. Nearly all liberal publications were stopped. Only Boloytkin constantly embodied the latest questions of the day in his numerous novels. Fiction was forced into new channels, where discussions of current life is impossible; the historical novel flourishes under Vsyevolod Solovoyeff, Mordavtseff, and Danilevskii. In poetry the most popular name is that

of Nelson (1862-87), whose themes are the sorrows of his own life. Poets like Minsky, Fofanoff, Mensikovski, Balnout, Andreyevski, turned into Decadents and Symbolists. Among the champions of liberal thought most prominent is the philosopher, critic, and poet Vladimir Solovyoff (1853-1900). Another foe of obscurantism is Menshikoff, a follower and personal friend of Tolstoy.

At present Russian thought turns to the discussion of material problems, the strides of capitalism being vigorously combated on sociological grounds by Mikhailovski. Gorky (q.v.) (pseudonym of A. Pyeshkoff) depicts the life of the lowest scums of city life, paupers, and vagabonds. Other prominent names among writers of this class are Tchekhoff and Melshin (pseudonym of P. Yakubovitch), the latter of whom had spent a dozen years in Siberian exile. Melshin's *From the World of Outcasts*, describing prison life as he saw it, has been unanimously assigned a place of honor by the side of Dostoyevski's *Memoirs from a Dead House*, while his poems mark him as the most eminent poet-thinker of Russia at present.

FOLK-LORE. Probably no other nation possesses a more remarkable wealth of folk-lore than Russia. The proverbs and the riddles run into the thousands, the best collections being those of Dahl, *Proverbs of the Russian People* (new ed., Saint Petersburg, 1879), and Ladovnikoff, *Riddles of the Russian People* (ib., 1876). There are several collections of fairy-tales, the most satisfactory being that of Afanasyeff, *Russian Popular Tales* (3d ed., Moscow, 1897). There are ritual songs and incantations for every event of life from birth to burial. The lyric songs mirror the whole of the Russian character. Those of Northern Russia are characterized by native strength; those of the south are graceful, delicate, and plaintive. The latest work on the subject is by Lobolevski, *Great Russian Folk-Songs* (7 vols., Saint Petersburg, 1895 et seq.). The epic songs or *bylinas* (q.v.) date from legendary times to the nineteenth century, but those dealing with the past are the best. These have appeared in collections by Kireyevski (10 vols., Saint Petersburg, 1860-74), Rybnikoff (4 vols., Petrozavodsk, 1861-67), Bilferding (Saint Petersburg, 1873), and Avenarius (5th ed., Moscow, 1898).

RUSSO-TURKISH WAR (1877-78). A conflict between Russia and the Ottoman Empire, growing out of the condition of the Balkan countries and involving an effort on the part of Russia to extend her dominion in the direction of the Mediterranean. (See EASTERN QUESTION.) In 1875-76 risings against Turkish misrule broke out in Bosnia and Herzegovina, encouraged by Serbia and Montenegro, and probably by Russia, the spirit of revolt spread. The Bulgarian atrocities in May, 1876, called the attention of the Western Powers in a forcible manner to the state of affairs in the Balkan provinces. Gortchakoff, Andrassy, and Bismarck drew up the so-called Berlin Memorandum, but the habitual failure of the Powers to agree in their action prevented the diplomatic representations made at Constantinople from having any result. Serbia and Montenegro began open war against the Porte in July, 1876. England supported the Porte in spite of the vigorous assaults upon the Turkish policy by Gladstone. Austria-Hungary and Germany avoided committing themselves to any policy. The Magyars openly expressed sympathy with the Turks. Serbia succumbed to the overwhelming forces of Turkey in October, but the Montenegrins, assured doubtless of Russian support, kept the field. After sounding the other Powers in regard to their attitude and finding no inclination to guarantee reforms in Turkey, Russia concluded a treaty with Rumania in April, 1877, and, announcing herself as the protector of the Balkan Christians, declared war against the Ottoman Empire on the 24th. The advance of the Russians was rapid. The Danube was crossed at Galatz, on June 22d, by a portion of the forces, and on June 27th the main army crossed at Simnitsa, into Bulgaria. In July the Czar joined the army in the field of operations. General Gurko took possession of Tirnova on July 7th, and a week later he crossed the Balkans. The Russian lines faced eastward toward Rustchuk, Rasgrad, and Shumla; southward from Tirnova to the Shipka Pass; and westward toward the Osna and Vid rivers. The Turkish Army of the Danube on the east was commanded by Mehemet Ali; Reuf Pasha commanded the Army of the Balkans, to which was intrusted the defense of the Shipka Pass, but was soon superseded on account of inefficiency by Suleiman Pasha. Osman Pasha took up a strong position at Plevna (q.v.) on the right flank of the Russians. The unexpected and desperate resistance offered by Osman Pasha arrested the Russian advance. On July 30th he beat back a division of the army of the Grand Duke Nicholas, under General Krüdener, with great slaughter. Early in September the attack was renewed in great force by the Russians and Rumanians, but Osman held his own, and a desperate assault on the 11th proved disastrous to the assailants. The Russians then decided to invest the place. In the meanwhile, General Gurko, who had been advancing upon Adrianople, was defeated by Suleiman Pasha at Eski-Zagra, and driven into the Shipka Pass, where he succeeded in holding his ground against the furious attacks of Suleiman. In August and September Mehemet Ali operated successfully against the Russian left under the Crown Prince Alexander in the region of the River Lom. Everything now depended upon the ability of Osman Pasha to hold out at Plevna. General Gurko was sent to

operate in the rear of the place and his successful movements rendered relief impossible. On December 10th Osman Pasha made a desperate attempt to break through the Russian lines, but was forced to surrender. Suleiman Pasha, who had succeeded Mehmet Ali in the command of the Turkish army in the east, was at first successful, capturing Elena on December 4th, but on December 12th he suffered a defeat at Metelika, which drove him from the field. The fall of Plevna enabled the Russians to undertake a rapid advance toward Adrianople. General Gurko entered Sofia on January 4, 1878. On January 9th Generals Mirski, Skobelev, and Radetzky captured the Turkish forces in the Shipka Pass. The army of Suleiman Pasha, who attempted to check the Russian advance, was shattered in three days' fighting near Philippopolis, and on January 20th Adrianople was in the hands of the Russians. Servia had declared war on December 14, 1877. On January 10, 1878, the Servians took Nish, and on the same day Antivari fell into the hands of the Montenegrins.

In Armenia the Russians had been equally successful. Four columns crossed the frontier on April 24, 1877. Loris Melikoff (q.v.) being in charge of the campaign. The first, moving on Batum, was driven back; the second stormed Ardahan on May 17th; the third besieged Kars and also advanced on Erzerum, but was checked by Mukhtar Pasha, the Turkish commander in Armenia, and retired to Alexandropol; the fourth took Bayazid, but, losing the support of the third, was forced to abandon it and retreat. Here, as in Europe, the Russians underestimated their opponents at the outset. In October the campaign was renewed. Mukhtar Pasha was completely defeated by the Grand Duke Michael at Aladja Dagh on October 15th and retreated upon Erzerum, which he held until after the close of hostilities in Europe. Kars fell on November 18th.

By the end of January, 1878, the Russians had advanced to the neighborhood of Constantinople, and the Ottoman Empire was at the mercy of the enemy. On January 31, 1878, an armistice was signed by which the Porte gave up all fortified places north of a line drawn from San Stefano, on the Sea of Marmora, to Derkos, on the Black Sea. The Treaty of San Stefano between Russia and the Ottoman Empire was signed March 3, 1878. In the meanwhile, on February 13th, a British fleet had entered the Sea of Marmora in order to guard against any intention on the part of the Russians to enter Constantinople. The Powers, unwilling to accord to Russia the aggrandizement involved in the Treaty of San Stefano, intervened (England even going so far as to embark a force of Sepoys for service against the Russians), and a congress was called at Berlin to revise the treaty and effect a new settlement of the Eastern Question. See BERLIN, CONGRESS OF.

Consult: Ollier, *Cassell's Illustrated History of the Russo-Turkish War* (New York), somewhat journalistic, but comprehensive; Müller, *Political History of Recent Times*, trans. Peters (ib., 1882), a concise brief sketch; Greene, *The Russian Army in Its Campaigns in Turkey in 1877-78* (ib., 1879), with an atlas; Buyshe, *The Liberation of Bulgaria* (London, 1894); Hozier, *The Russo-Turkish War* (ib., 1877-79); Le Faure, *Histoire de la guerre d'Orient, 1877-78*

(Paris, 1878); Williams, *The Armenian Campaigns* (London, 1878); Gay, *Plevna, the Sultan, and the Porte* (ib., 1878).

RUST (AS. *rust*, OHG. *rost*, Ger. *Rost*; connected with Old Church Slav. *ruzdā*, Lith. *rubis*, Lett. *ruša*, Lat. *rubigo*, rust, and with Goth. *raþs*, AS. *reaf*, Eng. *red*, OHG. *rot*, Ger. *rot*, Lat. *rupus*, *rubra*, Gk. *ῥοῦφος*, *erythros*, OIr. *ruad*, Old Church Slav. *rubna*, Lith. *ruša*, Skt. *ruhrān*, red). Parasitic fungi (Uredinales, q.v.), especially injurious to wheat, oats, and other cereals, usually appearing as yellow, brown, or black lines and spots on the leaves and stems. The name is often applied with various qualifications, as white rust, etc., to diseases of other plants, but as commonly regarded by botanists it applies only to the Uredineæ. Nearly all cereals are subject to the attack of rust, and from an economic standpoint this is one of the most serious pests of grain crops. In 1891, a season especially favorable to the rusts, the estimated loss to wheat, barley, rye, and oats in Prussia, as stated by a commission, was over \$100,000,000. In Australia, it is said, the loss to the wheat crop is ten to fifteen million dollars annually, and in the United States it is equally great, or even greater, for seldom is a field entirely free from it and sometimes a considerable portion of the crop is destroyed. As generally understood the most common and destructive species, at least in the United States, are *Puccinia graminis* and *Puccinia rubigo-vera* on wheat, oats, barley, and rye, and *Puccinia coronata* on oats. Investigations conducted in the United States and Sweden have shown that there are specialized forms of the first two species that occur only upon certain host plants. All of these rusts pass through three stages in their life cycles—uredospore and teliospore stages upon cereals and an aecidial stage upon some very dissimilar plant. For *Puccinia graminis* the aecidial stage is upon the barberry, for *Puccinia rubigo-vera* upon members of the borage family, and for *Puccinia coronata* upon the buck thorn (*Rhamnus lanceolata*) and related species. The aecidial phase of these rusts, being passed upon plants of little economic value, is not considered as injurious. The uredospore stage, called red, brown, or yellow rust, is passed upon the leaves and stems of the cereals; the black rust or teliospore is the winter stage, in which the spores are thick-walled and remain in the dead leaves and stubble through the winter. The general facts regarding the life history of all are the same, and that first discovered, *Puccinia graminis* of wheat, which was worked out by Debarry in 1864, will serve as an example. Under normal conditions small cup-like depressions appear in the spring on both surfaces of the barberry leaves. The true cluster cups, as they are called, which appear upon the lower side of the leaves, are crowded with spores, which are blown about by the wind, and, falling upon wheat, germinate and gain entrance into the tissues. Once inside, the mycelium develops with the growth of the wheat and about harvest time a crop of spores is produced. These red rust spores are blown about and produce new rust spots wherever they alight upon a similar plant, causing injury by dwarfing the plant and shriveling the grain. Later in the season black lines of spores are produced upon stubble or the leaves of

plant that remain. The thick-walled, two-celled resting spores produced at this time will not germinate until they have hibernated, but in early spring they germinate upon barberry plants, forming what are called basidiospores, or peridia. Thus the life cycle is completed.

While progress seems to have been made in combating many plant diseases by means of fungicides, etc., little has been accomplished in the prevention of wheat rust in spite of the attention and study given to this problem. While apparently no variety is wholly exempt, there is great variation in the susceptibility of different varieties. As a rule the hard red wheats, the leaves and stems of which have a decided bloom, are more resistant than others, and resistant varieties will probably be developed along this line, as also in the breeding of early ripening varieties, which largely escape injury. Since late sowing upon moist soils almost always results in a badly rusted crop, such should be avoided.

RUSTAM. A legendary Iranian hero, whose adventures are related in the *Shah-Namah* of Firdausi (q.v.). During the first day of his life he grew as much as other children do in a year. Before reaching manhood he entered the fortress of Sipend in disguise and avenged the murder of his great-grandfather Nariman. His father, Zal, made Rustam a Pahlavan or hero of the realm. After some years, on the death of Garshasp or Keresaspa, Rustam was commissioned to offer the crown of Zabulistan to Kai Kobad. This accomplished, he defeated with the help of the new sovereign the armies of the Turanian chief Afrasyab, upon which the Turanian King, Pashang, sued for peace. During the reign of Kai Kaus, the successor of Kai Kobad, the hero performed seven adventures to deliver his King from the ruler of Mazanderan. These adventures are the killing of a lion by Rustam's horse Raksh, the discovery of a spring in a desert, the destruction of an enormous dragon, the killing of an enchantress, the defeat of Aulad, the lord of Southern Mazanderan, who was forced to guide Rustam to the cavern of the White Demon, the defeat of the demon Arzang, and finally the death of the White Demon. Losing his horse Raksh, Rustam visited the city of Samangan to recover it. There he wedded the Princess Tahminah. He was called away, however, and left a bracelet as a token of recognition for his unborn child. This son, Suhrab, was brought up, nevertheless, unknown to his father, and became a famous warrior on the Turanian side. In single combat father and son met, and Suhrab was slain. Recognizing the corpse by the bracelet, Rustam

went to Zabulistan, but later renewed the war on the Turanians, and performed countless feats of arms during the three succeeding reigns. The base-born son of Zal, and Gushasp's son-in-law, named Shaghad, angered by the annual tribute of a cow-skin paid to Zabul by Kabul, finally enticed Rustam with a hundred of his knights to Kabul, where they were entrapped in a park in which pits filled with javelins had been made. Into one of these Rustam fell and perished, living only long enough to shoot a fatal arrow at Shaghad. The Rustam cycle is not found in Iranian literature until a comparatively recent period. The legend was known, however, at least in part, as early as the seventh or eighth century. The episode is familiar to English readers through Matthew Arnold's poem *Sohrab and Rustum*.

RUSTCHUK, or RUŠČUK, ruš'chuk. A town of Bulgaria, on the Danube, opposite the Rumanian town of Giurgevo, 139 miles northwest of Varna (Map: Balkan Peninsula, F 3). It is an important manufacturing centre, producing tobacco and cigars, soap, beer, and good pottery. Its trade is also considerable. Under the Turks Rustchuk was an important fortress. Population, in 1900, 32,661.

RUSTIC (or RUSTICATED) WORK (Lat. *rusticus*, relating to the country, from *rus*, country), and **RUSTICATION.** The name of that kind of masonry in which the various stones or courses are marked at the joints by plays or recesses. The projecting surface thus left is sometimes called bossed, if the surface is entirely or comparatively dressed, and rustic when left rough and irregular or made artificially irregular. Rustication is chiefly used in Renaissance architecture, particularly in the later period of the Barocco style, although rustic quoins were often used in rough Gothic work.

RUSTIGE, ruš'ti-ge, HEINRICH VON (1810-1900). A German historical genre and landscape painter and poet, born at Werl, Westphalia. He was a pupil of Schadow at the Düsseldorf Academy, and won success with one of his first pictures, "Swiss Women Seeking Shelter from Storm" (1836, National Gallery, Berlin). In 1845 he became professor at the School of Art in Stuttgart and inspector of the royal galleries. Of his other works may be pointed out "Inundation Scene" (1841), in the National Gallery, Berlin; "Duke of Aya and the Countess of Rudolstadt" (1861), "Otho I. After Conquering the Danes" (1872), both in the Stuttgart Museum; and "Transportation of the Remains of Otho III. Across the Alps" (1863), Stettin Museum. As a poet he was favorably known through several dramas, and through lyrics, both serious and humorous. He also published *Das Poetische in der bildenden Kunst* (1876), an essay in aesthetics.

RUST MITE. See ORANGE INSECTS.

RUSTRE. In heraldry, one of the subordinaries. See HERALDRY.

RÜSTOW, ru'stô, WILHELM (1821-78). A Prussian soldier and writer, born at Brandenburg. Because of the liberal views he expressed in his pamphlet, *Der deutsche Militärstaat vor und während der Revolution* (1850-51), he was court-martialed, but managed to escape before sentence was pronounced on him. He settled in

Zurich, where he lectured at the university on military science. In 1860 he joined Garibaldi, in Sicily, and distinguished himself by an energetic and decisive attack which did much to decide the battle of Volturno. Upon his return to Zurich he resumed his military studies and became one of the most celebrated of modern writers on military science. His numerous writings include: *Geschichte des griechischen Kriegswesens* (1852-55); *Der Krieg von 1805 in Deutschland und Italien* (1853-59); *Der Krieg und seine Mittel* (1856); *Die Feldherrnkunst des 19. Jahrhunderts* (1857); and *Die ersten Feldzüge Bonapartes in Italien und Deutschland* (1867).

RUTA BAGA. See TURNIP.

RUTE, *rut*, Mme. DE SOLMS RATAZZI DE. See BONAPARTE, LÉTTITIA MARIE WYSE.

RUTEBEUF, *rut'bœf'* (c.1220-c.1285). A French poet of the thirteenth century. His real name is not known. He wrote, often satirically, about the foibles of his time, rebuking monks and nuns, confessing his own sins, and speculating upon life and death. Some of his ideas reappear in Villon two centuries later. Besides his satirical poems, Rutebeuf wrote a number of fabliaux and *Le Miracle de Théophile*, a sort of miracle play. Rutebeuf has the merit of a clear style, which is spicy and original when he is really interested. His *Works* have been edited, with a *Life*, by Jubinal (new ed. Paris, 1874-75). Consult also Clélat, *Rutebeuf* (Paris, 1891); Kressnel, *Rutebeuf, ein französischer Dichter des XIII. Jahrhunderts* (Cassel, 1894).

RUTGERS, *rut'gêrz*. HENRY (1745-1830). An American patriot and philanthropist, born in New York City. He graduated at King's College (now Columbia University) in 1766, at the outbreak of the Revolution entered the Continental Army, in 1776 took part as a captain in the battle of White Plains, and after the war became successively major and colonel of New York militia. He also took an important part in State politics, and was elected to the Assembly as a Republican in 1784, 1800, 1801, 1802, and 1807. From 1802 to 1826 he was a regent of the University of the State of New York. In 1819 he was a member of a committee organized with a view to perfecting a method for checking the advance of slavery. He is probably best known as the benefactor of Rutgers College (q.v.). He also gave numerous sites for church purposes, and his charities were liberal.

RUTGERS COLLEGE. An institution of higher learning, at New Brunswick, N. J., originally planned by Theodore James Frelinghuysen and Hendrik Fisher, in 1738, but not begun till 1755, when Theodore Frelinghuysen, the son of Theodore James, urged the formation of a college to be nurtured by the Dutch Church, and went to Holland to solicit aid. He died on his return voyage, and it was not until 1766 that the institution was chartered as Queen's College, in honor of Queen Charlotte. The present site of the college was secured in 1808, and the present Middle building, now known as Queen's College, was erected in 1809. In 1825 a gift from Colonel Henry Rutgers, of New York, gave new life to the institution, and the present name was given to the college. A grammar school was established at the same time as the college; medical degrees were conferred upon the students

of an affiliated medical faculty in New York as early as 1792; and in 1864 the scientific school was designated by the Legislature as the State College for the Benefit of Agriculture and the Mechanic Arts, to which the act of 1887 added an agricultural experiment station. The classical and the scientific departments of the college are very closely related. In the Classical School the courses lead to the degree of Bachelor of Arts and Bachelor of Letters; in the Scientific School to that of Bachelor of Science. Graduate work leads to the degrees of M. A., Ph. D., and Sc. D. The degree of Civil Engineer is conferred for three years' satisfactory practice and study of engineering. Graduates of the Theological Seminary of New Brunswick may receive the degree of Bachelor of Divinity. The college has successfully developed a system of student self-government. In 1903 there were 62 classical and 161 scientific students, with a faculty of 30. The library contained 45,655 volumes. The endowment was \$1,200,000, with an income of about \$60,000. The fifteen buildings, including the Ceramics Building and the Ralph Voorhees Library, erected in 1902-03, were valued, with the grounds, at \$1,000,000.

RUTH (Heb. *Rûth*, friendly), Book OF. One of the canonical books of the Old Testament, belonging to the third division of the Hebrew Canon (the Hagiographa). It relates events of the time of the Judges, and in the English Bible, as in the Septuagint and Vulgate, follows the Book of Judges. The Book of Ruth tells how Elimelech, with his wife, Naomi, and his two sons, Mahlon and Chilion, left their home in Judah because of a famine and settled in the land of Moab. There the sons married Moabite women, Ruth and Orpah. Elimelech and his sons died and Naomi decided to return to her native land. She advised her daughters-in-law to remain in Moab and remarry. Orpah complied, but Ruth declared that nothing but death should separate her from Naomi. The two women came to Bethlehem and there Ruth gained favor with Boaz, a kinsman of Elimelech and one of the leading men of Bethlehem. She claimed his protection as a kinsman, at the instigation of Naomi. Boaz was willing to accept the responsibility, but in accordance with custom, a 'nearer' kinsman must be consulted. Summoning the elders of the city as witnesses, Boaz called upon this kinsman to redeem Elimelech's patrimony, which poverty compelled Naomi to sell, involving the duty to marry Ruth in order to "raise up the name of the dead upon his inheritance." The kinsman resigned his rights in favor of Boaz, and accordingly the latter married Ruth, and their first-born son, Obed, became the grandfather of David.

Opinions as to the date and purpose of the Book of Ruth differ. It has been called a religious romance, a purely fictitious narrative told in order to point to a moral, and included in the canon mainly because of the reference at the end to the genealogy of David. The aim of the writer is thought to have been to protest against the tendency, represented in the Books of Ezra and Nehemiah, to condemn marriages between Hebrews and surrounding nations. If David, the ideal Jewish King, were descended from a Moabite woman, mixed marriages could hardly

be the unqualified evil which the 'legalists' of Ezra's day represented them to be. The declaration of Ruth that Naomi's God shall be her God, and Naomi's people her people (i. 16), is understood by some as a bold protest against the exclusive conception of Yahweh as the God particularly of a single people, and is thought to reflect the theory of universal monotheism of the post-exilic prophets; while others find in it a reflection of that willingness to accept proselytes from other nations which characterizes the fully developed monotheistic faith. On either view the book is certainly post-exilic and may be considerably later than the time of Ezra.

According to another view, the book was written earlier than a.c. 500, and the purpose of the writer may have been to supply information concerning the ancestry of David, omitted in the books of Samuel, or to urge the duty of the next of kin to marry a childless widow. Consult the commentaries of Wright (London, 1864), Keil (with Judges, 2d ed., Leipzig, 1874), Bertheau (with Judges, 2d ed., ib., 1883), Oettli (*Die geschichtlichen Hagiographen*, Munich, 1889), Wildeboer (Freiburg, 1898), and Nowack (Göttingen, 1900); also the Old Testament introductions of Reuss, Driver, König, Bleek-Wellhausen, and Cornill, and the works on the canon by Wildeboer (Groningen, 1889; Eng. trans., London, 1895), Buhl (Leipzig, 1891; Eng. trans., Edinburgh, 1892), and Ryle (London, 1892).

RUTHE'NIANS, or **RUSS'NIAKS**. A Slavic people of the eastern group, forming a branch of the Little Russians. They live chiefly in Galicia. The height of the Ruthenian plainmen of Galicia is 1,640 meters; their cephalic index, 83.4; the height of the Ruthenian highlanders is from 1,666 to 1,670 meters; their cephalic index, 83.6. Chestnut hair and brown eyes characterize about half of the population; the remainder have dark skin and hair.

The term Ruthenian is also applied to the Little Russians of the Ukraine as well as to those of Galicia and the Carpathians. This group, less affected by Mongol invasions and influences, is thought to represent the purest type of the Slav. In the ethnic movements that mark the history of Russia the Ruthenians sank beneath the overwhelming current of the more powerful Slav groups. From the time of the Slav dispersion between the second and sixth centuries to their conquest, partly by Casimir the Great of Poland and partly by the Lithuanians, the Ruthenians were a free people. Many of the old customs are preserved, together with much folklore. The Ruthenians in Galicia number about 3,500,000, and there are over 400,000 in Hungary and 300,000 in Bukowina. In Galicia a bitter political warfare has been going on between the Ruthenians and the Poles, the latter being enabled by their superior intelligence, wealth, and position to maintain the upper hand. Consult Bonmariage, *La Russie d'Europe* (Brussels, 1903).

RUTHENIUM (Neo-Lat., from *Ruthenia*, a name of Russia). A metallic chemical element discovered by Claus in 1845. Osann, in 1828, announced his discovery of three new metals in the platinum ores from the Urals, giving the name ruthenium to one of these metals. The announcement of this discovery he subsequently withdrew, and the existence of the new metal was not accepted until the subject was again

studied by Claus, who proved its existence, retaining the old name. It occurs in its metallic state in platinum ores and in osmiridium, also as the sulphide in the mineral laurite. The metal is separated from iridosmium as the oxide by a complicated chemical process, and is then reduced in a graphite crucible and fused by the oxyhydrogen flame.

Ruthenium (symbol, Ru; atomic weight, 101.68) is a white, lustrous, hard, heavy, brittle metal that melts at upward of 2500° C. (4530° F.). It combines with oxygen, forming a monoxide, a sesquioxide, a dioxide, a trioxide, a tetroxide, and a tetroxide, of which the trioxide and the heptoxide are known only in combination. These oxides form various salts, none of which is of any commercial importance.

RUTHERFORD, rüth'er-ford. A borough in Bergen County, N. J., nine miles north by west of Jersey City; between the Passaic and Hackensack rivers, and on the Erie Railroad (Map; New Jersey, D 2). Many New Yorkers have their residences here. In the adjoining borough of East Rutherford are extensive cotton and linen bleaching establishments, steam boiler works, a manufactory of glass mirrors, etc. Each borough maintains a public library. The population of Rutherford in 1900 was 4411, and of East Rutherford 2640.

RUTHERFORD, SAMUEL (1600-61). A Scottish divine. He was born in the parish of Nisbet, now part of Crailing, Roxburghshire, graduated from Edinburgh University in 1621, and became 'regent of humanity' in 1623, but resigned this place in 1626 and turned to the study of theology, which he pursued for a year, and became pastor of Anwoth. When his *Exercitationes Apologetice pro Divina Gratia* appeared in 1636, he was brought before the High Commission in Edinburgh, charged with non-conformity to the Acts of the Episcopacy and with attack upon Arminian tenets, with the result that he was forbidden to preach and banished to Aberdeen during the King's pleasure. His exile ended with the covenanting revolution eighteen months later. In 1638 he was appointed professor of divinity at Saint Mary's College, Saint Andrews, and in addition became a colleague to Robert Blair in one of the city churches. He was appointed rector of his university in 1651. From 1650 to the end of his life he was engaged in controversy more or less bitter with any who did not take the rigid view of 'covenanting,' and participated in the protestation to the Assembly at Saint Andrews in 1651 against the lawfulness of the treaty made in 1650 between the Covenanters and Charles II. After the Restoration he lost his official positions, and illness and death intervened to save him from appearing before Parliament on a charge of treason. Little of his work has been preserved except his *Letters*, edited by Bonar, and his *Sermons* (reprinted 1876-85). Consult his *Life*, by Bonar, in the *Letters* (Edinburgh, 1894).

RUTHERFORD, WILLIAM GUNION (1853 —). A distinguished English scholar, born in Peeblesshire and educated at Saint Andrews University and Balliol College, Oxford. He was appointed assistant master at Saint Paul's School, which office he continued to hold until 1883, when he succeeded Dr. Charles Brodriek Scott as headmaster of Westminster School. His

more important publications consist of *The Aor Phrygichus*, with introduction and commentary (1881), and *Fables of Babrius* (1883). He also published several other works relating to the classics, among them a *First Greek Grammar*, which has gone through several editions.

RUTHERFURD, LEWIS MORRIS (1816-92). An American astronomer, born in Morrisania, N. Y. He graduated at Williams College in 1834, and became a lawyer. But even during his active legal career, which he gave up in 1849, he devoted his spare time to astronomy and built in New York an observatory, which was the primary station for longitude determination. Two years after the construction of the observatory, in 1858, he first attacked the problem of astronomical photography, his work being independent if not earlier than that of De La Rue. Interrupting his research in this direction, about 1862 he began his studies in spectroscopy, following the suggestions of Fraunhofer; distinguished the star spectra by a classification practically identical with Secchi's, and if not prior to Donati, gaining results far more minute and accurate. He constructed a large spectroscope late in 1863, and about the same time realized the advantage over bisulphide prisms of diffraction gratings. For several years he studied Nobert's gratings and finally greatly improved on them. His telescope especially constructed for photography was finished in 1864; a photographic corrector was made in 1868, and in 1876 he devised a glass circle for the measurement of angles. As early as 1865 Rutherford had suggested a photographic chart of the heavens. His health began to fail about 1877, and in 1883 he gave up active work and presented to Columbia College his telescope, micrometer, and many of his valuable photographs, which were published by Rees in 1891. He was one of the original members of the National Academy of Sciences.

RUTHERGLEN, rŭth'ĕr-glĕn or (locally) rŭg'lĕn. A royal, Parliamentary, and municipal burgh in Lanarkshire, Scotland, on the Clyde, three miles southeast of Glasgow (Map: Scotland, D 4). It was an important town in the twelfth century. It has extensive iron and steel works, and neighboring coal mines. It contains an old church of the twelfth century, and a fine town hall. Population, in 1901, 18,280.

RUTHVEN RAID. See GOWRIE CONSPIRACY.

RUTILE (Fr. *rutile*, from Lat. *rutillus*, reddish, yellowish-red). A mineral, titanium dioxide, that crystallizes in the tetragonal system, and is of a reddish-brown color. It is found in older rocks, in various localities in Norway, in Sweden, in the Urals, and in Switzerland; also in the United States in New England, New York, Pennsylvania, Georgia, North Carolina, New Jersey, and Arkansas. The variety from Graves Mountain, Ga., has furnished a number of specimens that have been cut into gems. When found as fine needle-like crystals in limpid quartz they are called *sagenite*, *Venus's hair stone*, or *flèches d'amour*.

RUTILIUS NAMA'TIA'NUS, CLAUDIUS. A Latin poet of the beginning of the fifth century. He was a Gaul by birth, but a patriotic Roman in sentiment, and under Honorius was prefect of Rome. His poem *De Reditu suo* (416), in very good elegiacs, describes his trip from

Rome to Gaul. A part of the first and most of the second books are lost. It was edited by Müller (1870) and by Bährrens (in *Poeta Latini Minores*, vol. v., 1883). An excellent sketch of its contents is in "L'Als. Animé," *Atlantio Monthly* (vol. Xii., 1888, pp. 742-752).

RÜTIMEYER, rŭ'tĕm'ĕr, LUDWIG (1825-95). A Swiss paleontologist, born at Eggen, in the Emmenthal. He studied theology and medicine at Bern, and natural history in Paris, London, and Leyden; became professor of zoology and comparative anatomy at Basel in 1855, and made important studies on the early fauna of Switzerland and on craniology. His many and valuable works include: *Beiträge zur Kenntnis der fossilen Pferde* (1863); *Crania Helvetica* (with His, 1864); *Ueber die Herkunft unserer Tierwelt* (1867); *Ueber Thier- und Siedhabung* (1869; 2d ed. 1874); *Die Veränderungen der Tierwelt in der Schweiz seit Anwesenheit des Menschen* (1875); *Die Rinder der Tertiarperiode* (1878-79); *Beiträge zu einer natürlichen Geschichte der Hirsche* (1881-83); and *Die rovine Saugtierwelt von Egerkingen* (1891).

RUTLAND. The smallest county in England, bounded on the northeast by Lincoln, on the southeast by Northampton, and on the west by Leicester (Map: England, F 4). Area, 152 square miles; population, in 1891, 20,659; in 1901, 19,700. The Wash divides it into two portions, of which the northern is a somewhat elevated tableland, while the southern consists of a number of valleys running east and west, and separated by low hills. The principal stream is the Welland, forming the boundary on the southeast. The chief mineral production is fire-building stone. The climate is mild and healthful, the soil loamy and rich. Oxen and sheep are raised in great numbers. The capital is Oakham.

RUTLAND. A town, including several villages, in Worcester County, Mass., 12 miles northwest of the city of Worcester; on the Boston and Maine Railroad (Map: Massachusetts, D 3). It has the State Hospital for Consumptive and Tubercular Patients, and a public library. Population, in 1890, 980; in 1900, 1334. Rutland was settled about 1716, and was incorporated as a town in 1722. In 1777-78 part of Burgoyne's troops, who had surrendered at Saratoga, were quartered here. Rutland was the home from 1781 to 1787 of Rufus Putnam (q.v.), on account of whose influence, as a member of the Ohio Company, in founding the settlement of Marietta, Ohio, the town has been called the "Cradle of Ohio." Consult: Hurd (ed.), *History of Worcester County, Mass.* (Philadelphia, 1889); and a chapter in Powell (ed.), *Historical Towns of New England* (New York, 1898).

RUTLAND. The county seat of Rutland County, Vt., 67 miles south by east of Burlington; on Otter Creek, and on the Delaware and Hudson, the Rutland, and the Burlington and Rutland railroads (Map: Vermont, C 7). Some of the loftiest, most picturesque peaks in the Green Mountains are near. Noteworthy features of Rutland include Memorial Hall, the Public and the H. H. Baxter Libraries, House of Correction, United States Government building, and the court-house. The city is primarily important for its extensive marble quarrying industry, the marble deposits here being among the most pro-

ductive in the United States. The city has also large saw works, lumber mills, machine shops, boiler and engine works, and manufactories of brick, furniture, cheese, etc. Population, in 1900, 11,499.

Rutland was chartered by New Hampshire in 1761, but not settled until nine years later. Along with the rest of the State, it was claimed for many years by both New Hampshire and New York, and in 1772 the latter re-chartered it as Socialborough. This name, however, seems never to have been used. Till 1804 Rutland was one of the two State capitals, and the State House built here in 1784 is the second oldest building in Vermont. In 1892 Rutland was chartered as a city. Consult Williams, *Centennial Celebration of the Settlement of Rutland* (Rutland, 1870).

RUTLAND, JOHN JAMES MANNERS, Duke of. See MANNERS.

RUTLEDGE, EDWARD (1749-1800). An American patriot, born at Charleston, S. C. After studying law, first in Charleston and then in London, he was admitted to the bar, and became very prominent as a lawyer. He was a member of the Continental Congress in 1774-77, was one of the signers of the Declaration of Independence, served on the first Board of War in 1776, and in the same year was a joint commissioner with John Adams and Franklin to treat with Lord Howe with regard to peace. He was reelected to Congress in 1779, but, on account of illness, did not take his seat. He was taken prisoner near Charleston in 1780, and was confined at Saint Augustine for eleven months. From 1798 until his death he was Governor of South Carolina.

RUTLEDGE, JOHN (1739-1800). An American statesman, born at Charleston, S. C. He studied law in London, and began to practice at Charleston in 1761. He sat in the Stamp Act Congress at New York in 1765, in the South Carolina convention in 1774, and the Continental Congress of 1774; was chairman of the committee which framed the new Constitution for South Carolina in 1776, and was first President (1776-98) under that Constitution. In 1779 he was Governor of the State, and during the siege of Charleston was given almost absolute power by the Legislature. On the surrender of the city in 1780 he joined the Army of the South, with which he remained till the end of the war. He was a member of Congress in 1782, and again in 1783, was Chancellor of his State in 1784, member of the convention which framed the Federal Constitution (1787) and of the State convention which adopted it. He was an associate justice of the United States Supreme Court (1789-91), was Chief Justice of South Carolina from 1791 to 1795, and in July, 1795, was appointed Chief Justice of the United States Supreme Court, but, owing to the loss of his reason, the appointment was not confirmed.

RÜTLI, rüt'lé. A meadow in Switzerland. See GRÜTLI.

RUTULI. An ancient Italian people on the coast of Latium, south of the mouth of the Tiber. In the early legends they appear as hostile to the Latins, but later are found in the Latin League. Their capital was Ardea, which was conquered by the Romans in B. C. 442 and made a Latin colony. In Vergil's *Æneid*, Turnus is their king, and leads them against Æneas and

the Trojans, who threaten to supplant him with Latins, whose daughter he had been promised.

RUVO DI PUGLIA, rōv'vò dé pūv'lyá. A city in the Province of Bari, Italy, 20 miles west of Bari, with which it has steam tramway connection (Map: Italy, L 6). It is surrounded by walls, has a twelfth-century cathedral, a seminary, and a gymnasium. The Apulian tombs in the vicinity have yielded many beautiful vases. The city is famous for its potteries. It trades in grain, pulse, and fruits. Population (commune), in 1881, 17,956; in 1901, 23,776.

RUWENZORI, rōw'wën-zō'rè. A mountain mass in Central Africa, on the boundary between the Congo Free State and British East Africa, and between the Albert Nyanza and the Albert Edward Nyanza (Map: Congo Free State, F 2). It consists of several parallel ridges and groups of peaks with altitudes estimated at from 16,000 to 20,000 feet, so that it may prove to be the highest mountain mass in Africa. All the higher summits are capped with perpetual snow, and the whole mass has a very imposing appearance, falling steeply on the west and south into the great fissure which runs through the African plateau. The core of the mountains is of eruptive granite, and the sides are covered with mica-slate. Ruwenzori was discovered in 1888 by the Stanley expedition. In 1901 Wyld reached an altitude of 15,000 feet.

RUY BLAS, ruy'blás. A drama by Victor Hugo (1838). The hero is the lackey of Don Salluste, who was disgraced by the Queen. His relative, Don César de Bazan, disappears and Ruy Blas is forced to personate him at Court, where he rises to power. Salluste plans a rendezvous to ruin the Queen, but Ruy Blas, who loves her, kills his master and himself to save her honor.

RUYSBROEK, rois'brōek, or RUSBROEK, JAN VAN (1293-1381). A Dutch mystic. He was born at Ruysbroek; studied at Brussels, and became vicar of the Church of Saint Gudule in Brussels, but in 1343 he retired to the Augustinian Monastery of Groenendael, near Waterloo, where he spent the remainder of his life as prior. Here he believed his writing to be under the direct inspiration of the Holy Spirit. From him dates the succession of mystical teachers in Germany and the Netherlands prior to the Reformation. He earned the name of *Ecstatic Teacher*. An edition of his works, which he wrote partly in Flemish and partly in Latin, was published in Hanover in 1848. Consult: Engelhardt, *Richard van Saint Victor and Ruysbroek* (Erlangen, 1838); Schmidt, *Etude sur Ruysbroek* (Strassburg, 1859); and Anger, *De Doctrina et Meritis Joannis de Ruysbroek* (Louvain, 1892).

RUYSCH, rois, RACHEL (1664-1750). A Dutch flower and fruit painter, born in Amsterdam. She was a pupil of Willem van Aelst, married the portrait painter Juriæn Pool in 1695, was received into the guild at The Hague in 1701, and became Court painter to the Elector Palatine in Düsseldorf in 1708. Her reputation as a flower painter was second only to that of Jan van Huysum. She excelled particularly in painting rare exotic flowers and insects. Two admirable pieces (dated 1700 and 1715) are in The Hague Museum, a fine fruit piece and four others in the Pinakothek at Munich, four in

Amsterdam, and others in Karlsruhe, Berlin, Dresden, Vienna, and New York. She died in Amsterdam.

RUYSDAEL, rois/däl, or **RUISDAEL**, JACOB (c.1625-82). One of the greatest landscape painters of the Dutch school. He was born at Haarlem and studied under his uncle, Salomon Ruysdael. In 1648 he was received into the guild at Haarlem and in 1659 obtained the rights of citizenship at Amsterdam, where he lived from 1657 to 1681. Although he must have occupied a distinguished position among his fellow artists, as such masters as Berchem, Lingelbach, Philip Wouwerman, and Eglon van der Neer painted the figures in some of his landscapes, he was so little appreciated by his contemporaries that he fell into poverty. His friends of the Mennonite sect, to which he belonged, procured for him, in 1681, admission to the almshouse at Haarlem, where he died in March, 1682.

He was a close observer of nature, which he rendered in its various aspects with rare truthfulness, a powerful and warm coloring, and a mastery of execution ranging from the minutest touch to the broadest treatment. Selecting usually the flat and homely scenery of his native country, with lonely hamlets, water-mills, dark sheets of water overshadowed by trees, while the sky is usually clouded, he imparts a somewhat melancholy character to his landscapes, which are tinged, however, with the poetic charm of repose in nature. Dark masses of foliage make the prevailing tone of his coloring a dark green. Unfortunately, his earlier pictures have darkened so as to have lost much of their charm. He delighted in depicting wide expanses of land or water, especially the surroundings of Haarlem or Amsterdam and the coast of Scheveningen. Of his marine views there are comparatively few. They are characterized by cloudy skies and an agitated sea, and include some of his most successful efforts. Some of his greatest triumphs he won, however, with the representations of hilly and even mountainous scenery, with foaming waterfalls. Among the numerous fine examples in public galleries are an "Oak Forest," "View of Haarlem," and an "Agitated Sea," in the Berlin Museum; "Ford in a Wood," "Castle of Bentheim," "The Hunt" (with accessories by Van de Velde), "The Monastery," and especially the "Jewish Cemetery," of sombre but imposing effect, in the Dresden Gallery. Admirable specimens of his waterfalls are in Munich, Brunswick, Cassel (1682), Amsterdam, The Hague, which also contains a fine view of the "Bleaching Green Near Haarlem," in Antwerp, and in the National Gallery, London, where may also be seen a "Landscape with Ruins" (1673), and several others. A "Storm at Sea," a "Forest" (with cattle and figures by Berchem), and two landscapes, known as "Le huisson" and "Le coup de soleil," are in the Louvre. The Hermitage at Saint Petersburg preserves fourteen of his works, and 130 rare examples are in various private collections in England. Ruysdael also left seven spirited etchings. Consult: Van der Willigen, *Les artistes de Haarlem* (The Hague, 1870); Crowe, *Handbook of Painting* (London, 1874); Winzloch, in *Dohe, Kunst und Künstler*, ii. (Leipzig, 1878); and Michel, *Jacob van Ruysdael et les paysanistes de l'école de Haarlem* (Paris, 1890).

RUYSDAEL, or **RUISDAEL**, SALOMON

(c.1605-70). A Dutch landscape painter, uncle of the preceding, born at Haarlem. In his earlier works he was a close imitator of Jan van Goyen, but later his mannered treatment of foliage and a more powerful color make his pictures more easily distinguishable from those of his master. Among his pictures may be quoted: A "Dutch Canal" (1642), with many figures, and four others (two dated 1631, 1656) in the Berlin Museum; "Village in Flat Country" (1633) and "Fisherman's Cottage Near Canal" (1643), in Dresden; "Canal with Boats" (1642), in Munich; a "River Landscape" (1652), in Copenhagen; "Banks of the Meuse" and "View of Alkmaar," in the Metropolitan Museum, New York; and "Crossing the River," in the Gallery of the Historical Society, New York.

RUYTER, royt'er, MICHAEL ABRAHAMSSOON DE (1607-76). A Dutch admiral, born at Flushing. He went to sea as a boy and rose to be captain of a vessel employed by the Flushing merchants for the protection of their commerce in the British Channel (1637). In 1641 he was made rear-admiral of a squadron dispatched by Holland to the aid of the Portuguese against the Spaniards and distinguished himself in a battle which was fought near Cape Saint Vincent, November 3d. In 1647 he rendered effective service against the Barbary pirates. When war between Holland and England broke out in 1652 Ruyter was placed in command of a fleet of some 35 ships and on August 26th fought a drawn battle with Sir George Ayscue off Plymouth. He was under Maarten Tromp when the latter defeated Blake in the Channel (December 10th), and participated in the three days' battle with Blake near Portland (February 28-March 2, 1653). After the peace of 1654 he cruised in the Mediterranean and captured several Turkish ships. In 1659 he was dispatched to aid the King of Denmark against Sweden and for his services was ennobled. In the second war against the English, Ruyter received the chief command. In June, 1666, Ruyter and Cornelis van Tromp, with 90 sails, engaged the English fleet under Prince Rupert and the Duke of Albemarle. Both sides fought with such obstinacy that the battle lasted four days, ending in a partial victory for the Dutch. The conflict was renewed in July, when the British gained a complete victory, destroying above 20 of Ruyter's men-of-war. In 1667 Ruyter ravaged the English shipping at Sheerness, sailed up the Medway as far as Chatham, burned several English men-of-war, and effected more toward the conclusion of peace at Breda (1667) than any diplomatist. In 1672 he commanded the Dutch fleet and fought several battles with the combined English and French fleets, but without decisive results. In 1675 he was sent to the Mediterranean to cooperate with the Spanish fleet against the French. He fought a drawn battle with the French under Dupesne off Stromboli (January 8, 1676), but was defeated near Mersina, off the east coast of Sicily (April 21st). He made good his retreat into the harbor of Syracuse. His legs, however, were shattered in the engagement and he died April 29th. Consult: Lieble, *The Great Dutch Admirals* (London, 1873); Grimmel-Milne, *Life of Lieutenant Admiral de Ruyter* (London, 1896).

RYAN ABRAHAM JOSIPH, best known as "Father Ryan" (1839-86). An American Roman Catholic priest, probably the most conspicuous poet of the Southern Confederacy. Shortly after

ordination Ryan became chaplain in the Confederate Army, served to the close of the war, and wrote not long after Lee's surrender his famous poem, "The Conquered Banner." He then served in New Orleans as priest and editor of the *Star*, a Roman Catholic weekly; founded in Augusta, Ga., the *Banner of the South*, a religious and political weekly; then he reassumed priestly duties in Mobile, till 1880, when he visited the North to lecture and published in Baltimore *Poems, Patriotic, Religious, and Miscellaneous*, among which the most popular, besides "The Conquered Banner," is "The Sword of Lee."

RYAN, PATRICK JOHN (1831—). A prelate of the Roman Catholic Church, born at Cloneyharp, Ireland. He was educated at the Christian Brothers' School at Thurles and at Carlow College. He came to the United States in 1853 and began teaching in the Theological Seminary at Saint Louis, Mo. The same year he was ordained priest, and soon became rector of the cathedral. In 1860 he became pastor of the Church of the Annunciation and in 1868 of Saint John the Evangelist's Church and vicar-general of the diocese, in 1872 coadjutor bishop of Saint Louis, and in 1894 archbishop of Philadelphia. He was one of the leading pulpit orators of the Roman Catholic Church. Among his published addresses are *What Catholics Do Not Believe* (1877) and *Some of the Causes of Modern Religious Skepticism* (1883).

RYAZAN, ryá-zán'y', or RIAZAN. A government of Central Russia, bounded by the Government of Vladimir on the north, Tambow on the east and south, and Tula and Moscow on the west (Map: Russia, E 4). Area, 16,261 square miles. It is divided by the valley of the Oka into two parts, of which the northern is low, marshy, and thickly wooded, and the southern is slightly elevated, sparsely wooded, and has a rich black soil. Ryazan contains deposits of iron, coal, and various clays, of which iron is mined to a considerable extent. Agriculture, the principal occupation, is greatly hampered by the inadequate size of the peasants' holdings. Rye and oats are the principal cereals raised for export. Stock-raising is in a state of decline. The house industry is but little developed, yet the manufacturing industries are making some progress and the annual value of the manufactures now exceeds \$11,000,000, principally cotton goods and flour. Population, 1897, 1,827,085, consisting principally of Great Russians. Ryazan was one of the mediæval principalities of Russia, which was annexed to Moscow in 1517.

RYAZAN, or RIAZAN. The capital of the government of the same name in Central Russia, near the confluence of the Trubezh with the Oka, 123 miles southeast of Moscow. It is a picturesque place with a number of ancient churches. Ryazan manufactures candles, tallow, and spirits, and has a considerable trade in grain, wood, animals, and salt. It was the capital of the mediæval Principality of Ryazan. Population, in 1897, 44,552.

RYAZHSK'. An important railway centre in the Government of Ryazan, Russia, situated 70 miles south of Ryazan. It has an extensive trade in grain. Population, in 1897, 12,993.

RYBINSK, ríbinsk. A river port in the Government of Yaroslavl, Russia, on the Volga, near

its confluence with the Sheksna and the Tcheremakha, about 228 miles north-northeast of Moscow (Map: Russia, E 3). It is well built and is of great commercial importance, an immense amount of freight carried on the Volga and the canals connecting that river with the Baltic and the White seas being handled here. Of late its trade has been falling off, owing to railway competition. The chief manufactured product is flour. Population, in 1897, 25,200. There is a vast influx of people during the season of navigation.

RYDBERG, rud'bär-y', VIKTOR (1829-95). A Swedish author, born in Jönköping and educated at Lund. In 1854 he became an editor in Göteborg, and in 1876 professor of the history of civilization in the university of Göteborg, whence in 1884 he went to Stockholm in a similar capacity. Two volumes of lyrics (1882 and 1891) show unusual poetic form and originality of thought; but his historical novels are his real claim to fame. The best known are *Frygbytaren på Östersjön* (1857); *Singolla* (1865); *Vapensmeden* (1891); and *Den siste athenaren* (1859), the last mentioned, which was translated into English (1883), being the most powerful. Consult: Schenck's biography (Marburg, 1896); and Zachrisson, *Rydberg som uppfostrare* (Göteborg, 1897).

RYDE, ríd. A fashionable watering-place and market-town on the north coast of the Isle of Wight, England, five miles south-southwest of Portsmouth (Map: England, E 6). It consists of Upper and Lower Ryde, the former anciently called *Rye*, or *La Riche*, and the latter of modern construction. The shores are wooded, and the appearance of the town is pleasing. The pier, nearly a mile long, forms an excellent promenade. Yacht and boat building is carried on to some extent. Ryde is the largest town in the island. It was incorporated in 1868. Population, in 1891, 10,952; in 1901, 11,042.

RY'DER, ALBERT PINKHAM (1847—). An American landscape and figure painter, born in New Bedford, Mass. His earlier landscape works include: "Spring," "Lowlands, Near Highbridge," and "The Forest of Arden." Later he painted figures chiefly. His subjects, sometimes from Shakespeare or Wagner, are idealistic and imaginative. They are to be regarded for general effect rather than detail, and are often painted in an unusual color scheme. Such pictures include "Siegfried," "Jonah," and "The Flying Dutchman."

RYDER, WILLIAM HENRY (1822-88). An American Universalist clergyman, born at Provincetown, Mass. After preaching at Concord, N. H., Nashua, N. H., and Roxbury, Mass., in 1860 he became pastor of Saint Paul's Church, Chicago, and remained there until his death. He left bequests amounting to over \$500,000 to charitable and educational institutions, and also founded a free lecture course "in aid of the moral and social welfare of the citizens of Chicago, upon an unsectarian basis."

RYE (AS. *ryge*, OLG. *rocco*, Ger. *Rocken*, *Roggen*, rye; connected with OPruss. *rugis*, Lith. *rugys*, Lett. *rudzi*, OChurch Slav. *rūdī*, rye). Several species of the genus *Secale*, native to western temperate Asia and adjacent Europe. Common rye (*Secale cereale*), the only species in cultivation, does not seem to have been grown so long ago as the other common cereals, as it

has not been found in Egyptian monuments, and has no name in ancient languages. Its cultivation was known to the Romans in Pliny's time, but not to the ancient Greeks. Rye is extensively cultivated in Northern Europe, in some parts of Asia, and to some extent in North America. It does not grow as far north as barley, but succeeds in regions too cold for wheat and on soils too poor for any other grain. It will ripen in colder latitudes than most other grains, but is most productive where wheat will ripen. It is adapted to light, sandy lands, and does not thrive well on heavy, damp, humous soils. The varieties of rye, much less numerous than those of the other important cereals, may be classified into winter and spring varieties. The former, which are most frequently grown, are sown in autumn, the latter in spring. Cultural management is much the same as for other cereals. Winter rye is usually ripe in June. Rye is also frequently grown for green manuring on lands deficient in humus. A good crop of rye yields from 20 to 30 bushels of grain per acre. Russia is the greatest rye-producing country in the world, producing on 37 per cent. of her total acreage of tillable land about 700,000,000 bushels annually. The annual production of rye in the United States is about 24,000,000 bushels, with an average yield of about 11 bushels per acre. See Colored Plate of CEREALS.

FOOD AND FEEDING VALUE. In Europe rye ranks next to wheat as a bread-stuff, but since its flour is darker than that of wheat and since the gluten of rye flour does not possess the same elastic and tenacious quality as that of wheat, rye bread is darker and more compact than wheat bread. When the grain is milled entire—the usual way—it contains more protein than wheat flour. Mixtures of wheat and rye flour and corn and rye are often made for bread-making. Rye bread has the following average percentage composition: Water, 35.7; protein, 9.0; fat, 0.6; nitrogen-free extract, 52.7; crude fibre, 0.5; and ash, 1.5. The fuel value is 11.80 calories per pound. The 'black bread' of Europe is made of rye, an especially dark form being known in North Germany as 'pumpernickel.'

The various rye products have the following percentage composition:

AVERAGE PERCENTAGE COMPOSITION OF RYE PRODUCTS

	Water	Protein	Fat	Nitrogen-free extract	Crude fibre	Ash
	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.
Rye, whole grain.....	11.6	10.6	1.7	52.5	1.7	1.9
Rye, flour.....	13.1	6.7	0.8	75.1	0.1	0.7
Rye, bran.....	11.6	11.7	2.8	63.8	3.5	3.6
Rye, shorts.....	9.3	18.0	2.8	59.9	5.1	5.9
Rye, fodder.....	76.6	2.6	0.6	6.8	11.6	1.8
Rye, hay.....	8.5	9.8	2.3	44.1	30.1	5.9

As regards composition, the rye grain does not differ materially from wheat. It has been urged that, as rye is often affected with ergot, it is not a wholesome food for animals. This objection cannot be urged of clean rye, and the fact that it has been so long used as food by man without harmful results indicates that there is nothing in the grain itself which would render it harmful.

RYE. A small seaport town of Sussex, England, one of the Cinque Ports (q.v.).

RYE. A town in Westchester County, New York, eight miles northeast of New Rochelle; on the New York, New Haven and Hartford Railroad (Map; New York, G. 5). It includes the manufacturing village of Port Chester (q.v.). Rye Beach, on Long Island Sound, has some reputation as a summer resort. Population, in 1890, 9477; in 1900, 12,861. Rye was settled in 1660 and was organized as a town under the jurisdiction of Connecticut in 1765. The boundary line at this point between Connecticut and New York was long disputed, and Rye was included within the limits of the former until 1683, and again from 1697 to 1700. The Jay homestead is in Rye, and John Jay spent his early life here. Consult Baird, *Chronicle of a Border Town, History of Rye* (New York, 1871).

RYE-GRASS (*Lolium*). A genus of grasses, having a two-rowed, flatly compressed spike, the spikelets appressed edgewise to the rachis. A common rye grass, ray grass, or perennial rye grass (*Lolium perenne*), is frequent in meadows and pastures, and is highly valued in Europe, where it is the most popular grass for forage and hay. In North America it is less esteemed than timothy for either pasture or hay. It succeeds well on poor soils. Of the numerous varieties common perennial rye-grass is most generally cultivated. A form called annual rye grass—not really an annual plant, although useful for only one year—is sometimes cultivated, but is in almost every respect inferior. Italian rye grass (*Lolium multiflorum*) is much esteemed as a forage and hay grass in Southern Europe, where it is native, and in the Eastern United States. It is preferred by cattle to common rye grass. The young leaves are folded up, while those of the common rye-grass are rolled together. In the United States this species is especially esteemed in the East. It grows rapidly, forms a dense turf, and upon good soils yields several cuttings in a season. It is readily distinguished from all forms of perennial rye-grass by its awned or bearded spikelets.

RYE HOUSE PLOT. A conspiracy in 1683, among extremists of the Whig Party, to waylay and assassinate King Charles II. of England on his return from Newmarket, at a house called the

Rye House farm, whence the plot got its name. It was frustrated and discovered owing to the fact that the house which the King occupied at Newmarket took fire accidentally and the King in consequence left the place eight days sooner than was expected. The indignation excited by the Rye House plot was taken advantage of by the Royalists to implicate the whole Whig Party, and among those who suffered death for alleged complicity were Lord William Russell and Algernon Sidney (q.v.).

RYERSON, ADOLPHUS EGERTON (1803-82). Co-founder of Ontario's public school system. He was born in Charlotteville, Upper Canada, and received a good education, and became a Methodist minister. In 1829 he was chiefly instrumental in founding and became the editor of the *Christian Guardian*, the religious organ of Canadian Methodism. He also took the leading part in founding the Upper Canada Academy at Cobourg, afterwards chartered as Victoria University, of which he was the first president. In 1844 he was appointed Superintendent of Education for Upper Canada, and from that year until 1876, when he resigned, he was the guiding and controlling force in establishing the school system of that province, now the Province of Ontario. He visited Europe to study the different educational systems, and drafted legislative measures, afterwards enacted into laws, embodying their best features. His publications include: *Letters in Defense of Our School System* (1859); *The Loyalists of America and Their Times* (1880); and *The Story of My Life*, an autobiography unfinished at his death, but subsequently completed and published by Dr. John George Hodgins (1883).

RYEZHITSA, ryé'zhít-sá. A town in the Government of Vitebsk, Russia, situated about 65 miles northeast of Dünnaburg (Map: Russia, C 3). Population, in 1897, 10,681.

RYLE, ril, JOHN CHARLES (1816-1900). An English clergyman, Bishop of Liverpool. He was born near Macclesfield, and educated at Eton and at Christ Church, Oxford. He took orders in 1841, and was appointed successively curate at Exbury, rector of Saint Thomas's, Winchester, in 1843, rector of Helmingham in 1844, vicar of Stradbroke in 1861, rural dean of Hoxne in 1869, and honorary canon of Norwich in 1871. In 1880 he was appointed by Lord Beaconsfield Dean of Salisbury, but before entering upon his duties he was appointed Bishop of Liverpool by the same statesman. He was numbered among the 'evangelicals' of the Church of England, and his work among the poorer classes of the west of England was of an aggressive and helpful character. His works include: *The Bishop, the Pastor, and the Preacher* (1854), sketches of Latimer, Baxter, and Whitefield; *Bishops and Clergy of Other Days* (1868), lives of Hooper, Latimer, Ward, Baxter, and Gurnall; *The Christian Leaders of the Last Century* (1869); *Principles for Churchmen* (1884); *Many Points of View* (1886); *Is All Scripture Inspired?* (1898).

RYLEYEFF, ri-la'yéí, KONDRATIY FEODOROVICH (1795-1826). A Russian lyric poet, who was one of the leaders of the Decembrists, and died on the scaffold. His fearless attack on the all-powerful Arakcheyeff (q.v.), in *The Minion* (1820), made him famous. A collection of his lyrics, *Dumy* (Meditations), and the epics, *Valerianko's Confessions* and *Vogvarovskii's Dream*, assign to him a rank next to that of his friend Pushkin. With Bestuzheff he edited in 1823-25 the literary almanac, *The Polar Star*, to which Pushkin liberally contributed. His works were first edited by M. N. Mazayeff (Saint Petersburg, 1893).

RYLSK, ril'y'sk. A town in the Government of Kursk, Russia, situated at the confluence of the Ryló with the Seim, 84 miles southeast of Kursk (Map: Russia, E 4). It manufactures oil and trades in grain and agricultural implements. During the twelfth and thirteenth centuries it was the capital of the independent Principality of Rylysk, which was annexed to Lithuania in the beginning of the fourteenth century, and to Moscow in 1500. Population, in 1897, 11,415.

RYMER, THOMAS (1641-1713). An English critic, poet, and historian, born in Yafforth, Yorkshire, and educated at Sidney-Sussex College, Cambridge. He was called to the bar in 1673, but devoted himself mostly to literature. Of his poems, the best known are those in memory of Waller. Both his poetry and his criticism, which is chiefly dramatic and attacks Shakespeare for failing to preserve the unities, were highly praised by Pope and fiercely ridiculed by Macaulay. In 1692 he succeeded Shadwell as Court historiographer; but in this province his only important publication was the Latin compilation of English treatises under the title *Parera* (1704-35). Of this a *Syllabus* by Sir Thomas Duffus Hardy appeared in 1869 et seq.

RYSWICK, rí'z'wík, PEACE OF. A treaty concluded between France and Great Britain, Spain, and Holland, September 20, 1697, ending nine years of war between Louis XIV. and the Grand Alliance. A congress of envoys from Austria, Denmark, England, Holland, the German States, Spain, and France had been in session through the summer of that year. France agreed to restore to Spain places in Catalonia and the Netherlands, and to recognize William III. as King of England. Charles IV., Duke of Lorraine, was placed in possession of his States. In America and the East Indies all conquests were to be restored. Indeed, so far as territory was concerned, the general result was a return to the *status quo ante*. In a supplementary treaty, signed October 20, 1697, by the Emperor, considerable restitutions were made to the German States by France. The chief result of the war, as determined by the peace, was the check given to the overweening ambition of Louis XIV., whose power from this time underwent a steady decline. The village of Ryswick (Dutch *Rijs-wijk*) is in the outskirts of The Hague. Consult Neuhaus, *Der Friede von Ryswick* (Freiburg im Breisgau, 1874).

RZESZÓW, rzeh'shuy. A town in the Crown-land of Galicia, Austria, 98 miles by rail east of Cracow (Map: Austria, II 1). Its principal buildings are the castle of Prince Lubomirski and the Cloister of Saint Bernard. Linen-weaving and the manufacture of gold wares, leather, bone-dust, and pipes are carried on. The town is a famous horse mart. Population, in 1890, 11,953; in 1900, 14,714, mostly Poles.

RZHEV, rzhev'. A river port of the Government of Tver, Russia, situated on the Volga, 112 miles southwest of Tver. It has a considerable flax-spinning industry, and carries on a trade in grain. Population, in 1897, 21,390, of whom about half were Dissenters.

S

S

The nineteenth letter of the English alphabet. The name for its Semitic equivalent was *shin*, tooth, the letter-form roughly representing a toothed edge. The development of the letter was as follows:

ω	ξ	Σ	ζ	ς
Phœnician	Early Greek	Later Greek	Early Latin	Later Latin

In its usual phonetic sound *s* is the breathed alveolar spirant. In the formation of this sound the tongue, which is raised and approximates the upper tooth-sockets, is grooved longitudinally, and the air passes through this narrow channel with a hissing sound, whence *s* is called a sibilant. The result is the *s* in *sing*, *must*. The same sound is represented by *c* (before *e, i, y*) in *cent*, *face*, *cytic*; and by *sc* in *science*, *conscience*. *S* has the phonetic value of *z* after a sonant at the end of a word and also between sonants, as *flics*, *rise*, *busy*, *nose*; of *sh* (before consonantal *i*, and rarely *u*), as *passion*, *mission*, *sure*, *sugar*; of *ch* in *measure*, *osier*, *treasure*. The digraph *sh* is a sibilant formed in much the same manner as *s*. The tongue-tip, however, is turned upward rather than forward, and the sound is more palatal, as in *shadow*, *sud*; *shall*, *salt*. This *sh* sound is an extremely common one, whether represented by *ch*, as in *chaise*, *machine*, or by other combinations: *Asia*, *social*, *conscious*, *ocean*, *vitiate*.

English *s* is derived from various sources. It represents original Indo-Germanic *s* in *self*, Skt. *sva*, Lat. *se*, Goth. *sik*; Skt. *hansu*, Gk. $\chi\acute{\eta}\nu$, Lat. *anser*, Eng. *goose*. In words of Latin origin it represents Indo-Germanic *d + t* or *t + t*: *risible*, Lat. *risus*, from **rid-tus*; *voracious*, Lat. *vertus*, from **vert-tus*. *S* represents French-Latin *s* and *ti*; *s* in *saint*, *usage*; *ti* in *ransom*, from Lat. *redemptionem*; *silence*, from Lat. *silentium*.

∞ As a mediæval Roman numeral *S* = 7 or 70, Σ = 70,000. In chemistry *S* stands for sulphur. As abbreviation *S.* stands for *south*; *s.* for *second*, *shilling*; *S.S.* for *steamship*, *Sunday school*. *S.* stands for *science* in *B. S.*, Bachelor of Science, and *society*, in *F. R. S.*, Fellow of the Royal Society.

SAADIA (sâ-â'dê-â) **BEN JOSEPH** (892-942). A distinguished Jewish philosopher and exegete. He was born in the Fayum, Egypt. At an early age he made a translation of the Bible into Arabic, with notes, intended to serve

as an attack upon the doctrines of the Karaites (see **JEWISH SECTS**), against whom he had previously written a work, *In Reputation of Anan*. Through his efforts largely the spread of the Karaitic movement, which threatened at one time to subvert Rabbinical Judaism, was checked. By 928 his fame had spread beyond the borders of Egypt, and he was called to the head of the Rabbinical school at Sura in Babylonia. Owing to a disagreement with the "Prince of the Captivity," the head of the Babylonian Jews, he lost his office, and went into retirement (933), and during this period wrote in Arabic a philosophical work, *Faiths and Doctrines* (translated into Hebrew by Judah ben Tibbon). Saadia also wrote commentaries on the Bible and many poems, which are at present used in the Jewish liturgy. His works have been published by Derenbourg and Lambert, vols. i, iii, v, vi, and ix, having already appeared. Saadia ranks next to Maimonides among Jewish philosophers, while he surpasses the latter in the thoroughness of his Biblical and Talmudical scholarship. Consult Winter and Wünsch, *Judische Literatur*, vol. ii., pp. 28-40 (Trier, 1894).

SAALE, zâ'le. A river of Germany. It rises in the Fichtelgebirge, in Bavaria, and flows northward through some of the Thuringian States, and finally across the Prussian Province of Saxony, falls into the Elbe, about 25 miles above Magdeburg, after a course of 226 miles (Map: Prussia, D 3). It is navigable 103 miles by means of 17 locks.

SAALFELD, zâ'fêlt. A town in the Duchy of Saxe-Meiningen, Germany, situated on the left bank of the Saale, 87 miles by rail southwest of Leipzig (Map: Germany, D 3). It is an old town with an interesting Gothic church of the thirteenth century, a castle of the seventeenth century, a Gothic town hall, dating from 1537, and the ruins of the Sorbenburg, a castle believed to have been built by Charlemagne as a fortress against the Sorbs. The town manufactures various kinds of machinery, paints, knit goods, etc. Population, in 1900, 11,681. It was probably founded during the reign of Charlemagne.

SAAR, zâr (Fr. *Sarre*). A river of South-western Germany. It rises in the Vosges Mountains on the boundary of Alsace, and flows northwest through Lorraine and the Prussian Rhine Province, emptying into the Moselle a few miles above Troyes (Map: Germany, B 4). It is 152 miles long, navigable 54 miles to Saar-

of the Rhine, and by means of a system of locks connects further to Saargemünd. The Saar canal connects its middle course with the Rhine-Rhone Canal.

SAAR, FERDINAND VON (1833—). An Austrian poet and novelist, born in Vienna. He entered the army in 1849, and, retiring after the Italian campaign of 1859, devoted himself entirely to literature. In 1902 he was made a member of the House of Peers. As a lyric poet of decided individuality he made his mark with *Gedichte* (1882). Equally striking are his *Wiener Elogen* (1893). His stories, *Vocellen aus Oesterreich* (2d ed. 1894), *Schicksale* (1889), *Frankenbilder* (1892), *Herbstreigen* (1897), and *Camera Obscura* (1901), depict Vienna society with rare power of analysis. His dramatic works are less valuable.

SAARBRÜCKEN, zār'brük-en. A town in the Rhine Province, Prussia, on the Saar, 50 miles east by north of Metz (Map; Prussia, B 4). It is connected with the opposite town of Sankt Johann by two bridges, has an old castle, a town hall with frescoes by Werner, a fine new statue of Bismarck, and a gymnasium. The town is the centre of a coal-mining district, which produces annually over 7,000,000 tons of coal. Its manufactures include woolen and linen fabrics, hardware, Berlin blue, tin and zinc wares, glass, leather, and tapestry. Saarbrücken, originally a possession of the counts of Ardennes, fell to Nassau in 1381. It was garrisoned by France from 1801 to 1815, when it came to Prussia. Saarbrücken was the scene of the opening engagement in the Franco-Prussian War of 1870-71. A French army corps, under Napoleon III., captured the town on August 2, 1870, but was forced to retreat on August 6th. Population, in 1890, 13,812; in 1900, 23,242.

SAARBURG, zār'boork. A town of Alsace-Lorraine, Germany, on the Saar, 44 miles by rail northwest of Strassburg. (Map; Germany, B 4). It is surrounded by walls and strongly garrisoned. Gloves, lace, beer, and watchsprings are manufactured. Population, in 1900, 9,178.

SAARDAM, sār'dám. A town of the Netherlands. See ZAANDAM.

SAARGEMÜND, zār'ge-münt' (Fr. *Sarre-guimines*). A town in the Province of Alsace-Lorraine, Germany, situated at the confluence of the Blies and the Saar, 40 miles east of Metz (Map; Germany, B 4). It has a gymnasium, and manufactures pottery, hempen fabrics, silks, velvets, etc. Population, in 1900, 14,680.

SAARLOUIS, zār'lōw'z. A town in the Rhine Province, Prussia, on the Saar, near the French frontier, and 31 miles southeast of Treves (Map; Germany B 4). Its fortifications were built by Vauban in 1680-85 during the reign of Louis XIV. They are now comparatively unimportant, and are used as barracks and depots. In the vicinity are lead and iron mines, and the town has manufactures of leather, wire, and firearms. Population, in 1900, 7,864.

SAAVEDRA, sār'vā'drá. ANGELO DE, Duke de Rivas (1791-1865). A Spanish statesman and author, born in Córdoba. After eight years' service in the army he devoted himself to literary studies, and had written *Ensayos poéticos* (1813) and several tragedies before the revolution of

1820, in which he took so prominent a part that from 1823 to 1834 he was forced to live in exile. In 1834 he returned to Spain, and in 1836 he became Minister of the Interior. The revolutionary rising of that year drove him again into exile. In 1844 he became Ambassador to Naples, in 1855 he was sent to France, and in 1860 to Florence. Among his works are *Florinda* (1824-25), an epic of the Moorish conquest; *El Moro caposito* (1834), also an epic; histories of the Neapolitan revolution (1848; revised, 1881) and of Masaniello (1860); and many romances and some excellent plays. His complete works were edited by his son in the Castilian *Colección* (1895).

SAAZ, zäts (Bohemian *Zatec*). A town in the Crownland of Bohemia, Austria, on the Eger, 43 miles northwest of Prague (Map; Austria, C 1). It is the centre of the Bohemian hop industry. The town has an institute for instruction in hop-growing and preparing, and gives annual prizes for excellence in this line. There are manufactures of machinery, leather, and sugar. The population in 1890 was 13,234; in 1900, 16,168, mostly Germans.

SABA, sä'lä. An island of the Dutch West Indies belonging to the Colony of Curaçao, and situated among the Leeward Islands, 26 miles southwest of Saint Martin Island (Map; West Indies, Q 6). Area, 5 square miles. It is a circular volcanic peak rising 2817 feet above the sea. Cotton and indigo are produced. Population, in 1900, 2177.

SABADELL, sä'tä-näl's'. A town of North-eastern Spain, in the Province of Barcelona, situated on the Barcelona-Saragossa Railroad 11 miles northwest of the former city (Map; Spain, G 2). It is an important manufacturing centre, about half of its population being employed in its textile mills. The town has a college. Population, in 1887, 19,645; in 1900, 23,375.

SAB'ADIL'LA (Sp. *cevadilla, cedabilla*, diminutive of *cevala, echaba*, barley, from *cebar*, Lat. *cibare*, to feed, from *cibus*, food), **CEBADILLA**, or **CEADILLA** (*Asarum officinalis*, or *Schenocaulon officinalis*). A Mexican plant of the natural order Liliaceæ whose winged wrinkled seeds have been employed in medicine like white hellebore (*Veratrum album*) since the sixteenth century and have been considered irritant, sedative, and rubefacient.

SABÆANS. The name of an ancient people of Southern Arabia. Information concerning this people is derived from three sources: (1) Certain notices in the Old Testament. In Gen. x. three pedigrees are given for Sheba (or Saba), the eponymous ancestor of the Sabæans, but it is clear that Sheba belongs to Southern Arabia. The visit of the Queen of Sheba to Solomon (I. Kings x.) is by many thought to be legendary, but even if so, it indicates the importance which the kingdom of the Sabæans had acquired at an early date. References in Isaiah, Jeremiah, Ezekiel, and Job point to the commercial activity of the Sabæans. (2) Classical writers, especially Pliny, represent the people of Yemen (which they use as a general name for Southern Arabia) as wealthy, widely extended, and enterprising, of fine stature and noble bearing, particularly distinguished as merchants; the chief articles of their merchandise were gold, perfumes, spice, incense, and

precious stones. The wealth and luxury of the Sabæans, however, are exaggerated by the classical writers and many of the stories related are fanciful. (3) Much more reliable information is now available from inscriptions and coins found in large numbers in Southern Arabia during the last century by travelers such as Wellsted, Oslander, Halévy, and Glaser, and deciphered by the labors of D. H. Müller, H. Derenbourg, Prætorius, Hommel, Morltnann, Winckler, Schlumberger, and others. The cuneiform inscriptions also have shed some light on early Sabæan history.

The dated inscriptions do not appear to be earlier than the sixth century B.C., but the beginnings of the Sabæan kingdom may be carried back several centuries. It is clear in the first place that Saba was the name of a nation that gradually extended its rule from Marib or Mar'yab as a centre until it embraced practically all of Yemen. The height of its power appears to have been reached in the fifth century; some centuries later we find several independent kingdoms sharing Southern Arabia between them. The political control does not appear to have been vested in a single family, but in a number of distinguished families; hence we find several 'kings' of Saba ruling contemporaneously. The great families of the land possessed towers and castles, the building of which is the subject of many inscriptions. The Sabæans became the natural intermediaries between Egypt and India, since the land route from Egypt to the distant East lay through Yemen. The inscriptions frequently refer to the commercial side of Sabæan history and the chief articles dealt with are gold, precious stones, perfumes of various kinds, horses, and camels. The general state of society bore some resemblance to that of Europe in feudal times. A notable feature was the high position occupied by women, and while no 'queens' have been as yet encountered in the inscriptions, we find a woman described as mistress of a castle, and in many cases women are joint authors with men of the dedicatory or votive inscriptions or are encountered as the sole authors. The number of gods mentioned in the inscriptions is considerable, chief among them Al-Wakkîh Ta'lah Athtar and Rahman. While originally personifications of the phenomena of nature, they became abstractions somewhat like the gods of Egypt, and a number of them are conceived as having several forms. Magnificent temples were erected and gifts and sacrifices were lavished on the gods. Pilgrimages at regular intervals were customary.

The *Sabæan language* was Semitic, showing the strongest affiliation with the Arabic and Ethiopic, though in its syntax it sometimes approached closer to the Hebrew and in certain of its morphological features to the Aramaic. The characters are alphabetic and in many respects more archaic than the Phœnician; the theory is gaining favor that the Phœnicians did not invent the alphabet, but borrowed it from South Arabia. For bibliography, see the article MINÆANS.

SABANILLA, sā'nā-nē'lyā, or **SAVANILLA**. A seaport in the Province of Bolívar, Colombia, the maritime outlet of Barranquilla, with which it has railway connection (Map; Colombia, C I).

SABATIER, sā'bā'tyā', LOUIS AUGUSTE (1839-1901). A French Protestant theologian,

born at Vallon (Ardèche), and educated at Montauban, and at several German universities. From 1869 to 1877 he was professor of theology at the University of Strassburg, and afterwards for several years professor at the Sorbonne. He became known as a representative of liberal theology. His printed works include *Le témoignage de Jésus-Christ sur sa personne* (1863); *Essai sur les sources de la vie de Jésus* (1866); *Monnaie sur la nation hébraïque de l'esprit* (1879); *De l'origine du péché dans la théologie de l'apôtre Paul* (1887); *De la vie intime des douze et de leur puissance d'évolution* (1890); *Essai d'une théorie critique de la connaissance religieuse* (1893); *Essai sur l'immutabilité* (1895); *L'apôtre Paul* (3d ed. 1896); *Esquisse d'une philosophie de la religion* (1897). A memoir appeared in Paris in 1901.

SABATIER, PAUL (1858-). A French theologian and historian, born at Saint-Michel-de-Chabrillanoux (Ardèche). He studied in the theological faculty of the University of Paris, became vicar of the French parish of Saint-Nicolas at Strassburg, and afterwards pastor there of Saint-Germe-la-Serre. His health compelled him to withdraw from active ministerial duties. His publications include learned editions of the *Speculum Perfectionis seu Francisci Assisiensis Legenda Antiquissima*, *Factore Fratris Leonis* (1898) and Bartholus's *Tractatus de Indulgentia* (1900); *La Didaché, ou l'enseignement des douze apôtres* (1885), with the Greek text and a commentary; and *La vie de Saint François d'Assise* (1893), based on previously unused documentary sources, discovered by him in various local Italian archives. This work was widely read and several times translated.

SABA'ZIUS (Lat., from Gk. Σαβάζιος). A Thracio-Phrygian nature-god. He originally typified the powers of nature in their vivifying aspect, and the yearly renewal of life. His worship was therefore closely associated with the cults of Cybele (q.v.) and AÜS (q.v.), and was orgiastic in character, later degenerating into sexual excesses. Sabazius was represented as horned, and had for his symbol a snake, which typified by the shedding of its skin the renewal of nature (see NATURE-WORSHIP, section *Zoolatry*). The worship of this god was introduced into Athens as early as the fifth century B.C., but by the time of Demosthenes the more cultured classes stood aloof from it. From Greece it was carried to Rome. Here, together with other Oriental cults, it became widespread, especially during the decadence of paganism. In Greco-Roman mythology Sabazius was identified with Dionysus, or occasionally with Zeus. He was further regarded as the son of Zeus and Persephone, and was said to have been destroyed by the Titans. Consult Lenormant, *Sabazius* (Paris, 1875).

SABBATH (Heb. *shabbāth*, *Shabbāthôn*, from *shābath*, to desist, cease). The Old Testament designation for the seventh day of the week, set aside as a period of cessation from work, and one of the most important religious institutions provided for in the Pentateuchal codes. Besides the stipulation for the observance of the Sabbath in these codes, there are important allusions to it in the historical and prophetic books. In both Deuteronomy (EX. xv, 8 ff.; Deut. v, 12-15; see DEUTERONOMY), the ordinance to cease from all

It was enjoined as the fourth 'word' or commandment, and the obligation is extended to all members of the household, including man and maid servants, and also to ox and ass, all cattle, and to the non-Hebrew dwelling in a Hebrew community. But whereas, in the earlier codes (see HEXATEUCH), the Sabbath (generally associated with the new moon celebration) marks a cessation from the ordinary labor, it did not prior to the Babylonian exile involve a strict prohibition of all secular occupations. It was permitted, e. g. to undertake a journey on the Sabbath day (II. Kings iv. 22-23). Its character as a sacred day sanctified for all times by Yahweh lends the 'Holiness Code' (Lev. xvii. to xxvi.) to lay special stress upon this 'sanctified' character, and the outcome of this movement is to connect the institution with the creation of the world. This step is distinctly taken in the Priestly narrative (Gen. ii. 3), Yahweh setting the example to mankind by Himself 'resting' on the seventh day after finishing the work of creation. Released from its association with the new moon, the regulations for the Sabbath increased in number and severity until the obligation to 'rest' was made to include the prohibition of almost everything requiring physical effort. The rabbis vied with one another in carrying out the comparatively few and simple regulations of the Pentateuchal codes to their last consequences. Thus the ordinance not to kindle fires on the Sabbath day (Ex. xxxv. 3) was interpreted to include the prohibition of cooking meals on the Sabbath day, while the injunction "let no man go out of his place on the seventh day" (Ex. xvi. 29) led to restrictions upon walking beyond a certain distance. The cessation from labor was made to embrace a strict avoidance of handling money, no matter for what purpose, and while public amusements were not prohibited, the Sabbath restrictions made such amusements practically impossible. In this way the Sabbath acquired an austere character, at least in appearance, which was relieved only by the intensity of the religious spirit with which the Jews entered upon the ritual prescribed for the day, and by the opportunity it afforded for family reunions, which became one of the features of the day. From Judaism the institution passed on to Christianity with a change of the day from the seventh to the first day of the week, as commemorating the resurrection of Jesus. See SUNDAY.

Considerable speculation has been indulged in as to the origin of the Hebrew Sabbath. In cuneiform syllabaries a word *shabattum* has been found, which is explained in one instance as 'the day of rest for the heart.' This phrase, however, does not refer to cessation from labors, but to the 'cessation' of the divine wrath. In other words, *shabattum* for the Babylonians meant a day in which it was necessary to observe certain precautions in order to insure the 'pacification' of the gods. What these precautions were are learned from a religious calendar in which it is told that the King is not to ride in his chariot, nor to don finery, nor to eat cooked meat, nor to bring sacrifices until the evening of the 7th, 14th, 19th, 21st, and 28th day of the month, which are designated as unfavorable or inauspicious days. These regulations are prescribed only for the King, upon whose conduct toward the gods the general disposition of the gods, and hence the

welfare of the country, depended. There are traces in the Pentateuchal codes that the 'Sabbath' was once regarded as an inauspicious day on which it was not advisable to risk the displeasure of Yahweh, or even safe to seek His presence. There is also some evidence that a 'Sabbath' observed not every seventh day, but on the 7th, 14th, 21st, and 28th day after the new moon, was an ancient institution which the Hebrews shared with the Babylonians, but these considerations only point to an ultimate common origin for the Hebrew and Babylonian Sabbath.

Consult the Hebrew archaeologies of Nowack and Benzinger; Wellhausen, *Prolegomena zur Geschichte Israels* (4th ed., Berlin, 1895; Eng. trans., Edinburgh, 1885); Montefiore, *Religion of the Ancient Hebrews* (Hibbert Lectures, London, 1893); Smend, *Alttestamentliche Religionsgeschichte* (Freiburg, 1893); Jastrow, "Original Character of the Hebrew Sabbath," in the *American Journal of Theology* (New York, 1898); Hesse, *Sunday, Its Origin, History, and Present Obligation* (Bampton Lectures for 1860; new ed., London, 1889); Abrahams, *Jewish Life in the Middle Ages* (ib., 1896).

SABBATHAI ZEVI. A pseudo-Messiah of the Jews. See JEWISH SECTS; MESSIAH.

SABBATICAL YEAR. An institution of the Pentateuchal codes, according to which, primarily, the fields were to lie fallow every seven years; afterwards the provisions were extended to include relief from various obligations incurred by members of the community. The Sabbatical year is referred to in all of the three chief codes (the Book of the Covenant, the Deuteronomic Code, and the Priestly Code; see HEXATEUCH). In the first and third, special stress is laid upon the provision requiring the land to lie fallow (Ex. xxiii. 10-11; Lev. xxv. 3-7); in the Deuteronomic Code no reference to such an ordinance occurs. Again, the first two codes agree in providing for the remission of slaves after six years' service (Ex. xxi. 2-6; Deut. xv. 12-18); the Priestly Code provides for such emancipation only in the fiftieth or jubilee year (Lev. xxv. 39-55). Lastly, the Priestly Code (Lev. xxv. 8-10; 12-16; 23-34) is unique in providing under certain conditions for the 'release' in the jubilee year (i. e. the seventh Sabbatical year) of patrimonial estates which have been sold, to the end that such estates should not be permanently alienated. Deuteronomy (xv. 1-3) has a special ordinance for the remission or suspension of debt every seven years.

These divergences indicate a gradual evolution of the institution, beginning with the custom, common in agricultural communities, of letting the land lie fallow at periodical intervals. The Book of the Covenant does not specify that the same year shall be observed by all districts and all individuals. So impracticable an injunction is found only in the 'theoretical' Priestly Code. On the other hand, the remission of Hebrew slaves after six years of service had apparently become a dead letter, and accordingly the term of service is extended, and a general emancipation appointed every fifty years, no matter how long (or short) a period of service had preceded. The remission of debt also disappears in the Priestly Code, but instead, stipulations are inserted for the reversion of property to the original owners in the jubilee year. Hence it is

very probable that the only feature of the Sabbatical year which was carried out in practice was the ordinance requiring that the land should lie fallow every seven years. Consult the archeologies of Benzinger and Nowack. See JEREMIAH.

SABELLIUS. A celebrated heretic of the third century who taught that God manifests Himself in three successive modes, or forms, without, however, recognizing any real personal distinctions in the Godhead, as did the orthodox. (See TRINITY; NICENE CREEK.) Our information respecting the events of Sabellius's life is very scanty, only a few fragments of his works having survived and the existing accounts being written by his theological opponents. He was perhaps born in the Libyan Pentapolis, where his peculiar views were afterwards widely current. Early in the third century he took up his residence in Rome, where he adopted Monarchian views, especially those of a modalistic type. (See MONARCHIANS.) Here he was excommunicated by Pope Callistus (or Calixtus). Leaving Rome, Sabellius went to Ptolemais, where he was made presbyter and met with much success in propagating his views. The Sabellian view of the Trinity is this: The One Divine Essence, or Substance, unfolds itself in creation and in human history as a trinity, God operating in the works of nature is Father; God operating in Jesus Christ, to redeem men from sin, is Son; and God operating in the hearts of believers is Holy Spirit. But these three are not eternal divine hypostases, or persons (see HYPOSTASIS); they are merely so many successive manifestations of the one God. Besides the works of Hippolytus, Athanasius, and Epiphanius, consult: Fisher, *History of Christian Doctrine* (New York, 1896); Harnack, *History of Dogma*, vol. iii. (Eng. trans., London, 1897); Rainy, *The Ancient Catholic Church* (ib., 1902); Cheetham, *Church History of the First Six Centuries* (ib., 1894).

SABIANS. See SABEANS.

SABIANS. A name given by Mohammed and early Moslem writers to a people classed with those possessing a written revelation, distinguished from idolaters and accorded an exceptional position, probably the Mandeans (q.v.). From the ninth to the twelfth century it was falsely applied to themselves by the pagans of Harran for the purpose of escaping persecution; and in later times it was used indiscriminately of both Mandeans and pagans of Harran, or explained as apostates from the true faith, or worshipers of the host of heaven. There are three passages in the Koran in which Mohammed refers to the Sabians. A number of passages from Buchari, Ibn His-ham, and Aghani have been collected, which show that Mohammed himself and his followers were designated as 'Sabians' by their pagan contemporaries. The reason for this designation must have been some practice or belief that to the popular mind identified Mohammed and his followers with the Sabians. As the name Sabians undoubtedly is derived from *saba'saba*, 'to immerse,' there can be no question but that a sect practicing baptism is meant. The relations of the Elkesaites (q.v.), Hæmorrhobists, Mugh-tasila, and Mandeans have not yet been cleared up. But the emphasis put upon their sacred books renders it perhaps probable that some

branch of the Mandeans is intended. (See MANDEANS.) It was the institution of ablutions before the daily prayers that seemed so peculiar to the pagan Arabs and led them to describe the Moslems as Sabians.

According to the testimony of a Christian writer, Abu Ynsuf Alshahrî al-Qathîrî, who lived at the end of the ninth century, some of the pagans in Harran who were neither willing to become Christians nor to adopt Islam gained for themselves toleration by following the advice of a Moslem lawyer to call themselves Sabians. This was in the year 830. A Sabian cult community was formed in Bagdad, and among its members were men of great learning and influence. The greatest of all these so-called Sabians were Thabit ben Qurrah (died 901), who wrote 150 works in Arabic and 16 in Syriac, and Abu Is-hak Ibrahim, poet, scientist, and historian. But many eminent men were among their descendants, to whose enthusiastic study of Greek antiquity and liberal views on theology their Mohammedan contemporaries were greatly indebted. Through Shakerstam, Maimonides, and others their religious and philosophical views became known to European scholars. At first these accounts caused much confusion. Hottinger identified the Sabians with the Sabeans (q.v.); Gollius regarded them as star-worshipers. Although based on wholly impossible etymologies, these explanations were widely accepted. Spencer understood the term to designate Oriental idolaters in general. Norberg first proposed the correct etymology and Michaelis distinguished between two kinds of 'Sabians,' the Mandeans and the star-worshipers. Saint Martin was the first to call attention in 1825 to the fact that the Harranians were known as Sabians by Arabic writers. It is the merit of Chwolson to have presented all the important literary material bearing on the question and to have drawn the conclusions now generally accepted as to the use of the term in Arabic literature, thereby putting an end to the baseless speculations about 'Sabism.' Consult: Chwolson, *Die Sabier und der Sabismus* (Saint Petersburg, 1856); Wellhausen, *Reste arabischer Heidentums* (2d ed., Berlin, 1897).

SABIN, JOSEPH (1821-81). An American bibliographer, born at Braunston, Northamptonshire, England. After serving as an apprentice to Charles Richards, an Oxford bookseller, he set up an independent shop, and published in 1844 *The XXXIX Articles of the Church of England, with Scriptural Proofs and References*. In 1848 he removed to the United States, where he conducted shops for the sale of old and rare books and prints, from 1850 to 1856 at New York, from 1856 to 1860 at Philadelphia, and again at New York from 1860. He prepared auction catalogues of many important libraries, including that of Edwin Forrest (1866); undertook in 1868 the publication of *A Dictionary of Books Relating to America, from Its Discovery to the Present Time*, continued by others as *Bibliotheca Americana* (20 vols., 1868-92); and prepared *C Bibliography of Bibliography; or, A Handy Book About Books Which Relate to Books* (1877). He also published two series of reprints concerning American history, one of tracts in seven volumes (1865), and one of more extended works in five volumes (also 1865). *A List of the Printed*

Edwards of the Works of Fray Bartolome de las Casas, Bishop of Chiapa (1870), was extracted from the *Dictionary*. Sabin was the editor of *The American Biblioplist* (New York, 1869-75).

SABINE. A river which rises in the north-eastern part of Texas, and flows southeast to the Louisiana boundary, then southward, forming the boundary between Texas and Louisiana, until it empties through Sabine Lake and Sabine Pass into the Gulf of Mexico (Map: Texas, H. 1). It is about 500 miles long, but navigable only for a short distance, and for small vessels. The navigation of the pass has been improved by dredging and jetty-building. The Sabine is an historic stream and was involved in the sharp boundary controversy between Spain and the United States.

SABINE. A shrub. See **SAVINE**.

SABINE, sab'in, Sir EDWARD (1788-1883). A British physicist and soldier. He was born in Dublin, and after receiving a military education at Marlow and Woolwich, served in the Royal Artillery. He saw active service in the war with the United States in 1812, being captured by the United States privateer *Yorktown* and participating in the actions on the Niagara frontier in 1814. He accompanied Sir John Ross (q.v.) and Sir William Parry (q.v.) in their expedition (1818-20) to the north coast of America (see **ARCTIC REGIONS** and **POLAR RESEARCH**), making a series of observations of great value. He later (1821-23) undertook a series of voyages, visiting many places between the equator and the north pole, and making at each point observations on the length of the seconds pendulum, and on the dip and intensity of the magnetic needle, the results of these observations being published, along with other information, in 1825. His many experiments dealt with almost every phase of terrestrial magnetism and he extended magnetic science by causing the establishment of magnetic observatories in different parts of the world, and by the collation of the enormous mass of facts thus acquired. In 1818 Sabine was elected a fellow of the Royal Society; in 1856 he was raised to the rank of major-general; and in 1869 he was created a Knight Commander of the Bath. He was the author of a work *On the Cosmical Features of Terrestrial Magnetism* (1862), and contributed many papers to the *Philosophical Transactions* of the Royal Society, the *Philosophical Magazine*, and other scientific journals.

SABINE, sab'in, LORENZO (1803-77). An American author and politician, born in New Lisbon, N. H. After a meagre education, he became a merchant and bank officer, and for some time was secretary of the Boston Board of Trade. He also served three terms in the Maine Legislature. In 1852 he became secret agent of the United States Treasury Department, and served nine weeks in Congress. His best known publications are a *Life of Commodore Preble* (1847), in "Sparks's American Biography;" *The American Loyalists* (1847); *Notes on Ducks and Bunting* (1855); and an address on the *Hundredth Anniversary of the Death of Major-General Wolfe* (1859).

SABINES (Lat. *Sabinii*). An ancient people of Central Italy, of Umbro-Sabellian stock, whose territory lay to the northeast of Rome.

Their land appears to have extended from the sources of the Nar, on the borders of Picenum, as far south as the Anio. The nations contemporary to the Sabines were the Umbrians on the north, the Umbrians and Etruscans on the west, the Latins and Equi on the south, and the Marsi and Picentini on the east. The entire length of the Sabine territory did not exceed 85 miles, reckoning from the lofty and rugged group of the Apennines, anciently known as the *Mons Fisciellus* (now *Monte della Sibilla*), to Fidene on the Tiber, which is not more than five miles from Rome. None of their towns were of any size or political importance. The inhabitants had no inducements to congregate in large towns. Their country was an inland region; much of it, especially in the north, very mountainous and bleak, though the valleys were (and are) often richly productive. The Sabines were a brave, stern, religious race, whose virtues were all of an austere and homely character. Their part in the formation of Rome is mentioned under **ROMULES**. The whole territory of Sabinium fell under Roman sway after the victory of M. Curius Dentatus in B.C. 290, and in B.C. 268 its inhabitants received the full Roman franchise, while about B.C. 240 they were enrolled in the newly formed *tribus Quirina*. No literature or inscriptions remain in the Sabine dialect, which has to be studied from the few words quoted by the ancients as Sabine (all with Latin terminations) and from place and personal names. It was early driven out by the dialect of the Latin conquerors.

SABINIANUS. A school or sect of Roman jurists during the first and second centuries of the Christian Era. Its origin was ascribed to Capito, head of one of the law schools at Rome in the time of Augustus, as the origin of the rival Proculian sect was ascribed to Labeo, a distinguished contemporary teacher and writer. Each school, however, took its name from a pupil and successor of its founder; the Sabinian school from Masurius Sabinus, second head of the school and author of a standard commentary on the civil law. His successor was Cassius Longinus, who flourished in the reign of Nero and enjoyed so high a reputation that the later adherents of the sect sometimes termed themselves Cassians. Other distinguished members of the school were Salvius Julianus, Pomponius, Africanus, and Gaius. Gaius was the last jurist who regarded himself as an adherent of either of the two schools, and in not a few cases he accepts, in his Institutes, the doctrines of the Proculians. See **CIVIL LAW**; **PROCLIANUS**; and for literature, consult Muirhead, *Historical Introduction to the Private Law of Rome* (2d ed., Edinburgh, 1899).

SABLE (OF. Fr. *suble*, black, from Russ. *soboli*, Lith. *sabaltas*, sable, perhaps from Turk. *samür*, from Ar. *sammür*, martin). A fur-bearing animal, noted for yielding the most valuable pelt of any of the Mustelidae, of which two species exist, one in Northern Russia and Siberia (*Mustela sibiriana*), and one in Canada (*Mustela americana*); but the latter is usually known as the pine-marten. The Siberian sable, exclusive of the tail, is about 18 inches long. The fur is dark brown (not black), grayish-yellow on the throat, and small grayish-yellow spots are scattered on the sides of the neck. The whole fur is extremely lustrous, and hence of the very

highest value, an ordinary sable skin being worth \$30 or \$35, and one of the finest quality \$200. The fur attains its highest perfection in early winter, and the pursuit of the sable at that season is one of the most difficult and adventurous of enterprises. It is taken by traps, which are of a kind to avoid injury to the fur, and it is not easily captured. Its general habits are those of the marten (q.v.). See Plate of FUR-BEARING ANIMALS.

SABLE. The name for black in heraldry (q.v.).

SABLE, CAPE. See CAPE SABLE.

SABLE ANTELOPE. A large antelope of South Africa (*Hippotragus niger*), remarkable for its glossy black coat, sharply set off by the white of the under parts, buttocks, and parts of the face. It carries its head high, its neck is adorned with a heavy mane, and it has long, curving, and heavily ringed horns, which it uses with terrible effect when attacked by packs of the Cape hunting-dogs or by hunters' hounds. It has been known to impale and kill leopards and even lions. It formerly ranged over all the high plains in small herds which had great speed and endurance, and its beauty and the sport it afforded have been enthusiastically commented upon by every South African hunter, but it is now scarce. Consult *The Book of the Antelopes* (London, 1894-1900). See Plate of ANTELOPES.

SABLE ISLAND. A low-lying crescent-shaped island in the Atlantic Ocean, situated in latitude 44° north and longitude 60° west, 104 miles southeast of Cape Canso (Map: Nova Scotia, D 6). Formed of sandhills thrown up by the sea, it is about 25 miles long by 1½ miles wide. The sandhills surround a shallow lagoon 11 miles long, and nowhere exceed 80 feet in height. The island lies in the track of navigation between America and Great Britain; since 1873 it has had three lighthouses built upon it by the Canadian Government, two of which have been swept away by the sea, which frequently levels the outlying hills. From 1583 to 1899, 170 vessels were lost on its treacherous shoals. A life-saving establishment of 30 persons is now stationed here. In 1901 the Canadian Government completed arrangements for checking the shifting of the sands and making the island a more prominent feature on the ocean by the planting of 68,000 spruces, pines, and junipers, and 13,000 hardy, deciduous trees. Covered with wild grasses and cranberry bushes, which formerly supported a breed of wild horses, known as Sable Island ponies, the island is interesting to the naturalist as the only known nesting place of the Ipswich sparrow.

SABLES D'OLONNE, sā'bō' dō'lōn', Les. The capital of an arrondissement and a seaport in the Department of Vendée, France, 23 miles south of La Roche-sur-Yon by rail (Map: France, E 5). Oyster and sardine fishing and canning and ship-building are carried on. There is a lighthouse, visible for 14 miles. The fine, sandy beach, encircled by a wide promenade, carriage road, and elegant villas, attracts numerous summer visitors. Population, in 1901, 12,241.

SABOTS, sā'bō' (Fr., wooden shoe). A species of wooden shoes much used by the French and Belgian peasantry, especially by those who inhabit moist and marshy districts, as an effectual pro-

tection of the feet from external moisture. The fabrication of sabots forms an important branch of French industry, and is chiefly carried on in the départements of Aisne, Aube, Maine-et-Loire, and Vosges. After being made they are subjected to the smoke of burning wood till they acquire the reddish color so much prized in certain countries. See SHOES AND SHOE MANUFACTURE.

SABRE. See SWORD.

SABRE-TOOTHED TIGER. The Macharodontidae, or sabre-toothed cats, comprise a group of fossil cat-like mammals, characterized chiefly by enlargement of the upper canine teeth. By some writers they are regarded as constituting a distinct family, while others rank the group as a subfamily of the Felidae. The term 'sabre-toothed tiger' designates particularly *Saibodon* (or *Macharodus megarus*, a fossil cat from the Pleistocene deposits of South America, of which complete skeletons have been found exceeding the lion in size. It is chiefly remarkable by reason of the enormous development of the upper canines, which are seven inches long and flattened, with finely serrated cutting edges. In compensation for the enlargement of these teeth, the lower canines are so reduced as to resemble the incisors. The brain is proportionally smaller than in the modern large cats. In England the sabre-toothed tigers are known to have been contemporaneous with cave man. The group attained its highest specialization and finally became extinct in the Pleistocene period. A nearly allied form (*Simravus*) occurs in the Middle Miocene of Oregon.

SABRINA. Daughter of Loerine, the son of King Brute of ancient Britain, and Estrildis, thrown into the river Severn by Queen Guendolen, and metamorphosed by Nereus into the goddess of the river. She is described as a nymph in Drayton's *Polyolbion*, in Milton's *Comus*, and in Fletcher's *Faithful Shepherdess*.

SAC AND FOX INDIANS. A confederacy of the two North American Indian tribes of Sacs or Sauks and Foxes or Muskwaki. The tribes combined about 1760 as a result of the attacks of the Ojibwa (q.v.) and of the French. The united population in 1903 was about 950. See FOX OR MUSKWAKI; SAKK.

SACCARDO, sāk kā'dō, PIETRO ANDREA (1845—). An Italian botanist, born at Livorno, and educated at the Liceo of Venice and in the University of Padua, where he became professor of botany in 1879 after ten years as teacher of natural history in the school of technology of the same city. Save for his *Summario d'un corso di botanica* (3rd ed., 1880), his work is almost entirely on mycology. Following such special treatises as *Unsa Tractata* (1872) and *Leve Tuberi* (1877-86, with 1500 colored plates), came his great universal work, *Saltus Fungorum*, in ten volumes, which began to appear in 1882.

SACCHARIN, sāk'kār'īn (from MI., *saccharin*, Lat., *saccharum*, from Gk., σάκχαρον, *sakcharon*, sugar, from Persian, *ser*, from Prakrit *sakka*, i. e., sugar, Skt., *sarkara*, candied sugar, grit), ortho-

benzo-sulphimide, C₁₀H₇NH₂SO₂. An intensely

sweet substance discovered by Remsen and Fahlberg in 1879. Its sweet properties were not recognized until some time after. The substance was patented in the United States and in Euro-

from various countries, and is now manufactured on a large scale in Germany. The process is as follows: Toluol, $C_6H_5CH_3$, a hydrocarbon obtained from coal-tar, is carefully treated with concentrated sulphuric acid; the result is a mixture of ortho- and para-toluol-sulphonic acids. These are acted on by phosphorus pentachloride, which converts them into the corresponding ortho- and para-toluol sulphochlorides. The ortho-compound is liquid, and is easily separated by pressure from the solid para-derivative, which is discarded. The ortho-toluol sulphochloride,

whose formula is $C_6H_4 \begin{matrix} \diagup CH_3 \\ \diagdown SO_2Cl \end{matrix}$ is now treated with ammonia, which produces the ortho-toluol sulphamide, $C_6H_4 \begin{matrix} \diagup CH_3 \\ \diagdown SO_2NH_2 \end{matrix}$.

This is then oxidized by potassium permanganate, and thus converted into ortho-benzo-sulphimide, $C_6H_4 \begin{matrix} \diagup CO \\ \diagdown SO_2 \end{matrix} NH$, the

final product, which is precipitated from the solution on adding an acid. It forms a white powder, only slightly soluble in water, but readily soluble in alkaline liquids. Recent experiments show that the pure substance possesses about 500 times the sweetening power of cane-sugar. The commercial product, however, often contains as much as 50 per cent. of impurities, and its sweetening power is only about 300 times as great as that of cane-sugar. Saccharin is usually sold in tablets of one grain each, mixed with a little bicarbonate of soda, to increase solubility. These may be dissolved in water, in milk, or in coffee. Saccharin is now largely used in the manufacture of cordials and mineral waters, in baking, preserving fruit, etc.

SACCHAROMYCETES, sāk'kārō-mī-sō'téz (Neo-Lat. nom. pl., from ML. *saccharum*, sugar + Gk. *μύκης*, *mykēs*, mushroom). One of six

YEAST.

a, reproduction by budding; *b*, formation of spores; *c*, division in budding.

great groups of fungi (q.v.), and containing the yeasts. (See FERMENTATION.) Yeasts are one-celled plants with a peculiar method of growth

termed budding, in which the cell puts out one or more processes which finally become pinched off from the mother cell. The buds may remain attached for a long time, so that they form an irregular group of cells clinging together. Many yeasts form spores, the protoplasm separating into two or four masses that become walled and lie inside the mother cell. *Saccharomyces cerevisiae*, the beer yeast, has been cultivated for centuries and is not known in the wild state. The origin of such yeasts is not certain, but all evidence points to their derivation from some of the higher fungi. The conidia of many ascomycetes and basidiomycetes, and especially the smuts, will bud extensively in culture solutions and induce fermentation. None of the cultivated yeasts are known to have come from these wild yeast stages, which are generally mere passing phases of much more complicated life histories. The yeast of wine fermentation is said to originate from spores of the filamentous mildew-like fungus (*Dematium*) that grows on the surface of grapes. It is well understood that the cultivated yeasts constitute fixed species that have not been made to develop into other fungi. The identification of yeasts is a matter of practical importance to those who use the organisms in brewing, because certain wild yeasts seriously injure or spoil the work of the beer yeast. The species are distinguished chiefly by physiological characters, among which are the maximum and minimum temperatures of growth, and the optimum temperature for spore formation. Some beers and ales owe their peculiarities not alone to the character of the wort, but to the specific nature of the yeasts employed.

SACCHETTI, sāk-kēt'té, FRANCO (c.1330-c.1399). An Italian novelist and poet, born in Florence. His most important work is a collection of several hundred *Novelle*, simple, straightforward descriptions of real events in many instances, and admirable pictures of the society of his time. They were written about 1392-95, and were first published in 1724. The best edition is that of Gigli (Florence, 1860). Ten of the tales are translated in Roscoe's *Italian Novellists* (1825). His ballads are of great freshness and charm. There is a good edition of them by Franchi and Majonchi (Lucca, 1853), and some of the best are included in Carducci's *Studi letterarii*.

SACCHINI, sāk-kē'né, ANTONIO MARIA GASPARO (1734-86). An Italian operatic composer of the Neapolitan school. He was the son of a fisherman, born in the environs of Naples, and owed his musical education to Durante. His first marked success was the opera *Semiramide*, produced at Rome in 1762. In consequence of the success in Venice of *Alessandro nell'Indie* (1768), he became director of the Conservatory del Ospedaletto in that city. In 1771 he went to London, where he spent the next ten years, scoring several successes. He then went to Paris, where he wrote two new works, *Dardanus* (1784), and his most famous production, *Adipe à Colone* (1786). He also wrote a large number of sacred compositions and some chamber music.

SACHALINE, or GIANT KNOTWEED (*Polygonum sachalinense*). A hardy perennial herb 6 to 12 feet high with strong, extensively spreading root-stocks, broad, nearly heart shaped leaves oft-

on a foot in length, and small greenish flowers, which appear late in autumn. The plant is a native of Eastern Siberia, from whence it was brought to Europe and grown in many botanic gardens. It came prominently into notice about 1833, when the drought in Western Europe caused a decided shortage in forage for cattle. This plant was little affected, and since its tender shoots and leaves were eaten by stock, the plant was widely grown experimentally as a forage crop. It has proved less useful than was predicted, and its cultivation in the United States has been almost entirely abandoned. False sachaline (*Polygonum cuspidatum*) has smaller and more pointed leaves.

SACHAU, zä'gou, EDUARD (1845—). A German Orientalist, born in Nennünster, and educated at Kiel and Leipzig. In 1869 he became professor of Semitic languages in Vienna, and in 1876 went to the University of Berlin, where, in 1887, he took charge of the new Oriental Seminar. Sachau traveled much in the East, and published, among many other volumes, an English translation of Alberuni's *Chronology of Ancient Nations* (1879; Arabic text, 1876-78) and of the same writer's *India* (1888; Arabic text, 1887); *Reise in Syrien und Mesopotamien* (1883); *Arabische Volkslieder aus Mesopotamien* (1889); *Ueber die Poesie in der Volkssprache der Nestorianer* (1896); *Mohammedanisches Recht* (1897); *Am Euphrat und Tigris* (1900); and several valuable catalogues of Persian, Syriac, and Arabic manuscripts.

SACHER-MASOCH, sä'göer mä'zög, LEOPOLD VOX (1835-95). An Austrian novelist. He studied at Gratz and Prague, taught history at Gratz, and published (1857) *Der Aufstand in Gent unter Karl V.* His first novel, *Eine galizische Geschichte*, appeared in 1866. His fiction, devoted in part to Galician life, is unsavory, sensational, but of rich imagination. Best known of his many novels is *Das Verhängnis Kains* (1870).

SACHEVERELL, sä-shäv'er-äl, HENRY (c.1674-1724). An English high churchman. He was born at Marlborough and was educated at Magdalen College, Oxford. In 1705 he became preacher of Saint Saviour's, Southwark. His prominence is due to two sermons preached in 1709, one at Derby, the other at Saint Paul's, in which he attacked the principles of the Act of Settlement, asserted the doctrine of non-resistance, and decried the Act of Toleration. The House of Commons impeached him for these utterances, and the Lords found him guilty. But popular opinion rose so strong in the preacher's favor that the authorities dared go no further than to suspend him from preaching for three years and to order the obnoxious sermons to be publicly burned. Sacheverell became, for the time, the most popular man in the kingdom. At the general election, which came on almost immediately, his prosecution was the decisive issue, and brought about the defeat of the Whigs, who had been the political party in power. When, in 1713, his suspension expired, he was appointed by the new Tory House of Commons to preach before them the sermon on the anniversary of the Restoration, and was specially thanked on the occasion. Consult: Howell, *State Trials*, vol. xvi. (London, 1809-26); Stanhope, *History of Queen Anne's Reign* (ib., 1872).

SACHEVERELL, WILLIAM (1638-91). An English politician. He first appeared in Parliament in 1670, and at once joined the opposition, where he came into prominence almost immediately. In 1673 he began the movement which brought about the downfall of the Cabal (q.v.) and the passage of the Test Act (q.v.). His hostility to the Court policy, however, continued unabated. Especially did he advocate a return to the Triple Alliance of 1668 between England, Spain, and Holland. Sacheverell was the first man who openly suggested the exclusion of the Duke of York from the succession. He made the proposal in 1678 and continued to advocate it even against the wishes of the party leaders. A year later he succeeded in getting a bill to this effect before the House, but Parliament was prorogued and dissolved before it could be read a third time. In the new Parliament he was one of the managers of Lord Stafford's trial. On the accession of James II, he was forced into retirement, but with the Revolution he again came into prominence, serving on the committee which drew up the Declaration of Right. He also was among the most active of those who tried to disfranchise the Tories implicated in the obnoxious measures of James.

SACHS, säks, BERNARD (1858—). An American neurologist, born in Baltimore, Md., and educated at Harvard and in the University of Strassburg. After research in Vienna and Berlin, he began to practice medicine in New York City in 1883 as a specialist in nervous diseases. Dr. Sachs first described the disease known as amantotic family idiocy. He contributed to Keating's *Discases of Children* (1890), to Hare's *Therapeutics* (1892), and to Hamilton's *Medical Jurisprudence* (1894), as well as to German, British, and American neurological journals; and wrote *Nervous Diseases of Children* (1895; German version, 1897).

SACHS, säks, HANS (1494-1576). A German poet and dramatist, the best and also the most prolific of the *Meistersingers* (q.v.). He was born in Nuremberg, the son of a shoemaker, to whose trade he was trained, having first enjoyed a classical education at the town Latin school. After his apprenticeship he entered on the usual years of journeyman wandering in 1511 and passed five years practicing shoemaking in many places of South and North Germany, among them Pussau, Munich, Salzburg, Regensburg, Leipzig, Osnabrück, and Lübeck. Returning to Nuremberg in 1516, he married in 1519 and again in 1531; he was diligent alike at his trade and his literary avocation, gained high esteem among his townsmen both as burgher and poet, took earnest but serene interest in the Reformation movement, and died in 1576. Though early trained in the rules of the *Meistersingers*, he soon emancipated himself from their excessive pedantry. His versification was always mechanical and his purpose prevalingly didactic, but his humor was exuberant, his imagination fertile, and his fancy tireless. He wrote hymns, some of which did great service to the Reformation in its first decades, fables, allegories, merry tales (*Schwänke*), dialogues, comedies, and Shrove-tide plays (*Fastnachtspiele*); in all some 6300 pieces. In an often-quoted and characteristic passage in a preface of 1560, he describes his poetry as "an open public pleasure garden by the wayside for the

comes a man, in which you may find not only some trees bearing sweet fruit for the food of the healthy, but roots and herbs sharp and bitter, for medicine to purge sick minds and expel the peccant humors of vice. There you may find, too, fragrant violets, roses, and lilies from which to distill and prepare precious waters, oils, and essences that may strengthen and restore feeble, troubled, and weak minds; and finally, weeds and field flowers, clovers, thistles, and cornflowers, to make the gloomy and melancholy gay and light-hearted by their bright and beautiful colors." Sachs's work continued popular till the days of Opitz; then his fame suffered almost total eclipse till it was revived by Goethe, especially through his *Haus Sachsens Poetische Sendung* (1776). The best edition is in 23 vols. by A. von Keller and C. Goetze in the *Bibliothek des Stuttgarter Literarischen Vereins* (Stuttgart, 1886-96). The best selection is by Gölleke and Tittmann in *Deutsche Dichter des 16ten Jahrhunderts* (2d ed., Leipzig, 1883-85). Consult also Schweitzer, *Etude sur la vie et les œuvres de Hans Sachs* (Nancy, 1889); Drescher, *Studien zu Hans Sachs* (Berlin, 1890; Marburg, 1891); Génée, *Hans Sachs und seine Zeit* (2d ed., Leipzig, 1902); Goetze, *Hans Sachs* (Nuremberg, 1894); Saphan, *Hans Sachs in Weimar* (Weimar, 1894); and *Hans Sachs: Humanität: it and Gegenwart* (Weimar, 1895); *Hans Sachs-Forschungen* (ed. by Stiefel, Nuremberg, 1894).

SACHS, JULIUS VON (1832-97). A German botanist, founder of the modern science of experimental vegetable physiology. He was born in Breslau. After a year in Freiburg he became professor at the University of Würzburg in 1868, and built up there a great physiological laboratory. Of especial importance were his researches on the influence of light, natural and colored, on plant assimilation, and on heliotropic curves. In the matter of assimilation of starch and its test by iodine applications, and of culture in nutrient solutions, his work was that of a pioneer, and the same may be said of his law of the 'three cardinal points' in the relation of germination to temperature and of his work on tropism. He wrote: *Handbuch der Experimentalphysiologie der Pflanzen* (1865); *Lehrbuch der Botanik* (1866); *Vorlesungen über Pflanzenphysiologie* (1882); *Geschichte der Botanik* (1875; English translation, 1890); and *Gesammelte Abhandlungen über Pflanzenphysiologie* (1892-93).

SACHSENSPIEGEL, zäk'sen-sbpe'gel (Ger., Mirror of Saxony). The best German law treatise of the Middle Ages. It was a private compilation of the customary law of Saxony, made by Eike von Repgow, c.1230. Although not authoritative, it had much influence and was the source of other treatises on law. The best edition is by Homeyer (3 vols., Berlin, 1835-44). Consult Stobbe, *Geschichte der deutschen Rechtsquellen*, vol. i. (Brunswick, 1864).

SACK (Fr. *sec.*, from Lat. *siccus*, dry). A name given in England in the seventeenth century to the strong white wines from the south of Europe. Originally the term applied to dry light-colored wines, and to the punch made by sweetening and flavoring them.

SACK'ETTS HARBOR. A village in Jefferson County, N. Y., 11 miles west of Watertown; on Black River Bay, Lake Ontario, and on the

Rome, Watertown and Ogdensburg branch of the New York Central and Hudson River Railroad (Map: New York, D 2). Madison Barracks (q.v.), a United States military post; Fort Tompkins Park, the scene of a battle in the War of 1812; and a United States naval station, are noteworthy features. Sacketts Harbor is admirably situated, but its commercial and industrial interests are insignificant. Population, in 1890, 787; in 1900, 1266.

Founded by Augustus Sackett in 1801, Sacketts Harbor had a score of houses by 1812, and was the centre of a considerable trade with Canada. During the War of 1812 the frigates *Sappho* and *Madison* were built here in 80 days and 45 days respectively. On May 29, 1813, the place was unsuccessfully attacked by a British force under Prevost. The English lost 259 in killed, wounded, or missing, while the Americans lost only 23 killed and 114 wounded. Consult an article by Willecox, "Sacketts Harbor and the War of 1812," in *Jefferson County Historical Society Transactions* (Watertown, 1886-87).

SACK'VILLE, CHARLES, sixth Earl of Dorset (1638-1706). An English poet and patron of letters at the Court of Charles II. Immediately after the Restoration, he was elected to Parliament. For some years he lived a very dissipated life, engaging in several disgraceful 'frolics.' In 1665 he served as a volunteer against the Dutch, and after this lived a life of leisure, gaining a deserved reputation for his wit and his patronage of letters. Dryden dedicated to him the *Essay of Dramatic Poesy* and introduced him under the name of Eugenius into the dialogue of this famous piece of criticism. He was also a friend of Waller, Butler, and Wycherley, and was beloved by Prior in the next generation. He lost some of his prestige under James II., but regained it under William. On the death of his father (1677) he succeeded to the earldom; in 1691 he was honored with the Garter; and he served three times as Regent during King William's absences. Sackville's reputation as poet now rests mainly upon the poem beginning, "To All You Ladies Now at Land." It is said to have been written at sea on the night before the great naval battle with the Dutch (June 3, 1665). Consult Johnson's *Lives of the Poets*; Ward's *English Poets* (vol. ii.); and the *Musa Proterra*, ed. A. H. Bullen (London, 1889).

SACKVILLE, GEORGE GERMAIN, first Viscount (1716-85). An English soldier and statesman. He was the third son of the first Duke of Dorset and was educated at Westminster School and at Trinity College, Dublin. He served with the Duke of Cumberland, was wounded at Fontenoy, and was promoted to be lieutenant-general. As commander of the British forces in Germany, he served under Ferdinand of Brunswick, but for his failure to carry out the order of the commander-in-chief to charge the retiring French cavalry and infantry at the battle of Minden in 1759, was dismissed from the service, a sentence that was confirmed by the court-martial that he demanded. He was reinstated in royal favor by George III. and, as Lord Germain, became Secretary of State for the Colonies in the Cabinet of Lord North during the American Revolutionary War, incurring a share of the odium attached to that statesman's policy. He was raised to the peerage as Viscount Sackville in 1782.

SACKVILLE, LIONEL SACKVILLE-WEST, Baron (1827—). An English diplomat. The son of the fifth Earl de la Warr, he was born at Bourn Hall, Cambridgeshire. He received a private education; entered the diplomatic service in 1847, and prior to 1868 was attached successively to the British legations at Lisbon, Naples, Stuttgart, Berlin, Turin, and Paris. He became British Minister to the Argentine Republic in 1873, to Spain in 1878, and to the United States in 1881. He was a member of the North American Fisheries Commission in 1888. The same year, in the American Presidential campaign, a decoy letter now known as the 'Murchison letter,' presumably sent by a naturalized citizen of British birth, requested his views on the attitude of the Administration toward England. His answer, which claimed that the reflection of Cleveland would be advantageous to British interests, was published, and gave offense to the President, who sent him his passports, thus terminating his career at Washington, and, incidentally, his political life.

SACKVILLE, THOMAS (1536-1608). The first Earl of Dorset and Baron Buckhurst, an English poet and statesman. He was born at Buckhurst, Sussex, in 1536. He joined the Inner Temple and was called to the bar. In conjunction with Thomas Norton (q.v.) he wrote the first English tragedy in blank verse, *Ferrex and Porrex*, afterwards called *Gorboduc* (q.v.), performed at the Inner Temple on Twelfth Night, 1560-61. It is founded on British legend and is molded to the form of Latin tragedy. It has no dramatic life or energy, but the style is pure and stately, evincing eloquence and power of thought. Sackville's other productions (first published in 1563) are the *Induction*, a poetical preface to the *Mirror for Magistrates*, and the *Complaint of the Duke of Buckingham*, which was designed to conclude the work. The *Induction* is a noble poem, uniting, as Hallam says, "the school of Chaucer and Lydgate to the *Fairy Queen*." Soon after his father's death in 1566, he was created Lord Buckhurst, and became a favorite with the Queen, who employed him in foreign diplomacy. He went to Parliament as early as 1557. In the spring of 1568 he was sent to France, where he twice negotiated for the Queen's marriage. In 1587 he incurred her displeasure by what she called his shallow judgment in diplomacy and he was confined to his own house as a prisoner for six months. On the death of Leicester he returned to favor. He succeeded Burleigh as Lord High Treasurer (1599). On the accession of James his patent of office was renewed for life, and in the following year he was created Earl of Dorset. He was buried in Westminster Abbey. Consult his *Works*, ed. by R. W. Sackville-West (London, 1859); and *Gorboduc*, as ed. by W. D. Cooper for the Shakespeare Society (ib., 1847), and by Toulmin Smith in Vollmüller's *Englische Sprach- und Literaturdenkmäler* (Heilbronn, 1883).

SACO, sä'kó. A river of New England, rising in the White Mountains of New Hampshire, flowing southeast through the southwestern part of Maine, and emptying through Saco Bay into the Atlantic Ocean (Map: Maine, B S). It passes through the mountains in the famous Crawford Notch, whose sides are formed by imposing rocky peaks. Its course of 160 miles is almost

a continuous succession of falls, affording excellent water power. One of these falls is 72 feet high, and the last is but 4 miles from the mouth of the river.

SACO. A city in York County, Me., 15 miles southwest of Portland, on the Saco River, here spanned by four bridges, and on the Boston and Maine Railroad (Map: Maine, C S). It has Pepperell Park, Thornton Academy, the Dyer Library of 12,000 volumes, the York Institute Library, and a scientific and historical society, with a museum. The Saco River, which falls 55 feet near the city, affords abundant water power. The industrial establishments include cotton mills, cotton machinery works, and manufactories of brick, box-shooks, belting, and carriages. Old Orchard Beach, four miles distant, is a popular summer resort. Population, in 1890, 6075; in 1900, 6122.

The site of Saco was visited by De Monts and Champlain in 1604-05 and by Captain John Smith in 1614, but no permanent settlement was made here until 1631. Until 1762, when it was separately incorporated as Pepperellboro, Saco formed part of Biddeford (incorporated in 1718). In 1805 the present name, which before 1718 had been applied to Biddeford also, was re-adopted, and in 1867 Saco was chartered as a city. Consult: Owen, *Old Times in Saco, A Brief Monograph on Local Events* (Saco, 1891); and Clayton, *History of York County* (Philadelphia, 1880).

SACRAMENT (Lat. *sacramentum*, sacrament, mystery, engagement, military oath, from *sacrare*, to dedicate, consecrate, from *sacer*, sacred). The name given to certain religious rites of the Christian Church, as to whose number and effects there has been much controversy, especially since the Reformation. According to the traditional and most widely held view, a sacrament is composed of two parts, an outward and visible sign, and an inward and spiritual grace conveyed by the sacrament to those who receive it worthily. This twofold nature is supposed to correspond to the needs of man, as organized with body and soul.

This doctrine is most definitely and clearly taught in modern times by the Roman Catholic Church, though the Eastern churches are in substantial agreement with it. It holds that the sacraments contain grace within themselves as instruments and convey it *ex opere operato*, that is by the fact of the performance of the sacramental act, to those who have the proper dispositions and so place no obstacle in the way of its reception. The *opus operantis*, or the independent act of the receiver, may add to the effect, but does not produce it. The sacraments are seven in number—baptism, confirmation, communion, penance, unction, orders, and matrimony—all of them held to have been instituted by Christ directly. They are divided into sacraments of the dead and of the living; the former class includes those which are held to give supernatural life or sanctifying grace to the spiritually dead—baptism and penance; the latter are supposed to be received by those who are already in a state of grace. Three of them, baptism, confirmation, and orders, are held to impress a certain character or stamp upon the soul, and therefore cannot be repeated; they are administered conditionally if there is any doubt

has been duly received. Besides the intention of the minister it is essential to the validity of any sacrament. There has been much discussion as to the exact sense in which this requirement is to be taken; but all agree that a true inner intention, not necessarily explicit, of performing the act as a religious one is required. If this were denied, it is held that the sacraments would be reduced to the level of mere charms, without any moral responsibility on the part of the minister. A distinction is made between irregular and invalid administration of the sacraments; thus the sacraments administered by a suspended or excommunicated priest would be valid, but not regular, except in the case of a dying person where no other priest was to be had, when such a priest would be allowed to administer them. For the details of the sacraments in their traditional acceptance and use, see BAPTISM; CONFIRMATION; LORD'S SUPPER; PENANCE; CONFESSION; EXTREME UNCTION; ORDERS; HOLY MARRIAGE.

Under the titles LORD'S SUPPER and MASS the doctrinal and sacrificial aspects of the Eucharist have been covered, but some further details of the history and usages of communion may be given here. The manner of reception has varied considerably at different periods. As to the sacramental bread, the question whether it should be leavened or unleavened has caused acute controversies between East and West. In the modern practice of the Roman Catholic Church it is a thin unleavened wafer, large and stamped with sacred symbols for the celebrant, smaller for the other communicants, and is placed directly in their mouths by the priest. Reception in the hand, which seems to have been usual in the early ages, is now the common rule in the non-Catholic churches. (For the history of the withdrawal of the chalice from all but the celebrant, see COMMUNION IN BOTH KINDS.) The modern dread of bacterial infection has led to the adoption in some Protestant churches of a small separate cup for each communicant. The frequency of reception has also varied, from apparently every day in the apostolic times to once a month, a quarter, or a year. The latter, for Roman Catholics, has been a fixed minimum since the time of the Lateran Council of 1215. In practice with them it is generally preceded by sacramental confession, although there is no strict obligation of this where the communicant is free from mortal sin. The Anglican Church makes provision for the celebration of the sacrament in the sick-room, but by the Roman Catholic practice it is carried from the church to the sick person.

By the majority of the reformed churches the sacraments are held to be merely ceremonial observances, partly designed as a solemn act by which persons are admitted to membership or make solemn professions thereof, partly intended to stimulate the faith and fervor of the recipient, to which disposition alone all the interior effects are to be ascribed. As to the number of rites called by the name of sacrament, almost all Protestants agree in restricting it to baptism and communion, even though they retain as religious observances some of the rites which Catholics regard as sacraments. It is contended, however, by the High Church party in the Church of England that Article XXV., which seems to deny the sacramental nature of confirmation, orders, and so on, does not really do so,

but merely asserts that they are not on the same footing with the two great sacraments as generally necessary to salvation.

Consult: Dix, *The Sacramental System the Extension of the Incarnation* (New York, 1893); Oswald, *Die dogmatische Lehre von den heiligen Sakramenten* (5th ed., Münster, 1894); Schanz, *Die Lehre von den Sakramenten der katholischen Kirche* (Freiburg, 1893); and most general works on dogmatic theology.

SACRAMENTALS (Lat. *sacramentalis*, relating to a sacrament, from *sacramentum*, sacrament, mystery, engagement, military oath). A term used in Roman Catholic theology to designate certain rites which partake of the nature of sacraments in so far that they are, if properly used, means of grace, which is conveyed through an external ceremony. While all the sacraments are held to have been instituted directly by Christ, sacramentals are of ecclesiastical institution. The term may be applied either to a material object which is blessed for the purpose or to its employment as a means of grace. A multitude of objects which receive priestly benediction are used in this way: holy water, blessed candles, palms, the ashes used on Ash Wednesday, medals, crosses, and the like, all come under this head. Consult, Probst, *Sakramente und Sakramentalien* (Tübingen, 1872).

SACRAMENTARIANS. The name given in the sixteenth century to those among the reformers who separated from Luther on the doctrine of the Eucharist. Luther taught the doctrine of a mystical presence of the body and blood of Christ along with the bread and wine. (See LORD'S SUPPER; LUTHER.) The first of his followers who called this doctrine in question was Andreas Carlstadt (q.v.); and notwithstanding the protest of his leader, Carlstadt had many followers. The party became so considerable that in the Diet of Augsburg (1530) they presented a special Confession distinct from that put forward by the general body of Protestants, known as the *Tetrapolitan Confession*, because written in the name of the four cities, Constance, Lindau, Memmingen, and Strassburg. It was prepared by Martin Bucer and Wolfgang Capito (qq.v.) and contained 23 chapters. The Confession rejects the doctrine of a corporeal presence, and although it admits a spiritual presence of Christ which the devout soul can feel and enjoy, it excludes all idea of a physical presence. The four cities continued for many years to adhere to the Confession, but eventually they accepted the Augsburg Confession and were merged in the general body of Lutherans. Simultaneous with this South German movement, yet independent of it, was that of the Swiss reformer Zwingli (q.v.), whose doctrine on the Eucharist was that in it the true body of Christ is present by the contemplation of faith, but not in essence of reality. Zwingli himself presented a private confession of faith to the Augsburg Diet, in which this doctrine is embodied. His article upon the Eucharist was in substance embodied in the Helvetic Confession of 1566.

SACRAMENTO. The principal river of California, draining the northern half of the great central valley of the State (Map: California, C 2). The head-stream which bears the name of the main river rises on the southern slope of Mount Shasta, in the northern part of

the State; but it soon receives from the east the much larger and longer Pitt River, which in the wet season is the outlet of Goose Lake, lying partly in Oregon, and having its headstreams in that State. From the junction the main river flows southward until it meets the San Joaquin River, which drains the southern half of the inland basin. The two unite by several arms, but flow through separate channels westward into the northeastern inlet of San Francisco Bay, whence their waters enter the Pacific Ocean through the Golden Gate. The length of the Sacramento is about 400 miles, but to the source of the Pitt River it is over 600 miles. It is navigable for small vessels to Red Bluff, 300 miles, and for larger steamers generally only to Sacramento, 80 miles. The river receives numerous tributaries from the Sierra Nevada and the Coast Range, on many of which there has been a great deal of gold-mining. The valley of the Sacramento is very fertile, becoming marshy toward the junction with the San Joaquin.

SACRAMENTO. The capital of California and the county seat of Sacramento County, 90 miles northeast of San Francisco, on the Sacramento River, here spanned by a bridge, and on the Southern Pacific and the Central Pacific railroads (Map: California, C 2). The city is noted for the remarkable beauty of its environment. The most prominent feature is the State Capitol, which was erected in 1869, and cost \$2,500,000. It occupies a site in the central part of the city and is surrounded by a large picturesque park. Sacramento has three libraries: the State Library of more than 113,000 volumes, the Public Library with 28,000 volumes, and the Odd Fellows' Library. The Christian Brothers' College, Howe's Academy, and Saint Joseph's Academy are the leading educational institutions. There are a fine city hall, court house, United States Government building, Crocker Art Gallery, Roman Catholic Cathedral, Marguerite Home, Protestant Orphan Asylum, the City Dispensary, and the Southern Pacific Railroad Company's hospital. An annual fair is held at Sacramento under the auspices of the State Agricultural Society, which maintains here a handsome exhibition building, and a park and racecourse.

The valley of the Sacramento, in which the city is situated, is one of the most productive sections of the State, yielding large quantities of wheat, and various fruits. Manufacturing is extensively carried on, the various establishments, in the census year of 1900, having had an invested capital of \$7,369,013, and an output valued at \$11,141,896. There are flouring and grist mills, foundries and machine shops, harness and saddlery factories, slaughtering and meat-packing establishments, breweries, and manufactories of carriages, furniture, soap, crackers, and lumber products. Shops of the Southern Pacific Railroad also are here. The water works are owned and operated by the municipality. Population, in 1890, 26,386; in 1900, 29,282.

In 1839 Captain John A. Sutter, having obtained from the Mexican Government a grant of a large tract of land in this vicinity, built here a fort which he called New Helvetia. This fort, which has been rebuilt and is preserved for its historic interest, was the first point in California reached by miners coming from the East in 1848. In this year a village called Sacramento was laid out. The land was originally

only 15 feet above low water, and destructive floods occurred in 1850, 1852, and 1853. Subsequently levees were built and the general level of the land raised, the city now being eight feet higher than when first settled. Terrible fires occurred in 1852 and 1854, the first causing a loss of \$5,000,000 and the second one of \$600,000. Sacramento was incorporated as a town in 1849, became the State capital in 1854, and was chartered as a city in 1863.

SACRAMENTO PERCH. A bass-like fish (*Archoplites interruptus*) of the Sacramento and San Joaquin rivers and tributary lakes, the only fresh-water percid west of the Rocky Mountains. It is an excellent food fish, from one to two feet in length, dark colored, with the sides marked with about seven irregular dark bars. This fish is liable to be exterminated by the carp and catfish, which infest its spawning grounds. See Plate of PERCHES.

SACRAMENTO PIKE. A large, greenish chub, two to four feet in length (*Ptychocheilus Oregonensis*), which abounds in the rivers of the Pacific Coast, and is used as food. Other names are 'squaw-fish' and 'chappaul.' See Plate of DACE AND MINNOWS.

SACRED HARMONIC SOCIETY OF LONDON. An important English musical organization, organized in 1832 for the performance of oratorios and sacred music generally. It became famous for its extraordinary performances of Handel's work at the Handel festivals, which were begun in 1857 at the Crystal Palace, Sydenham, and which have been held triennially with one exception since 1862. As many as three thousand singers have frequently been assembled with an orchestra of 500 pieces. In the triennial festival of 1900, 4000 performers participated. Sir Michael Costa was conductor of the society from 1848 up to the time of his death.

SACRED HEART, LADIES OF THE. A religious society of the Roman Catholic Church, founded at Amiens, France, in 1800, by Madeleine Sophie Barat and Octavie Bailly, under the direction of Father Joseph Désiré Vaurin, S. J. The object of the society was the education of young ladies of the higher classes. The constitution was approved by Leo XII, in 1826; a house was opened in Rome and branches established in many cities. The first house in the United States was established by Bishop Duboung in 1817, near Saint Louis. The society has now over 100 houses in various parts of the world, and 5000 members. The mother house is in Paris. For the story of its beginning, consult Barnard, *History de Marie, Barat* (Paris, 1876).

SACRED HEART, LEAGUE OF THE, OR APOSTLESHIP OF PRAYER IN LEAGUE WITH THE SACRED HEART OF JESUS. A pious confraternity founded at Vals, in France, 1811, by Father Gantrellet, of the Society of Jesus, with the intention of cultivating an apostolic spirit among the young Jesuit students who were in the seminary there preparing for the mission. It soon spread throughout France and thence to other countries and to the missions. Gantrellet's foundation was organized and perfected by Father Henri Ramière, S. J., who also gave it renewed life and vigor and founded the *Messenger of the Sacred Heart of Jesus*, as a monthly organ of the association. This was soon reproduced in several

In images and circulated throughout the world. Pius IX. granted the association many indulgences and the Congregation of Bishops and Regulars at Rome approved of its statutes in 1866. After this it grew very rapidly. Leo XIII. revised its statutes in 1896. At present there are throughout the world over 60,000 local centres aggregated to the Apostleship of Prayer and its membership is estimated at 30,000,000. There are 6,000 local centres in the United States and about 1,000,000 associates. The purpose of the organization is by prayer to unite with the efforts of missionaries throughout the world for the conversion of souls and for the betterment of true believers. A special director for each country is appointed and the *Messenger of the Sacred Heart* appears in about thirty different editions, printed in fifteen languages. Consult: *Manual of the Apostleship of Prayer* (33d ed., New York, 1900); Ramière, *Apostleship of Prayer* (Eng. trans., ib., 1890).

SACRED HEART OF JESUS, FEAST OF THE. A festival of the Roman Catholic Church celebrated on the Friday after the octave of Corpus Christi. The feast of the Sacred Heart originated in the latter half of the seventeenth century, and was established because of certain revelations made to Marguerite Marie Alacoque, a French nun of the Order of the Visitation, who lived at Parayle-Monial in Burgundy. She related that the Saviour appeared to her on a number of occasions, showed her His wounded heart, and bade her institute a new office in His honor. The devotion to the Sacred Heart was gradually propagated in France, and at length was approved by Pope Clement XII. in 1732 and more formally in 1736, and by Clement XIII. in 1765. The spread of the Apostleship of Prayer in League with the Sacred Heart of Jesus (see SACRED HEART, LEAGUE OF) has given a fresh impulse in recent years to this devotion. In 1899 Leo XIII. lent the full weight of his supreme approbation to the devotion by consecrating the whole Christian Church in a special manner to the Sacred Heart. Consult Gallifet, *The Adorable Heart of Jesus* (New York, 1887).

SACRED MUSIC. From the very earliest times music has been connected with the religious cult of all nations. The part it has played in the religions of the Egyptians, the Greeks, and the Hebrews is discussed under EGYPTIAN MUSIC, GREEK MUSIC, and HEBREW MUSIC; the present article treats merely of sacred music as it is identified with Christianity. The early Christian Church adopted its music from the Hebrews. Besides the liturgy hymns were also used. When, toward the end of the fourth century, antiphonal singing was introduced in the rendering of the psalms, they were regarded as a class by themselves, because two choruses answered each other; whereas in the hymns the entire chorus sang all the verses. Psalms were always preceded by an *antiphon*, a short piece written in the same tone as the following psalm. Harmony at that time was unknown and the music consisted of a kind of recitation known as 'plain chant.' About the end of the fourth century Saint Ambrose collected the various chants used in the Church, arranged them systematically and promulgated certain rules for their proper execution. He is also credited with the introduction of the four *authentic modes*. (See *MODES*.)

Afterwards the Hellenic popes added many new hymns and distributed the various chants so as to cover the services for the entire Church year. They likewise increased the modes by the addition of the four *psalmodic modes*. When polyphonic music arose, composers selected their texts entirely from the liturgy of the Church. The old plain chant melodies became the *cantus firmus*. But soon popular melodies were introduced. The famous vesper canticle *Magnificat* received its first polyphonic setting probably by Josquin des Prés (d. 1500). After the invention of the discant (see MUSIC, SCHOOLS OF COMPOSITION) it was customary to sing the alternate verses in plain chant and fauxbourdon. Josquin and the earlier polyphonic masters, including even Palestrina, were influenced by this custom to such an extent that they retained the plain chant for the odd verses and composed only the even verses.

Bach's Mass in B minor marks the modern method of the composition of masses. Modern masses no longer exhibit characteristics of schools, but of individual composers. Although we have polyphonic masses dating from the fourteenth century, the mass for the dead, the *requiem*, attracted the attention of composers much later. The first great polyphonic requiem was written by Palestrina. The character of some modern requiems approaches that of the oratorio.

In connection with the development of the mass we find the form of the *motet*, first cultivated by De Vitry about 1300. The text was always Latin selected from the offices of the Church. When the school of the Netherlands (see MUSIC, SCHOOLS OF COMPOSITION) was at its height, every composer of note wrote one or more masses, each bearing the name of the popular melody which was used as a cantus. In the course of time this practice led to abuses, and seriously detracted from the dignity of the Church style, so that the Council of Trent appointed a commission of cardinals and musicians of the Papal Chapel to restore Church music to its original purity. At no time had the plain chant been discontinued. In fact, it was the only music that had ever been officially sanctioned by the Church. At this crisis Palestrina came forward and composed three masses in the polyphonic style. The commission decided that the contrapuntal art was not incompatible with the dignity and simplicity essential to Church music. Palestrina continued to compose masses in this style and also set to music the services used during Holy Week, the *Lamentation* and *Laupereria*. All these works of Palestrina and the other masters of the Roman school were written strictly *a capella*, i.e. without instrumental accompaniment. This style has ever since been known as the Palestrina style. The masters of the Neopolitan school introduced the orchestra into the Church, and thus brought about a new style in which the individuality of the composers found greater freedom of expression. See MUSIC, SCHOOLS OF COMPOSITION.

The Reformation wrought a great change in the forms of Church music. The introduction of congregational singing gave rise to the *chorale*. At first popular melodies were taken and adapted to German words; then composers began to write original melodies. In England Protestant composers took the form of the motet and wrote their music to English words. Thus arose the

anthem. In 1539 by a decree of Elizabeth the anthem became an essential element in the Anglican ritual. In respect to form a distinction was soon made between the *full anthem* and the *verse anthem*, the former containing more choral writing, the latter more solo numbers. In Germany the anthem was developed by the immediate predecessors of Bach into the *Church cantata* (*Kirchenkantate*), and Bach himself marks the culmination of this form. Bach's cantatas are more elaborate than the anthems, especially in the treatment of the instrumental accompaniment.

Independent of the Church service there arose the form of the *oratorio*. Catholic composers originated this form about 1575, and German and English Protestant composers adopted it. The German masters confined themselves in the selection of the texts to the Passion of Christ, as related in the Gospels. They introduced the character of the *narrator* and made free use of the chorale, thus adding an element of pious contemplation. In this form the oratorio became the *Passion oratorio*, or, briefly, the *Passion*. The perfection of this form is reached in Bach's *Passion According to Saint Matthew* (1729). See AMBROSIAN CHANT; ANTHEM; ANTIPION; CANTUS FIRMUS; CHORALE; HYMNODOGY; IMPROPERIA; MASS; MODES; MOTET; ORATORIO; PASSION; PLAIN CHANT; POLYPHONY; REQUIEM; SEQUENCE; STABAT MATER.

SACRED ORDER. A Siamese order for members of the royal line, founded in 1851 and reorganized in 1869. It had previously been a personal decoration of the King. The insignia comprises a rosette surmounted by a crown and set with nine different jewels. The ribbon is yellow, edged with red, blue, and green.

SACRED WARS (Gk. *ιεροι πόλεμοι*, *hieroi polemoi*). The name given to the wars waged at the instigation of the Amphictyonic Council in Greece in behalf of Delphi. On the ground that the Phocian cities of Crissa and Cirrha had maltreated women returning from the shrine, and had exacted too heavy toll from pilgrims to Delphi, war was made on Cirrha about B.C. 596-586 and the city was destroyed. About B.C. 357, the Phocians were charged with having cultivated ground sacred to Apollo and were heavily fined by the Amphictyonic Council. They retaliated by seizing Delphi, and by the aid of the treasure prolonged the war for ten years, when they were finally overpowered by Philip of Macedon, and their towns dismantled. On a similar accusation made in B.C. 339 by Æschines, the Amphictyons declared war against the Locrans, and made Philip commander-in-chief. When his operations seemed to be directed against Athens, Demosthenes succeeded in forming an alliance with the Thebans and the struggle ended in the battle of Charonea, which put Greece at the feet of Philip. A war between the Phocians and Delphians in B.C. 448 also figures as a sacred war.

SACRED WAY (Lat. *via sacra*, Gk. *ιερή ὁδός*, *hierē hodos*). (1) A famous road leading from Athens northwest to Eleusis. It issued from the city at the Dipylon Gate, passing through the Ceramicus and continuing through the Pass of Daphne. It was the route of the great annual procession of the mysteries, and was for the greater part of its length lined on both sides with tombs, many of which are preserved, together

with remains of shrines and temples. (2) The most important street of the ancient Roman Forum, forming the chief means of communication with the Capitol. Starting near the Meta Sudans in the hollow of the Colosseum, it passed between the Palatine and Oppian, some 150 yards north of its later line, leading through the Arch of Titus, thence diagonally between the Temple of Vesta and the Regia to the Vicus Tuscus, past the Basilica Julia to the summit of the Capitoline, a total length of about 860 yards to the foot of the ascent, which in Imperial times was called the Clivus Capitolinus. The road received its name from the three sacred huts of Vesta, of the high priest, and of the Penates brought from Troy. In early times it was divided into three sections, *infima*, *summa*, and *clivus sacr.* Its classic name was retained down to the ninth century.

SACRIFICE (Lat. *sacrificium*, sacrifice, a making sacred, from *sacr*, sacred + *facere*, to make). An offering to a spiritual power of something consumed in the service of that power. The word therefore includes the rite and the thing that is sacrificed, but excludes in the latter case, except when used metaphorically, such objects as are made over to a deity without being consumed (lands, temples, etc.). The deity is supposed to eat the sacrifice or its essence, sometimes only the blood (life) of the victim. In the developed ritual a sacrifice is generally made by an appointed priest (q.v.). Not all priests, however, are sacrificers. Sacrifices are sometimes divided, as among the Romans, into honorific and piacular. In either case the motive in making a sacrifice is the counterpart of that which induces a man to make an offering to another man. Thus the sacrifice is a means of benefiting, a token of esteem and brotherhood, or it is a palliation of actual or potential anger. The simplest form of sacrifice is when grain is flung upon the ground for spirits, either ancestral ghosts or goblins. But as this is usually the accompaniment of a family meal, so a great feast in honor of gods is merely an extension of the same idea. Such a sacrifice may be either vegetable or animal. Both kinds are enumerated in the Gudean tablets, and since both are offered to-day by savages, as they were common in classical antiquity and were known to the Aryans from a still more remote period, it is probably impossible to derive one from the other. There is, further, besides the simple vegetable sacrifice, the sacrifice made by offering intoxicating liquor, usually as an accompaniment of a feast, such as the beer sacrifice to Wotan, the Soma sacrifice to Indra, and parallel offerings and rites among the Aztecs. Among animal sacrifices, as man is the best animal, human sacrifices have always held a prominent place. They were common among the Semites, not unusual among the Greeks and Romans (in a veiled form), and from time immemorial have been performed in India. The worshippers in some Saiva rites still eat of this sacrifice and many peoples are cannibals only at a time of sacrifice. The fruit sacrifice is sometimes clearly an afterthought, typifying a revolt against the cruelty of animal sacrifice. Thus in the Vishnu cult of India only vegetable sacrifices are permitted. In such a case, for animals are substituted cakes in the likeness of animals; or small animals first take the place of large animals and are in turn exchanged for effigies (as

name of *Pragname* rites; or, instead of being *pragname*, the victim is only beaten or otherwise treated as in expiatory rites. The same notion sometimes in the mutual abuse of festivals, *pragname* is a means of purification.

In cases of piacular sacrifice, the gift serves as an atonement. This gift is usually the life (blood) of the sinner or of his substitute, but it may be merely a dish of food. In a totem system, the sin committed by the clan is often expiated by the sacrifice of some man or animal of the clan. In proportion to the god's anger the gift must be precious, and even the chief of the clan or his children must suffer. But piacular sacrifice may be made without any such notion and then a stranger or slave is sacrificed, as in the *mon-ai* rites, when victims are offered to atone for erecting bridges, building foundations, and the like. No sacrificial altar is needed for primitive rites, but as gods are or dwell in stones, fire, or water, gifts are made at the stone or thrown into the fire or water. In the former case, however, even after the conception of the divinity has changed, and the god is supposed to live in heaven, he is still imagined either to come to the stone or to smell the sacrifice offered thereon. Many religions, moreover, have the extension of piacular sacrifice known as the scapegoat. In this conception sin, like disease, clings to a man, but may be put off upon some one else, who is either driven away burdened thus with sin or is slain for the real sinner. The proxy sacrifice is a redeemer. In the *Brāhmanas* we read that an animal sacrifice on a certain occasion represents a man who has 'bought himself off' by means of the animal. A tale of the same period recounts that a man who had been promised as a sacrifice to a god 'bought himself off' by purchasing another man for 1000 cows to serve as a redeemer. Redemption implies atonement, but atonement does not imply redemption. The mystical sacrifice of the Greeks, Samites, Mexicans, and other races is always an atoning sacrifice, and the victim represents the offended deity because the clan is of his blood; and by partaking of this blood, which symbolizes life, the clan renew their strength in communion with their god. (For various Christian views of the sacrifice of Christ and its effect, see ATONEMENT.) According to the view of the Roman Catholic and Eastern churches, Christianity is still, by the daily re-presentation of the one offering of Christ, essentially a sacrificial religion. For an exposition of this view, see MASS.

The piacular sacrifice has been explained by Robertson Smith as a development from a totem offering, consisting originally in swearing a betel with wine and blood, in which the life of a member of the brotherhood is required (whereas in the commensal meal there is a feast). According to some scholars, all sacrifices have their origin in the same cult, but this is a great exaggeration. Sacrifice, whether as piacular or honorific, may be an offering of alien life, and it is impossible to derive from totemism the jollification of a drunken debauch in which the gods are invited to share. Inside the province of totemism sacrifice may be honorific or piacular, and in neither case is it necessary (although in the latter case it is common) to sacrifice a clan-member. Disregarding the totemic sacrifice, we have a mass of evidence pointing to the fact that sacrifice may be without implication of any blood-

fellowship. Sometimes there are symbolic sacrifices. There can be no doubt, for example, that thuggery belongs to this class. The goddess of thuggery is the Dravidian mother-monster, to whom as symbolizing the reproductive power of nature (a different notion altogether from that of totemism) phallic rites are performed; but as representative of life human victims are offered to her. In the holocausts offered to the Aztec deities there is no expiation, but only propitiation by means of victims sometimes alien and sometimes native. The human sacrifice offered by the Assamese and by the Khasis, or again by the intermediate Nāga tribes, are both expiatory and propitiatory. The Khasis, for example, kill (and eat) a stranger as a piacular rite to *Thlen* (the dragon); the Nagas expiate sin by sacrificing slaves (not of the same stock) and enemies captured in battle; and in Assam the privileged victims (feasted and petted till execution, as in Mexico) are strangers, though they are piacular as well as honorific victims. Such cases point to a wider conception of sacrifice than that put forward by those who deduce all sacrifice from one origin. The god earth, the only chain binding together all the Khond tribes in India, is a malignant demon, and propitiatory blood-sacrifice is made to him, but only to symbolize rain withheld by the demon, as the tears of the Aztec children symbolized rains ('sympathetic magic'). In its simplest aspect sacrifice is a gift intended to propitiate any spirit and not a renewal of a blood-bond nor an expiatory rite. Demonolatry has its sacrifices, and they are the earliest known as they survive to-day among such primitive savages as the Mishmis, who have no idea at all of a good god, but propitiate a demon with offerings. The motive of the sacrifice is to please as well as to benefit the spirit.

In view of the facts here cursorily considered, instead of starting with the assumption of totemism and endeavoring to explain all sacrifices as either a totemic commensal feast on a hostile victim or a piacular rite, it will be better to divide sacrifices into three main classes, as follows: (1) offerings made to goblins, ancestral spirits, or other spiritual powers, to propitiate them, such as grain to the *Bhūts* ('beings') and tithes to a king-god; (2) offerings made as a feast to great gods (distinguished guests), the sacrifice consisting of vegetables or of animals, or human aliens, often of intoxicating liquor; the idea of both (1) and (2) being that of a friendly gift, though (2) may in a totemic environment be a brotherhood feast; (3) sacrifices, either vegetable or animal, made to expiate sin. In a totemic environment a clan-member is the victim, but often an alien; in many cases only the life is demanded and the flesh is not eaten when an animal (including man) is sacrificed. These forms are not always distinguishable. A cannibal feast may be expiatory and may not be a commensal feast with the god. On the other hand, it may be commensal with the god and yet expiatory. As a general thing, piacular sacrifice is not primitive, but secondary, when ethical feeling is developed. Among savages sin against a god has no ethical side. A demon's wrath is simply inferred from trouble presumably caused by the god. The sacrifice is not to remove sin, but to avert anger, the usual cause of anger being a supposed neglect of the god, who has not enough food to satisfy him.

There are many savage tribes who thus offer sacrifice to goblins, gods, or demons whom they regard as quite apart from the clan-life, merely to be on good terms with a power susceptible to such bribery. Besides benefiting or revering a spirit, a third motive lies in pleasing a god by depriving one's self of something valuable; but this is included in the gift notion, which may be inspired by this idea rather than by the notion of benefiting the god. Consult: Robertson Smith, *Religion of the Semites* (new ed., London, 1894); Jevons, *Introduction to the History of Religion* (London, 1896); Tiele, *Gifford Lectures* (New York, 1897-99); Frazer, *The Golden Bough* (3 vols., revised ed., London, 1900); Tylor, *Primitive Culture* (New York, 1874); and see the articles NATURE-WORSHIP; SHAMANISM; and TOTEMISM.

SACRIFICE AMONG THE HEBREWS. The Old Testament presents sacrificial customs belonging to at least three different periods, the Pre-Mosaic, the Mosaic, and that which resulted in the Post-Exilic ritual; there are also many references to alien rites which intruded into the Israelitish religion. The Hebrew sacrificial ideas are of common origin with those of the other Semites, and may have been influenced by the Babylonian religion, but withal the Hebrew system was original enough to make its own selection and to develop in its own way. The materials of sacrifice were of two kinds, flesh and vegetable. In the former the Jewish ritual is distinguished by the limitation to domestic food-animals, namely, the bull, sheep, goat, turtle-dove, and pigeon. As the most valuable food and as the most typical because of its life, flesh was the preponderating element of sacrifice, and *Zebakh*, meat sacrifice, is the general word for sacrifice. The vegetable sacrifices consisted of all cultivated vegetable products, either in the raw state or in cakes of flour kneaded with oil and salted, also sometimes incensed. In the later ritual there is no libation of wine or oil, and leaven or other fermenting component was tabooed, with one exception (Lev. vii. 12). The sacrifices may be divided into three classes: the tribute sacrifice (*minkhah*, 'oblation'); the commensal (*shelem*, 'peace-offering'); the propitiatory, divided into several classes. In the first kind the worshiper rendered back to God, as the liege lord of the land, a typical part of his bounties. This included the first-fruits (q.v.) and the tithes of his fields and flocks; the matter of the sacrifice fell to the ministers of the sanctuary. The commensal sacrifice consisted in the sacrifice and the consumption by family or clan of an animal; it involved a sacramental meal, with all the necessary accompaniments of a banquet, bread, wine, etc. The Passover is an example. Here the primitive idea was of the common consumption by the divinity and his people of the same food, the portion consumed in the flame and the blood spilt on the ground being the god's portion, the rest of the carcase being that of the worshipers. While this was the prevailing sacrifice earlier, the later code made it yield to the third kind, the propitiatory. With the growth of ethical consciousness and of the sense of guilt toward offended Deity, and with the development of the transcendental idea of God, the festal, sacramental character of sacrifice was replaced by a solemn act of animal sacrifice to God, in which at the most only the priests

shared. Such rites 'atone for' human sin, by propitiating God. At the same time, they were effective only for the general frailty of the Church or for unwitting sins of individuals, never for willful sin. Here are several classes, in all of which the blood appears as the atoning element. First, there is the whole burnt offering (*olah, kâth*), in which class belonged the stated daily sacrifices. Secondly, the sin offering (*chat'âth, b'ith*), in which the fat was offered in fire, the flesh being burnt without the sanctuary, or, in individual offering, falling to the priest. To this class belonged the supreme sacrifice of the later ritual, that of the Day of Atonement. The guilt or trespass offering was accompanied with a restitution for some specific offense. To this general department also belong the sacrifices of purification. In early times the sacrifice was the *patrifamilias*, chieftain, or king; in the later development sacrifice was confined to the Aaronic priesthood. Consult the Epistle to the Hebrews and the fifth division of the Mishna; Kurtz, *Der alttestamentliche Opfereultus* (Münch., 1862; Eng. trans., *Sacrificial Worship*, Edinburgh, 1863); the archaeologies of Ewald, Benzinger, Nowack, and the Old Testament theologues of Dillmann, Smend, and Schulz; Lévysonn, *The Temple and Its Ministry* (London, 1874); Wellhausen, *Reste des arabischen Heidenthums* (Berlin, 1887); Robertson Smith, *Religion of the Semites* (London, 1894). For compendium of Levitical laws, see Carpenter, *Hebrews* (London, 1900, 1902).

SACRIFICE AMONG THE GREEKS AND ROMANS. With the Greeks, sacrifice offered to the gods of the upper world was a share in the daily or public meal, a rendering to them of a portion of the good things enjoyed by men. It is probable that in a sense every slaughter of a beast for food was accompanied by an offering of some parts of the animal to the god. In these bloody sacrifices there were many differences in the ritual, depending on the city, the god, and the period, but the main features of the common rite show no great variation. The victim was adorned with garlands and fillets, and the horns of cattle were frequently gilded. A basin of water was consecrated by plunging into it a brand from the altar, and the spectators, animal, and altar were sprinkled. Then barley groats mixed with salt were passed about, strewn on the victim, and thrown by those present into the fire. Hair was then cut from the brow of the animal and thrown into the fire, thus dedicating it to death. Then in solemn silence the victim was killed by cutting the throat, with the head turned back so that the blood might spurt upward. Large animals were first stunned with an axe. The blood was thrown on the altar, and parts of the entrails, bones, and a little flesh, along with incense, burned for the gods. From these sacrifices must be distinguished those offered to the gods of the lower world, to the heroes or the dead, where the blood was allowed to flow into the earth, and the entire victim was consumed or otherwise destroyed, as when animals were cast into the sea, rivers, or subterranean caverns. In these offerings we find dogs and animals unfit for food sometimes slain. Besides these bloody sacrifices, unbloody offerings of fruits, wine mixed with water, honey, milk, and especially cakes, were very common. Cakes in the form of animals were used by the poor

as substitutes for the more expensive victims. No wine was ever offered to the gods of the lower world. Their libations were honey, milk, and water. At some altars only bloodless offerings were allowed.

Among the Romans offerings were made daily and on special occasions by the family to the Lares, Penates, and other household gods. In their simplest form these consisted of the articles of daily food, milk, wine, beans, grain, cakes of many shapes and sizes, garlands, firstfruits of the flock or field, or incense. Similar were doubtless the public offerings of the early religion, and this simplicity was long preserved, accompanied by an elaborate and minute ritual. Thus in certain sacrifices the victim must be slain by a flint knife; elsewhere only hand-made earthenware vessels could be used, or the grain must be pounded, not ground. The swine was perhaps the commonest animal sacrificed, and the great offering was the *Suovetaurilia* (q.v.), or boar, ram, and bull. In the developed ritual the state sacrifices were usually bloody, and the choice of the animal was regulated by minute rules, which prescribed the color, age, and sex, as well as the kind of victim appropriate to the god or the occasion. Horses were only offered to Mars; for the gods of the lower world black or dark victims were prescribed, and white cattle for Jupiter and Juno as gods of the heaven; in the latter case we find that chalk sometimes helped nature in securing the needful color. While the old ritual seems to have prescribed very modest sacrifices, the later custom added extra victims, *honoris causa*, and often in great numbers. The ceremonial of the sacrifice consisted in a careful inspection of the victim, which was then brought to the altar decked with garlands, ribbons, and fillets. Here the offerer first threw incense and wine into a fire by the altar, and then symbolically slew the victim, the actual killing and cutting up being performed by servants. The *exta* (heart, lungs, liver, etc.) were carefully examined to see that they were perfect, then cooked, and offered on the altar to the god; the remainder of the animal was eaten by the priests and officials, or, in the case of private sacrifices, by the worshiper and his friends. In the case of foreign gods other rituals, especially the 'Greek rite' (*græcus ritus*), were followed. For the literature, see the articles on GREEK and ROMAN RELIGION.

SACRISTAN (OF., Fr. *sacristain*, from ML. *sacristanus*, sexton, from *sacrista*, sacristan, from Lat. *sacer*, sacred). A title applied in the Roman Catholic and Anglican churches to the official who has the care of the sacristy and the sacred vessels, vestments, and other valuables contained in it. The duties of the sacristan were originally performed by a separate class of clerics, who constituted the lowest of the four minor orders. (See OSTIARIUS.) The term sacristan has become corrupted into sexton, and the two terms are sometimes used interchangeably, although the sacristan proper has a more responsible office. In cathedrals and collegiate churches he is usually a dignitary of the chapter—in the English cathedrals one of the minor canons.

SACRISTY (ML. *sacristia*, vestry, from *sacrista*, sacristan). An apartment attached to a church, in which are kept the sacred objects used in the public worship, and in which the

clergy and other functionaries who take part in the service assemble and prepare for the ceremonies on which they are about to enter. In many European churches the sacristy is a spacious and costly building. Anciently there was a distinction between the sacristy, where the vestments were kept, and the treasury, where the books and vessels were guarded, these two chambers being placed on the right and left of the apse of the church, where they were replaced in the Middle Ages by the side-apses and chapels. Many church sacristies in Europe are still small museums.

SACROBOSCO, JOHANNES DE, JOHN OF HOLYWOOD, or HALIFAX (?-1256). An English mathematician, probably born at Halifax, in Yorkshire. He was educated at Oxford, entered the University of Paris about 1230, and afterwards became professor of mathematics and astronomy there. Sacrobosco was among the first scholars of the Middle Ages to make use of the astronomical writings of the Arabians. His treatise *Tractatus de Sphæra Mundi* is a paraphrase of a portion of Ptolemy's *Almagest* (see ALMAGEST), and no book enjoyed greater renown as a manual among the scholastics. First published in Ferrara in 1472 (an edition now very rare), it passed through twoscore editions with many commentaries. Sacrobosco's work on arithmetic, *Tractatus de Arte Numerandi* (printed without place and date), variously called *Opusculum de Praxi Numerorum quod Algorismum vocant* (1510) and *Algorismus Domini Joannis de Sacro Bosco* (1523), contains the nine Hindu digits and the zero. He also wrote *De Anni Ratione* (1350). Consult: Eneström on Sacrobosco's arithmetic, in *Bibliotheca Mathematica* (1894); Halliwell, "Tractatus de Arte Numerandi," in *Rara Mathematica* (London, 1839).

SACRUM (Lat., sacred), or OS SACRUM. A triangular bone situated at the lower part of the vertebral column (of which it is a natural continuation), and wedged between the two innominate bones so as to form the keystone to the pelvic arch. It is readily seen to consist of five vertebrae with their bodies and processes, all consolidated into a single bone. Its anterior surface is concave, not only from above downward, but also from side to side. The posterior surface is convex, and presents, in the middle vertical line, a crest, formed by the fusion of the spines of the vertebrae, of which the bone is composed. The last sacral vertebra has, however, no spine, and the termination of the vertebral canal is here very slightly protected.

SACY, সাঁসঁ, ANTOINE ISAAC, Baron Silvestre de (1758-1838). One of the greatest of French Orientalists. He was born in Paris, began the study of Hebrew at the age of twelve, and gradually acquired an extensive knowledge of Semitic and Iranian languages. Being intended for the civil service, he studied law, and in 1781 was appointed counselor of the mint. In 1785 he was elected a member of the Académie des Inscriptions, and rendered valuable service as member of a committee to publish unedited manuscripts in the royal library. During the Revolution he lost his position. He had already begun the decipherment of the Pehlevi inscriptions of the Sassanian kings, and in 1793 published his *Histoire de la dynastie des Sassanides*, translated from the Persian, with four dissertations. In

1795 he was appointed professor of Arabic in the newly founded Ecole des Langues Orientales, in Paris. In 1806 he became also professor of Persian at the Collège de France, and in 1808 was elected a member of the Corps Législatif. He was given the title of Baron in 1813, and in 1832 became a peer of France. With Abel Rémusat he founded the Société Asiatique in 1822. De Sacy greatly furthered the study of Arabic by his text-books: *Grammaire arabe* (1810; 2d ed. 1831); *Chrestomathie arabe* (1806; 2d ed. 1826), and its supplement, *Anthologie grammaticale arabe* (1829). Other noteworthy works were: *Principes de grammaire générale* (1799; 8th ed. 1852); a translation of Abd ul-Latif's *Egypt* with notes (1810); an edition of the Arabic book of fable, *Calila et Dimna* (1816), and of Farid-ud-din Attar's *Pendnâme*, with translation and an Arabic preface written by himself (1819); *Mémoires d'histoire et de littérature orientales* (1818), the *Makâmât* of Hariri (1822; 2d ed. 1847-53); *Exposé de la religion des Druzes* (1838). There are biographies of De Sacy by Reinand (Paris, 1838) and H. Derenbourg (ib., 1895).

SADDLE MOUNTAIN. The culminating group of the Taconic Mountains in northwestern Massachusetts. The highest peak is Mount Greylock, 3533 feet, the loftiest mountain in the State.

SADDLERY (from *saddle*, AS. *sadol*, OHG. *satal*, *satul*, Ger. *Sattel*, perhaps a Slavic loan-word, cf. OChurch Slav. *sedlo*, saddle; ultimately connected with Skt. *sad*, Gk. ἕσθαι, *hezesthai*, Lat. *sedere*, OChurch Slav. *sěsti*, Goth. *sitan*, AS. *sittan*, OHG. *sizzen*, Ger. *sitzen*, to sit). The general furniture of horses.

An ordinary harness consists of leather straps, simple or padded, and of the various rings and buckles with which these straps are united and fastened. With the invention of the leather-sewing machine, the process of making harness has been greatly simplified. In general the parts of a harness are: Crown, blinders, throat-latch, front, cheek-piece, nose-band, bit, curb, check, and reins; the saddle, to which the terrets or rings are attached through which the reins pass and to which the check-rein is also attached; the crupper, a strap to secure the saddle in place, passing over the back of the animal and around its tail; the collar; the hames, which are fastened to the collar; the hame-link and the hame-strap, to which the traces are fastened; the pole-strap; the martingale, a strap to hold the horse's head down, which runs from the belly-band between the front legs to the bit or nose-band; the belly-band turn-back; the trace-tug, a loop depending from the saddle, which in a single harness supports the shaft and in a double harness the tug; the traces, sometimes also called tugs, which connect the collar with the swingletree; the hip-strap; and the breeching, or strap passing around the buttocks of the animal and attached to the shafts or pole, to enable him to back the vehicle or hold it back on a down grade.

The earliest known saddles were those which have been found in Egypt, which were not used for riding, but as the part of a draught harness which bears the load. Probably to the ancient Egyptians, as to the ancient Greeks and Romans, equestrian saddles were unknown. The fore-runner of the saddle was the pad or saddle-cloth,

which was secured to the horse's back by one, two, or three girths. These seats, however elaborately padded, differed from the true saddle in having no tree. Saddles with trees did not come into use among the Romans till about the fourth century A.D. *Stirrups* did not come into use till three centuries later. Previously the rider mounted from a horse-block, or with the aid of his spear, and the Roman cavalry were subject to various ills caused by having their legs hanging for hours from the horse's back. *Sidi saddles* were introduced as early as the twelfth century. They were developed from the pillion or pad on which a lady rode sidewise behind her husband and steadied herself by holding on to his belt. The present type of side saddle seems to have come into vogue about 1650, but the third pommel or leaping horn, by which a firm grip is secured, did not appear till 1830.

The saddles of different periods and among various nations differ much in their form and construction. The parts of a saddle are: the tree or foundation, consisting of the pommel or horn-like projection at the front of the saddle, the cantle or hind-bow, and the side bars; the padding, which is sometimes, as in the McClellan saddle, entirely omitted; the skirts, seat, and girth; the stirrups, which are attached to the side bars; the crupper, which is attached to the cantle. The tree is usually of wood, although in the French cavalry saddle it is of iron. It is fastened together with temons and mortises and secured by a covering of canvas or rawhide, which is tacked on wet and then allowed to shrink. The outer covering is usually of pigskin. Besides the saddle for horses, there are specially constructed saddles for other draught animals, as oxen, camels, and elephants. The *pack saddle* is shaped to hold securely the largest possible load. To increase its capacity *panniers* are sometimes added.

SAD'DLEWORTH. A woolen-manufacturing town in the West Riding of Yorkshire, England, 11 miles southwest of Huddersfield. Population, in 1891, 13,475; in 1901, 12,300.

SADDUCEES (Gk. Σαδδουκαῖοι, *Saddoukaioi*, from Heb. *Šaddūqim*). The conservative and aristocratic party in the late Jewish commonwealth. The name is now generally derived from Zadok, high priest in Solomon's reign, from whom the later high-priestly line was derived, and whose descendants, 'the sons of Zadok,' according to Ezekiel's programme, were the only legitimate priests. (See LEVITE; PRIESTS.) Although this narrow restriction to the line of Zadok was not finally maintained, this family was the great majority in the later priesthood and formed its aristocratic and controlling element. This etymology agrees with the actual character of the Sadducees, who were the party of the priestly aristocracy as over against the democratic Pharisees (q.v.). The sharp distinction between the two was not made till the time of the Asmonean house in the second century B.C., but its origins go back to the fifth century, when, as we see in the book of Ezra-Nehemiah, a division began to arise between the priests who were the ministers of the cultus and hence a privileged and conservative class, and the Scribes (q.v.), who, although loyal to the cult and its ministers, were nevertheless interested in making the law the rule of life for the whole people. The Maccabean or

As a man of letters (see MACCABEES) was itself of foreign origin, but accomplished its work through the help of the patriotic and religious party, which now came to the fore. But the ambition and worldly interests of this dynasty, which united in itself the high-priesthood and the monarchy, soon alienated the rigorous or Pharisaic party, and in the latter part of the reign of John Hyrcanus (B.C. 135-105) the Court allied itself with the conservative priestly aristocracy. With this reign the distinction between the two parties as such began, and the remainder of the Maccabean history is characterized by the struggle between the two parties.

Pompey's destruction of Jewish independence gave the final advantage to the Pharisees, but the Sadducees, through their wealth and position, still remained a strong element, although small and divorced from popular sympathy. It is a mistake to regard them as diametrically opposed to the Pharisees. The latter were the party of keen religious development: the Sadducees were those who hung back from religious advance through motives of conservatism, caste and culture. Hence in the theological differences between these parties, the Sadducees stood closer to the Old Testament, while their opponents went far beyond the theology of the Canon. The chief differences were these: The Sadducees did not believe in the resurrection of the flesh (cf. Matt. xxii. 23 sqq.), or in the existence of spirits and angels (cf. Acts xxiii. 8), in opposition to the huge development of Pharisaic angelology. Josephus also records that they denied Providence, while the Pharisees were predestinarian, and this is an indication of the comparative religious indifference of the party and perhaps also of Greek influence. The view that the Sadducees accepted only the Pentateuch is an error, although it is probable that they did not assign much authority to the later books as an integral part of the Canon. The chief sources of knowledge for these parties are the New Testament and Josephus: the former vividly represents the acute differences between the two (cf. Acts xxiii. 6 sqq.), but without shows how the two could work together, as in the trial of Jesus and the persecution of the Christian Church (cf. Acts v. 17). The Sadducees have left no literary productions. The classic study of the subject is Wellhausen, *Pharisäer und Sadducäer* (Greifswald, 1874). Consult also: Schürer, *History of the Jewish People in the Time of Jesus Christ* (Eng. trans., Edinburgh, 1886-90); Derenbourg, *Histoire de la Palestine* (Paris, 1868); Edersheim, *Life and Times of Jesus* (London, 1896). See PHARISEES.

SADLER, sä'de-lër. A Flemish family of engravers, the best-known of whom were the following: JAN the Elder (1550-c.1610), who was born at Brussels, worked at Mainz, Cologne, Frankfurt, and Munich, and then settled in Venice, where he died. Of his work, numbering more than 200 plates, the portraits were the most meritorious part.—RAPHAEL (1561-1628), born at Brussels, was a pupil of Jan, and accompanied him to Germany and Venice; thence he returned to Munich in 1604, to execute the engravings for *Barbaria Sancta et Pia*, an extensive publication, completed in 1618. One of his principal works, which has become very rare, was "The Battle of Prague" (1620), in eight plates.—EUGENE (1570-1629), engraver and painter, nephew of the preceding, the most talented of

the family, was born at Antwerp, accompanied his uncles on their travels, was called to Prague by Rudolph II, and continued there in high favor also under Rudolph's successors, Matthias and Ferdinand II. His plates after Italian, Dutch, and Flemish masters, his own compositions, and many excellent portraits number more than 400. A series of 52 plates on the Roman Antiquities, *Festigi della antichità in Roma* (1606), was always held in great esteem, and two very rare plates represent the "Interior of Vladislav Hall in the Burg at Prague" (1607). His painting of the "Martyrdom of Saint Sebastian" is in the Vienna Museum.

SÁ DE MIRANDA, sä dá mê-rän'dá, FRANCISCO DE (c.1495-1558). A Portuguese poet, who wrote in Spanish also. He was born in Coimbra, studied law at Lisbon, traveled in Spain and Italy, and gave up all chance of advancement at Court or on the bench to devote himself to poetry. Save for a few of his pastorals, all his work bears the impress of the Italian school, and he is ranked first of the 'Petrarchists' in Spain and Portugal. Of his eight eclogues, six are in Spanish, and only two in Portuguese. As an innovator in the drama he was unsuccessful, his plays arousing no popular interest. His complete works, published first at Lisbon in 1595, were often reprinted; the best edition is that of 1885 at Halle, with biography by Karoline Michaelis-Vasconcellos.

SADI, sä'dë (Pers. *Sa'di*) (c.1184-c.1291). One of the greatest of Persian poets, whose full name was Musharrif-ud-din ibn Muslim-ud-din Abdallah Sadi. He was born at Shiraz about 1184. The career of Sadi may be divided into three periods, of which the first extended from 1193 to 1226. These were years of study, which were spent in Bagdad, whither he had been sent by the Atabeg prince, Sad ibn Zengi, and it was then that he came under the influence of Sufism (q.v.). The dethronement of his patron by the Mongols in 1226 drove Sadi forth on a series of wanderings which lasted until 1256. This period of thirty years forms the second epoch in his life. In Delhi he learned Hindustani, in which he composed a few poems, and went thence to Yemen, after which he visited Abyssinia, returning before long to Arabia. After performing the pilgrimage to Mecca several times, he resided at Damascus and Baalbek, and finally dwelt as a hermit in the desert near Jerusalem. Here he was made captive by a scouting party of Crusaders, and was forced to menial drudgery, until he was recognized by a friend at Aleppo and ransomed. The poet married the daughter of his deliverer, but the union was an unhappy one, and Sadi resumed his wandering life. He traveled first through Northern Africa and then through Asia Minor, returning at last to his native city, where the Atabeg Abu Bekr ibn Sad, the son of his old patron, ruled. Here he spent the last and most important period, from 1256 until his death, about 1291. Within a year after his return to Shiraz he had composed his *Büstân* or Fruit-Garden (also called the *Sa'dinâmah* or Book of Sadi), a didactic poem in ten cantos which deal respectively with ethics, justice, beneficence, love, humility, devotion, contentment, culture, gratitude, and repentance. The same general plan characterizes his more popular book, the *Gulistân* or Rose-Garden, which was written in the following year, and which still enjoys the utmost es-

teem in Persia. It is divided into eight 'gates,' which symbolize the eight doorways of Paradise, and which treat of the customs of kings, of the morals of dervishes, of the preciousness of contentment, of the benefit of silence, of love and youth, of imbecility and old age, of the impressions of education, and of the duties of society. The lyric poetry of Sadi was voluminous. It comprised *Qasidas* or eulogies, both in Arabic and in Persian, *Mathāris* or elegies, highly artificial *Ghazals* or sonnets, the *ṣāhibbiyah* or Book of the First Minister, forming a manual of statecraft, besides quatrains and distichs, and the *Mufāyabat* or Jests (also called *Nabīḥat* or Facetiae), which are obscene in character and were written despite their author's protest at the command of his patron. The editions of the collected works of Sadi usually contain also six (or seven) prose works called *Risālas* or Missions, attributed to him, which are ethico-didactic in content. A *Pand-nāmah* or Book of Counsel, modeled on a poem of Farid-ud-Din 'Attar (q.v.), bearing the same name, is also often attributed to him, but is probably spurious. The *Kulliyat* or collected works of Sadi were edited by Harrington (Calcutta, 1791-95), and have been repeatedly published in the East both with and without commentaries. The *Būstān* was edited by Graf (Vienna, 1850), and translated into English by Clarke (London, 1879) and Davie (ib., 1882). The *Gulistan* was edited by Eastwick (Hertford, 1850), Johnson (ib., 1863), and Platts (London, 1874). It was the earliest of all Persian literature to be introduced into Europe, being translated into French by du Ryer in 1634. English translations have been made by Ross (London, 1823; reprinted, ib., 1890), Eastwick (Hertford, 1852; new ed., London, 1880), Platts (London, 1873), the Kama Shashtra Society (Benares, 1888), and Arnold (London, 1899). Partial editions or translations of his lyric poetry have been made by Barb (Vienna, 1856), Gudemann (Breslau, 1858), Bacher (Strassburg, 1879), and Rüdert (Berlin, 1893-94). Consult: Neve, *Le poète Sadi* (Louvain, 1881); Ethé, "Neuperische Litteratur," in Geiger and Kuhn, *Grundriss der iranischen Philologie*, vol. ii. (Strassburg, 1896).

SADI-CARNOT, sā'dē' kār'nō'. See CARNOT.

SADLER, Sir RALPH (1507-87). An English diplomat. He was born at Hackney, near London, received a classical education, became early associated with Cromwell, Earl of Essex, and through his patronage was employed by Henry VIII. in the dissolution of the monasteries, and afterwards on diplomatic missions to Scotland. He was knighted for his gallantry in rallying the repulsed English cavalry at the battle of Pinkie in 1547, and was named in the King's will one of the 12 counselors to the commission of 16 nobles to whom the government was given. Elizabeth called him to the Privy Council; made him a jailer of Mary Queen of Scots at Tutbury Castle, and after her execution sent him in 1587, shortly before his death, on a mission of reconciliation to James VI. of Scotland. Consult *The State Papers and Letters of Sir Ralph Sadler, Knight Banneret*, edited by A. Clifford, with biographical memoir by Sir Walter Scott (2 vols., London, 1809).

SADLER'S WELLS THEATRE. A theatre in Clerkenwell, London, built in 1764 and recon-

structed in 1876. The theatre is so called from a previous place of amusement on the site, opened in the latter part of the seventeenth century by one Sadler, after discovering an ancient mineral well, formerly renowned for its curative properties, but long choked up.

SADLER, sād'lēr, MARY ANNE (MADDEN) (1820-1903). A Canadian author, born in Cootehill, County Cavan, Ireland. In Canada she married in 1846 James Sadler. She translated several devotional works, especially De Ligny's *Life of the Blessed Virgin*; and wrote Irish historical novels, of which *The Confederate Chieftains* is the best known, and such novels of Irish immigrants in Canada as *Willy Burke* and *Elleanor Preston*.

SADO, sādō. A Japanese island (latitude 38° N., longitude 138° 45' E.) off the western shore of the main island, Honshū, nearly opposite Niigata (Map: Japan, P. 4). It is 335 square miles in extent. Two mountain ranges, from northeast to southwest, with a cultivated valley between them, constitute the island. The principal formation is limestone. Chalk, which is rare in the rest of Japan, is common here. The island was used as a place of banishment in the past. The capital is Aikawa, a poor town with a population of about 15,000. The chief harbor is Eleisu Minato, on the eastern coast. The island belongs administratively to the Prefecture of Niigata. Population, in 1898, 114,756.

SADOWA, sādō-wā, BATTLE OF. The name commonly given by French and English writers to the decisive battle of the Seven Weeks' War (q.v.), fought on July 3, 1866, and known to the Germans as the battle of Königgrätz. The Austrian army, with the Saxon contingent of 21,000 men, numbered about 200,000, under the command of Benedek, and occupied a strong position behind the Bistritz, some seven or eight miles northwest of Königgrätz. The Prussians numbered about 221,000 men, under the command of King William I. of Prussia, who directed the fighting from a hillock near the village of Sadowa. At 8 o'clock on the morning of July 3d the Prussians crossed the Bistritz and the First Army delivered an attack in front while the Second Army was sent to operate against the enemy's right. The Prussian centre met with stubborn resistance and after six hours' fighting had produced no effect on the Austrian lines. The movement on the left, however, had succeeded, and soon after 2 o'clock in the afternoon the Austrian right was in imminent danger. A concerted attack by the Prussian left and centre resulted in the capture of Chlum, the key of the Austrian position, and by 4 o'clock the battle had been decided, though desperate fighting continued until after night-fall. The Austrians and Saxons lost more than 1450 officers and 43,000 men in killed, wounded, and prisoners, while the Prussian loss amounted to 360 officers and 8800 men. Consult: Jähns, *Die Schlacht bei Königgrätz* (Leipzig, 1876).

SADTLER, sād'lēr, SAMUEL PHILIP (1847-). An American chemist, born at Pine Grove, Pa., and educated at Pennsylvania College (class of 1867), at Lehigh University, at Lawrence Scientific School, and in the University of Göttingen. He was professor of natural science in Pennsylvania College from 1871 to 1874, professor of chemistry in the University of Pennsylvania, and

in 1878 was appointed to a like chair in the Philadelphia College of Pharmacy. He was chemical editor of the American reprint of the *Encyclopædia Britannica*, became chemical editor of the *United States Dispensatory* in 1880, and wrote a *Hand-Book of Chemical Experimentation* (1877); *Industrial Organic Chemistry* (1891); and *Pharmaceutical Chemistry* (with Coblenz, 1895).

ŠAFARIK, šáfár-shík, PAVEL JOSEF (1795-1861). A Slavic philologist, born at Kobeljarowo, Hungary, and educated at Kesmark and Jena. After acting for two years as a private tutor at Pressburg, he became in 1819 director of the Servian gymnasium at Neusatz. He resigned this post in 1833 and removed to Prague, where he spent the remainder of his life. From 1837 till 1847 he was a censor, and in 1841 became connected with the library of Prague, of which he was appointed librarian seven years later, having declined calls to Moscow and to both Breslau and Berlin. He accepted, however, in 1848, the appointment to the chair of Slavic philology, founded at his own suggestion in the University of Prague, but resigned it in the following year. In 1857 he became insane. Šafárik was a prolific author. His principal work was the *Slovanské Starožitnosti* (*Slavic Antiquities*) (1837; 2d ed. 1863; trans. into German 1842-44). Important also were his collection of Slovak folksong, prepared in collaboration with Kollar and others (1823-27); *Slovanský Národopis* (*Slavic Ethnology*) (1842; 3d ed. 1849), containing a chart of the Slavic dialects; *Počátky staročeské mluvnice* (*Elements of Old Czech Grammar*) (1845); *Geschichte der slavischen Sprache und Litteratur* (1826; 2d ed. 1869); *Die ältesten Denkmäler der böhmischen Sprache* (in collaboration with Palačků, 1840); *Glagolitische Fragmente* (in collaboration with Höfler, 1857); *Geschichte der südslawischen Litteratur* (3 vols., ed. by Jireček, 1864-65).

SAFED, sä'fed'. A city in Palestine, situated on a mountain 2500 feet high, 13 miles north by west of Tiberias (Map: Palestine, C 2). It has ruins of a huge oval castle built by the Crusaders in the twelfth century. There is a college for instruction in Hebrew and the Tahmid. The industries are dyeing and the manufacture of cloth. The surrounding country grows grapes and olives abundantly. Before 1837 Safed was a handsome town. In that year it was partly destroyed by an earthquake and more than 4000 persons were killed. Population, about 25,000, the bulk of whom are Jews, who believe that the Messiah will make Safed his capital.

SAFES AND SAFE DEPOSIT VAULTS

(Of. *sauf*, *saulf*, *sulf*, Fr. *sauf*, from Lat. *salvus*, safe, whole; connected with Skt. *sarva*, whole, entire). The first attempt to make a fireproof safe dates from about 1820 when a metal box was built in France with double walls, filled between with a non-conducting composition. A little later a so-called fireproof safe was invented in New England. It was built of oak planks, three or four inches thick, saturated with an alkali, covered with thin sheets of iron and secured with many bands of iron. In the New York configuration of 1835 hundreds of these safes were destroyed. In 1843 a fireproof safe was patented by Edward Fitzgerald in which

plaster of Paris was the non-conducting material. To-day safes are built of iron or steel and the packing used is some non-conducting substance, as clay, concrete, or plaster of Paris. In this packing either (1) alum or some other salt which when exposed to heat gives off large quantities of water is placed, or (2) glass or metal vessels filled with water are so arranged in the packing as to give off steam when subjected to great heat. The contents of a safe cannot be injured by fire as long as the inner chest is surrounded by steam at 212° F. It is essential that there be sufficient water to furnish steam through a protracted fire, that the water be retained until required by heat, and that in ordinary use the safe be free from dampness. Substances which contain water in their chemical composition seem to meet these requirements more satisfactorily than water itself.

Security against burglary is procured in three different ways: (1) by the 'laminated' construction; (2) by the use of blocks of chilled iron, a method particularly adapted to the construction of large vaults, rather than portable safes; (3) by spherical chilled-iron safes. In the laminated type of construction the chamber designed to be burglar-proof is made of alternate layers of soft and tough steel or iron, and of plates of steel hardened as intensely as is found practicable; the two metals being laid alternately, one over the other in the walls of the chamber, in such manner as finally to constitute as nearly as possible a single mass. The idea of the constructors is to insure strength, toughness, and permanence of form by the use of the softer but more ductile material, while the harder and more brittle gives a certain immunity from the dangers of attack by drilling the mass. A common method of manufacture is to alternate three layers of iron or soft steel with two intermediate layers of steel capable of taking on extreme hardness, and to roll them down together hot to form one finely tempered sheet of about one-half an inch thick. Composite sheets of this sort are then built into the walls of the safe or vault, alternating with heavy one-half inch iron or steel plates. Sometimes, instead of steel, a material made from franklinite ore found in Sussex County, N. J., is used. This material is said to be harder than the hardest tempered steel. In safe construction joints are avoided as much as possible and rounding corners used.

The weak point in ordinary safe construction is the door, with its lock-spindle and jams. To do away with a key-hole, the 'time lock' has been introduced (see LOCK), and various contrivances have been adopted to secure so tight a joint about the door that it is impenetrable both for tools and for the liquid explosives so commonly used by burglars. Sometimes an air-tight packing is interposed between the jams and their abutments. In certain safes a screw door is used. In others the doors are made with a set of dovetails, engaging with the corresponding parts of the jamb.

In the second and third types of safes, instead of a series of sheets, constituting a built-up structure, a single mass of metal is used. The two qualities of toughness and hardness are obtained by modifying the character of the metal, from inside to outside. The metal employed is a peculiar grade of iron, found in certain localities, both in the East and West of the United

States, and much used in car-wheel construction. Although naturally soft, and easily wrought, its surface can be rendered exceedingly hard by sudden cooling; hence its name 'chilled iron.' Certain vaults are made of masses of blocks of chilled iron, of great size and weight, and with ingenious and curiously arranged rabbets and dovetailed connections of block with block. The external surfaces of these blocks are chilled to a hardness impenetrable by a chisel or ordinary drill. The blocks weigh from three-fourths of a ton to several tons and are secured by an elaborate system of bolting, on the inside. The door is a single casting of iron, two inches thick, and weighing five tons or more. It is chilled on the exterior and slides on anti-friction rollers into a deep recess in the vault wall.

In the third type, invented by William Corliss, of Corliss engine fame, the safe consists of a spherical shell, from four to seven inches thick, chilled on its surface about two inches deep. Within this shell is a 'bugging,' composed of a set of cast-iron segments of sufficient thickness to permit the passing into them, in holes east for that purpose, of a set of tool-steel rods, hardened as hard as fire and water can make them, and lying loosely in their places. It is supposed that a drill, striking one of them, will be unable to penetrate the metal, and the rod, turning under it, will simply break the drill. The door of this safe consists of a sphere or an oblate spheroid of iron, also chilled on its exposed face, hollowed out to receive the locks and attachment of the bolting system, and fitted into the doorway, which is simply a circular orifice in the outer shell, by exactly turned and faced stepped joints. The door is brought up to its place by pressure acting outward. It is the conclusion of most safe experts that with sufficient time and good tools and other material it is possible to penetrate probably all forms of safes. This, however, does not destroy their usefulness, as rarely if ever is sufficient time at the disposal of the burglar, while tools of the requisite quality, high explosives, and other materials are usually beyond his reach.

Vaults are simply larger safes constructed in the form of rooms instead of portable boxes. This permits of the use of more massive material.

BIBLIOGRAPHY. The report of a commission of experts appointed by the Secretary of the Treasury (Washington, 1894) contains an interesting account of experiments with high explosives made on the different safes manufactured in the United States. The tests were made by Prof. Chas. E. Munroe and Lieut. Sam'l Rodman, Jr., U. S. Army. See also the article by Henry W. Chubb, on "Locks and Safes," published in the *Journal of the Society of Arts* (London, April 14, 1893). Also the chapter on "American Safe Works," by Wm. B. Marvin, in *Dupew, One Hundred Years of American Commerce* (New York, 1895).

SAFETY APPLIANCES. Methods and mechanisms used to insure workmen against bodily harm. With the multiplication of factories and the increasing use of machinery, the necessity of safeguarding the conditions under which labor is performed has become a vital one to the public as well as to the workmen. The result of long-continued labor in industries not properly safeguarded manifests itself upon the physique

of the workmen. Their height is usually below the average, their bodies are weak and anæmic. Eventually the average length of life is shortened. Rohé gives the following statement showing the average length of life in Massachusetts:

	Years
Factory workers	36.3
Craftsmen	50.8
Workmen without any definite vocation	47.4
Farmers	65.3

Among the most important safety appliances are those designed to protect workmen from vitiated air. Ordinary deterioration resulting from exhalation, or from illumination, can be avoided by ventilation. Special appliances are necessary to guard against dust and gases. Of many arrangements for the removal of noxious gases, fans and hoods are among the most effective. In many smelting rooms sheet-metal hoods are used, which can be moved vertically and are connected with the chimney by pipes. When material is melted hoods are let down to cover the smelting kettles. Mechanical stirrers are used to obviate the necessity of workmen standing over the kettles. Dust in its several forms—metallic, mineral, vegetable, animal, and mixed—is removed by exhausters, or laid by water-sprayers. In especially dangerous industries workmen are provided with respirators—usually in the form of a sponge or cloth worn over the mouth. Workmen can be protected from injuries resulting from the character of materials handled. Impermeable gloves and shoes can be provided against hot liquid. Dangerous machinery can be fenced. Consult Doehring, "Factory Sanitation and Labor Protection," *Bulletin of Department of Labor, No. 44*.

SAFETY-LAMP. A lamp used by miners, the flame of which is protected by wire gauze, so that the ignition of inflammable gases is prevented. In the Davy lamp, invented by Sir Humphry Davy in 1815, the cylinder is covered with a close metallic gauze, and is protected by three external, strong, upright wires, which meet in a plate or cap at the top to which a ring is attached for suspending the lamp. The oil is supplied to the interior by a pipe projecting from the cylinder, and the wick is trimmed by a wire bent at the upper end, and passed through the bottom of the lamp, so that the gauze need not be removed for this process. When a lighted lamp of this kind is introduced into an explosive mixture of air and fire-damp, the flame is seen gradually to enlarge as the proportion of light carburated hydrogen increases, until at last it fills the entire gauze cylinder. Whenever this pale, enlarged flame is seen the miners should depart to a place of safety, for, although no explosion can occur while the gauze is sound, yet at a high temperature the metal becomes rapidly oxidized, and might easily break; and a single aperture of sufficient size would then occasion a destructive explosion. Sir Humphry Davy's claim as an original discoverer was immediately challenged by various persons, among whom may be especially noticed Dr. Reid Clanny, of Newcastle, and the great engineer George Stephenson. Clanny's safety-lamp was based on the principle of forcing air through water by bellows; but the machine was ponderous and complicated, and required a boy to work it. In later forms of the Clanny lamp the bellows was omitted and a glass cylinder was used to surround

while there was a wire gauze cylinder (Stephenson's, familiarly called the *Geordie*), was actually in use at the Killingworth mines. In its general principle it was the same as Davy's, the main difference being that Stephenson's lamp had a glass cylinder besides the gauze one, to resist strong currents of air, and that glass without gauze is not safe from fracture. In the Gray lamp, which is considered one of the best safety-lamps, the air enters at the top and passes down through four tubes and then a strip of gauze before reaching the flame. The products of combustion pass up a cylindrical chimney, which is of smaller diameter half way to the top in order to avoid down currents and to keep the air near the burner as vitiated as possible and thus retard combustion. In the French and Belgian collieries Mueseler's lamp is in almost universal use, and it is also employed in England and America. It consists of a glass cylinder immediately around the flame, and of wire gauze above. An internal metal chimney opening a short distance above the flame creates a strong upward draught, which causes the freed air to pass briskly

DAVY SAFETY-LAMP.

down from the wire gauze, and so keeps the glass cool and insures thorough combustion.

In connection with improvements in the safety-lamp various devices increase its safety and efficiency as a detector of the presence of fire-damp. By mechanical arrangements the danger of the safety-lamp being converted into an open-flame lamp by any chance or mishap is obviated. In nearly every instance there is some device for locking the gauze about the flame after the lamp has been lighted. This is done to prevent by any possibility the naked flame from coming in direct contact with the exterior atmosphere, and the locking device is operated either by a key, a powerful magnet, or compressed air. The presence of fire-damp is shown by an elongation of the flame of the lamp and the formation of a luminous cap or blue flame, which increases in size with the amount of gas present in the atmosphere. The miner tests for the gas by turning his flame down to a point where it is practically non-luminous and then noting the size of the cap. As detectors of fire-damp the various lamps have been ranked as follows: Gray, Mueseler, Marsaut, Morgan, Davy, and Stephenson. For this special purpose lamps have been devised which burn alcohol or some other substance and give a sensitive flame. Of these the Pieler lamp, which burns alcohol, is one of the simplest arrangements which has been modified by Chesneau in a lamp burning methyl alcohol containing cuprous chloride, which indicates the gas not only by the cap but by the changed color of the flame. The

Clayes lamp contains, besides a luminous flame of oil, a supply of compressed hydrogen, which is burnt at a small jet and is used for testing where the air contains less than three per cent. of the gas.

The use of electricity has become very general in mines, both for lighting and power, and it is obvious that the incandescent lamp, as it burns *in vacuo*, and is perfectly safe in an atmosphere of any gas, however explosive, furnishes the best possible means of illumination. The only objection raised against the incandescent lamp for mines is that with proper insulation, suitable wiring, and the rough usage it receives, the expense of the light is very large in comparison to the wire-gauze lamp. Portable electric lamps for miners are also used, but their use has never been widespread, owing to the difficulty of carrying a battery large enough to supply the light for a reasonable time, the tendency to get out of order with rough usage, and the high cost of the apparatus. Consult Graves and Thorp, *Chemical Technology*, vol. ii. (Philadelphia, 1895).

SAFETY-VALVE. A circular valve placed on an opening in the top of a steam boiler, and kept in its place either by weights above it, by a lever of the second order, with a weight capable of sliding along the arm, or by a spring. In stationary engines one valve is frequently found sufficient, and the pressure on the valve is produced in the first or second of the methods indicated above. In locomotive engines (see *LOCOMOTIVE*), on the contrary, there are always two valves. Whenever the tension of the steam in the boiler rises above a certain amount (the weight in pounds with which the valve is held down divided by the area in inches of the under-surface as exposed to the steam), the valve is forced upward and, the pressure on the boiler thus relieved, the valve sinks to its place. The only precaution necessary is to be sure that the valves are not too heavily loaded or fastened. The grate surface is now the commonly accepted unit by which to determine the size of the safety-valve. The United States regulations for steam vessels require that lever safety-valves shall have an area of not less than one square inch to two square feet of grate surface in the boiler, and this proportion also obtains in good stationary engine practice.

SAFFI, säff'fë. A seaport of Morocco. See *SAFI*.

SAFFLOWER (OE. *safior*, *safleur*, from OIt. *saffiore*, *asfiore*, from Ar. *usfür*, safflower, from *safrā*, yellow, influenced by popular etymology with Eng. *flower*), *Carthamus tinctorius*. A branching annual plant of the natural order Composite, two or four feet high, with dark orange or vermilion flowers. It is a native of India, whence it probably spread to Egypt and the Levant, where it became naturalized. It is extensively cultivated in Southern Europe, especially France, and in some parts of South America, for its corollas, which are picked by hand in dry weather, dried in a kiln, and formed into small, round cakes used as yellow and red dyes. The safflower of Persia is generally esteemed the best. Safflower is sometimes called bastard saffron, and is used to adulterate saffron. The yellow coloring matter is valueless as a dyestuff, and since the red (earthamic acid or earthamine)

fades with light and age, it is not as popular as formerly. Rouge derives its color from safflower.

SAF'FORD, JAMES MERRILL (1822—). An American geologist, born at Zanesville, Ohio, and educated at the Ohio University and at Yale. He was professor of natural sciences at Cumberland University, Lebanon, Tenn.; of chemistry in the medical department of the University of Nashville, and in 1875 was made professor of mineralogy, botany, and economic geology at Vanderbilt University. His publications include *A Geological Reconnaissance of the State of Tennessee* (1856), and the *Geology of Tennessee*, with a map of the State (1869).

SAFFORD, TRUMAN HENRY (1836-1901). An American astronomer, born in Vermont, and educated at Harvard. In 1863 he was made assistant observer at the Cambridge Observatory, and in 1865 became director of that at Chicago. He was professor of astronomy at Williams College (1876-99) and built a meridian observatory there. He published a star catalogue and a catalogue of right ascensions of close polar stars. Safford

also predicted the position of the companion of Sirius (q.v.).

SAFFRON (OF. *safran*, *saffran*, Fr. *safran*, It. *zafferano*, Sp. *azafran*, from Ar. *azfarān*, saffron, from *safrā*, yellow). A bright yellow coloring and flavoring material, consisting of the dried stigmas of the common yellow crocus (*Crocus sativus*), the bulbs of which were introduced into Europe from Asia Minor. They are largely cultivated in Spain. Saffron is often employed as a perfume, but its

SAFFRON (*Crocus sativus*).

chief uses in America are for flavoring and coloring confectionery and culinary articles. Its great solubility in water prevents its use as a dye for fabrics. See CROCUS.

SAFFRON WOOD. A South African timber tree. See ELEODENDRON.

SAFI, sā'fē, or **SAFFI** (Arab. *Asfi*, or *Asaffi*). A seaport on the northwest coast of Morocco, 102 miles west-northwest of the city of that name (Map; Africa, D 1). It was at one time the chief seat of the trade with Europe, and, though it has declined with the rise of Mogador, it still has considerable export trade, chiefly in leather, horses, and grain. Population about 9,000.

SAFTLEVEN, sāft'lā'fēn. **SAFTLEBEN**, or **ZACHTLEVEN**, CORNELIS (1606-81). A Dutch painter and etcher, born in Rotterdam. Influenced by Brouwer and Teniers, he painted

guard rooms, rural interiors, and landscapes with figures and cattle, characteristic specimens of which may be seen especially in the Dresden Gallery, while others are in the Louvre, in Amsterdam, Cologne, Karlsruhe, Brunswick, Vienna, and Saint Petersburg. His etchings are held in great esteem. **HIRMAN** (1609-85), a brother and probably pupil of the preceding, was a landscape painter and etcher, who formed himself chiefly by studying nature. In 1633 he went from Rotterdam to Utrecht, where, in 1655, he became head of the painters' guild. His views on the Rhine, Meuse, and Moselle, enlivened with figures and animals, are distinguished by their clear perspective and a soft bluish coloring. The Dresden Gallery possesses seventeen of his pictures on a small scale, executed with minute delicacy, while others may be seen in most of the principal galleries of Europe. His etchings, about 38 in number (1640-69), include a portrait of himself and rank among the best of their kind.

SAGA, sā'gā. The capital of the prefecture of the same name in Japan, situated in the north-western part of the island of Kiu-shiu, 82 miles by rail northeast of Nagasaki (Map; Japan, B 7). It was formerly the residence of the lords of Iizen, whose beautiful park is a feature of the town. Population, in 1898, 32,753.

SAGA (Icel., tale, story, history). The name applied to the most important division of Icelandic prose literature. This form of literary production was developed in Iceland alone, and this was due possibly to the fact that the families that settled there were men in whom the talent for story-telling was inherent, while the long period of gloom and semi-night that shrouds this remote island the greater part of the year evoked this form of instructive amusement, whereby the deeds of their ancestors and even their friends were related in attractive form. Possibly their intercourse with the Irish, who even before the eleventh century had a prose literature, may have abetted this tendency.

At the annual gathering at the Thing in Iceland in midsummer old sagas were told and material for new ones was often gathered. At first the sagas were merely told by Sagna-menn and kept alive in the hearts and minds of each succeeding generation until they were written down, some in the twelfth century, but the majority in the thirteenth. The written saga has used the oral saga only as a background, inasmuch as it has borrowed certain definite data and genealogies, but the author of the written saga has been original in language, in characterization, and in dramatic arrangement. The saga has its fixed laws and set phrases, and, although there is a vast difference in style among the sagas, certain restrictions are as clearly adhered to as in verse. The saga rises at times to an almost epic grandeur and some of them have much poetry interspersed through them. The simplest form of saga was the þáttur and the frá-sögn or frá-saga, the former of which was mainly some stirring deed or episode out of the life of a great Icelandic, and the latter a simple narrative.

The sagas are divided into several groups: (1) Historical sagas; (2) mythical or heroic sagas; (3) romantic sagas. Historical sagas are subdivided into *Íslendingasögur* and *Kontingasögur*. The *Íslendingasögur* had as their theme the life of some noted Icelandic. They frequently began with his ancestry, traced it down through him

and sometimes his descendants, recounted his own struggles, his travels, his loves, and his wars, and frequently, after his death, the vengeance that was wreaked upon his enemies by his kinsmen. They are stirring accounts, vivid and forceful, and by the introduction of dialogue, have intense dramatic vigor. The events recorded occur mostly between the years 874-1030, and they convey to us a fair and faithful picture of life in Iceland during those centuries. Several sagas are sometimes grouped together as the *Egilssaga* and *Gumlaugssaga*, the *Hrafnkelssaga* and *Droplaugarsonasaga*. Some show evidence of several sagas combined, as in the *Njalssaga*, which comprise both the *Gunnarssaga* and the *Njalssaga*.

The *Konungasögur* contain the lives of the kings, mainly of Norway; the most important is the *Heimskringla*, by Snorri Sturluson (q.v.) (ed. by Unger, Christiania, 1868). It contains among other well-known sagas the *Olafs saga Tryggvasonar*. Historical sagas rarely contain any personal views of the author and they attained under Snorri, about 1230, their greatest height. Some of the sagas of the classical period are literary and æsthetic works of art.

The mythical or heroic sagas are quite different in form and speech from the historical. Some legend or hero is the central figure of the saga, and fact and fancy are mingled freely together. The most striking example of this type is the *Volsungasaga* (q.v.) (ed. by Bugge, Christiania, 1865), which is a prose rendition of the Nibelungen story as it is given in the Eddic lays. See EDDA.

The romantic sagas are mainly adaptations or imitations of Latin, French, or German themes, and were not reduced to writing before the middle of the thirteenth century. There were sagas dealing with Alexander, Charlemagne, Parcival, Tristan, etc.

The *Íslandingsögur* may be divided according to the different geographical districts of Iceland. As a rule the best sagas come from the West. Here are found, among others, the *Egilssaga* (ed. Copenhagen, 1809, 1856, 1888; trans. by Green, London, 1893); the *Eybyggjasaga* (ed. by Vigfusson, Leipzig, 1864; trans. by Morris and Magnússon in *The Saga Library*, vol. ii., London, 1892); and the *Laxdalasaga* (ed. by Kaalund, Copenhagen, 1890-92; trans. by Press, London, 1899). The last-named is a saga of romance and is the foundation for William Morris's "Lovers of Gudrum." The *Gumlaugssaga*, a continuation of the *Egilssaga*, is the most beautiful yet tragic Icelandic love story (ed. by Von Rygh, Christiania, 1862, tr. by Morris and Magnússon, London, 1869). To the North belong the following: *Kormáks saga* (ed. Mübius, Halle, 1886), *Reykjarlasaga* (ed. by Ásmundarson, Reykjavik, 1898), *Svarfdalasaga* (edited by the same scholar, ib., 1893), *Víga Glumssaga* (edited by the same scholar, ib., 1898, tr. by Sir Edmund Head, London, 1866), *Grettissaga* (ed. by Magnússon and Thordarson, Copenhagen, 1852-59, by Ásmundarson, Reykjavik, 1900, tr. by Magnússon and Morris, London, 1869). This is the story of the most famous of Icelandic outlaws.

To the East belong the *Vápnfirþingasaga*, the best saga from this district (ed. by Ásmundarson, Reykjavik, 1898). We have also the *porsteins saga herta* (ed. with previous saga by

Thordarson, Copenhagen, 1848), the *Hrafnkelssaga*, a purely idyllic saga (ed. by Ásmundarson, Reykjavik, 1893), and the *Droplaugarsonasaga* (ed. by Jónsson, Reykjavik, 1878).

In the South is found the *Njalssaga* (ed. by Ásmundarson, Reykjavik, 1894, tr. by Dasent, Edinburgh, 1861). This is the foremost of all sagas, full of intrigue and cunning, of hate and love, with remarkable characterization.

Sagas relating to Greenland and America are the *Eirikssaga rauda*, *Fostbráprásaga*, *Grah-lendiga þáttir* in the *Flatey-bók* (all ed. by Rafn in *Antiquitates Americanae*, Copenhagen, 1837), and by Reeves, *The Finding of Winland the Good* (London, 1890).

The *Sturlungasaga* occupies a position different from the sagas mentioned above because we can here trace authorship to Sturla Thordsson (1214-84) (ed. with elaborate introduction by Vigfusson, Oxford, 1878).

Historical sagas referring to other countries are the *Knyppingasaga*, giving a history of the Danish kings, and the *Orkneyingasaga* or *Jarlasaga*, giving a history of the earls of Orkney.

The *Flatey-bók* (ed. by Unger and Vigfusson, Christiania, 1859-68) contains many þættir. The most notable are *Ogmund dytt* and *Thorstein Oæfot*.

In addition we have the *Skröksögur* or spurious sagas which show the rapid decline of the saga in the fourteenth century.

Consult: Muller, *Sagabibliothek* (3 vols., Copenhagen, 1817-28. German tr. by Lange, Frankfurt, 1832); Weinhold, *Altnordisches Leben* (Berlin, 1856); Mübius, *Ueber die älteren isländischen Sagas* (Leipzig, 1852); Döring, *Ueber Typus und Stil der isländischen Sagas* (ib., 1877); Vigfusson, *Prolegomena* in his edition of the *Sturlunga Sága* (Oxford, 1878); Heinzel, *Beschreibung der isländischen Sagas* (Vienna, 1880); Morris and Magnússon, *The Saga Library* (London, 1884 et seq.); Mogk, "Norwegisch-isländische Literatur," in Paul, *Grundriss der germanischen Philologie* (vol. ii., 2d ed., Strassburg, 1902).

SAGAING, sã'gã-ëng'. A Division of Upper Burma, British India, comprising the districts of Upper and Lower Chindwin, Sagaing, and Shweb. Area, 30,938 square miles. Population, in 1891, 821,769; in 1901, 999,168.

SAGAN, zã'gãn. The capital of the media-tized Principality of Sagan, in the Province of Silesia, Prussia, on the Bober, 82 miles northwest of Breslau (Map: Prussia, F 3). It has a castle with a beautiful park, a gymnasium, and a normal school. Its manufactures include cotton and woolen cloths, pottery, porcelain, glass, and paper. Population, in 1900, 13,367.

SAGAR, sã-gêr'. An island of Bengal, India. See SAUGOR.

SAGAR, SAUGUR, or SAUGOR. The capital of a district of the same name in the Central Provinces, India, 47 miles southeast of Bina by rail, on the Sagar Lake (Map: India, C 4). It is regularly laid out, and has broad streets. The most striking feature is the fort on an elevated site overlooking the town; it covers an area of 6 acres, and is surmounted by several towers. The military cantonment lies to the northeast of the city. Agriculture and the breeding of cattle and buffaloes are the leading

industries of the surrounding section. Population, in 1901, including cantonment, 42,330.

SAGASTA, *sá-gás'tá*, PRAXEDES MATEO (1827-1903). A Spanish statesman, born at Torreçilla de Cameros. After following the profession of engineer at Valladolid and Zamora, he was elected from the latter city to the Cortes of 1854. His share in the uprising of July, 1856, forced him to flee to France, whence he returned, after being amnestied, to take a position in the faculty of the school of engineering at Madrid and to assume the editorship of the Progressist organ, *La Iberia*. From 1859 to 1863 he sat in the Cortes, and, as a staunch Liberal, participated in the struggle against the reactionary Government of Isabella II. After the rising of June 22, 1866, Sagasta again fled to France. Upon the outbreak of the revolution of September, 1868, Sagasta became Minister of the Interior in the provisional Government, attaching himself to Prim. He became president of the Cortes in October 1871, assumed the portfolio of the Interior in December, and from February to May, 1872, was head of the Ministry. He took office as Minister of Foreign Affairs under Serrano (q.v.) in January, 1874, and, after the latter made himself virtual head of the Government in the following month, became Minister of the Interior, and subsequently Premier. Upon the election of Alfonso XII. to the Spanish throne Sagasta resigned (December, 1874). In the following year, however, he appeared as the leader of those Liberals in the Cortes who rallied to the support of the new throne, and, upon the fall of Cánovas del Castillo, in 1881, was intrusted with the formation of a Cabinet. He remained in power till 1883, but failed to carry out any of the sweeping reforms advocated by the Liberal Party. After the death of Alfonso XII. he once more became Premier, and remained in power till 1890, signaling his term of office by firmly repressing all attempts on the part of the military element to renew the anarchy of the years following the dethronement of Isabella II. The weakness of the Conservative Party afforded Sagasta another period of office from December, 1892, to March, 1895, his resignation being due to his inability to cope with the military situation in Cuba, where a new insurrection had broken out. In September, 1897, he was called to the head of affairs at a time when matters in Cuba were hastening to a crisis. The unhappy outcome of the war with the United States, which all his efforts could not prevent, led to his resignation in March, 1899. For the last time he assumed office in March, 1901. He resigned in December, 1902, after the young Alfonso XIII. had attained his majority. He died at Madrid, January 5, 1903.

SAGE (OF. *sauge*, *saulge*, Fr. *saup*, from Lat. *salvia*, sage-plant, from *salvus*, safe, Gk. *ῥῶσ*, *holos*, OIr. *slán*, entire, Skt. *sarva*, all; so called from the healing properties attributed to it), *Salvia officinalis*. A perennial garden herb used to flavor dressings, sauces, etc. It is a half shrubby plant which grows on sunny mountain slopes in Southern Europe, and has long been in cultivation. The whole plant has a peculiar, strong, penetrating aromatic smell, and a bitterish, aromatic, somewhat astringent taste. It contains much essential oil (oil of sage). Sage grows best in a dry soil, and is

easily propagated by slips or cuttings. Meadow clary, or meadow sage (*Salvia pratensis*), is a common ornament of meadows and borders of fields in most parts of Europe. The apple-bearing sage (*Salvia pomifera*) is a native of Southern Europe and of the East, remarkable for its large reddish or purple bracts, and for the gall-nuts (sage apples) which grow on its branches.

SAGE, HENRY WILLIAMS (1814-). An American philanthropist. He was born at Middletown, Conn., studied medicine for a while, and in 1832 entered upon a mercantile career. He succeeded to the business of two of his uncles in Ithaca, N. Y., where he soon became recognized as one of its most enterprising business men. After the death of Ezra Cornell in 1874, he succeeded to the presidency of the board of trustees for the university. Besides the college hall for women and a chapel which bear his name, he gave Cornell a new library building with an endowment. He was the founder of the Lyman Beecher lectureship on preaching at Yale.

SAGE, RUSSELL (1816-). An American capitalist, born in Shenandoah, Oneida County, N. Y. He was educated in the public schools, and after serving as a clerk for several years he established himself in the wholesale grocery business in Troy in 1839. He served from 1841 to 1848 as an alderman in Troy, was for several years county treasurer, and in 1852 was elected to Congress as a Whig, and reelected in 1854, serving on the Ways and Means Committee. Having become one of the leading wholesale merchants in the upper part of the State, he removed to New York City in 1863, purchased a seat in the Stock Exchange, and became largely interested in railroad investments. He became associated with Jay Gould (q.v.) in the control of the Wabash, the Saint Louis and Pacific, and other Western roads, and in the Western Union Telegraph Company and the Manhattan Elevated Railroad system of New York City.

SAGE-BRUSH. Certain drought-resisting plants. See ARTEMISIA.

SAGE-BRUSH STATE. Nevada. See STATES, POPULAR NAMES OF.

SAGE COCK. See GROUSE.

SAGE GROUSE. The largest of American grouse (*Centrocercus urophasianus*), which inhabits the sage-brush plains of Western North America and the mountain valleys up to about 9500 feet. The full-grown cocks average about 2½ feet in length; the hens rather under two feet; the weight varies from three to six pounds. The tail equals, or rather exceeds, the wing in length, and consists of twenty very narrow acuminate feathers, stiffened and graduated in length from the middle pair outward. A more remarkable feature of the cock is the immense dilatable air-sac of naked yellow skin on each side of the neck, bordered by a patch of curiously stiffened, horny feathers, like fish-scales, often terminating in bristly filaments several inches long. The feet are feathered to the toes. The upper parts are varied with gray, black, brown, and tawny or whitish, and a noticeable mark is a broad black area on the under part of the adult. It is numerous in its habitat, and affords good sport with dogs, but its flesh is so tainted with the bitterness of the artemisia buds upon which it principally feeds (unless 'drawn' as

is considered as to be undesirable for the table. It eats many insects, especially 'locusts.' It feeds on the ground and lays elongated, heavily spotted eggs. (Consult Coles, *Birds of the North* (Washington, 1874). Compare GROUSE.

SAGE HARE. A jack-rabbit. See HARE.

SAGE SPARROW. One of the pale-colored desert sparrows of the genus *Amphispiza*, related to the song-sparrow, and inhabiting the sage-brush district of the Western United States.

SAGHALIEN, sā'gā-lyēn', or **SAKHALIN**, sā'kā-lyēn'. An island off the eastern coast of Siberia, extending from 46° to 54° 30' N. latitude, and from 141° 30' to 145° E. longitude (Map: Asia, O 3). It is separated from the Maritime Province on the west by the Strait of Tartary, which is only about five miles wide near the mouth of the Amur; and from the Japanese island of Yezo on the south by the Strait of La Pérouse, about 27 miles at its narrowest part. The island is of oblong shape and covers an area of over 29,000 square miles. The surface is largely mountainous, the elevations extending to the very sea. The western coast for the most part presents the appearance of a steep wall, varying in height from 100 to 200 feet, and is practically without indentation. The eastern coast is almost as precipitous as the western, but is more indented, and forms a number of lagoons. In the northern part of the island three separate mountain ranges are marked, two running along the coasts and one through the centre. They vary in altitude from 1500 to 3000 feet, and are densely wooded. In the centre there is a wide plain between the two coast ranges. Another mountain range runs along the eastern coast down to Aniva Bay, and still another covers the southeastern part of the island.

The rivers of Saghalien have the character of mountain streams, and are of little value as waterways. The chief rivers are the Tym, flowing in a northern and a northeastern direction and falling into the Sea of Okhotsk after a course of about 150 miles; and the Paranaï, which falls into the Gulf of Patience on the eastern coast. Very little is known of the geology of the island, but extensive deposits of coal have been discovered, and some mines are worked near Dui, on the western coast. The climate varies in different parts of the island in accordance with the proximity of the locality to the mainland or to the Sea of Okhotsk. Thus the northern part which lies close to the mainland has a continental climate during the winter, when the narrow strait freezes over; and the eastern coast, subject to the cold currents of the Sea of Okhotsk, has a more severe climate than the western coast, which is affected principally by the Sea of Japan. In the central part the winters are very severe. The precipitation is abundant and the snow occasionally reaches a depth of seven feet.

Almost the entire surface of the island is covered with forests, chiefly coniferous. In the southern part are found some Japanese plants. The fauna of Saghalien does not differ essentially from that of Eastern Siberia. The rivers are well stocked with fish, and provide the natives with their staple food. Neither the climatic conditions of the island nor its soil are favorable to agriculture, and the area under cultivation at present is insignificant. The Russians, who are prin-

cipally convicts, released convicts or exiles, engage chiefly in coal mining and lumbering. The convicts are employed in the coal mines and furnish the labor for the construction of roads and other improvements. The natives are engaged in fishing and hunting. Fishing on a large scale is carried on by the Japanese, who use herring for fertilizing purposes. The total population of the island in 1897 was 28,113 (7641 women), of whom 4979 (759 women) were convicts, 6934 exiles and 1566 released convicts. Prisons are maintained at the chief settlements of the island. The native population consists of about 2000 Gilyaks, who inhabit the northern part of the island; about 2500 Ainos (see AINO), the aborigines of Saghalien, found principally in the south; and a small number of Oroks of Tungus origin. There are also a number of Japanese and Chinese. The island forms a separate administrative district. The principal settlements are Alexandrovsk or Dui, the seat of the administration, Rykovskoïe, Korsakov, and Muravievski.

The existence of Saghalien was first brought to the attention of Europe by the Dutch navigator Gerrit de Bries, about the middle of the seventeenth century. The southern part of the island belonged to Japan until 1875, when it was acquired by Russia in exchange for some of the southern Kurile islands. The island became a penal colony in 1869.

Consult: Fr. Schmidt, *Reisen im Amurlande und auf der Insel Sachalin* (Saint Petersburg, 1868); Poljakow, *Reise nach der Insel Sachalin*, 1881-82, trans. (Berlin, 1884).

SAG HAR'BOR. A village in Suffolk County, N. Y., 100 miles east of New York City; on Gardiners Bay, and on the Montauk division of the Long Island Railroad (Map: New York, H 5). It was formerly one of the most important whaling centres in America, but at present is best known as a summer resort. The leading industry of the village is the manufacture of watch cases. Population, in 1900, 1969.

SAGINAW. The county-seat of Saginaw County, Mich., and the commercial metropolis and railroad centre of northern Michigan, 100 miles northwest of Detroit; on the Saginaw River, at the head of deep-water navigation (Map: Michigan, J 5). It is on both sides of the river, which is spanned by four railroad and five public bridges. The city covers an area of about 13 square miles, and its streets are well paved, principally with asphalt and brick. Several parks add to the attractiveness of the city, of which Hoyt and Riverside are especially noteworthy. The Hoyt Library with 24,000 volumes, the Public Library, the Germania Institute, and the Saginaw Valley Medical College are also prominent features. A free manual training school building, the gift of Hon. W. R. Burt, dates from 1903. It cost \$200,000. Among the edifices of note are the Masonic Temple, the Court House, City Hall, Hoyt Library building, Saint Mary's Hospital, Arbitrator Hall, the Germania Institute, and the Post Office building. The hospitals and charitable institutions include Saint Mary's Hospital, Saginaw General Hospital, Woman's Hospital, Home of the Friendless, and Saint Vincent's Orphan Home.

Saginaw was long known as one of the greatest lumber manufacturing centres in the country. The disappearance of the pine forests, however,

has necessarily led to the abandonment of its saw-mills and to a change in the nature of its industry. There are still large firms engaged in the manufacture of rough and dressed lumber, and sash, doors, and boxes. With the passing of the lumber industry came the discovery of bituminous coal, the mining of which is now very important. More than 1,000,000 tons were mined in 1902. Three of the mines are within the municipal limits. A productive beet sugar district surrounds the city. In the census year 1900 the capital invested in the various manufacturing industries was \$7,558,806, and the total output was valued at \$10,034,499. This has been very largely increased since 1900, over \$2,000,000 having been invested in new industries during 1902. Among the leading establishments are the Saginaw Plate Glass Company (the only one in Michigan), with a yearly capacity of 1,000,000 square feet, and immense beet-sugar factories, which were built at a cost of over three-quarters of a million dollars each. Besides lumber, glass, and beet sugar, there is a great variety of manufactured products. As an industrial point Saginaw ranks third in the State. Its railroads, radiating in eleven different directions, comprise seven divisions of the P&M, three of the Michigan Central, and the Grand Trunk Railroad. The city is therefore the great distributing point for northern Michigan, and its wholesale houses are among the largest in the country.

Under the revised charter of 1897, the government is vested in a mayor, chosen biennially, and a unicameral council. The majority of the administrative officials are either appointed by the mayor or elected by the council. The school board, however, is chosen by popular vote. For maintenance and operation, the city spends annually about \$450,000, the chief items being: Schools, \$142,000; interest on debt, \$57,000; streets, \$40,000; police department, \$38,000; and for the fire department, \$35,000. The water-works, which were constructed in 1872 at an outlay of \$909,895, are owned by the municipality. Saginaw was created in 1890 by the consolidation of Saginaw City and East Saginaw. It was first settled in 1822. East Saginaw received a city charter in 1859. Population, in 1890, 46,322; in 1900, 42,345.

SAGINAW BAY. An arm of Lake Huron, 60 miles long and 20 miles wide, extending south-westward into the State of Michigan (Map: Michigan, K 5). It receives the Saginaw River (q.v.).

SAGINAW RIVER. A short river of Michigan, formed by several head-streams at Saginaw City, and emptying into Saginaw Bay after a course of about 20 miles (Map: Michigan, J 5). It is navigable up to the city for steamers drawing 10 feet.

SAGO (from Malay *sagu*, *sagu*, *sago*). A starch prepared from the pith of several species of palms (*Myroxylon*, *Borassus*, *Arenga*, etc.), natives of the East Indies. The pith constitutes a large proportion of the trunk and contains a considerable quantity of starch, which is elaborated by the plant as a reserve material. The tree must be cut down after blossoming, otherwise it is useless for the production of sago, as the starch is used by the tree for the growth and

development of the seed. The pith, sometimes as much as 700 pounds from a single tree, is pounded in wooden mortars, the starch removed by washing with water and purified by sieving in the usual way. (See STARCH.) The finely divided sago (sago flour) is worked into a dough by kneading and forced through sieves upon hot greased pans to form pearl sago. The dough forms granules, which become covered with a paste made from some of the starch by the action of heat. The finished product consists of translucent globes. Sago has the following percentage composition: Water, 12.2; protein, 9.0; fat, 0.4; nitrogen free extract (chiefly starch), 78.1; ash, 0.3. It is an important article of diet with the natives of the East Indies, and is largely exported to Europe and America for thickening soups, making puddings, etc. A peculiarity of pearl sago is that the grains swell and become still more translucent on cooking, but do not form a homogeneous paste. Imitation sago is made from potato starch and other starches.

SAGRA, *sá'grá*, RAMÓN DE LA (1798-1871). A Spanish economist and historian, born at Coruña. From 1822 until 1834 he was director of the botanical garden at Havana, Cuba, and then became an editor at Madrid. Among his numerous works are: *Historia económica, política y estadística de la isla de Cuba* (1834); *Historia física, política y natural de la isla de Cuba* (2 vols., 1837-42); and *Icones Plantarum in Flora Cubana Descriptorum* (1863).

SAGUA LA GRANDE, *sá'gwá lá grán'dá*. A town of Cuba, in the Province of Santa Clara, situated on the Sagua River, 5 miles from the north coast and 30 miles north of Santa Clara (Map: Cuba, E 4). It is a comparatively modern town with wide streets, and has machine shops and lumber yards. The main article of export is sugar. The town is connected by rail with Santa Clara and Havana. Population, in 1899, 12,728, mostly whites, and a considerable number of Chinese.

SAGUENAY (*sá'g'e-ná'*) **RIVER.** A large tributary of the Saint Lawrence River, falling into the estuary, on the north side, about 115 miles below Quebec (Map: Quebec, F 2). It is the outlet of Lake Saint John, though its name is sometimes extended to the Chamouchoan, the main feeder of the lake, rising 150 miles to the northwest of it. The length of the Saguenay below the lake is about 150 miles. It leaves the lake in a series of rapids, and for the first 36 miles is a narrow stream running between densely wooded hills. At Chicoutimi it widens out into a tidal estuary or fiord about two miles wide, and for the rest of its course it passes between bare and gloomy cliffs, rising to a sheer height of 1000 to 1800 feet, and broken here and there by deep, wooded, but equally gloomy cross valleys. The water in this fiord has a mean depth in mid-channel of 800 feet, and in some places the depth exceeds 2000 feet. The largest ships can ascend to Ha Ha Bay, a few miles below Chicoutimi.

SAGUNTUM (Lat., from Gk. *Σάκωντος*, *Zakynthos*). An ancient town, near the eastern coast of Spain, on an eminence near the mouth of the Pallantias (modern Palancia), about midway between the mouth of the Ebro and New Carthage (Cartagena). Later tradition attributed its

foundation to Greeks from Zacynthus and Rutulians from Ardea. In reality there seems no reason to doubt that it was an Iberian city, with an admixture of Greek culture due to its commerce. It owes its historical importance to its connection with the outbreak of the Second Punic War. The town had been received into alliance by the Romans, apparently after the treaty of B.C. 226, which bound the Carthaginians not to cross the Ebro. Hannibal, who saw that war must come, attacked the city, which had refused to acknowledge the Carthaginian supremacy, in B.C. 219. After a desperate defense for eight months, the skill of the Carthaginian general prevailed. The Romans thereupon demanded the surrender of Hannibal for attacking their ally, and, upon the refusal of the Carthaginians, declared war. The ruined town was subsequently rebuilt by Scipio Africanus, and appears as a *municipium* under Augustus. The ancient walls (*muri veteres*) gave rise to the name of the modern town, Murviedro (q.v.).

SAHARA, sâ-hâ'râ (Ar. *sâhira*, desert), THE. The largest continuous desert on the earth's surface. Extending east and west between the Atlantic Ocean and the Red Sea, and north and south between the Sudan and the Mediterranean countries, whose southern borders overlap it, the desert embraces an area of 3,510,000 square miles, being nearly as large as the European mainland (Map: Africa, E 2). In the last quarter of the nineteenth century it was proposed to convert the western Sahara into an inland sea by admitting the waters of the Atlantic through a canal south of Morocco. It is now known that the mean elevation of this part of the desert is at least 1000 feet above the sea, that the lowest part of the region it was expected to submerge is 500 feet above the sea, and that the area below sea level is comparatively insignificant. The recent discovery of fossils and limestone deposits of Cretaceous and Tertiary times extending over a wide area of the southwestern part of the Sahara has led Professor de Lapparent to the conclusion that the Tertiary sea must have extended inland at least as far east as Lake Chad. He mentions other facts also that point to an unbroken sea communication between India and the central Sahara by way of Egypt in Cretaceous and Tertiary times.

The surface of the Sahara is not, as was once supposed, merely a monotonous and comparatively level waste of sand. Its surface presents, on the contrary, considerable variety of aspect which makes it possible to divide it into five natural groups: (1) The western Sahara, (2) the mountain lands of the central Sahara, (3) the Libyan waste, (4) the Nile lands, and (5) the mountain zone east of the Nile. As a whole, the Sahara is a tableland whose surface has an average elevation of 1300 to 1600 feet above the sea, with only limited areas falling to 500 or 600 feet, and a few small depressions below the sea level.

The most northern of the depressions beneath the sea level are the salt lakes or marshes (shotts) in the southern part of Tunis. They contain scarcely any water and are 50 to 90 feet below the level of the Mediterranean. This is now a region of date palms nourished by the springs which gush from the neighboring hills. In the eastern part of the Libyan desert is a

series of deeply depressed oases sharply defined by the precipitous walls of the plateau: Aradj, 230; Siva, 98; Sittra, 82; Uttiah, 66; and the Birket el Kerun, in the Egyptian Fayum, near the Nile, 131 feet below sea level. These are the only depressions, except one, beneath sea level in Africa. A strip of considerable breadth extending along the Atlantic fringe of the western Sahara from the Senegal River to Morocco may be classified as lowland (not more than 650 feet in elevation). Another strip of lowland stretches from the shotts of Tunis to the Nile.

The chief distinction between the western Sahara and the Libyan desert is that the larger part of the western Sahara is steppes while the Libyan desert, excepting its depressed oases, is almost purely a sand waste. The two regions are separated by the great highlands of the central Sahara. About two-thirds of the western Sahara is composed of sterile, rock-strewn plains, and the remainder is sand waste, the plains or steppes extending across the desert from northeast to southwest, the sand desert being interspersed among them. There are many deep valleys, the beds of streams flowing from the Atlas ranges or from the western slopes of the highlands of the central Sahara, some of the northern wadis or rivers carrying at times considerable water a short distance into the desert; but the water in most of the basins sinks through the permeable strata to an impermeable one of clay, forming vast subterranean reservoirs needing only to be tapped to spread life and wealth over the surrounding surface. The oases are situated above these underground supplies and may be extended wherever water can be brought to the surface. The most remarkable of these tracts is El Erg, whose wells are capable of irrigating as many as 8,000,000 date palms. The oases embrace only about 80,000 square miles, or only a little more than one-fortieth of the desert area. The lines of wells that make a number of caravan routes across the western Sahara possible are found along the courses of these subterranean water supplies. The valleys show that at an earlier period the climatic conditions permitted far larger volumes of water to flow on the surface; and evaporation has produced numerous salt pans, particularly in the west and south.

The plateau of the central Sahara, which extends three-fourths of the way across the desert from northwest to southeast, is from 1900 to 2500 feet in elevation, and above it rise mountain ranges (Ahaggar, Tibesti, and Air), some of the peaks being 6000 to 9800 feet high, and snow-crowned in winter. The Ahaggar mountain land is the source of several long, wide river valleys, now waterless above ground, but contributing their subterranean supplies for the creation of a series of wells. East of the mountains to the Nile extends the Libyan waste, waterless, barren, almost devoid of life save for its few inhabited oases, its sand dunes, often piled up by the winds to a height of 300 or 400 feet, stretching away to the Nile. This sand waste, remarkably difficult to cross, has been characterized by Rohlfs as the most treacherous and tediously monotonous region of the Sahara. The Nile lands and the eastern mountains are described in the articles EGYPT and NILE.

The Sahara is dry in winter because it is then an area of high pressure, forcing the air currents

outward in all directions and so receiving little moisture from the seas; and in summer, because the intense heat over the desert expands the air so that it is like a sponge, absorbing moisture instead of parting with it. There is, however, considerable precipitation in the region of the central mountains. There are four months of winter and eight months of summer. The range of temperature is large for a tropical region. Owing to the intense radiation, the hottest days are often succeeded by cool nights.

Except in the oases the desert is almost devoid of vegetation save for stunted and thorny shrubs in the western Sahara. One of the commonest shrubs is the gum acacia. Wild animals are also rare, though the Sahara is preëminently the home of the domesticated camel, and the southwestern part of it is particularly well adapted for the ostrich. The game includes gazelles, wolves, hyenas, foxes, jackals, wild boars, and leopards. Granite, quartzite, and porphyry are everywhere the predominant rocks, as far as is yet known, except the Tertiary limestones along the Barka coastline of Tripoli and the similar formations newly discovered in the southwestern part of the desert. The date palm is the staple product of the oases and the principal source of revenue in the Sahara. Under the shade of the palm trees the natives raise some wheat, barley, and vegetables. Cotton produced in most of the oases is the chief fibre used for native spinning and weaving. The coarse fibre esparto (alfa) thrives on the Saharan steppes of Southern Algeria and Tunis, and is an article of export. The chief mineral riches is salt, formed by evaporation in the salt pans of the south and west, in inexhaustible reservoirs that supply the whole Sudan. One of them in El Juf is 30 miles long by 12 broad; 20,000 camel-loads of salt are extracted from it annually. Camels, sheep, goats, horses, donkeys, and a few cattle are the domestic animals.

Excepting dates and salt, the commerce of the Sahara itself is insignificant, but the desert is the highway for considerable trade between the Sudan and Morocco and Tripoli. The chief trade routes (along the lines of wells) are (1) from Taflelt (for Morocco and Algiers), via Tuat, to Timbuctu; (2) from Gadames (for Tunis and Tripoli) to Tuat and Timbuctu on one hand and to Sokota and Kano on the other; (3) from Murzuk or Tripoli, via Bilma, to Kuka, near Lake Chad, the most frequented of all the desert routes; (4) from Bengazi, via Ujila, to Wara, in the Kingdom of Wadai; (5) from the Nile Valley, via numerous oases parallel to it, to Darfur. Another great camel route skirts the northern fringe of the desert and connects the principal inland towns of the Mediterranean States. The west is inhabited by Moorish tribes (Berbers), the centre by Tuaregs, the most formidable robbers of the desert and the greatest impediment to peaceful trade, and the east by Tibbu (Sudanese negro stock) and Bedouins. By a convention between Great Britain and France, the right of France to all of the unappropriated Sahara west of the Nile basin has been recognized. The French Sahara includes about three-fifths of the desert, the remainder belonging to Spain (a part of the Atlantic coast), Morocco, Tripoli, and Egypt. No estimates of the population of the Sahara are given.

SAHARANPUR, sā hā'rūn-pūr', or **SEHARUNPOOR**. The capital of a district of the same name in the United Provinces of Agra, India, 111 miles north by east of Delhi, on the Damaula Nadi River, near the Doab Canal (Map; India, C 2). The surrounding section has been made very fertile by means of irrigation and produces grain, cotton, and sugar cane. Saharanpur is the commercial centre of this region and also carries on considerable trade in native textiles. Population, in 1901, 66,254. The city dates from the fourteenth century, and during the Mogul régime was a popular summer resort. It was for a time under the control of the Sikhs, and came under English sway in 1804.

SAHUAYO, sā-wā'yó. A Mexican town of the State of Michoacan, 60 miles southeast of Guadaluajara, on the southern margin of Lake Chapala. It was conquered by Nuño de Guzman in 1530. The population in 1895 was 8443.

SAI. One of the many native South American words applied to monkeys. This one seems to be a general term for 'monkey' and to lie at the root of many names, such as 'saimiri,' 'sahui,' 'sajou,' 'saguin,' 'saki,' 'sapajou,' 'ouakari,' and similar terms which have come down to us through the writings of various early European travelers, by whom they have been variously spelled and changed.

SAID PASHA, sā-ād' pá-shā', MEHMEH (1835—). A Turkish statesman, born in Constantinople. He served under Fuad Pasha in Syria in 1860, became Governor of Cyprus, and commanded a corps in the Russo-Turkish War. He was afterwards made Secretary of State and member of the Reform Commission by Abdul Hamid II. In 1879 he became Prime Minister, was removed the following year, but returned quickly to power and remained in office till May, 1882. He was restored to his post in July of the same year, and in December became Grand Vizier, holding this office till 1885, and again for a few months in 1895.

SAI'GA (Rus., *saiga*, antelope). An interesting antelope (*Saiga Tartarica*) with an extraordinary inflated nose, due to the size and position of the nasal bones, inhabiting the steppes of Asiatic Russia south of 55° N. The sheep-like expression is more pronounced in the females, as the male has erect, annulated horns (see Colored Plate of ANTELOPES); there is a thick tuft of hair beneath each eye and each ear, and the animal's coat is fleecy. In some of its habits also it resembles sheep, especially in jumping and butting. This antelope inhabited Western Eu-

rope as late as the time of Paleolithic man, and was doubtless one of the objects of his chase. Its remains are common in caves of France and Belgium, and have been found in Great Britain, and at least one sketch of the head of the animal has been found upon a bone.

SAIGON, sî'gôn'. The capital of the French possession of Cochín-China, on the River Saigon, in latitude 10° 50' N. and longitude 106° 32' E. (Map: Asia, K 7). It is forty miles from the coast. Its excellent harbor makes it accessible to the largest steamers. The city is in three parts: Government town, the colony, and the native town. The European portion is elegantly built with broad, regular streets and fine public buildings, including the cathedral, Governor's Palace, the Palace of Justice, hospital, and Chamber of Commerce. Two fine gardens overlook the town, the Governor's and botanical, the latter containing a not-worthy collection of plants. There are two colleges, an arsenal, a fine dry dock, machine shops, foundries, three banks, and two steam rice mills. Communication with the world is amply provided by cables and steamship lines. Most of the commerce is at Cholon, four miles distant, and connected with Saigon by steam tramways. It is a great rice market and has a number of large rice mills. Its population in 1901 was about 127,000, chiefly Annamese and Chinese. The population of Saigon in 1900 was nearly 51,000, including over 3000 Europeans. Saigon was the capital of Cochín-China while it was still under native rule. The French captured it in 1858, and it

safety by his own clan to the island of Oshima (q.v.). In 1863 he was recalled and placed at the head of the Provincial Government. In the civil war which resulted in 1868 in the abolition of the Shogunate, he was found fighting with distinction on the Imperial side. In 1873 he was named commander-in-chief of the land forces, but ere long, becoming dissatisfied with the new Government and its adoption of so many foreign ideas, he retired to Kagoshima. Here he established a great 'private school,' ostensibly for the promotion of learning, but really for the training of soldiers to be used in an attempt to revert to the former form of government, with the Satsuman clan and himself at its head under the Mikado. In February, 1877, they broke out in open rebellion with Saigo as leader. The struggle lasted until September 24, when Saigo's forces were utterly defeated and himself and his chief officers slain in battle. Posthumous honors were granted him in 1890.—His brother, SAIGO TSUKUMICHI, also a soldier, was born in Satsuma in 1843, led the Japanese expedition to Formosa in 1874, and was a general in the Imperial army engaged in suppressing the Satsuma Rebellion (see above). From 1879 to 1900 he was a Cabinet officer.

SAIL (AS, *segel*, *segl*, OHG, *segal*, Ger, *Segel*, sail, of uncertain etymology). A contrivance of canvas, matting, or similar material designed to utilize the pressure of the wind in the propulsion of vessels. Sails are generally made of flax or cotton canvas, but in China, and in many partly civilized countries, they are made of grass, or

TYPES OF SAILS.

(1), A staysail of ordinary cut; (2), a schooner's foresail or mainsail, a sloop's mainsail, a spaker, etc.; (3), a jib; (4), a big sail; (5), a topsail, topgallant sail, etc.; (6), a square foresail or mainsail; (7), a Chinese junk's sail having battens or bamboos across it to keep it flat; (8), a leg-of-mutton sail.

was formally made theirs by treaty in 1862, when it became the capital of their possessions instead of Touraine.

SAIGO TAKAMORI, sî'gô tã'kã-mô'rô (1826-77). A Japanese general, born at Kagoshima, Kinshiu, in 1826. He was educated chiefly in Kioto. He was one of those patriots who desired the overthrow of the Shogunate, the restoration of the Mikado to his proper place as the sole ruler of the Empire, and the expulsion of foreigners. He soon took an influential position in his clan, but his views earned for him the displeasure of the Shogun's Government, and when about to be seized he was banished for

fibre mattings. While sails are made in various shapes, they are usually triangular or quadrilateral.

The letters *h*, *s*, *t*, attached to the various figures, indicate the position of the halliards, sheets, and tacks. Some sails are not hoisted, therefore they have no halliards; others are drawn down by their sheets alone and have no tacks; some, which are secured to booms, have the sheets secured to the boom instead of the sail, and some have both tacks and sheets at the same corner. The tack is a rope which secures the forward lower corner of a sail. In the case of square sails, which secure to yards above and

below, the ropes at each lower corner are called sheets; but square sails which hang from a yard and have no yard below them have tacks leading forward from their lower corners and sheets leading aft. When the sail is set at an angle

FORE-AND-AFT SAIL—MAINSAIL.

with the keel, one tack is hauled forward and one sheet is hauled aft.

Typical sails on a larger scale than in the diagram are shown in the accompanying figures, and the letters indicate parts of the sail and the ropes called "gear" attached to it: B, buntline; b, bowline; C, clew; c, clewline; D, downhaul;

JIB.

TOPSAIL, AFT-RIE EIDE.

E, head-earring; F, foot of sail; g, bunt-glut for bunt-whip; H, halliards; h, head of sail; L, luff of sail; l, leech of sail; l', leechline; n, nock or throat of sail; p, peak of sail; R, reef-tackle; r, reef-band of sail, carrying reef-points; S, sheet; T, tack, the rope which secures the corner of the sail (also called the tack) t, to the deck or mast.

Canvas sails are made up of narrow strips

(called 'cloths') of canvas running up and down the sail. These are lapped about an inch and a half and both edges sewn with an overhand stitch. Around the edges of the sails are additional canvas strips called tabling, clew patches, etc.; and across it are strainbands, hantline cloths, reef-bands, etc. The edges of the sail are strongly sewed to the 'toping,' which goes entirely round and adds greatly to the strength as well as serving to attach the gear to the sail.

As applied to ships, sails are of two types, 'square' and 'fore and aft.' Square sails are bent to yards which pivot about their middle. Fore-and-aft sails pivot at the forward edge (or near it in the case of lug sails), and are bent to gaffs, masts, or lugs, or are hoisted on stays. A vessel can carry more canvas if square rigged, but the sails are heavier and less easy to handle, and a fore-and-aft rigged vessel can usually lie nearer the wind in sailing. Square rigged vessels, in addition to their square sails, have some fore-and-aft sails, as the jibs, staysails, trysails, and spanker. See SHIP.

The lower sails of a square-rigged vessel are called the courses; they consist of the foresail and mainsail (and, in some ships, the mizzen or cross-jack). The sails above these are the topsails—fore, main, and mizzen. Above the topsails are the fore, main, and mizzen topgallant sails; and above these again the fore, main, and mizzen royals. In some very lotty merchant ships there are skysails above the royals. In recent years the merchant practice has been to cut the topsail in two parts, called the upper and lower topsails. This plan saves reefing close down—instead of reefing, the upper topsail is

furled. Moreover, the sails are of less unmanageable dimensions for handling with small crews.

Sails are hoisted with ropes called halliards; hauled out flat with sheets or outhauls (on booms and gaffs); pulled up to the yard for furling by means of clewlines (at lower corners), buntlines (made fast at foot), leechlines (at side), and bunt-whip (middle); and pulled

up to the yards for reefing by reef-tackles. Square sails are bent to iron rods (called bending jack-stays) on the yards with rope-yarn stops called rebands; fore-and-aft sails are bent to travelers or hanks sliding up and down stays or railways (on masts), or to hoops sliding up and down the masts. Fore-and-aft sails are either lowered when furled or pulled in and furled up and down the mast. In the latter case they are pulled in by the brails. Jibs and staysails are hauled down by down-hauls. When the force of the wind reaches a certain point, the light sails are furled and the other sails reefed by tying up parts of each to its yard or boom by means of small, short ropes called reef-points. In severe storms, heavy sails of small area called storm sails are bent in place of certain of the ordinary sails, which are used except in very strong winds. In the severest hurricanes no sail can be carried—except, possibly, a tarpaulin laid against the mizzen rigging, which serves to keep the vessel partly up to the seas.

The action of the wind upon the sails is best shown by a diagram. Let AB represent a ship moving in the direction BA; CD one of her sails;

EF the apparent direction of the wind. Then if EF represents in length the force of the wind, GF will be the resolved component at right angles to the sail, and HF the effective resolution of this component applied to pushing the ship ahead. The component GF will tend to push the ship sideways (give her leeway) or heel her over. It is evident that, as the wind draws aft, less of its power is lost, but with the wind aft is not usually the best point of sailing, as the sails will not all draw in this position. Most ships sail best with the wind between the quarter and the beam. Some fore-and-aft sails are in two parts—a broad strip along the foot being laced to the upper part. To reduce the area of the sail, instead of reefing by drawing up the foot and tying it with reef-points, the broad strip mentioned—which is called a bonnet—is removed.

SAILER, zī'lēr, JOHANN MICHAEL (1751-1832). A Roman Catholic theologian, born at Aresing, in Upper Bavaria. He entered the priesthood and in 1780 was made professor of dogmatics at Dillingen. In 1794 he was removed from his chair because of his mysticism, and in 1799 was appointed professor at the seminary of Ingolstadt, which removed in 1800 to Landshut, where he remained until 1821, when he became prebendary of Regensburg. In 1829 he became bishop of the same see. His influence was very great throughout Germany in behalf of renewed spiritual activity within the Roman Catholic Church. His complete works were edited by Widmer (1830-42). Consult the biography by Messmer (Mannheim, 1876).

SAILFISH (so called from the shape of the dorsal fin). (1) A fish (*Istiophorus nigricans*) of the warmer waters of the Atlantic, especially about the West Indies, where it is called 'spike-fish,' 'boohoo,' and by various Spanish names. It is very similar in character and habits to the swordfishes (q.v.), but has a shorter and less flattened sword and the skin is rougher. Several other species are known in Eastern waters. See Plate of SPEARFISH AND SWORDFISH.

(2) A carp-sucker. See SKIMBACK.

SAILINGS. The term applied in navigation (q.v.) to the different methods of conducting a ship from one point to another and the solution of problems connected with these methods. They are (a) plane sailing; (b) traverse sailing; (c) parallel sailing; (d) middle latitude sailing; (e) Mercator sailing; (f) great circle sailing. So far as the track of the ship is concerned, the first five of these are identical, for in all of them the ship's track is along the rhumb-line or loxodromic curve; these sailings, therefore, are merely different methods of computation of the same problem. In great circle sailing, however, an attempt is made to follow the great circle of the earth which passes through the points of departure and arrival.

In *plane sailing* the small portion of the earth under consideration is regarded as a plane.

In the figure let W be the point of departure and A the point of arrival. Then if NS is a north and south line (part of the meridian through W), the angle NWA is the course. Draw WE perpendicular to NS and AE parallel to NS. If we regard as a plane the portion of the earth's surface under consideration, the vessel in moving from W to A will have changed her latitude by an amount equal to AE and her longitude by an amount equal to WE. If we designate WA (the distance sailed) by d , AE (the change in latitude) by l , and WE (the distance gained in the direction in which longitude is measured) by p ,

FIG. 1.

we shall have $l = d \cos C$ and $p = d \sin C$. AE, or l , is called the 'difference in latitude;' AW, or d , the 'distance;' and WE, or p , the 'departure.' If d is expressed in nautical miles and C in degrees, l will be given in minutes of latitude. (This is not exact, but the error is inappreciable in practice.) The departure, or p , will also be given in nautical miles. The method of determining the relation between the departure (p) and the difference of longitude (D) is given under 'traverse sailing.'

Traverse sailing consists in computing the total

gain in latitude and in departure when the ship's track is made up of several pieces, the whole track being called a 'traverse.'

In Figure 2 W is the point of departure and H the point of arrival; and WABFGH is the ship's track. The total gain in latitude is equal to $(l_1 - l_2 + l_3 - l_4 + l_5)$. The total gain in de-

parture is equal to $(p_1 + p_2 + p_3 - p_4 + p_5)$. Each value of p and l may be computed from its own triangle.

FIG. 2.

parture is equal to $(p_1 + p_2 + p_3 - p_4 + p_5)$. Each value of p and l may be computed from its own triangle.

In sailing due east or west along a parallel of latitude the difference of latitude (i.e. l) is zero and $p = d =$ distance sailed. But p is expressed in nautical miles. To determine how many minutes of longitude to which it corresponds, we must determine the length of a minute of longitude.

FIG. 3.

In Fig. 3, W N E S is the meridian of the earth passing through the point P. OE = R = the equatorial radius of the earth. TP = r = the radius of the circle of latitude passing through the point P.

$$\frac{\text{Circumference of circle of latitude}}{\text{Circumference at equator}} = \frac{2\pi r}{2\pi R}$$

Each of the circumferences is divided into the same number of minutes of longitude, therefore $x' =$ length of a minute of longitude at P $= \frac{r}{R} x =$ length of a minute of longitude at equator = R

Since the earth is very nearly a sphere, we may without serious error assume it to be so. (See LATITUDE AND LONGITUDE.) Then we have angle TPO = angle POE = L = latitude of P (nearly); also OP = OE (nearly); and $\cos L = \frac{r}{R}$ or $x' = x \cos L$. If p (= departure) correspond to

of plane and traverse sailing, we find D by the formula $D = p \sec L$. The value of l , p , and D may be picked out of a table of right triangles such as is given in Bowditch's *Navigators* and other works of the kind, or the triangle may be solved in the usual trigonometrical manner.

PARALLEL SAILING is a special case of plane sailing or traverse sailing in which the course is east or west along a parallel of latitude. The formulæ may be deduced from those for traverse or plane sailing by putting $C = 90^\circ$.

The latitude (L) used in the foregoing formulæ is that of the point of departure. If the distance sailed is considerable and the change in latitude more than a few miles, it is evident that the resulting difference of longitude will be considerably in error, for the length of a minute of latitude' at the latitude L differs from the length of a minute at L' (the latitude at the point of arrival). The exact average length of a minute of longitude is slightly greater than the mean of its lengths at the latitude of L and L' and slightly less than its length at the latitude of $\frac{L + L'}{2}$, but the error is not large for ordinary cases, and it is customary to use the formulæ

$$D = p \sec \left(\frac{L + L'}{2} \right); \text{ and this, together with}$$

$l = d \cos C$ and $p = d \sin C$, which have already been given, constitute the formulæ used in computing a ship's position by 'dead reckoning' (q.v.) when the latitude and longitude of the point of departure and the courses and distances sailed are known. Thus, suppose a ship leaves a place of which the latitude is 30° N, and the longitude 60° W, and sails northeast 100 miles and then S.S.E. 60 miles; required, the latitude and longitude of the place of arrival. The following table is prepared:

COURSE (C)	Distance (d)	Diff lat (l)	Dep. (p)	Diff long. (D)
N E.	100	+70.7	-70.7	-82.1
S S E.	60	-55.4	-23.0	-26.8
		+15.3	-93.7	-108.9

The latitude of the place of arrival is therefore $30^\circ 15' 18''$ ($30^\circ + 15'.3$), and the longitude

58° 11' 06" (60 — 1 48.9). When the distances sailed are short it is customary to find the sum of the departures and pick out (from the table of right triangles) the difference of longitude corresponding to the sum, using the mean of the latitudes of the place left and the place reached. While not so exact, it is sufficiently so for ordinary purposes of navigation; in the example under consideration the error would be about one-half a minute of longitude.

MERCATOR SAILING is a more accurate method of determining the latitude and longitude of the place of arrival, or the course and distance between places of which the latitude and longitude are known. A complete demonstration of the method requires too much space for insertion in this work. The formulae used are: $l = d \cos C$; $l' = l + l$; $p = d \sin C$; $m = M' - M$; $D = m \tan C$; $X = \lambda \pm D$. In these formulae the symbols have the same meaning as in the other sailings. In addition, M and M' are the meridional parts or augmented latitudes corresponding to the latitudes of the point of departure and point of arrival respectively; and λ and X are the longitudes of these points. In the accompanying sketches Fig. 4 is designed to show the

are the augmented latitudes of the points G, H, J, and K. It follows from the foregoing that the loxodromic line is a straight line when laid down on a Mercator's chart, and this is what makes the charts constructed upon that projection so convenient and so widely used. While Mercator's charts are almost universally employed for ocean navigation, Mercator sailing is used very little. The ordinary unavoidable errors of navigation are sufficiently large to render the slight superiority in accuracy over middle latitude sailing of no practical value, except where the distances are very great or where the ship's track crosses the equator between the points of arrival and departure.

In *great circle sailing* a ship is made to follow as closely as practicable the arc of the great circle of the earth passing through the points of departure and arrival. Since the shortest line between any two points of a sphere is the arc of a great circle passing through the points, it follows that a ship which moves from one point to another on the earth's surface will pass over the shortest route when she follows the arc of the great circle passing through those points. Theoretically, therefore, ships should always sail on great circles. Practically, this is impossible, and is not even generally desirable. Great circles make different angles with every meridian they cross, so that the course would be constantly changing. To effect this constant change would be difficult and very troublesome. Furthermore, to follow the great circle rigorously would often lead the ship into bad weather or dangerous localities or into regions where the currents and winds are adverse. The sole advantage is the shortening of the distance sailed. By determining points on the circle and sailing along the rhumb-line from point to point, the distance passed over may be made substantially the same as on the great circle, provided the rhumb-line tracks be made sufficiently short. In many cases it is desirable to follow quite closely the great circle for some distance and then the rhumb-line course to some distant point on the circle, which is again followed quite closely to the designed point of arrival. For instance, the great circle from Puget Sound to Yokohama runs through the Aleutian Islands and into a region of fog. For this reason steamers do not follow it throughout, but only as far north as desirable, when they take the rhumb-line course to meet the great circle again (a long distance to the westward) in about the same latitude; from this point they follow it in short rhumb-line tracks to the destination.

The determination of numerous points upon the great circle involves considerable computation work, and, while not difficult, it is beyond the capacity of rule-of-thumb navigators. To adapt great circle sailing to the comprehension of such navigators and to avoid laborious computation, many devices have been invented, such as charts on the gnomonic projection, the spherograph, great circle protractors, etc. Of these, the gnomonic charts are decidedly the simplest and most practical. The projection is upon a plane tangent to the earth at some selected point on the surface, and the point of sight is the centre of the earth. As all planes cutting great circles out of the earth pass through the earth's centre, they also pass through the point of sight; and

FIG. 4.

FIG. 5.

actual shape of a segment of the earth in which P is the pole, EQ a portion of the equator, PE and PQ meridians, and AB, GH, and JK portions of parallels of latitude. Fig. 5 represents the same segment of the earth on Mercator's projection. E'Q' is equal to EQ, as are also J'K', G'H', and A'B'. In Fig. 4 the line EB is a portion of a loxodromic curve or rhumb-line passing through E and B and making the same angle with the meridians PE and PG and all the other meridians. In Fig. 5 the angles between the lines E'B' and A'E', and E'B' and B'Q', are preserved; and, in order that this condition shall hold—since A'B' is longer than AB, and since A'E' and B'Q' are parallel—it is necessary that A'E' and B'Q' be longer than AE and BQ. A'E' and B'Q' are called the *augmented latitudes* of the points A and B; similarly G'E', H'Q', J'E', and K'Q'

the lines they cut in the plane of projection are straight lines. It is evident, therefore, that the straight line joining any two points on the chart is the projected great circle arc. The meridians and parallels of latitude being properly projected on the chart, it is very easy to obtain the latitude and longitude of as many points of a great circle arc as we wish. These points may be transferred to a Mercator chart and the courses between them obtained in the usual way, or they may be determined from the gnomonic chart itself, but this is usually unnecessary. The development of the gnomonic chart for use in great circle sailing is due to the late Gustave Herrle, chief draughtsman, and G. W. Littlehales, chief of the division of chart construction in the Hydrographic Office, United States Navy Department.

Various other means of graphically solving great circle problems have been devised. Probably the earliest was the 'great circle protractor' of Prof. W. Chauvenot, United States Navy. About the same time Mr. Stephen Martin Saxby of the British Navy designed a very similar instrument, which was called the spherograph. Capt. C. D. Sigsbee, United States Navy, designed a great circle protractor many years later, and recently devised a new form of it which is now issued by the Hydrographic Office of the United States Navy. All of these inventions utilize the stereographic projection of a hemisphere in which the meridians and parallels of latitude are shown.

The spherograph consists of a card upon which is the stereographic projection of a hemisphere with the meridians and parallels of latitude drawn and marked. Over this, and pivoted by a pin upon the same centre, there is an exactly similar projection of a hemisphere upon a transparent disk. All the meridians are great circles; therefore, if we consider the bounding meridian of the lower projection as that of the place of departure and mark the point upon it at the proper latitude, it is very easy to obtain the great circle leading to any other point as follows: Turn the transparent disk until its pole falls upon the marked point of departure. Every meridian of the transparent disk is now a great circle. If the point to be arrived at is marked on the lower disk in its proper latitude and longitude (reckoning the latter from the meridian of the point of departure), the meridian of the transparent disk which passes through it is the great circle connecting it with the point of departure. It is evident that this instrument is capable of graphically solving spherical triangles and other astronomical problems.

Captain Sigsbee's protractor is simpler and perhaps slightly slower in operation for some problems, but it is more easily handled, less likely to be injured and made useless on board ship, and is larger and more accurate. It consists of a large sheet of heavy smooth paper or thin cardboard upon which the hemisphere is stereographically projected. The points of departure and arrival are marked upon this as in the spherograph. In addition, upon a sheet of tracing paper, laid over the projection, you mark the centre, the point of departure, and the point of arrival. Turn the paper (keeping the centre always over the lower one) until the point of departure falls on the pole. The meridian which passes through the point of arrival is the great

circle. Trace such portion as you wish, turn the paper back to the first position, and pick up the latitude and longitude of as many points as you want. Captain Sigsbee's protractor readily lends itself to the graphical solution of a very large number of astronomical problems.

SAIL-LIZARD. A large Oriental lizard (*Lophurus Amboinensis*) allied to the frilled lizard (q.v.), sometimes a yard long, with a very compressed olive-green body and tail, the latter surmounted for half its length by a high, serrate crest, supported by spines from the vertebrae. It is found from Java to the Philippines, dwells in

THE SAIL-LIZARD.

the jungle near streams, eats almost everything, and when frightened rushes into the water and endeavors to conceal itself on the bottom, where it can readily be taken by a net. Its flesh is sought for food.

SAILOR'S CHOICE. A common and highly valued food-fish (*Orthopristis chrysopterus*) along the sandy southeastern coast of the United States, belonging to the family of grunters

SAILOR'S CHOICE (*Lagodon rhomboides*).

(Hamulidae), called 'pigfishes' in this genus. The form is ovate elliptical, and the length is 12 to 15 inches. The same name is given to several allied fishes, and especially to a small sparoid, or porgy (*Lagodon rhomboides*), also called 'pigfish,' a beautiful silvery-blue and gold fish of the Gulf Coast.

SAINFOIN (Fr. *sain-foin*, OF, also *saint foin*, *santfoin*, from *sain*, from Lat. *sanctus*, holy, less probably from Lat. *sanus*, sound - *foin*, from Lat. *foenum*, hay), or ESPARTELLI (*Onobrychis viciifolia*). A perennial pink flowered leguminous plant, native to the temperate parts of Europe and Western Asia, and widely cultivated in Europe for pasturage and hay, but little in the United States. The plant grows to from 1 to 2

feet high and has rather long pinnate leaves. The fruit consists of short single-seeded pods. It prefers a light, dry, calcareous soil, with a permeable, well-drained sub-soil. It is often grown on soils too dry or too barren for clover. The culture of sainfoin is similar to that of alfalfa. Usually, however, only one cutting is made a year. From 1½ to 2½ tons of hay per acre are obtained, and the yield of seed ranges from 10 to 25 bushels. It does not endure close pasturing.

SAINT (OF. *saint*, *scint*, *sainct*, Fr. *saint*, from Lat. *sanctus*, holy, from *sancire*, to hallow; connected with Skt. *sanj*, to adhere). A name applied in the New Testament to the members of the Christian community generally, but early restricted in ecclesiastical usage to men and women of special eminence for personal holiness. The earliest class of saints to receive distinct recognition was naturally that of the martyrs (q.v.). The name of confessors was originally applied to those who had exhibited signal courage and constancy in professing the faith, without the final crown of martyrdom, but later was used of male saints in general who were not martyrs. Women are honored either as virgins, matrons, or widows. For the methods by which the title of saint has been conferred in early and in modern times, see CANONIZATION.

In the history of religious controversy there has been much discussion as to the status of the departed saints and their relation to the Church on earth. That there is some practical relation is contended as a logical sequence from the article of the Apostles' Creed which declares belief in 'the communion of saints;' and in like manner it is not often disputed that the saints, or those who have passed from earth into the presence of God, may offer their prayers to Him for the necessities of the Church militant. But while the Council of Trent lays down that it is a good and useful thing to invoke the saints on account of the benefits to be obtained from God by their aid, Protestants generally contend that such invocation is not only useless, since there is no certainty that the departed can hear our prayers, but positively unlawful, as trenching on the worship due to God and derogating from the mediatorial office of Christ. The first objection is met by the theory that the saints are in the immediate presence of God, and, gazing upon the Beatific Vision, "behold with open face as in a glass" all that God wills them to know of what is happening on earth. It is further asserted that there is an infinite difference between the worship paid to God as the Supreme Lord of the Universe and the address to the saints, which is the same in kind as that made without objection to venerated friends on earth. The last objection is answered by emphasizing the belief that the prayers of the saints gain their efficacy only by virtue of their union with the all-prevailing mediation of Christ. For the veneration paid to images and relics of the saints, see IMAGE-WORSHIP; RELICS.

BIBLIOGRAPHY. The most extensive as well as most scholarly is the collection by the Bollandists (q.v.), *Acta Sanctorum* (q.v.). Familiar to all English students is Alban Butler, *Lives of the Fathers, Martyrs, and Other Saints* (original edition, London, 1756-59; n. e. ed., 1896); *Lives of Saints and Servants of God* (edited by F. W. Faber, ib., 1843-44); Jameson, *Sacred and*

Legendary Art (ib., 1848); id., *Legends of the Monastic Orders* (ib., 1850); Baring-Gould, *Lives of the Saints* (ib., 1872-92, new ed., ib., 1897-98); Gibson, *Short Lives of Saints for Every Day in the Year* (ib., 1896-97). For British and Irish saints particularly, consult: *Lives of the English Saints* (written by various hands, at the suggestion of John Henry Newman, ib., 1844-45; new ed., 1900 et seq.); Fleming, *A Complete Calendar of the English Saints and Martyrs for Every Day of the Year* (ib., 1902).

SAINT-ACHEUL, sãn'tã'shêl'. A celebrated archaeological site in the Somme Valley, Northern France. It gives name to the so-called Acheulean epoch in French archaeology, following the Chelléan, the oldest in their Paleolithic period. It was characterized by great cold and the fauna is a transition toward that of the more temperate climate that followed.

SAINT-AFFRIQUE, sãn'tãf'rêk'. A town of the Department of Aveyron, France, on the Dourdon River, 37 miles east of Albi (Map: France, J 8). It is situated in a beautiful valley, between two mountains, and is surrounded by meadows, orchards, and vineyards. The streets are broad, but the houses are mostly old and mean. The town has woolen and cotton factories and tanneries, and a lively trade in wool, and is celebrated for Roquefort cheese, made from ewe's milk, chiefly in the mountain pastures around the neighboring village of Roquefort. The town successfully resisted the Prince de Condé in 1628. Population, about 5000.

SAINT ALBANS. A municipal borough in Hertfordshire, England, situated on a picturesque hill, 21 miles northwest of London. It is close to the site of *Verulamium*, the most important town in the south of England during the Roman period. King Offa II. of Mercia, in 795, founded an abbey in memory of Saint Alban, a Roman soldier and the proto-martyr of England, who died at the end of the third or the beginning of the fourth century. The town grew up about the abbey, which became the most important in England. During the Wars of the Roses the place was the scene of two battles; the first was in 1455, when the Lancastrians were defeated and Henry VI. was made a captive; the second in 1461, when the Yorkists were defeated. (See ROSES, WARS OF THE.) In 1877 Saint Albans became a bishop's see. The abbey is built, in part, of Roman bricks from Verulamium. The abbey church is cruciform and one of the largest in England. Its length is 550 feet, its breadth 175 feet, and its Norman tower is 145 feet high. Its earliest portions date from about 1080. The church underwent, in 1875, an extensive restoration. The gate, which is now a school, is the only extant portion of the other monastic buildings. In Saint Michael's Church there is a monument to Lord Bacon, who was Baron Verulam and Viscount Saint Albans. The population, in 1891, was 12,895; in 1901, 16,000, many of whom were employed in straw-plaiting and the manufacture of silk goods. The various annals and chronicles of Saint Albans are published in the Rolls Series, in 21 volumes. See, especially, Matthew of Paris and Roger of Wendover.

SAINT ALBANS. A city and the county-seat of Franklin County, Vt., 45 miles northwest of Montpelier; on the Central Vermont Railroad

(Map: Vermont, B 2). It is attractively situated at an elevation of 400 feet, about two miles distant from Lake Champlain. Near by are the Aldis and Bellevue Hills, which afford extended views of the Green Mountains, Lake Champlain, and the Adirondacks. The city has a public library, the Warner Home for the Destitute, a hospital, and the Villa Barlow Convent. Saint Albans is noted as the centre of large dairying interests, and has a large creamery, several butter and cheese making establishments, and manufactories of iron and steel bridge work, iron roofing, and other iron products. Shops of the Central Vermont Railroad also are here. Population, in 1900, 6239.

Saint Albans was incorporated as a village in 1859, and was chartered as a city in 1897. It was a rendezvous of insurrectionist leaders during the Canadian troubles of 1837-38. On October 19, 1864, it was raided by Confederates from Canada, who seized more than \$200,000 deposited in the local banks. In 1866 a party of Fenians started from Saint Albans to attack Canada, and later a force of United States troops under General Meade was stationed here to prevent further acts of hostility against Great Britain. Consult *Vermont Historical Gazetteer* (Burlington, 1867-82).

SAINT ALEXANDER NEVSKI, nĕf'skô. A Russian military order founded by Peter the Great in 1722. It was first conferred by Catherine I. in 1725. Only those of the rank of major-general are eligible for the distinction. The decoration is an eight-pointed red cross with double eagles in the angles, and in the centre an image of the saint on horseback, armed.

SAINT-AMAND, sãn'tãmãn'. A town in the Department of Nord, France, 7 miles north by west of Valenciennes, at the confluence of the Elton and Scarpe rivers (Map: France, K 1). It is noted for its mineral springs and baths. The town hall is the most prominent structure and affords a magnificent view of the surrounding country. The town is important for its manufacture of iron and steel. Population, in 1901, 13,705.

SAINT-AMAND, IMBERT DE. See **IMBERT DE SAINT-AMAND**.

SAINT-AMAND-MONT-ROND, -môn-rôn. The capital of an arrondissement in the Department of Cher, France, 27 miles north by west of Montluçon, on the Cher River (Map: France, J 5). In the vicinity are interesting ruins of an old Roman city. The town is also noted as the birthplace of the great Condé. It played an important part in the Hundred Years' War. Population, in 1901, 8326.

SAINT-AMANT, sãn'tãmãn', ANTOINE GIRARD, Sieur de (1594-1661). A French poet, born probably near Rouen. Gautier calls him the creator, with Scarron and Théophile de Viau, of burlesque poetry in France. The most important of his poems are: *Moïse saurc des eaux*, which contains some beautiful descriptive writing; *Solitude*, which Boileau calls his best work; and *Albion*, a curious picture of English manners. He published his *Œuvres poétiques*, in 4 parts (1629, 1631, 1643, 1649), and a *Dernier recueil* in 1658. Consult Gautier, *Les grotesques* (Paris, 1844).

SAINT AN'DREWS. A royal burgh, seaport, and watering place in Fifeshire, Scotland, on Saint Andrews Bay, 15 miles southeast of Dundee (Map: Scotland, F 3). It has two small harbors, and is one of the most fashionable of Scotch summer resorts, and its fine golf links stretch along the shore to the north of the town for two miles. Saint Andrews has been noted as an educational centre since 1120. (See **SAINT ANDREWS, UNIVERSITY OF**.) The manufacture of golf clubs and balls is the chief industry, Saint Andrews being the headquarters of golfing in Scotland. Fishing gives considerable employment, and coal is mined in the neighborhood. There are ruins of the cathedral commenced in 1160 and destroyed in 1559, of the castle dating from 1200, and of a Dominican monastery founded in 1274. Population, in 1901, 7621. Consult the monographs by Lang (London, 1893) and Boyd (ib., 1892; another vol., 1896).

SAINT ANDREWS, UNIVERSITY OF. The oldest Scotch university. It was founded in 1411 by Bishop Henry Wardlaw and confirmed by a bull of Pope Benedict XIII. It was modeled in most respects after the University of Paris (q.v.), and from the very beginning received the encouragement of the Scottish kings. By the middle of the sixteenth century there existed already three colleges: Saint Salvator, Saint Leonards, and Saint Mary, established in 1450, 1512, and 1537, respectively. They were at first devoted mainly to theology and philosophy, and although originally intended to combat heresy, they became the strongholds of Protestantism, particularly Saint Leonards. In 1579 the colleges were reorganized, Saint Salvator and Saint Leonards assuming the instruction of philosophy, law, and medicine, while theology was taught at Saint Mary's. The secular colleges were united in 1747. University College, founded by Dr. John Baxter and Miss Baxter in 1880, at Dundee, became affiliated with Saint Andrews in 1890. The university library, founded in 1456, contains over 115,000 volumes and manuscripts. The university's attendance in 1902 was 261.

SAINT ANDREW'S CROSS. A cross with beams forming the letter X, so named because Saint Andrew is said to have suffered on such a cross. Since it forms the initial of the Greek word for Christ, it was held in great honor. It is also called Burgundian cross, because it appeared in the Burgundian arms.

SAINT ANN, ORDER OF. A Russian order founded in 1735 by Duke Charles Frederick of Holstein-Gottorp in memory of his wife, Anna Petrovna. In 1797 it was made a Russian order of merit, and its single class was divided into three, to which two classes, for military candidates, were subsequently added. The decoration is a red cross bearing the image of Saint Ann, and is worn by the first class in connection with an eight-pointed star with the Imperial crown and the device, "Amantibus Justitiam, Pietatem, Fidem." The first class confers hereditary nobility.

SAINT ANTHONY, FALLS DE. See **MINNEAPOLIS**.

SAINT ANTHONY'S FIRE. See **ERYSIPELAS**.

SAINT-ARNAUD, sãn'tãrnô', JACQUES LEROY de (1796-1854). A French marshal, born

in Paris. He helped suppress the abortive rising in the Vendée in 1832, and afterwards was sent to Africa. He defeated and captured the Algerian chief Bou Maza in 1847 and was rewarded with the rank of brigadier-general. Saint-Arnaud was in Paris at the Revolution of 1848 and fought against the rioters at the head of a brigade. In 1851, after a successful campaign against the Kabyles, he was made a general of division, recalled to France, and put in command of the Second Division of the Army of Paris. On October 26, 1851, he was appointed War Minister, and was one of the chief agents of Napoleon in the coup d'état of December 2, 1851. A year later he was made a marshal of France and grand equerry to the Emperor. On the outbreak of the war in the Crimea Saint-Arnaud was put in command of the French forces. Soon after Saint-Arnaud succumbed to the hardships of the campaign, dying on board a French war vessel. His *Lettres* (2 vols., Paris, 1855) are autobiographical in nature.

SAINT ASAPH, *sānt āz'af*. A city, standing on a small hill between the rivers Clwyd and Elwy, in the northwest of Flintshire, Wales (Map: Wales, C 3). Its trade is agricultural. The chief building is the cathedral, a cruciform structure, dating from 1284 on the site of a wooden structure founded before 596. Population, in 1901, 16,372. Consult Walcott, *Memoirs of Saint Asaph* (London, 1865).

SAINT AUGUSTINE, *s'gūs-tēn*. A city and the county-seat of Saint John County, Fla., 32 miles south by east of Jacksonville; on Matanzas Bay, and on the Florida East Coast Railroad (Map: Florida, G 2). The oldest city in the United States, Saint Augustine is especially attractive with its narrow streets, picturesque old houses, and interesting remains. The vicinity is one of remarkable beauty owing to its semi-tropical vegetation. In the northern part of the city are ruins of the old wall erected by the early settlers as a protection against Indian incursions. Here, too, is the ancient fort of San Marco (now Fort Marion), begun about 1656 and finished a century later. It covers four acres. From this point southward extends the sea wall, constructed by the Federal Government—a popular promenade. An old Spanish convent occupied the present site of Saint Francis barracks at the southern extremity of the wall, its ruins having been utilized in the building of the modern structure. Near the barracks is the Alicia Hospital. The old Governor's palace, on the Plaza de la Constitución, in the central part of the city, has been rebuilt and now serves as a United States custom house and post-office. The cathedral dates from 1793. Other features are the municipal buildings, the Public Library, State Institute for the Deaf and Dumb, the Museum of the Institute of Natural Science, and Saint Joseph's Academy. Saint Augustine is of some importance as the centre of large fruit-growing interests, but is best known as a winter and health resort, being noted for its mild uniform climate. The mean annual temperature is 70° and the winter average 53°. There are several large hotels, among which is the Ponce de Leon, erected at a cost of \$3,000,000. Across the bay from Saint Augustine is Anastasia Island, with a lighthouse and quarries of coquina, a shelly formation which has been used since the

Spanish régime for building and paving purposes throughout the city. The government is vested in a mayor, chosen biennially, and a council. The water-works are owned and operated by the municipality. Population, in 1890, 4742; in 1900, 4272.

In 1513 Ponce de Leon, in search of the 'Fountain of Youth,' seems to have visited the site of Saint Augustine. Half a century later, in 1564, a company of French Huguenots passed here and settled a few miles to the north, on the Saint John's River. Don Pedro Menendez de Aviles, sent by Philip II, of Spain to expel the intruders, stopped here, August 28, 1565, Saint Augustine's Day, and erected a fort. After butchering the French (September 20th) at the Saint Johns he returned and established a settlement, the earliest within the present limits of the United States. Saint Augustine was burned by Sir Francis Drake in 1586 and sacked by the piratical Captain Davis in 1665. Throughout its early history ill feeling between the Spaniards and the English colonists to the north was chronic. In 1681 a force from Saint Augustine attacked the English settlements at Port Royal. Governor Moore of South Carolina made unsuccessful attacks on Saint Augustine in 1702 and 1704, burning the greater part of the town on the former occasion; and in 1743 General Oglethorpe, having been ordered away from Georgia by the Spanish, marched to Saint Augustine and besieged it unsuccessfully for thirty-eight days. In 1763 it passed with the rest of Florida into English hands and was used as a military station during the Revolution; but it became Spanish again in 1783. In 1821 it was transferred to the United States, in pursuance of the treaty of 1819. During the Civil War it was twice captured by Union armies. Consult: Fairbanks, *The History and Antiquities of Saint Augustine* (New York, 1858); id., *The Spaniards in Florida* (Jacksonville, 1868); Reynolds, *Old Saint Augustine* (Saint Augustine, 1885); and a sketch in Powell, *Historic Towns of the Southern States* (New York, 1900).

SAINT BARTHOLOMEW. A small island of the Lesser Antilles belonging to the French colony of Guadeloupe, and situated near the northern end of the Leeward group 130 miles northwest of Guadeloupe (Map: West Indies, Q 6). Area, 8 square miles. It is about 1000 feet high, arid and devoid of forest, but produces some sugar, cotton, and cacao. Population, about 3000. The island was colonized by the French in 1648, bought by Sweden in 1785, and bought back by France in 1877.

SAINT BARTHOLOMEW, MASSACRE OF. See BARTHOLOMEW'S, MASSACRE OF SAINT.

SAINT BERNARD, *Fr. pron. sän bër'när'*, GREAT. A mountain pass in the Alps (q.v.) east of Mont Blanc, 8110 feet above the sea, with a carriage road connecting the valleys of the Dora Baltea and the Rhone (Map: Italy, B 2). The famous hospice or monastery of Saint Bernard, 17 miles from Aosta, in Italy, and 30 miles from Martigny, Switzerland, is almost at the summit of the pass beside a little lake which even in summer often freezes over. The hospice entertains yearly from 20,000 to 25,000 guests, who contribute only a small part of the \$6000 to \$8000 required to maintain the establishment.

This monastery was founded in 962 by Saint Bernard de Menthon. It is now occupied by twenty Augustine monks with seven assistants. It is their special mission with the aid of their famous Saint Bernard dogs to rescue travelers who may be lost in the snow. In the hospice are engravings and pictures given by grateful travelers, a collection of coins, and numerous antiquities found in the vicinity—among them fragments of brass tablets offered to Jupiter Peninus by pious Romans after escape from danger. From Jupiter Peninus, who had here at one time a temple dedicated to him, the range of mountains is called the Pennine Alps, the mountain itself by the Italians, Monte Giove, and, locally, Mont Joux. This pass was much used by the Romans, particularly after the foundation of Aosta (q.v.), was improved by Constantine, traversed by the Lombards, by Charlemagne's uncle, Bernard, by Frederick Barbarossa, and by large bodies of French and Austrian soldiers during the campaigns of 1798, 1799, and 1800.

LITTLE SAINT BERNARD is a pass 7170 feet above the sea southwest of Mont Blanc, connecting the valleys of the Dora Baltea and the Isère.

SAINT BERNARD DOG. The largest of domestic dogs, often nearly three feet high at the shoulder and 150 pounds in weight. The race was developed from an unknown origin, at the Hospice of Saint Bernard, in the Alpine pass of that name, whose monks have maintained the breed through centuries for the purpose of giving aid to belated travelers, or rescuing those lost in snow-storms. They are also used to test the practicability of a snow-covered track, or the safety of an ice-bridge. Their capacity for tracking and their keenness of nose equal that of the best bloodhound. They are very hardy dogs, yet in the middle period of the nineteenth century they were nearly exterminated, once by a pest that left but one, and once by an avalanche, which carried away all but three of the monks' dogs. Excellent dogs for similar use have been bred and trained on the Saint Gothard, Simplon, Grimsel, and Furka passes, and in other Alpine hospices. Two varieties of Saint Bernards are recognized—the smooth-coated and the rough-coated. The shorter-haired dog shows better its true power and shape. The standard of the breed calls for a tall, erect figure, strong, muscular, and bony in every part; a powerful and imposing head, with a wide massive skull, and an intelligent expression. The supraorbital ridges are strongly developed, and form nearly a right angle with the horizontal axis of the head. A furrow runs up the centre of the forehead, between the supraorbital arches. The skin on the forehead is wrinkled, but not deeply. The chops of the upper jaw are strongly developed, like those of the bloodhound, but turn with a graceful curve into those of the lower edge, and are slightly overhanging. The nostrils are dilated and black; the ears lightly set on, and close at the base, and the back edge standing away when the dog is listening; the eyes set more to the side than to the front, the lids showing a slight haw. The feet are broad, and the toes strong, with a single or double dew-claw, giving an extended surface to the foot when on the snow. The coat is very dense, lying smooth, but in the rough-haired is considerably long, and flat to slightly wavy, and

the tail is bushier than in the smooth-coated variety. The color may be black, red, or white in well-defined patches. Consult works cited under Dog; and see PLATE OF DOGS.

SAINT-BRIEUC, sãx bré'vœ'. The capital of the Department of Côtes-du-Nord, France, 63 miles northwest of Rennes, at the mouth of the Gouet River (Map: France, D 3). Its port, Le Légué, is one mile distant to the north on the English Channel. The town has an attractive situation, and is of considerable interest by reason of its antiquity. It has a cathedral dating from the thirteenth century, and recently restored, the Church of Notre Dame d'Espérance, also a thirteenth-century structure, and the Church of Saint Michel, a modern edifice. The town carries on a large coastwise trade in farm and garden produce and fish, and is largely interested in iron and steel manufactures. A monastery was established here in the latter part of the fifth century by Saint Brieuc, a Welsh missionary. Saint Brieuc was the scene of much fighting during the Reign of Terror. Population, in 1901, 22,198.

SAINT CATH'ARINE, Order of. A Russian order instituted in 1714 by Peter the Great, and originally intended as a special distinction for his consort Catharine, in recognition of her services in the Turkish campaign of 1711. The membership was subsequently extended to include all the princesses of the Imperial house and women of the nobility. The decoration, a diamond cross, has an oval medallion with an image of Saint Catharine holding a cross, on which are the letters D. S. E. R. (*Domine, Saluum Fac Regem*).

SAINT CATHARINES. The capital of Lincoln County, Ontario, Canada; situated on the Welland Canal and the Grand Trunk, the Welland, and the Niagara Central railroads; 12 miles northwest of Niagara Falls (Map: Ontario, D 4). The city has manufactures of machinery and agricultural implements. The surrounding country is picturesque and productive. The well-known mineral well of Saint Catharines supplies on an average 130,000 gallons a day. Saint Catharines has been called the Saratoga of British America. There are gas and electric lights, gravity system of water-works, good sewerage system, and superior educational institutions, including the Bishop Ridley College, an Anglican establishment. Population, in 1891, 9170; in 1901, 9946.

SAINT CATHARINE'S COLLEGE. A college founded at Cambridge, England, by Robert Wodeharke, or Woodlark, Provost of King's College and chancellor of the university, in 1473 (charter in 1475), for a master and three fellows. It is, and, save in the seventeenth century, has always been, one of the smaller Cambridge colleges. There were, in 1902, a master, 6 fellows, and 26 scholars, besides sizars. Among the more distinguished members of the college may be mentioned Archbishop Sandys, Dr. Addenbrooke, founder of the hospital in Cambridge, and the naturalist John Ray.

SAINT-CHAMOND, sãx'chã'mõn'. A town in the Department of Loire, France, situated at the confluence of the Gier and the Ban, 8 miles by rail northeast of Saint Etienne (Map: France, I. 6). It is a flourishing, well built town, and is the centre of a district extensively engaged in the

manufacture of laces and ribbons. There are also dye works, naval and railway workshops. There are coal mines in the vicinity. Population, in 1901, 15,469.

SAINT CHARLES. A city and the county-seat of Saint Charles County, Mo., 20 miles northwest of Saint Louis; on the Missouri River, and on the Wabash and the Missouri, Kansas and Texas railroads (Map: Missouri, F 3). It is the seat of the Lindenwood Female College (Presbyterian), opened in 1830, Saint Charles Military College (Methodist Episcopal), founded in 1834, and the Sacred Heart Academy. The court house here is a fine structure, having cost \$100,000. The centre of a rich agricultural section, Saint Charles has also important industrial interests. The car factory is one of the most extensive of its kind in the United States and there are also manufactories of cob pipes, flour, brick and tile, furniture, and beer. The leading articles of commerce include the manufactured products, tobacco, limestone, corn, and farm produce. The government, under the revised charter of 1899, is vested in a mayor, elected biennially, and a unicameral council. The city owns and operates the water works and electric light plant. Settled in 1769, Saint Charles was incorporated in 1849. Population, in 1890, 6161; in 1900, 7982.

SAINT CHARLES, ORDER OF. An order of merit founded in 1858 by Charles III. of Monaco, on the model of the Legion of Honor. The decoration is a white enameled cross with a red border, surmounted by a crown and interwoven with a wreath of laurel and olive. The central red medallion bears two C's with the legend *Princeps et Patria*.

SAINT CHRISTOPHER, or **SAINT KITTS.** One of the Leeward Islands, British West Indies, situated in 17° 18' N. latitude and 62° 48' W. longitude, and covering an area of 65 square miles (Map: West Indies, Q 6). It is traversed in the centre by a mountain range, of which the highest peak, the extinct volcano Mount Misery, is more than 4000 feet high. The climate is healthful; the chief products are sugar and rum. Coffee and cotton are also cultivated to some extent. Together with Nevis (q.v.) and the dependency of Anguila, Saint Christopher forms a division of the Leeward group. Population, in 1891, 30,876; in 1901, 29,782. Capital, Basse Terre. The island was discovered by Columbus in 1493 and settled by the English and French about 1623-25. It was ceded to Great Britain by the Treaty of Utrecht in 1713.

SAINT CLAIR. A borough in Schuylkill County, Pa., 3 miles north of Pottsville; on Mill Creek, and on the Pennsylvania and other railroads (Map: Pennsylvania, E 3). It is situated in a hilly region, containing extensive deposits of anthracite, the mining of which constitutes the leading industry. Miners' squibs and fuses and miners' caps are the principal manufactures. Population, in 1890, 3680; in 1900, 4638.

SAINT CLAIR, LAKE. A lake belonging to the Great Lakes system, and situated between Lake Huron and Lake Erie, and between the State of Michigan and the Province of Ontario (Map: Michigan, L 6). It is 27 miles long and 25 miles wide, and has an area of 396 square miles. It receives the waters of Lake Huron through the Saint Clair River, and discharges into Lake Erie

through the Detroit River. Its elevation above sea-level is 576 feet, being 6 feet lower than Lake Huron, and 3 feet higher than Lake Erie. Its greatest depth is 21 feet, and in the north, where it borders on the mud-flats of the Saint Clair delta, it is very shallow. Steamers drawing 20 feet, however, can pass between the two rivers.

SAINT CLAIR, ARTHUR (1734-1818). A Scotch-American soldier. He was born at Thurso, Caithness-shire, Scotland; was educated at the university of Edinburgh, joined the British army as an ensign, and in 1758 came to America with Admiral Boscawen. He served with distinction under Amherst at Louisburg, and under Wolfe at Quebec; resigned his commission in 1762, and in 1764 settled in Pennsylvania. He held various civil offices until the breaking out of the Revolution, when he joined the colonial army with the rank of colonel. For his gallant services at the battles of Three Rivers, Trenton, and Princeton, he was raised to the rank of major-general in 1777 and placed in command at Tienderoga. He was forced to abandon that place to Burgoyne, and, although acquitted of blame by court-martial, lost his command. Remaining in the army as a volunteer, he again rose to important positions, distinguishing himself in the operations which ended with the surrender of Cornwallis. He was a member of the Continental Congress 1785-87, becoming its president in the latter year, and from 1783 to 1789 was president of the Pennsylvania State Society of the Cincinnati, giving its name to that city in 1790. In 1789 he was made the first Governor of the Northwest Territory, and in 1791, as commander-in-chief of the United States army, was sent on an expedition against the Miami Indians, which ended in the disastrous rout of his forces. A committee of investigation appointed by Congress exonerated him, but he resigned his command in May, 1792, and in 1802 Jefferson removed him from his Governorship. His last years were spent in poverty and obscurity. Consult: *A Narrative of the Manner in which the Campaign against the Indians in the year 1791 was conducted under the command of Major-General Saint Clair* (Philadelphia, 1812); Smith, *The Life and Public Services of Arthur Saint Clair* (Cincinnati, 1882).

SAINT CLAIR RIVER. The outlet of Lake Huron. It is 41 miles long, and flows south on the boundary between Michigan and Ontario, emptying into Lake Saint Clair (q.v.) through a fan-shaped delta of seven channels (Map: Michigan, L 6). The river itself is navigable, and one of the delta channels has been improved by canalizing a part of it and guarding it by embankments. It is being made available for vessels drawing 20 feet. In 1891 a tunnel was built under the river between Port Huron and Sarnia, measuring with its approaches 3851 yards, and connecting the Canadian Grand Trunk and the Chicago and Grand Trunk railways.

SAINT-CLAUDE, sã'n'klôd'. The capital of an arrondissement in the Department of Jura, France, at the confluence of the Bienne and Tacon, 19 miles northwest of Geneva (Map: France, M 5). It is an episcopal see, with a fourteenth-century cathedral, the former church of an important abbey, which was suppressed at the Revolution. The town has manufactures of toys,

pipes, and snuff boxes, and is noted for its lapidary establishments. Population, in 1901, 10,499.

SAINT-CLOUD, klōō. A town of France, in the Department of Seine-et-Oise, situated on the declivity of a hill near the Seine, 5 miles west of Paris (Map: Paris and vicinity). Population, in 1901, 6205. Its famous and beautiful park contains about 1000 acres, is embellished by spacious allées and a large cascade and fountain, and commands a fine view over Paris. The town figures often in the wars of the Middle Ages, Henry II. was assassinated here in 1589, by the fanatical monk Jacques Clément. Saint-Cloud was long famous on account of its magnificent château, built by Mazarin, and embellished by successive dukes of Orleans, who possessed it till 1782, when it passed into the hands of Marie Antoinette. Here Bonaparte, in 1799, was named First Consul; and in this place Charles X. signed the ordinances which produced the Revolution of 1830. But during the siege of Paris, the château was set on fire and destroyed by the artillery.

SAINT CLOUD. A city and the county-seat of Stearns County, Minn., 65 miles northwest of Minneapolis; on the Mississippi River, and on the Northern Pacific and the Great Northern railroads (Map: Minnesota, D 5). It is the seat of a State Normal School and of the Minnesota State Reformatory. Saint Raphael's Hospital, the Catholic cathedral, the Public Library, and the Home for the Aged are other noteworthy features. Saint Cloud is the centre of a grain-growing and stock-raising region, but is best known for its large granite interests. Manufacturing is extensively carried on, excellent water power being derived from rapids of the Mississippi. There is considerable trade in iron and lumber products, brick, flour, and beer, which constitute the principal manufactures. The government is vested in a mayor, chosen annually, and a unicameral council. Settled in 1854, Saint Cloud was incorporated in 1868, and was chartered as a city in 1889. Population, in 1890, 7686; in 1900, 8663.

SAINT CROIX, kroī, or Schoodic. A river forming part of the boundary between Maine and New Brunswick (Map: Maine, J 5). It flows from the Schoodic or Grand Lakes in Maine 75 miles southeast into Passamaquoddy Bay. It is navigable to Calais, about 10 miles.

SAINT CROIX RIVER. A river forming part of the boundary between Minnesota and Wisconsin (Map: Wisconsin, A 3). It rises in the northwestern corner of the latter State and flows southwest for 200 miles, entering the Mississippi through a lake-like expansion, 20 miles below Saint Paul. It is navigable 54 miles to Saint Croix Falls, above which there are several picturesque falls.

SAINT-CYR, sän'sär', LAURENT GOUVION, Marquis de (1764-1830). A marshal of France, born at Tonl. In 1792 he volunteered in the Army of the Republic. He served under Custine, and having been promoted to the grade of general of division in 1793, took part in the campaigns on the Rhine and in Holland, whence in 1798 he was sent to Italy to succeed Masséna. There he quickly restored military discipline, and in 1800, after a brilliant campaign in Italy, he returned to Germany, became Moreau's lieutenant,

and defeated Kray at Biberach. Napoleon sent him to Spain as Ambassador in 1801, and in 1803 made him commander of the army of occupation in Naples. In 1809 he lost the favor of Napoleon and resigned, but in 1812 he was given command of a corps in the army which invaded Russia, and, after his great victory at Polotzk, he was made marshal. He was captured at Dresden in 1813. During the Second Restoration, in 1815, he became Minister of War, and again in 1817, serving till 1819. His *Mémoires* were published at Paris (1821-31). Consult De Vernon, *Vie du maréchal Gouvion Saint-Cyr* (Paris, 1857).

SAINT-CYR, MAISON DE. A once famous school for girls, founded by Madame de Maintenon (q.v.) in 1686, for the education of the daughters of the poor nobility and the children of dead or disabled officers. In 1692 the school was converted into a convent. Fénelon's *De l'éducation des filles*, published in 1687, influenced considerably the educational ideas at Saint-Cyr. The establishment of this institution marks the beginning of the emancipation of women's education. Madame de Maintenon personally supervised the institution from 1686 to 1717, and sometimes even taught there. The notoriety the school attained on account of the successful performances of a number of plays under the direction of Racine and Boileau had a demoralizing effect on the discipline of the school and undoubtedly influenced the founder in changing her liberal policy. It ceased to exist in 1793, when it was converted into a military hospital.

SAINT-CYR-L'ÉCOLE, lä'köl'. A village in the Department of Seine-et-Oise, France, 4 miles by rail west of Versailles. It derives its celebrity from the Ecole Spéciale Militaire de Saint-Cyr, which was transferred here in 1806 from Fontainebleau by Napoleon, and is the leading military training establishment in France, attended by from 700 to 800 pupils, and furnishing the army with 400 officers annually. Population, in 1901, 4253.

SAINT DAVID'S. A city in Pembrokeshire, Wales, on the Allan, a mile from its mouth, on the northern side of Saint Bride's Bay (Map: Wales, A 5). It is noted for Saint Mary's College (founded by John of Gaunt), within a high embattled wall nearly a mile in circuit. The cathedral, founded in 1180, on the site of the Monastery of Saint David, and restored since 1846, contains a curious movable pulpit. The town has been the seat of a bishopric since 519. It was several times pillaged and burned by the Danes and others during the ninth and two following centuries; in the Middle Ages it was a large city—the great resort of pilgrims to Saint David's shrine. Population, in 1901, 5400.

SAINT-DENIS, sän'de-né'. The capital of an arrondissement and a northern suburb of Paris, in the Metropolitan Department of Seine, France, 2 miles from the city walls (Map: Paris and vicinity). It is defended by a fort on the east and by ramparts on the north. The town is traversed by the Croud and Rouillon, and is well built, with clean, spacious streets. Its history centres around the Basilica of Saint-Denis, built in the seventh century as the church of an abbey by Dagobert I., on the site of the chapel raised above the grave of Saint-Denis, the

first Bishop of Paris, about A.D. 275. Dagobert was buried in the church, which became the mausoleum of the kings of France. The edifice was rebuilt in the twelfth century. By decree of the National Convention of 1793, the abbey was ordered to be destroyed, the royal tombs were demolished, and the bodies removed. The building was much damaged, stripped of its roof, and for some time was used as a cattle market. Restored under Napoleon I., and succeeding governments, it regained and even surpassed its former splendor under the complete restoration effected by Viollet-le-Duc during the Third Empire, and is now considered one of the finest of Gothic monuments. The restored royal monuments, the high and other altars, the lofty nave lighted by thirty-seven handsomely blazoned windows, the elegant triforium, and the radiating choir chapel are among its chief features. Adjoining the church is the extensive national Maison d'Éducation de la Légion d'Honneur, founded by Napoleon I., for the free education of the daughters and other female relatives of officers of the Legion of Honor. There are cotton mills, dye works, bleacheries, chemical works, and flour mills. The yearly market, at which there is an annual sale of about 180,000 sheep, is one of the oldest in France, and lasts for a fortnight. Population, in 1901, 60,808.

SAINT-DENIS. The capital of the French island of Réunion (q.v.), situated on the north-western coast (Map: Africa, K 7). It has an exposed roadstead and contains a museum, a theatre, and barracks. Population, in 1899, 32,850, chiefly French creoles.

SAINT-DIÉ, dyá. An episcopal city and the capital of an arrondissement in the Department of Vosges, France, 31 miles southeast of Lunéville, on the Meurthe River (Map: France, N 3). It is attractively situated in the midst of picturesque mountain scenery, and, with the exception of the eastern portion, is regularly laid out. The cathedral, dating from the eleventh century, is a composite of Gothic and Romanesque. Other features of the city include an eighth-century Romanesque church, the Canons' House, dating from 1557, the seventeenth-century episcopal palace, the museum, public library, the monument to Jules Ferry, born at Saint-Dié, and the park, extending along the bank of the river. Saint-Dié has important lumber interests and is also engaged in weaving and the manufacture of hosiery, filing, etc. A monastery was established here in the sixth century by Saint Deodat, from whom the city derives its name. Population, in 1901, 21,481.

SAINT-DIZIER, dé'zyá'. A town in the Department of Haute-Marne, 58 miles northeast of Troyes, on the Marne River, and on the Marne-et-Saône Canal (Map: France, L 3). It has a college, a museum, and a public library. Industrially the town ranks very high. It is especially noted for its extensive iron and steel manufactures, and large lumber interests. Shipbuilding is also a prominent industry. Population, in 1901, 14,601.

SAINTE-ALDEGONDE, sânt'al'de-gônd', PHILIP VON MARNIX, Baron. A Flemish statesman. See MARNIX.

SAINTE ANNE DE BEAUPRÉ, Fr. pron. sânt ân de bú'prá'. A celebrated pilgrim resort

of Montmorency County, Quebec, Canada, at the confluence of the Sainte Anne River with the Saint Lawrence River, on the north bank (Map: Quebec, F 3). It is connected with Quebec, 21 miles to the southwest, by the Quebec, Montmorency and Charlevoix Railway. The Church of Sainte Anne is a fine building; it dates from 1876 and was created a basilica by Papal decree in 1887. It contains relics of Sainte Anne, which have reputed miraculous powers. The shrine is visited by thousands of pilgrims annually, the number on the saint's feast day, July 26, in 1898, amounting to 125,000. Sainte Anne was founded about 1620 by Breton mariners; the ancient church dating from 1658, rebuilt and restored in 1878, is an interesting edifice near the modern basilica. The picturesque Falls of Sainte Anne (130 feet high), the Falls of Saint Féréol, and the Sainte Anne Mountains (2685 feet high) are prominent features in the neighborhood. Population (estimated), 1000.

SAINTE-BEUVE, sânt'bœv', CHARLES AUGUSTIN (1804-69). A French critic and essayist. He was born at Boulogne-sur-Mer, December 23, 1804. He was educated at Boulogne and at the Collège Charlemagne in Paris, studied medicine (1824-27), and served in the Saint Louis Hospital (1828). Beginning in 1824, he contributed literary articles, the *Premiers lundis* of his collected *Works*, to the *Globe* newspaper, and in 1827 he came, through a review of Hugo's *Odes et ballades*, into close relations with that poet and the Cénacle (q.v.). As a justification of the Romantic movement he published in 1828 a *Tableau de la poésie française au XVIIIème siècle*, and in 1829 and 1830 two volumes of subtle and ingenious though rather morbid poetry, the *Vie et poésies de Joseph Delorme* and the *Consolations*. He contributed also, in 1830, to the *Revue de Paris*, the first of his famous literary *Causeries*. The Revolution of 1830 brought him under new influences. Religious questionings were fostered by intimacy with Lamennais and his unrest is witnessed by his solitary novel, *Volupté* (1834), and by his lectures on *Port-Royal*, delivered at Lausanne (1837) and expanded during the next twenty years into five volumes (1840-60), of which the first and second show sympathy with Jansenism and the latter three the objectivity of an unbiased critic. At Lausanne, under the cherished influence of Vinet, Sainte-Beuve wrote his last volume of verse, the *Pensées d'août*. Then a visit to Italy clarified his mind, and from 1840 he appears wholly master of himself, as a 'naturalist of minds.' An appointment as Keeper of the Mazarin Library (1840) secured him scholarly leisure, and for 8 years he contributed regularly literary studies to the *Revue des Deux Mondes*. In 1845 he was elected to the French Academy, and during the turmoil of 1848 he lectured at Liège on *Chateaubriand et son groupe littéraire* (1860). In 1849 he returned to Paris and began his series of Monday chats (*Causeries du lundi*) in the *Constitutionnel*. These are collected in 28 volumes, 15 of *Causeries du lundi* and 13 of *Nouveaux lundis*. Longer studies in the reviews are gathered under the titles *Critiques et portraits, Portraits contemporains, et Portraits de femmes*. When Napoleon became Emperor he made Sainte-Beuve professor of Latin poetry at the Collège de France, but the anti-Imperialist students

hissed him, and he resigned. He was made Senator in 1865, and, although a partisan of Napoleon III., distinguished himself by his pleas for freedom of speech and of the press. He was in his last years an acute sufferer and lived much in retirement. Sainte-Beuve had vast knowledge, wonderful fact, and acute perception of what was vital and significant in his subjects. The mere bulk of his work (53 vols.) is imposing, and when we consider its precision, subtlety, and delicacy, the whole stands alone in the literature of criticism. A selection of the *Causeries* in English appeared as *English Portraits* (New York, 1875), and another as *Essays on Men and Women* (London, 1890). Consult: Sainte-Beuve, "Ma Biographie," in *Nouveaux lundis*, vol. xiii. (Paris, 1863-72); Hamsonville, *Sainte-Beuve, sa vie, ses œuvres* (ib., 1875); Vattier, *Sainte-Beuve* (ib., 1892); Levallois, *Sainte-Beuve* (ib., 1872); Brunetière, *Evolution des genres*, vol. i. (Paris, 1889); id., *Manual of French Literature* (Eng. trans. London, 1898); Pons, *Sainte-Beuve et ses Inconnus* (Paris, 1879); Troubat, *Souvenirs du dernier secrétaire de Sainte-Beuve* (ib., 1890).

SAINTE CHAPELLE, sânt shá'pél'. A chapel or oratory built to receive relics of peculiar sanctity. The name is, however, commonly used to designate in particular the 'Sainte Chapelle du palais' at Paris, erected 1242-47 within the precincts of the royal palace, to serve at once as the chapel royal and as a depository for the crown of thorns and fragments of the true cross, brought from Jerusalem by Louis IX., at whose expense it was built. The architect was the celebrated Pierre de Montreuil (see MONTREUIL) or de Montereau; and this, his master work, is justly regarded as one of the most consummate products of mediæval architecture. The extraordinary rapidity of its construction resulted in a remarkable unity of style not found in Gothic buildings whose erection extended over considerable periods of time. Its execution is marvelously refined and perfect. It consists of a lower or basement chapel, 24 feet high, and the main or upper chapel, preceded by a superb open porch, vaulted likewise in two stories. The upper or main floor was on the level of the main floor of the palace, with which the porch communicated. The length over all is 135 feet, with a height of 128 feet to the ridge of the roof, above which rises a slender (modern) spire. The upper chapel is internally 105 feet long, 33 feet wide, and 64 feet high to the ridge of the vault; it is without columns, and terminates in a polygonal apse, in which once stood the shrine of the relics. The superb vault is carried and abutted by a construction of buttresses, the space between which are wholly occupied by magnificent traceried windows 50 feet high, filled with the most gorgeous stained glass; the effect is extraordinary in its sumptuousness of color and boldness of design. The exterior is no less remarkable in exemplifying the perfection of French Gothic construction and carving in the middle of the thirteenth century. The rose window is of a later date. Other saintes chapelles were at Saint-Germain, Vincennes, and the Abbey of Saint-Germain-des-Prés. Consult: DeCloux and Doury, *La Sainte Chapelle* (Paris, 1865); Viollet-le-Duc, *Dictionnaire raisonné de l'architecture*, s. v. "Chapelle," "Chapelles, Saintes" (ib., 1853-68).

SAINTE-CLAIRE DEVILLE, sânt'klár'dé-vél', HENRI ETIENNE (1818-81). A French chemist, born at Saint Thomas, West Indies. He received his education in France. For several years he was instructor at Besançon; in 1851 he was appointed professor of chemistry at the Ecole Normale and subsequently also at the Sorbonne, in Paris. His chief work in theoretical chemistry consisted in a series of researches on the phenomena of what he termed *dissociation*, a peculiar and important class of physico-chemical reactions, the study of which has contributed greatly to our knowledge of the mechanism of reactions in general. By the use of a simple apparatus of his own invention, he demonstrated and succeeded in measuring the dissociation of carbonic acid gas, sulphur dioxide, and hydrochloric acid gas. See DISSOCIATION.

Deville founded two important industries, viz. the aluminum and the magnesium industries. In 1854 he rediscovered independently and showed how to apply on a large scale Wöhler's method by which metallic aluminum is isolated by decomposing its chloride with metallic potassium; instead of potassium Deville employed the cheaper metal sodium, in the industrial production of which he introduced highly valuable improvements. Ingots of aluminum were exhibited by him, for the first time, at the Paris Exposition of 1855. By applying Wöhler's principle to magnesium, he succeeded, jointly with Caron, in producing this metal, likewise, on a large industrial scale. His researches on the metallurgy of platinum, carried out in conjunction with Debray, have also proved of the highest importance. Deville wrote *De l'aluminium, ses propriétés, etc.* (1859); *Métallurgie du platine* (jointly with Debray; 2 vols., 1863), etc. Consult Gay, *Henri Sainte-Claire Deville, sa vie et ses travaux* (1889).

SAINTE CROIX, krwä. The largest of the Danish West India Islands. See SANTA CRUZ.

SAINTE CUNÉGONDE, Fr. pron. ky'ná-gón'd'. A northwestern suburb of Montreal, Canada, constituting a city of Hochelaga County, Quebec. It is noted for its educational institutions and has some manufactures. Population, in 1891, 9291; in 1901, 10,912.

SAINT EDMUND HALL. The only remaining hall or hotel of Oxford University. It is said to have derived its name from Saint Edmund, Archbishop of Canterbury in the reign of Henry III., and to have been founded in 1226. At the dissolution of the monasteries, it came into the possession of Queen's College (1557), and since 1559 the perpetual right of nominating its principal has been vested in that society by an act of congregation. The foundation consists of a principal and a vice-principal. There are ten exhibitions attached to the hall for students designed for holy orders. The buildings, dating from the seventeenth century, adjoin those of Queen's College, and the undergraduates of Saint Edmund are admitted to lectures in Queen's.

SAINTE GENEVIEVE. A city and the county-seat of Sainte Genevieve County, Mo., 60 miles by water south-southeast of Saint Louis; on the Mississippi River (Map: Missouri, F 4). It is the shipping centre for a farming and stock-raising section, which also has deposits of building stone and copper. Flour and beer are the

principal manufactures. Sainte Genevieve is one of the oldest towns in the Mississippi Valley, having been settled about 1735. Population, in 1890, 1586; in 1900, 1797.

SAINT ELIAS, MOUNT. One of the highest peaks of North America, being exceeded only by Mount McKinley, the neighboring Mount Logan, and by Mount Orizaba in Mexico. It is situated on the narrowest portion of Alaska Territory, between the Canadian boundary and the Pacific Ocean, in latitude 60° 17' N. and longitude 140° 55' W. (Map: Alaska, G 3). Its height is over 18,000 feet. The southern slope is covered with glaciers extending to the seashore, and is exceedingly steep, almost precipitous. The northern or landward slope is more accessible. In 1897 Prince Luigi of Savoy successfully made the ascent to the summit. The foothills are covered with forests to a height of 2000 feet, but the mountain itself is almost destitute of vegetation, and covered with ice and snow. It is not of volcanic origin, as has been supposed, but is formed by the faulting of a portion of the earth's crust.

SAINT ELIZABETH, ORDER OF. A Bavarian order of benevolence for women, founded in 1766 for noble Catholics. The membership is unrestricted, but candidates must show noble descent for four generations.

SAINTE-MARGUERITE, mâr'ge-rêt'. An island of the Mediterranean. See LÉRINS, ISLES DE.

SAINTE-MARIE-AUX-MINES, má'rê'ô'mên'. The French name of Markirch (q.v.).

SAINTEs, sânt. The capital of an arrondissement in the Department of Charente-inférieure, France, 27 miles southeast of Rochefort, on the Charente River (Map: France, F 6). It is noted for its many interesting remains of the period of Roman occupation. Among these the Amphitheatre and the Arch of Germanicus are the most prominent. The Church of Saint Eutropius, originally dating from the sixth century, was remodeled in the sixteenth. It has a large, handsomely embellished crypt. Other important features of the town are the Church of Notre Dame, dating from the eleventh century; the court house; the town hall, with its library; and the hospital. Iron and copper working and the manufacture of farm implements are the leading industries. Population, in 1901, 18,219.

Saintes, the ancient *Mediolanum*, was the chief city of the Santones before it passed into the hands of the Romans. The town was the capital of the old Province of Saintonge.

SAINT-ETIENNE, â'té'en'. The capital of the Department of Loire, France, and one of the most important industrial centres of Southern France. It is situated on the Furens, a tributary of the Loire, 36 miles southwest of Lyons by rail (Map: France, L 6). It is essentially a manufacturing city and, with the exception of the Church of Sainte Marie, the palace of justice, and the town hall, contains no buildings of architectural merit. Owing to its situation in one of the richest coal regions of Southern France and the abundance of water power furnished by the Furens, Saint-Etienne has developed very rapidly and its industrial importance is constantly increasing. The chief manufactures are firearms, and the national factory alone em-

plays in the neighborhood of 10,000 persons. Outside of firearms, small iron and steel products, and agricultural implements, Saint-Etienne is famous for its extensive ribbon factories, the product of which is exported all over the world and is regarded as the best of its kind. The coal mines in the vicinity of the city have an annual output of over 4,000,000 tons. Of educational establishments, Saint-Etienne has a fine school of mining, a lycée, a college, and a Palais des Arts containing a number of museums, among which the industrial museum, with its numerous samples of local manufactures, is the most interesting. The population of Saint-Etienne has kept pace with its industrial growth, and increased from 33,000 in 1830 to 92,250 in 1861, and to 139,350 in 1901.

SAINT EUSTACHE ISLAND. An island of the West Indies. See EUSTATIUS ISLAND.

SAINT-ÉVREMOND, sän'tä've-môn'. CHARLES DE MARGUETEL DE SAINT-DENIS, Seigneur de (1613-1703). A French critic and philosophical writer. He was born at Saint-Denis-le-Guast, was trained by the Jesuits, entered the army and served in Italy (1629) and Germany for the greater part of the Thirty Years' War. He was a friend of Condé and in philosophy a follower of Gassendi. Though a staunch Royalist, he was exiled, without sufficient apparent cause, after the fall of Fouquet (1661). He went to Holland and then to England, where Charles II. pensioned him. On the fall of James II, he declined an invitation to return to France, and made his home with the niece of Mazarin, Hortense Mancini. He died in London and was buried in Westminster Abbey. As a refined philosophical essayist and a master of French prose, worthy to be classed with Pascal and Voltaire, he has received, especially in the last century, increasing attention and appreciation. In his lifetime he published nothing, but circulated his work in manuscript, whence some of it found a side door to publicity in 1668. His *Œuvres* appeared in three volumes (London, 1705), with a memoir by Des Maizeaux, and have often been reëdited, perhaps best by Giraud (Paris, 1865). Consult: Gidel, *Étude sur Saint-Evremond* (ib., 1866); Marlet, *Saint-Evremond, étude historique, etc.* (ib., 1870); Sainte-Beuve, *Causeries*, vol. iv. (ib., 1857-62).

SAINT FERDINAND, ORDER OF. (1) A Sicilian order of merit, founded in 1800 by King Ferdinand IV., and abolished in 1861. (2) A Spanish military order, with five classes, founded by the Cortes in 1811 and renewed in 1815 by King Ferdinand VII. Connected with it are pensions ranging from 400 to 40,000 reals. The decoration for the first and third classes is a white eight-pointed cross, bearing the image of Saint Ferdinand, surrounded by a blue band and the inscription *Al merito militar*. The second and fourth classes bear the same decoration resting on a laurel wreath.

SAINT-FLOUR, flūr. The capital of an arrondissement in the Department of Cantal, France, 52 miles south of Clermont-Ferrand (Map: France, K 6). The town is built at an altitude of 2895 feet above sea level, on the edge of a plateau which rises sheer several hundred feet from a valley of the Cantal mountains.

It has manufactures of pottery and coarse cloth. Population, in 1901, 5634.

SAINT FRAN' CIS RIVER. A tributary of the Mississippi. It rises near Iron Mountain, in southeastern Missouri, and flows south into Arkansas, forming for a short distance the boundary between the two States (Map; Arkansas, E 2). It empties into the Mississippi near Helena after a course of 450 miles. The greater part of its course winds through a low, swampy country interlaced with bayous, and for about 70 miles the river expands into a lake from 1 to 5 miles wide. This serves as an important reservoir during the floods of the Mississippi. The river is navigable for 150 miles.

SAINT FRANCIS XAVIER. zāv'f-ēr. COLLEGE OF. A Roman Catholic institution in the city of New York, founded in 1847 and endowed with collegiate powers in 1861. It is conducted by the Fathers of the Society of Jesus, and is intended for day scholars only. The college comprises three departments—the college proper, the graduate school, and the high school department—and confers the degrees of B. A. and M. A. In 1902 it had a library of about 100,000 volumes, 32 instructors, and 650 students in all departments.

SAINT GALL, Fr. pron. sãx gãl (Ger. *Sankt Gallen*). A northeastern canton of Switzerland, bounded on the north by the Canton of Thurgau and Lake Constance, on the east by the Rhine, which separates it from Vorarlberg, Liechtenstein, and Grisons, on the south by Grisons and Glarus, and on the west by Schwyz and Zurich (Map; Switzerland, D 1). It incloses entirely the Canton of Appenzell and covers an area of 779 square miles. The north is hilly, while the south belongs to the region of the Western Alps, the Ringelspitz, near the southern frontier, reaching an altitude of over 10,500 feet. The canton belongs to the basin of the Rhine and its principal river is the Thur.

The climate varies in accordance with the conformation of the surface and is somewhat raw in the mountainous parts. Considering its uneven surface, Saint Gall is a very productive region, over 65 per cent. of its total area being under tillage, gardens, and meadows. Still the domestic supply of agricultural products is insufficient to meet the demand, owing to the density of the population. The grape and other fruits are cultivated in the valley of the Rhine and in the northern part. Saint Gall is among the industrial cantons of Switzerland and produces chiefly cotton goods and embroideries.

The Constitution of the canton provides for a legislative assembly (*Grosser Rat*), the members of which are elected by the communes at the rate of one member for every 1500 inhabitants; and an executive council of seven members elected by the people. The referendum is in force. The population of the canton was 228,174 in 1888, and 250,285 in 1900. Over one-half of the inhabitants are Roman Catholics, and the German language is spoken by a large majority of the population. For history, see SAINT GALL, the capital of the canton.

SAINT GALL. The capital of the Canton of Saint Gall and one of the most important manufacturing centres of Switzerland, situated at an

altitude of nearly 2000 feet, about 50 miles east of Zurich and about 12 miles from Lake Constance (Map; Switzerland, D 1). It consists of the irregular old town on a hill and the new quarters in the valley of the Steinach. The Roman Catholic cathedral, formerly an abbey church, is a neo-Gothic building dating chiefly from the middle of the eighteenth century. The Benedictine abbey was founded early in the seventh century by Saint Gallus, an Irish monk, and was one of the most famous seats of learning in Europe during the ninth and tenth centuries. The eighteenth-century building is now used by the cantonal Government. Its celebrated library contains about 30,000 volumes, including nearly 1500 incunabula and a number of valuable manuscripts. Among the educational institutions of the city are a cantonal school, a town library with valuable manuscripts of the Reformation period, the museum of the East Swiss Geographical Commercial Society, the museum of natural history, and the collection of the art society. Saint Gall is the centre of an extensive industrial region famous for its embroideries and white goods, which are exported all over the world. Population, in 1900, 33,116. German is spoken by most of the inhabitants. In the eleventh century the town acquired considerable independence, and, assisted by Imperial privileges and its growing economic importance, it succeeded in obtaining complete independence from its abbots in the middle of the fifteenth century and joined the Swiss Confederacy. The abbey was abolished at the introduction of the Reformation into Saint Gall in 1529, but was restored in 1532 and finally abolished in 1805. In 1803 the Canton of Saint Gall was constituted in the reorganized Swiss Confederacy.

SAINT-GAUDENS, sãnt-gã'denz. AUGUSTUS (1848—). One of the leading American sculptors. He was born in Dublin, Ireland, March 1, 1848, of French and Irish parentage, but the family came to New York City when the boy was six months old. At the age of thirteen Augustus was apprenticed to a cameo-cutter; his long training in this craft had much to do with the deficiency of his later work and his fine feeling for relief. After studying drawing at the Cooper Institute and the Academy of Design, in 1867 Saint-Gaudens went to Paris and entered the atelier of Jouffroy in the Ecole des Beaux-Arts. He was intimately associated with the sculptors Dubois, Mercié, Falguière, and Saint-Marcoux, and identified with the current movement in French sculpture, which was based rather upon the Italian Renaissance than classic work. In 1870 Saint-Gaudens went to Rome, and in 1873 he returned to America. As the first American sculptor to equip himself with complete French training, his work attracted universal attention. His first important work was the sculptured decoration of the chancel of Saint Thomas's Church in New York City, the chief feature of which is a large cross surrounded by panels of kneeling angels. During this early period Saint-Gaudens made many delightful portraits in extremely low relief.

In 1878 he was appointed member of the international jury for the fine arts at the Paris Exposition. At about this time he modeled the interesting monuments of Admiral Farragut for Madison Square and of Governor Randall for

Saint George, and the Statue of Liberty, both exhibited in 1880. The latter, an ornament, the base of which was designed by the architect, Stanford White, embodies, better perhaps than any other of his works, all Saint Gaudens's best personal and artistic qualities. In the entire field of sculpture there is little finer than the two figures in extremely low relief on the base of this monument. His statue of Deacon Chapin called "The Puritan" in Springfield, Mass., is a splendid idealization. The monument to Lincoln in Chicago is in the same style and spirit, as is also the superb equestrian statue of General Logan in Chicago.

Saint Gaudens has been extremely successful in certain poetic idealizations. A figure called "The Peace of God," in Rock Creek Cemetery, Washington, the caryatides of a mantelpiece in the house of W. K. Vanderbilt in New York City, and angels for the tomb of Governor Morgan, are fine examples. A fine equestrian statue of General Sherman has recently (1903) been erected at the principal entrance to Central Park. The Diana of the Tower of Madison Square Garden in New York City is the only nude statue which Saint Gaudens has made. From 1884 to 1896 he was engaged upon an immense work in high relief representing Colonel Shaw of Boston at the head of his colored troops. This, the most ambitious of his productions, is placed in Boston Common, with an elaborate architectural setting.

SAINT-GELAIS, MELLIN DE (1491-1558). A French poet, the most important member of the school of Clément Marot, noted among his contemporaries as a court singer and a skillful master of language. He was educated mainly at Bologna and Padua, and, on returning to France, took orders and received various valuable preferments. His work, though considerable in volume, is mainly composed of very short pieces, epigrams, rondeaux, and the like, composed in a fluent and graceful style. His works were edited by Blanchemain (Paris, 1873).

SAINT GEORGE. One of the Bermuda Islands (q.v.).

SAINT GEORGE, CAPE. See CAPE SAINT GEORGE.

SAINT GEORGE, CONSTANTINIAN ORDER OF. An order of Parma and Sicily, probably established by the Byzantine Emperor Isaac II. Angelus about 1190, under the name of the Order of Constantine. The order remained in the family of the Angeli until it was transferred to Duke Giovanni Francesco Farnese of Parma in 1697. When Don Carlos came into possession of Parma, and later of Naples, the order was reorganized and called after Saint George. The order was finally dissolved in 1860, when Sicily and Parma were incorporated with Italy. The decoration is a red cross of lilies, bearing the image of Saint George and the dragon, the initial of the name of Christ and the letters I H S V, and A and R. The Sicilian order had three classes, the Parmesan six. Consult Rhodokanaki, *The Imperial Constantinian Order of Saint George* (London, 1876).

SAINT GEORGE, ORDER OF. (1) A Bavarian order with six classes, established in 1729, and reorganized by King Louis II. in 1871, with the King as grand master. The candidate for admission to the order must show eight genera-

tions of nobility on both sides. The decoration is an eight pointed cross bearing the image of the Virgin and the letters V. I. B. I. (Virgini Immaculate Bavaria Immaculata). On the reverse is the image of Saint George with the letters I. V. P. E. (Justus ut Palma Florebit).

(2) A Russian military order with four classes founded in 1769 by the Empress Catharine II. and confined to officers having at least the rank of colonel. The decoration is a white Maltese cross, edged with gold, bearing an image of Saint George and the dragon, and suspended from an orange and black ribbon. See PLATE OF ORDERS.

(3) A Hanoverian order, established in 1839 by King Ernest Augustus, and dissolved in 1866. The device was "Numquam Retrorsum."

(4) A Sicilian military order of merit, founded in 1808. It was dissolved in 1861.

(5) The original name of the English Order of the Garter. See GARTER, ORDER OF THE.

SAINT GEORGE'S CHANNEL. An arm of the Atlantic Ocean which separates Southern Ireland from Wales and Southern England, and unites the Irish Sea with the Atlantic Ocean (Map: England, A 5). It varies from 60 to about 100 miles in width, is about 100 miles long from northeast to southwest, and has channel depths ranging from 300 to 500 feet.

SAINT-GERMAIN, sãnz'zhër'mãn', COUNT OF (died 1784). An eighteenth-century charlatan of European reputation. His origin and life history are unknown. He pretended to be thousands of years old, laid claim to miraculous powers, and surrounded himself with an air of mystery, which, added to his magnificent style of living, fine manners, and an agreeable person, gained him, after 1740, tremendous notoriety in an age that delighted in the mysteries of mesmerism and freemasonry. He first appeared in Parisian society about 1770. Louis XV, of France was among his dupes. He died at Cassel. Consult Ottinger, *Graf Saint-Germain* (Leipzig, 1846).

SAINT-GERMAIN-EN-LAYE, ãs'n'lã', A town in the Department of Seine-et-Oise, France, 11 miles west of Paris, on the Seine River (Map: France, H 3). It has an elevated site and, with its picturesque surroundings, is a popular summer resort. A handsome terrace, built in 1672, overlooks the Seine and affords an extended view of the river and adjacent country. The Forest of Saint-Germain is a magnificent park, covering an area of 11,000 acres. In the restored sixteenth-century royal castle are a splendid museum of Gallo-Roman antiquities and a chapel dating from 1240. The town hall has a library and an art gallery. Saint-Germain was at one time the summer home of the French Court. It was the residence of the dethroned James II. of England, who died here in 1701. Here on August 8, 1870, was concluded the treaty terminating the Third Civil War. (See HUGUENOTS.) Population, in 1901, 17,297.

SAINT GILES, CRIPPLEGATE. One of the most notable and historic churches of London, the burial place of George Fox, the author of the *Book of Martyrs*, the explorer Frobisher, and Milton. The church was built in 1545, and was among the few buildings spared by the great fire of London. Remains of the ancient London wall are visible in the churchyard.

AUGUSTUS SAINT-GAUDENS
"THE SHAW MEMORIAL," BOSTON, MASS

SAINT GOTTHARD, *Fr. pron.* sãx'gô'tãr', A mountain group in the Lepontine Alps, situated in south central Switzerland, on the boundary between the cantons of Valais, Uri, and Ticino (Map: Switzerland, C 2). It is a rugged mass of granite and gneiss, reaching in Pizzo Rotondo an altitude of 10,489 feet. Saint Gotthard is famous for the pass over the Alps, which at its highest point rises to the height of 6936 feet. By means of this pass, the highroad from Flüelen, on Lake Lucerne, is carried without interruption to Lake Maggiore, in the north of Italy. The road over the pass, constructed between 1820 and 1832, is one of the best and most convenient of the Alpine carriage-ways, and is free from snow for four or five months of the year. It is remarkable for the grandeur of its scenery, but has, however, been little used since the opening of the railroad. In 1869 and 1871 Germany, Italy, and Switzerland signed an agreement for the construction of a railway with a tunnel through the Saint Gotthard. The tunnel was begun in 1872 and completed in 1881 at a cost of about \$13,000,000. It is 9½ miles long, 26 feet wide, 21 feet high, and reaches an elevation in the centre of 3786 feet. The approaches to the tunnel exhibit the highest order of engineering skill. Consult Spitteler, *Der Gotthard* (Frauenfeld, 1897).

SAINT HELENA. An insular possession of Great Britain, situated in the Atlantic Ocean, in latitude 15° 55' S. and longitude 5° 42' W., about 1200 miles west of Africa and about 800 miles southeast of the island of Ascension, the nearest land (Map: Africa, D 6). Area, 47 square miles. The island is of volcanic origin and its surface is rugged and mountainous, reaching an altitude of about 2800 feet in the High Hills in the southwest. The coasts are lined with high cliffs, varying in altitude from 600 to 2000 feet. The climate is moderate and healthful and the mean annual temperature is somewhat over 70°. The forests have almost disappeared, and the remarkable indigenous flora, which included a large portion of species peculiar to the island, has been almost wholly supplanted by exotic species introduced from nearly all parts of the world.

The present economic importance of the island is insignificant, its commercial importance having greatly decreased since the construction of the Suez Canal. The island is a Crown colony and is administered by a governor and a council. Population, in 1901, 9850, including nearly 4700 Boer prisoners. Saint Helena is connected by cable with Europe and South Africa, and is an admiralty coaling station. The capital and only port is Jamestown in the northwest, a fortified place with an observatory and a population of about 2500.

Saint Helena was discovered about 1502 by a Portuguese navigator, João da Nova, and was settled by the Dutch in 1645. In 1657 it passed to the British East India Company, but was retaken by the Dutch on several occasions. The island owes its fame to the fact that it was from 1815 to 1821 the place of exile of Napoleon, who died there on May 5, 1821, in the farm house of Longwood, about 3 miles from Jamestown. During the South African War (1899-1902) many Boer prisoners, including General Cronje (q.v.), were sent to Saint Helena. Consult: Melliss, *Saint Helena: a Physical, Historical, and*

Topographical Description of the Island (London, 1875); Broeke, *History of Saint Helena* (ib., 1898-24).

SAINT HEL'EN'S. A manufacturing town in Lancashire, England, on an affluent of the Mersey, 193 miles northwest of London (Map: England, D 3). The town is of modern origin and was incorporated in 1868. It owns its markets, abattoirs, water, gas, electric lighting, tramways, dust destructors, and sewage farm. There are several parks, notably the Victoria, which contains a museum, and the town has a fine town hall, public libraries, and a technical school. Saint Helen's carries on an extensive trade in coal, and has plate glass, copper, bottle, patent medicine, and other works. There are collieries and deposits of stoneware, clay, and fire-clay. Population, in 1861, 18,396; in 1901, 84,410.

SAINT HÉLIER, *Fr. pron.* sãx'gã'lyã', or **SAINT HELIER'S**. The capital of Jersey, Channel Islands (q.v.), a seaport and favorite watering place on the south shore of the island, and on the east side of Saint Aubin's Bay (Map: France, D 2). It has an active English and foreign shipping trade, fisheries, iron foundries, perfume manufactories, etc. The town is well built and granite paved, and has fine markets, esplanades, marine walks, bathing places, aquarium, and parks, Victoria College, the Maison Saint Louis or Jesuit College, with its meteorological observatory and wind tower, the fourteenth-century parish church, the modern Catholic cathedral, hospital, town hall, State house, and public library are the chief buildings. The town is defended by Elizabeth Castle, on a rocky island off the shore, and by Fort Regent on the southeast, built about 1806 on a scarp of granite rock. Population, 29,000.

SAINT HENRI, sãx'gã'n'z'. A city of Hochelaga County, Quebec, Canada. It is a southwestern suburb of Montreal, and a busy industrial section with foundries, tanneries, cotton mills, manufactures of sewing machines, rock-drill implements, etc. Population, in 1890, 13,413; in 1901, 21,192.

SAINT HENRY, Order of. A Saxon military order founded in 1736 by Augustus III., King of Poland and Elector of Saxony. It had originally one class, which was increased to three in 1807. The decoration, a gold and white cross of eight points, surmounted by a crown, bears a central medallion with the effigy of Emperor Henry II, on a yellow ground, encircled by a blue band with the words "Frid, Aug. D. G. Rex Sax. Instauravit." The reverse shows the Saxon arms with the legend *Victuri in Bello*.

SAINT HERMENGILD, Order of. A Spanish order of merit with three classes, founded in 1814 by Ferdinand VII. The order is conferred for land and sea service; the first class on generals and naval commanders; the second on officers below the rank of brigadier; the third on officers of at least 10 years' standing after service of 25 years. The decoration is an eight-pointed cross of white enamel with a circular medallion bearing the effigy of Saint Hermengild on a blue ground, with the inscription *Premio a la constancia militar*.

SAINT-HILAIRE, sãx'gã'lãr'. AUGUSTIN FRANÇOIS CÉSAR (PROUVECAU DE) (1779-1853).

One of the most eminent of French botanists, born at Orleans, France. He was a member of a noble French family, and was trained by his father for a business career. In 1816 he sailed for Brazil, where he spent six years in exploration and botanical research, and in 1819 he was elected a correspondent of the Institute. In 1822 he returned to France with one of the most valuable collections of natural history specimens that up to that time had ever been gathered. It consisted of 21,000 specimens of plants of 6000 different species, the greater part of which were new; 2000 birds; 16,000 insects; 135 quadrupeds, and numerous other specimens of reptiles, fishes, and minerals. For several years he devoted himself to the preparation of an elaborate work on the flora of Brazil, which after long delays, caused by his ill-health, was published in 3 volumes in 1825, under the title *Flora Brasiliæ Meridionalis, ou histoire et description de toutes les plantes qui croissent dans les différentes provinces du Brésil*. Meanwhile he had become professor of botany in the Faculty of Sciences at Paris, and in 1830, on the death of Lamarck, succeeded him as a member of the Institute. His botanical investigations resulted in several discoveries of great value, including two entirely new families, the Paronychiæ and the Tamariscinæ; the difference between the aril and the arilode, and the direction of the radicle in the embryonic sac. In addition to his work on the flora of Brazil he published *Aperçu d'un voyage dans l'intérieur du Brésil* (1823); *Mémoire sur le système d'agriculture adopté par les Brésiliens* (2 vols, 1827); *Voyage dans le district des diamants et sur le littoral du Brésil* (2 vols, 1833); *Voyage aux sources du San Francisco et dans la prairie de Gogay* (2 vols, 1847); and *Leçons de botanique comprenant principalement la morphologie végétale* (1840-41).

SAINT-HILAIRE, GEOFFROY. See GEOFFROY SAINT-HILAIRE.

SAINT-HILAIRE, JULES BARTHÉLEMY. See BARTHÉLEMY SAINT-HILAIRE.

SAINT HUBERT, ORDER OF. The highest Bavarian order, founded in 1444 by Gerhard V., and originally called the Order of the Horn, from the hunting horns which formed the links of the chain. The order has but one class, composed of an unrestricted number of members of princely rank, with not more than twelve members of lower grade. The decoration is a white cross with eight points tipped with golden balls. Three golden rays separate the arms of the cross, which is surmounted by a crown. The medallion represents the conversion of Saint Hubert, with the Gothic inscription *In trust* (Firm in faith) on a red band.

SAINT HYACINTHE, Fr. prov. *sānt' è'â'sānt'*. The capital of Saint Hyacinthe County, Quebec, Canada, on the Yamaska River and the Grand Trunk, the Canadian Pacific, the Drummond County, and the United Counties railroads; 55 miles east-northeast of Montreal (Map: Quebec, C 5). It contains a city hall, Saint Hyacinthe College, and monasteries of the Precious Blood and Dominican Fathers. There are manufactures of leather, organs, tools, boots and shoes, wooden and flannel goods, hosiery, machinery, and farming implements. Population, in 1891, 7016; in 1901, 9210.

SAINT IGNA'TIUS COLLEGE. A Roman Catholic institution in Chicago, Ill., founded in 1870, and conducted by the Fathers of the Society of Jesus. There are two courses; a classical, with collegiate and academic departments, and a commercial. The college confers the degrees of Bachelor of Arts, Science, and Philosophy, Master of Arts, and Doctor of Philosophy. In 1902 the students numbered 500, and the faculty 36. The college has no endowment. Its property was valued at \$300,000, and the income was \$13,000. The library contained 30,000 volumes.

SAINT IGNATIUS'S BEANS. The seeds of *Strychnos Iquatii*, a shrub or small tree of the natural order Loganiaceæ, a native of Cochinchina and the Philippine Islands. The fruit, which is about the size of a large pear, contains about 20 brownish seeds about as large as olives, rounded on one side, and somewhat angular on the other, which have been used like nux-vomica seeds.

SAINTIN, sã'n'tãn', JULES EMILE (1829-94). A French genre and portrait painter, born at Lemé (Aisne). He studied under Drolling, Picot, and Leboncher. Afterwards he spent several years (1857-63) in the United States, and some of his works are inspired by American subjects. Most of his pictures are mediocre, and his treatment is likely to be conventional. His paintings include portraits of Paul Morphy (1860), Stephen Douglas (1860), in the Corcoran Gallery, Washington, D. C., and Mme. Carnot (1891). He was elected an associate of the National Academy of Design in 1861, and to the Legion of Honor.

SAINTINE, sã'n'tên', XAVIER. The name assumed by JOSEPH FRANÇOIS BONIFACE (1798-1865). A mediocre French novelist, collaborator in some 200 plays, and author of *Picciola* (1837), which won him the Monthyon prize from the Academy.

SAINT ISABELLA, iz'ã-bê'lã, ORDER OF. A Portuguese Order founded in 1801 by the Prince Regent (King John IV.). It consists of 26 ladies, nominated by the Queen. Its chief object is the supervision of the care of the sick and orphans. The decoration is a golden medallion surmounted by a crown and surrounded by golden roses and ribbons. It bears the image of Saint Isabella of Portugal and the device *Pauperum Solatio*.

SAINT IVES. A seaport and market-town in Cornwall, England, on Saint Ives Bay, on the Bristol Channel, 57 miles west-southwest of Plymouth (Map: England, A 6). It is a favorite bathing and winter resort, owing to its mild climate, and is a picturesque town; its church, a granite building of the early part of the fifteenth century, stands on the beach. The town was incorporated in 1639, and owns gas and water works. It is the headquarters of the pilchard fishery. In the vicinity are important tin mines. Population, in 1891, 6094; in 1901, 6700. Consult Matthews, *Saint Ives* (Saint Ives, 1884).

SAINT-JACOB, sã'n'zhã'kô'. A hamlet in Switzerland, situated a mile south of Basel, and noted as the scene of a great battle in 1444 between the Swiss and the Armagnacs (q.v.) (Map: Switzerland, B 1). As a memorial of this conflict, a monument was erected here in 1872, and

the anniversary of the battle is celebrated every year. The Swiss fought for ten hours and slew three times their number, but were themselves destroyed, except ten men. The wine of the neighborhood is called *Schweizer Blut*, or SWISS blood.

SAINT JAMES'S COFFEEHOUSE. A former noted resort on Saint James's Street, London, a Whig gathering-place during the eighteenth century. Swift, Goldsmith, Garrick, and Johnson were among its patrons. It was removed about 1806.

SAINT JAMES OF THE SWORD. (1) A military Order of Spain, established during the reign of Ferdinand II. of Leon and Galicia, about 1170, and confirmed by Pope Alexander III. in 1175. It had its origin in an association of thirteen knights, who banded together for the purpose of protecting the pilgrims to the shrine of Saint James of Compostela against the attacks of the Moors. The Order played an important part in the long struggle against the Mohammedan power, but, owing to its extensive privileges and power, aroused the jealousy of the Crown, under whose jurisdiction it was placed in 1493. In 1522 a Papal bull vested the office of grand master in the Spanish monarch. The insignia of the Order is a golden shield, bearing a broad cruciform sword in red. (2) A Portuguese Order (*São Thiago da Espada*) established as an offshoot of the Spanish Order, about 1290, and sanctioned by a Papal bull in 1320. The Order attained exceeding prosperity and in 1566 was united with the Crown. It was secularized in 1789 and made a civil and military Order of merit. It was reorganized in 1862, to be conferred henceforth for distinguished merit in science, art, and literature. (3) A Brazilian Order established on the removal of the Portuguese royal family to Brazil in 1808. It was secularized in 1843 and suspended in 1890.

SAINT JAMES'S PALACE. The London residence of the British sovereigns, from William III. to the accession of Victoria, and now used for levees and drawing-rooms. The Court of Saint James's is still the official designation of the British Court. It is a large inelegant brick structure fronting on Pall Mall. Originally a hospital dedicated to Saint James, it was reconstructed and made a manor by Henry VIII., who added a park to it, which he inclosed with a brick wall, to connect Saint James's with Whitehall, then the royal residence. Additions and improvements gradually changed the original palace, so that little, if any, of the old structure remains. In 1837 the royal household was transferred to Buckingham Palace. Saint James's Park lies south of the palace and extends over 87 acres. It is embellished with avenues of trees, and a fine piece of water in the centre. On the eastern side is the parade, where the body-guards on duty are mustered, and where the regimental bands perform in fine weather. On the outskirts are situated Buckingham Palace, Stafford House, and Marlborough House. Consult *Sheppard, Memorials of Saint James's Palace* (London, 1894).

SAINT JAN'UA'RIOUS, ORDER OF. An order of knighthood founded in 1738 by Charles III., King of the Two Sicilies, as a reward for service in the defense of the Roman Catholic Church

and fidelity toward the sovereign. It became extinct in 1861 on the union of Sicily with the Italian Crown.

SAINT-JEAN D'ACRE, sän'zhä'kär', A seaport of Syria. See *ACRE*.

SAINT-JEAN-D'ANGELY, dän'zhä'le'. The capital of an arrondissement in the Department of Charente-Inférieure, 30 miles south of Niort, on the Boutonne River (Map: France, F 6). Its chief objects of interest are the ruins of the old abbey and the thirteenth-century church. Population, in 1901, 7011. The town grew up around a Benedictine abbey, which the Calvinists destroyed in 1568. It was a Protestant stronghold until its capture by Louis XIII. in 1619.

SAINT JOHN. The chief town of the British West Indian island of Antigua, and capital of the Leeward group; situated on the western side of the island at the end of a somewhat shallow bay (Map: West Indies, F 6). It is well built and has several fine public buildings. The availability of its harbor is somewhat diminished by the bar at its mouth, which makes it inaccessible for heavier vessels. Population, in 1901, 9282.

SAINT JOHN. A city, seaport, and county-seat of Saint John County, New Brunswick, Canada, at the mouth of the Saint John River, on the Bay of Fundy, and on the Intercolonial, the Canadian Pacific, and the Grand Southern railroads, 190 miles northwest of Halifax (Map: New Brunswick, C 4). The harbor is one of the best on the continent; the entrance is protected by Partridge Island, on which are a lighthouse and a quarantine hospital. The channel is protected on the east by a breakwater. The city is built on a rocky peninsula, sloping up from the harbor, and with Portland, a city absorbed since 1889, and Carleton on the west side of the harbor, covers about 6000 acres. The streets are laid out at right angles; they are wide and some of them are cuttings 40 feet deep through solid rock; a steel cantilever railroad bridge and a highway suspension bridge span the river gorge. The principal building materials are brick and stone. Among the public buildings are the court house and jail, the Provincial Insane Asylum, market house, Post-Office, City Hospital, City Hall, Public Library, Sailors' Home, Wiggins Orphan Asylum for Sailors' Sons, Protestant and Roman Catholic orphan asylums, Mechanics' Institute, Masonic and Odd Fellows' halls, and Home for Aged Females. There are electric street railroads and municipal water-works supplied from Little River. The chief article of export is lumber, but there is also an important trade in fish, furs, and agricultural produce. Saint John is the commercial centre of New Brunswick; its shipping ranks third on Canada's official register. The manufactures include ships, lumber, machinery, tools, paper, leather, carriages, boots and shoes, cotton, etc. On January 24, 1604, the last day of Saint John the Baptist, whence its name, the Miamae Indian settlement here was first visited by Champlain and De Monts. Saint John became a permanent European settlement in 1635. From 1643 to 1645 it was the scene of internecine French conflicts and of the tragic hanging of the whole garrison by a successful rival of the commander. In 1758 it was taken by an Anglo-American force, although it

1. **SAINT JOHN OF JERUSALEM.** A British possession under the Treaty of Utrecht in 1713. Its modern growth dates from 1781, when it received an immigration of 10,000 United Empire loyalists. Its charter of incorporation (1785) is the oldest in Canada. Population, in 1891, 39,179; in 1901, 40,711.

SAINT JOHN, LAKE. A large lake in the Province of Quebec, Canada, situated about 100 miles north of Quebec (Map: Quebec, D 2). It is nearly circular in shape, with a diameter of about 25 miles, and receives several large streams. Its outlet is the Saguenay (q.v.). It is encircled by wooded hills, is much resorted to by sportsmen, and is the centre of an important and fairly populous dairy region.

SAINT JOHN, HENRY. An English statesman. See **BOLLINGBROKE, Viscount.**

SAINT JOHN, sânt jôn or sîn'jin. **JAMES AUGUSTUS** (1801-75). An English author and traveler, born in Carmarthenshire, Wales, September 24, 1801. He went to London in 1817; edited a Plymouth radical paper; in 1824 was appointed sub-editor of J. S. Buckingham's *Oriental Herald*; in 1827, with David Lester Richardson, started the *Weekly Review*; in 1829 removed to Normandy. He traveled extensively in Egypt and Nubia. Among his numerous works, comprising travel, fiction, and biography, are the following: *Egypt and Mohammed Ali* (1834); *Manners and Customs of Ancient Greece* (1824); *Egypt and Nubia* (1845); *Isis, an Egyptian Pilgrimage* (1853); *The Nemesis of Power* (1854); *There and Back Again in Search of Beauty* (1853); *Philosophy at the Foot of the Cross* (1854); *History of the Four Conquests of England* (1862); *Life of Sir Walter Raleigh* (1868).

SAINT JOHN, JOHN PIERCE (1833-). An American political leader, born at Brookville, Ind. He enlisted in the Federal Army in 1862, and worked his way up from private to lieutenant-colonel. At the close of the war he removed to Missouri, and in 1869 settled at Olathe, Kan. He was elected Governor of Kansas in 1879. At the expiration of his term in 1883 he accepted the nomination for President on the Prohibition ticket and polled 151,809 votes. Later, however, he became more radical in his economic views than the majority of his party, and seceded, becoming an independent and advocating prohibition, woman suffrage, free coinage of silver, and anti-imperialism.

SAINT JOHN, SIR SPENSER (1825-). An English diplomatist and author, born in London, and educated by private tutors. He early gave his attention to the study of the Malay language. In 1848 he went to Borneo as private secretary to Sir James Brooke, and in 1850 he accompanied Brooke on a mission to Siam. From 1855 to 1861 he was Consul-General at Borneo. He was then transferred to Haiti. He was afterwards Consul-General at Lima in Peru (1874), and after being sent on special missions to Bolivia (1875) and Mexico (1883) he was appointed Minister Plenipotentiary to Mexico (1884). He was transferred to Stockholm in 1893, and he retired from the service in 1896. He was knighted in 1881. He is author of *Life in the Forests of the Far East* (1862); *Life of Sir James Brooke, Rajah of Sarawak* (1878 and 1899); and *Haiti, or the Black Republic* (1885).

SAINT JOHN OF JERUSALEM, KNIGHTS or. A military and religious Order, known also as the Hospitalers, Knights of the Hospital, Knights of Rhodes, and Knights of Malta. Its origin is very obscure, and frequently a great antiquity has been claimed for the Order. One or more of the hospices which were established in the Holy Land by Pope Gregory the Great, in the sixth century, and cared for by Charles the Great, may have existed until the time of the First Crusade and may thus have given rise to this Order. The special hospital at Jerusalem from which it took its name was either founded or restored by merchants from Amalfi in 1070 or earlier. For some years the brethren were under the rule of Saint Benedict and were engaged strictly in hospital duties. After the capture of Jerusalem by the Crusaders in 1099, a hospital in honor of Saint John the Baptist was founded in Jerusalem and became the cradle of the later Order. The earliest authentic documents which can be dated belong to the years 1099 and 1100. The first head of the brotherhood whose name has been preserved was Gerard, who died probably in 1120. We know little of him, and are not even certain of his nationality. Under his administration the brethren followed the rule of Saint Augustine. His successor was Raymond de Puy, who changed the hospital brotherhood into a military Order and ruled as master until 1158. It is not certain that the Order was sanctioned in 1118, 1120, or 1130, as has been generally stated by the older writers; but in 1153 Pope Eugenius III. confirmed the privileges which had been accorded by Paschal II., Calixtus II., Honorius II., and Innocent II. This confirmation proves that the Order had been recognized earlier.

The brothers were of three classes: Knights, who were of noble birth; Priests or almoners; and Brethren, who were not nobles, but who were fighting men. Most of the members were French. They had to take the three monastic vows of poverty, chastity, and obedience. Their main duty was to aid in the defense of the Holy Land, and during the twelfth century the Hospitalers and Templars (q.v.) were the chief defense of the Kingdom of Jerusalem. At the same time their constant quarrels with one another often endangered the kingdom and prevented complete success in the various military undertakings. They vied with the Templars in wealth and ambition, and were second only to them in public esteem. After the destruction of the Order of the Templars they succeeded to much of its wealth. There were at least twelve commanderies of the Hospitalers in Syria, and branches were gradually established in the countries of Western Europe. The earliest was in France, and dates from the first years of the twelfth century. The house of the Hospitalers at Prague dates from 1159. In all, their possessions in Europe were divided into eight *langues*, or provinces, but some of these were not established until the fourteenth and fifteenth centuries. Their head was known at first as master, and later as grand master. The organization of the twelfth century was gradually modified, and the final form, which is now followed, was given to the Order by the Grand Master Pierre d'Aubusson (q.v.) in 1489. The Order maintained its headquarters in Syria until 1290, when, on account of the rapid conquests of the

Mohammedans, it was removed to Cyprus. Many of the knights, however, remained in Acre until its capture in 1291. The seat of the Order was in Cyprus from 1290 to 1310, and in Rhodes from 1310 to 1522. Then it passed successively to Crete, Messina, Baïe, Viterbo, and in 1530 to Malta, which was ceded to the Order by Charles V. of the Holy Roman Empire. Next to Pierre d'Aubusson the most celebrated head of the Order was Jean de la Valette, grand master from 1557 to 1568, who defended Malta successfully against the forces of Sultan Solyman II. (1565). During all of these centuries, and, in fact, until the close of the eighteenth century, the knights still continued to fight against the infidel, and still remained wealthy and famous. In 1798 the island of Malta was seized by Napoleon, whereupon the knights chose Paul I. of Russia as their grand master, counting on his aid against the French. Paul did enter into hostilities with France, and Malta was occupied by the English in 1800, and though the Treaty of Amiens provided for its retrocession to the Hospitalers, the island has remained an English possession. In 1801 the election of a grand master was vested in the Pope, who chose Bailli Tommasi. The latter made his seat at Catania, and the Order at once lost its political, social, and military importance. After the death of Tommasi in 1805, no new grand master was chosen until 1879, when Leo XIII. re-established the dignity and fixed the headquarters of the Order at Rome. In the interval the Order had been governed by lieutenants and by a general council, meeting at Rome. Since 1879 the members have entered into hospital service, under the Convention of Geneva. They have business offices in London, near Saint John's gate, a relic of their old priory, and in other capitals. Their dress is a black gown with a white cross. The seal of the Order has always represented the brethren attending a sick person. Many of the records of the local provinces have been preserved, and some have been printed; the archives of the general Order, going back to the twelfth century, are still in existence at La Valletta, Malta.

BIBLIOGRAPHY. The most important single work is the *Cartulaire général de l'ordre des hospitaliers, 1100 to 1310* (Paris, 1894-1901), edited by Delaville le Roulx. Of this magnificent work three volumes and the first part of volume iv. have appeared. The editor had already distinguished himself by numerous articles on the history of the Knights of Saint John; his dates have been followed in this article. For those who have not access to this great work, the following may be quoted: De Salles, *Annales de l'ordre de Malte*, etc. (Vienna, 1889); Rey, *Colonies franques en Syrie aux 12^{me} et 13^{me} siècles* (Paris, 1883); Vertot, *Histoire des chevaliers hospitaliers de Saint-Jean de Jerusalem* (Amsterdam, 1757); Archer and Kingsford, *The Crusades* (New York, 1898).

SAINT JOHN RIVER. The principal river of New Brunswick, Canada. It rises on the boundary between Maine and Quebec, and flows first northeast through northern Maine, then eastward on the boundary between Maine and New Brunswick, and finally southeast through the latter province till it empties into the Bay of Fundy at Saint John (Map: New Brunswick, B 4). Its length is about 500 miles, and it

receives several large tributaries, such as the Allegash and Amooctook, which drain most of the lakes of northern Maine. The upper course of the river still passes through a wild and sparsely inhabited timber region. Shortly after entering Canadian territory it plunges in the Grand Falls over a perpendicular rock 75 feet high. For the last 100 miles the river forms an irregular, winding, and branching lake-like expansion, part of which is known as Grand Lake. Immediately before entering Saint John harbor in the Bay of Fundy this expansion contracts into a narrow, rocky gorge with a fall of 17 feet, presenting very peculiar tide phenomena. At low tide the river above the gorge is 12 feet higher than the level of the harbor, but at high tide it is 5 feet lower, so that the rapids are reversed with every turn of the tide, and vessels can pass through the gorge only during a short period between ebb and flood. The river is navigable for steamers of considerable size 80 miles to Fredericton, for smaller steamers to Woodstock, 145 miles, and at high water to the Grand Falls, 225 miles. Above the falls it is again navigable 40 miles for small steamers. By the Ashburton Treaty its navigation was made free to citizens of the United States.

SAINT JOHN RIVER. A river of Quebec, Canada. See RICHELIEU.

SAINT JOHNS. The capital of Saint Johns County, Quebec, Canada, on the Richelieu River, opposite Iberville, and on the Grand Trunk, Canadian Pacific, and other railways, 27 miles southeast of Montreal (Map: Quebec, C 5). Three bridges span the river and connect with Iberville. The chief buildings are the county and district offices, a lunatic asylum, and military barracks. The town has electric lighting and water-works, manufactures of pottery, silk, etc., and an important river trade in lumber, grain, and agricultural produce. Population, in 1891, 4722; in 1901, 4030.

SAINT JOHN'S. The capital of Newfoundland, on the east side of the peninsula of Avalon, on the Atlantic Ocean (Map: Newfoundland, H 5). The city is built on sloping ground principally on the northern side of the harbor. The northern and southern sides are connected by a causeway and bridges. The city has been improved greatly since the disastrous fire of 1892, when 1800 buildings, including two thirds of the commercial establishments, were destroyed, the loss amounting to about \$16,000,000. The Roman Catholic cathedral stands on the top of the hill above the city, 225 feet above the sea; there is also an Episcopal cathedral. There are Saint Bonaventure College (Roman Catholic), and Anglican, Methodist, and Presbyterian colleges. Saint John's has a medical society incorporated in 1867; the Saint John's Athenaeum, having a large library; and the library of the Saint Joseph's Catholic Institute. Among the conspicuous public buildings are: the Government House, the residence of the Governor, the House of Assembly, the Public Hospital, Market House, Court House, Custom House, Poor House. The water supply is brought four miles from Wind-son Lake. The city is lighted by gas and electricity.

The entrance to the landlocked harbor, visible only at close range when approached from the sea, is marked by the Narrows, 2160 feet across

about 170 feet; at the narrowest point from the neck to Flomake Rock. On the northern side of the Narrows is a cliff of sandstone and granite rock 300 feet high, and above that towers Signal Hill, 510 feet above the level of the sea. On the southern side of the Narrows there is a tall 650 feet high, on which is a lighthouse called Fort Amherst. Cape Spear and Fort Amherst lights give guidance to vessels entering the excellent harbor. Around the harbor are substantially built stores, warehouses, and wharves, a dry dock capable of raising vessels of 600 tons, and a marine railway. Saint John's receives the bulk of the imports of the colony and has an important trade in clothing, fishermen's and hunters' outfits, and provisions. Its capitalists are mostly non-resident. The manufactures are principally ship-bread, nets, iron, boots and shoes, furniture, etc. It has distilleries, block and rope factories, oil refineries, breweries, and tanneries. Business connected with the fisheries absorbs general attention; there are large exports of seal, cod, and oil. The city is governed by the Legislature. From a fishing hamlet founded in 1580, Saint John's in 1836 had grown to a town of 15,000 inhabitants. Population, in 1891, 25,738; in 1901, 29,594.

SAINT JOHNS. A village and the county-seat of Clinton County, Mich., 22 miles north of Lansing; on the Detroit, Grand Haven and Milwaukee railroad (Map: Michigan, J 5). It is mainly a residential place, and has a ladies' library and a fine union school building. Saint Johns is situated in a farming and stock-raising region, and is noted for its manufactures of furniture, including extension tables, and sashes, doors, and blinds. There are also grain elevators, and manufactories of gasoline engines, agricultural implements, and quilts. Population, in 1890, 3127; in 1900, 3388.

SAINT JOHN'S BREAD. The locust-tree. See CAROB.

SAINT JOHNS'BURY. A village and the county-seat of Caledonia County, Vt., 34 miles east by north of Montpelier; on the Passumpsic River, and on the Boston and Maine and the Saint Johnsbury and Lake Champlain railroads (Map: Vermont, F 4). It has the Saint Johnsbury Academy, Fairbanks Museum, an art gallery, and a public library with more than 16,000 volumes. At Saint Johnsbury are the works of the Fairbanks Scale Company, one of the largest establishments of its kind in the world, and manufactories of steam hammers, hoes, forks, and other agricultural implements. The village is also an important trade centre. The government is vested in a board of village trustees. There are two systems of water-works, one owned and operated by the municipality. Population, in 1890, 3857; in 1900, 5666.

SAINT JOHN'S COLLEGE. A college at Cambridge, England. It was founded in 1511 by an endowment left by Lady Margaret Beaufort, Countess of Richmond and Derby, mother of Henry VII. The college succeeded to the site and buildings of a Hospital of Saint John, founded by Henry I. or in 1135, and altered to admit secular students and the students, not agreeing with the regulars, were removed in 1284 to the new foundation of Beaumont. Saint John's is the second college of Cambridge in size and importance.

The foundation consists of a master, 56 fellows, 60 scholars, and 9 so-called 'proper' sizar. There are some 200 undergraduates in all. The college has a considerable number of prizes, exhibitions, and studentships, and presents to 50 livings. The college buildings are extensive and of great beauty. The library contains about 50,000 volumes, numerous letters, and over 400 manuscripts.

SAINT JOHN'S COLLEGE. A college at Oxford, England. It owes its origin to Archbishop Chichele, founder of All Souls' College (q.v.), who converted a house of Bernardine monks into Saint Bernard's College in 1436. At the dissolution of the monasteries, Henry VIII, gave this college to Christ Church College, which in turn transferred it to Sir Thomas White. He established on this foundation in 1555 the present college, dedicated to the study of sacred theology, philosophy, and the Good Arts, and he is therefore its real founder. The college was largely added to by the generosity of Laud (q.v.), who was for a time its president. It consists of a president, 15 fellows, a number of honorary fellows, lecturers, and tutors, 4 Fereday fellows, 37 scholars, a number from the Merchant Taylors' School, 4 exhibitioners, a chaplain, an organist, and a choir, with some 175 undergraduates in all.

SAINT JOHN'S COLLEGE. A non-sectarian collegiate institution at Annapolis, Md., chartered in 1784 and opened in 1789. It was developed from King William's School, established in 1696, and is therefore one of the oldest of American colleges. Its campus is picturesquely situated on Severn Creek, a few miles from Chesapeake Bay, with commodious buildings valued in 1903 at \$250,000. The collegiate department embraces four courses: classical, Latin-scientific, scientific, and mechanical engineering, which lead to the degrees of Bachelor of Arts and Bachelor of Science. There is also a preparatory school, with 52 students in 1903, in which year the collegiate department had an attendance of 103 and a faculty of 10 instructors. The endowment was \$5000 and the income \$23,000. The library contained 9000 volumes.

SAINT JOHN'S COLLEGE, FORDHAM. A Roman Catholic institution, in the Borough of the Bronx, New York City, organized in 1841. The administration was in the hands of secular priests until 1846, when the college was purchased by the Fathers of the Society of Jesus. The estate embraces about 70 acres, with nine buildings. The income in 1902 was \$66,262, and the value of the college property \$1,553,200. In 1902 the students numbered 442, including 85 in the college, 315 in the academic department, and 42 in the grammar school. There were 41 instructors, and the library contained 53,000 volumes. The college confers the degrees of B.A., B.S., and M.A.

SAINT JOHN'S EVE. The night before the festival of Saint John Baptist (June 24th), or Mid-summer Eve. It seems to have been observed with similar rites in every country of Europe. Fires were kindled chiefly in the streets and market places of the towns; sometimes they were blessed by the parish priest, and prayer and praise offered until they had burned out; but as a rule they were secular in their character, and conducted by the laity themselves. The

young people leaped over the flames, or threw flowers and garlands into them, with merry shoutings; songs and dances were also a frequent accompaniment. The kindling of the fire, the leaping over or through the flames, and the flower-garlands render plausible the theory that these rites are essentially of heathen origin, and of a sacrificial character, possibly connected with the worship of the sun.

SAINT JOHN'S RIVER. The principal river of Florida. It rises in the swamps of Brevard and Osceola counties, and flows northward, roughly parallel with, and 20 miles from, the Atlantic coast (Map: Florida, G 1). It empties into the Atlantic Ocean 25 miles south of the Georgia boundary. It is a sluggish stream passing through a low and level country and bordered by luxuriant semi-tropical vegetation. From its source downward it passes through a chain of lakes, the largest of which is Lake George. From that lake to its mouth, about 200 miles, the river expands into the form of a lagoon from one to five miles wide. A channel is kept open by means of jetties through the bar at the mouth, and the river has been dredged to a depth of 18 feet to Jacksonville, about 20 miles. There is a depth of eight feet as far as Lake George, while small steamers ply regularly as far as Enterprise, 230 miles, and may ascend some distance beyond.

SAINT JOSEPH. A river of southwestern Michigan. After making a detour into Indiana it flows northwest into Lake Michigan at the town Saint Joseph (Map: Michigan, H 7). It is 250 miles long and navigable about 100 miles for small steamers.

SAINT JOSEPH. A city and the county-seat of Berrien County, Mich., 60 miles by water east of Chicago, Ill.; at the mouth of the Saint Joseph River, on Lake Michigan, and on the Père Marquette, the Lake Shore and Michigan Southern, and other railroads (Map: Michigan, G 6). A daily line of passenger and freight steamboats connects with Chicago. Saint Joseph is a popular summer resort. Among its features are the Carnegie Library, Lake Front Park, and Battery Beach. The surrounding district is chiefly interested in fruit-growing, and for this industry the city is an important centre. There are also iron works, paper mills, lumber mills, knitting mills, and manufactories of boats, fruit baskets and packages, motor bicycles, and flour. The government is administered by a mayor, elected annually, and a unicameral council. The city owns and operates the water-works and the electric light plant. First settled in 1829, Saint Joseph was incorporated as a village in 1836, and received a city charter in 1892. Population, in 1890, 3733; in 1900, 5155.

SAINT JOSEPH. The third city of Missouri and the county-seat of Buchanan County, on the Missouri River, 62 miles north of Kansas City and 132 miles south of Omaha, Neb. (Map: Missouri, B 2). Nine railroads give the city excellent transportation facilities. They are the Atchison, Topeka and Santa Fe; the Chicago, Rock Island and Pacific; the Chicago, Burlington and Quincy; the Kansas City, Saint Joseph and Council Bluffs; the Hannibal and Saint Joseph; the Burlington and Missouri River; the Chicago Great Western; the Saint Joseph and Grand

Island; and the Missouri Pacific. A steel bridge connects the city with its Kansas suburb, Elwood.

Saint Joseph is nine and a half square miles in area, and, being built along the bluffs which lie close to the Missouri River, has an unsurpassed drainage system. The city has a river front of three miles. There are 280 miles of streets, of which fifty miles are paved. Vitrified brick is the most popular paving material, but asphaltum, macadam, and granite blocks are used where the service requires them. There are 85 miles of water mains and 52 miles of gas mains in the city.

Among the prominent buildings are the courthouse, the new public library, live-stock exchange, high school, Carnegie Library, post office, and city hall. State Hospital for Insane, No. 2, is located here, as is also the State Fish Hatchery. Other features are the Sacred Heart Academy, Home for Little Wanderers, Memorial Home for Aged People, Saint Joseph's Hospital, Ensworth Hospital, Benton Club, and the Commercial Club. Mount Mora Cemetery is of interest. There are two medical colleges, and a large number of private schools; and thirty public and four parochial schools, with an enrollment (1903) of 31,764 pupils. There are more than forty miles of track in the street railway system, at the north end of which is Krug Park, and at the south Lake Conrary.

The stock yards have a daily capacity of 20,000 cattle, 30,000 hogs, 15,000 sheep, and 2000 horses and mules. The packing houses do a business of \$50,000,000 annually, exclusive of poultry, which is valued at \$1,000,000. Saint Joseph has also very large shirt and overall factories, which with other manufacturing establishments give employment to nearly 20,000 persons. The value of the manufactured products is \$35,000,000 a year, and the jobbing trade amounts to \$75,000,000. There are also harness, collar, saddle, trunk, plow, glue, candy, furniture, shoe, and cracker factories, flour, hominy, and woolen mills, machine shops, foundries, etc.

The mayor and council are elected for two years and the president of the council for four years. The city's revenue is \$413,800. Some of the principal expenditures are: Fire department, \$72,000; police department, \$68,400; streets, sewers, and bridges, \$51,000; water service, \$33,000; and street lighting, \$33,000. The city owns its lighting plant. The assessed valuation is \$30,000,000; and the municipal debt, \$1,108,000.

Saint Joseph dates from 1826, when Joseph Robidoux, an Indian trader and trapper, opened a trading post a short distance above the present site of the city, at Roy's Branch. In 1830 he moved to the Blacksnake Hills, now in the heart of the city. The first post office was established in 1840, and in 1843 'Blacksnake Hills' had a population of 500. The plats of Saint Joseph were recorded July 26, 1843, when the change in name took place. Saint Joseph became the permanent county-seat in 1846, and in 1853 it was chartered as a city. During the excitement over the discovery of gold in California in 1849, the city was a prominent outfitting and starting point for miners. The first census of Saint Joseph, taken in December, 1846, showed a population of 936. Its growth since the Civil War has been very rapid, the population in 1870 being

1470; in 1880, 32,431; in 1890, 52,324; in 1900, 126,909.

SAINT JOSEPH, *Order of*. A former grand-canal order of Tuscany, founded in 1514 and extinguished in 1860. It had three classes, and was restricted to persons of noble birth.

SAINT-JUNIEN, *sāx'zhū'né'fāx*. A town of the Department of Haute-Vienne, France, on the right bank of the Vienne, 18 miles north-north-west of Limoges. The beautiful twelfth-century abbey church contains a sculptured tomb of the patron saint from whom the town takes its name. Saint Junien has a college. The manufactures of gloves and straw paper, and the leather-dressing, felt, and clog factories are important. Near by are a large porcelain plant and slate quarries. Population, in 1901, 11,432.

SAINT-JUST, *zhüst*, ANTOINE (c.1767-94). A French revolutionary leader, born at Decize, in Nivernais. He was the son of a retired cavalry officer and was educated at Soissons by the Oratorians. He went to Rheims to study law, but soon returned to his native village, where he devoted himself exclusively to literature. When the Revolution broke out Saint-Just was in Paris in connection with the publication of his poem *Organt*, and he was at once transported with republican enthusiasm. Later on he became a lieutenant-colonel in the National Guard of his commune, and was present at Paris in 1790 to assist at the Fête of the Federation. In 1791 appeared his *Esprit de la révolution et de la constitution de la France*, in which the various causes of the Revolution were dealt with; and in the following year he was chosen Deputy to the Convention by the electors of Aisne. He voted for the death of the King and became one of Robespierre's strongest and most influential supporters. In all the fierce debates of this period Saint-Just took a leading part. He also displayed a great capacity for administrative organization. After the fall of the Girondists in June, 1793, Saint-Just became more prominent than ever. He had been chosen a member of the Committee of Public Safety in April, and during the Reign of Terror he showed himself well fitted to be the associate of Robespierre and Conthon. On February 19, 1794, he was elected president of the Convention. He drew up the report which led to the arrest and execution of Danton and his adherents. With Robespierre, Saint-Just fell on the fateful Ninth Thermidor, and with him was guillotined on the following day, July 28, 1794. For the life of Saint-Just, consult Fleury, *Saint-Just et la Terreur* (Paris, 1851); Hamel, *Histoire de Saint-Just* (ib., 1859), both of which, however, are biased; one of the best brief accounts is that in Aufray, *Les orateurs de la législature et de la convention* (Paris, 1879-81).

SAINT KITTS. One of the Leeward Islands. See SAINT CHRISTOPHER.

SAINT LAWRENCE. A river of North America (Map: Canada, R 7). The basin of the Saint Lawrence includes the entire system of the Great Lakes, constituting the largest body of fresh water in the world. Its drainage area and rate of discharge, however, are much less than those of the Mississippi.

The name Saint Lawrence River is properly confined to the outlet of Lake Ontario, flowing

from the northeastern extremity of that lake in an almost straight northeast course of about 700 miles to the Gulf of Saint Lawrence, through which it enters the Atlantic Ocean. For a distance of 30 miles below Lake Ontario the river is from 4 to 10 miles wide, but this wide expanse is filled with a wilderness of beautiful rocky and wooded islands, known as the Thousand Islands, ranging in size from about 20 square miles to mere rocks bearing a few trees. Below this expansion the river maintains an average width of 13½ miles as far as Quebec, narrowing in some places to less than a mile, and widening in others into lakes nearly 10 miles wide. The fall of the river from Lake Ontario to Quebec is 240 feet, nearly the whole of which is accomplished above Montreal in a series of rapids separated by long reaches of quiet water. The upper rapids occur where the Laurentian spurs cross the river to form the Adirondacks; the lowest are the Lachine Rapids, just above Montreal harbor, where a line of igneous rock traverses the plains. From Montreal to Quebec the river passes between low banks through a wide, cultivated plain. Tide-water is reached at Three Rivers, about half way between Montreal and Quebec, and at the latter city the spring tide rises 18½ feet, while salt water becomes noticeable 30 miles below. At Quebec begins the great estuary, which is 350 miles long, and widens gradually from 10 miles below the island of Orleans to about 90 miles at the west end of Anticosti Island, where it enters the gulf. The south shore continues low some distance below Quebec. The north shore soon becomes high and bold, and toward the mouth of the estuary the south shore also is lined with high, rugged, and forest-covered mountains. The chief tributaries of the Saint Lawrence proper are the Ottawa, which enters it from the north through several channels around the islands at Montreal, and whose dark, amber-colored waters flow side by side with the light blue of the main stream until tide-water is reached; the Richelieu, the outlet of Lake Champlain, which enters the river from the south some distance below Montreal; and the Saguenay, flowing into the estuary. Instead of the river entering the ocean through a shallow and shifting delta, the valley of the Saint Lawrence has been submerged through the sinking of the land, so that its entrance is about 90 miles wide and 1200 feet deep. A depth of 600 feet extends half way to Quebec, and the river is 100 feet deep nearly or quite up to that city. Between Quebec and Montreal the natural depth is over 20 feet, and the channel has here been deepened so that the largest ocean steamers can pass up to the wharves at the latter city. Above Montreal the rapids are passed by a series of 9 canals, with a total length of 42 miles, and provided with locks, each of which is 45 feet wide and 270 feet long, with 14 feet of water on the sills. These canals, however, are used only on the up-stream route; on the return trip even the passenger steamers descend the rapids. For the navigation of the waterways above the Saint Lawrence proper, see GREAT LAKES. Consult Steckel, *Water Levels* (Ottawa, 1893).

SAINT LAWRENCE. An island in Bering Sea, belonging to Alaska, between that Territory and Siberia, to the southwest of Cape Nome (Map: Alaska, B 3). Its greatest length and width are respectively 90 miles and 30 miles.

It reaches its greatest height toward the east, where the hills have an elevation of over 500 feet. On the fringe of the Arctic zone, the island is sparsely peopled by Eskimos, who engage in whale, seal, and walrus fisheries, and have trading relations with the mainland. Bering discovered the island in 1728; fifty years later it was visited by Captain Cook, who thought it comprised two islands, which he named Saint Lawrence and Clark.

SAINT LAWRENCE, GULF OF. An inlet of the northern Atlantic, bounded by the western shore of Newfoundland, and the shores of the Canadian provinces of Quebec, New Brunswick, Nova Scotia, and Prince Edward Island (Map Canada, S 7). It has three communications with the ocean—the Strait of Belle Isle, between Newfoundland and Labrador; the Gut of Canso, between the island of Cape Breton and the peninsula of Nova Scotia; and Cabot Strait, 62 miles wide, with the island of Saint Paul in the middle, between Cape Breton and Newfoundland. In the opposite direction it narrows at the western end of Anticosti into the estuary of the Saint Lawrence River. Besides Anticosti, Saint Paul's, and Prince Edward the gulf contains several clusters of islands, more particularly in its southern half, among them being the Magdalens. The northern shore, which is bold and rocky, is fringed with small islets. The waters are frequently rendered dangerous to shipping by thick fogs and uncertain currents. The passages from the ocean to the river, however, are clear, broad, and deep channels, the one through Cabot Strait being 1200 feet, and the one through the Strait of Belle Isle 600 feet deep. The latter is the route taken by transatlantic steamers. The Gulf of Saint Lawrence is celebrated for the productiveness of its fisheries.

SAINT LAZARUS, ORDER OF. An Order of chivalry founded in Palestine for the purpose of caring for sick pilgrims, and transferred to Europe after the destruction of the Christian power. The chief seat of the Order was at Boigny, in France. It was merged in the Order of Our Lady of Mount Carmel, founded in 1807, and was thenceforward known as "Ordre militaire et hospitalier de Saint Lazare et de Notre Dame du Mont Carmel réunis." It was dissolved in 1830.

SAINT LEGER, sânt lej'ér or sil'im-jér. BARRY (1737-89). A British soldier in the American Revolution. He entered the army as an ensign in 1756, and in the following year was sent to America to fight against the French. He served under General Abercrombie, took part in the siege of Louisburg in 1758, and fought under Wolfe at Quebec. When the British Ministry planned the campaign of 1777 against the revolted colonists, Saint Leger, then a lieutenant-colonel, was chosen to command an expedition which was to go up the Saint Lawrence to Lake Ontario, land at Oswego, and, with the assistance of Sir John Johnson and the Indians, capture Fort Stanwix, and then march down the Mohawk Valley and join General Burgoyne. On August 3, 1777, Saint Leger reached Fort Stanwix, and three days later fought the battle of Oriskany (q.v.) with a relief force under General Herkimer. On the 22d of the same month the approach of a second relief force under General Arnold produced such a panic among

Saint Leger's men that they retired in great haste to Canada. Saint Leger continued to serve in Canada and on the northern border of the colonies, and in 1780 he was promoted colonel. He published *Saint Leger's Journal of Occurrences in America* (London, 1780).

SAINT LEONARDS, len'ôrdz. EDWARD BURNESHAW STEDON, Baron (1781-1875). An English lawyer, born in London. In 1802 he began the study of law, and three years later became known by his *Practical Treatise of the Law of Vendors and Purchasers of Estates* (1805). He was called to the bar in 1807. He was returned to Parliament in 1828, was knighted and made Solicitor-General in 1829, and became Lord Chancellor of Ireland in 1835, and again from 1841 to 1846. He was appointed Lord Chancellor of England and raised to the peerage in 1852. The fourteenth edition of his *Law of Vendors and Purchasers* was published in 1862. He published many other valuable legal treatises.

SAINT-LÔ, sânt'lo'. The capital of the Department of Manche, France, 47 miles southeast of Cherbourg, on the Vire River (Map: France, E 2). The principal building is the Gothic Cathedral of Notre Dame, dating from the fourteenth century. It was remodeled in the seventeenth century. The town hall, museum, hall of justice, and prefecture are among the features of the town. Horse-breeding is extensively carried on, and there are manufactures of cloth, leather, etc. Population, in 1901, 11,604. The industrial prominence of the town suffered severely through the revocation of the Edict of Nantes.

SAINT-LOUIS, sânt'loo'is. The capital of the French colony of Senegambia, situated on a small island in the delta of the Senegal, about 12 miles inland and 163 miles by rail northeast of Dakar (Map: Africa, C 3). It is a well laid out town, with a number of public buildings. The climate is extremely unhealthy. At the mouth of the river is a sand bar which practically deprives Saint-Louis of all value as a port. The town was founded in 1626. The population, about 20,000, is extremely heterogeneous.

SAINT LOUIS, sânt'loo'is or lo'is. The chief city of Missouri and of the States formed from the 'Louisiana Purchase' of 1803; in population, the fourth city of the United States and the principal city of the Mississippi Valley (Map: Missouri, F 3). It is situated on the west bank of the Mississippi River, 1170 miles from New Orleans and 720 miles from Saint Paul; about 20 miles below the mouth of the Missouri, and 174 miles above the mouth of the Ohio; in latitude 38° 38' N.; longitude 90° 12' W.

DESCRIPTION. The city, as originally founded, occupied a bluff of the 'Saint Louis limestone,' one of a series extending north and south along the west bank of the river, from which the land gradually rises westward in rolling hills. The lowlands of the Mississippi, known at this point as the American bottoms, are wholly on the east, or Illinois, side of the river. Although in the central part of the city the original bluffs have been graded away for convenience of access to the river, the city, now extended north and south beyond its original site, still enjoys the advantages of a limestone foundation. It has a river frontage of 19.15 miles, with a depth in a direct line to the extreme western limits of 6.6

of the city included within these limits is of the same order.

The original site of the city, now a small part of the business district, lay below the crest of a hill not far from Broadway, the present north and south thoroughfare, which follows the general course of the river, at a minimum distance from it approximating one-eighth of a mile. The city lies within a curve of the river having a general easterly direction. The characteristics impressed on the city by its original French founders exist now only in a few streets between Broadway and the river; and even there, except in a few unchanged buildings, such as the Catholic Cathedral on Walnut Street, they are hardly to be detected. The streets are narrower than elsewhere in the city, and the buildings still used or formerly used for residences show the influence of the Colonial style in their architecture.

The tendency of the modern city has been toward exact regularity. Wherever possible, its streets have been laid out at right angles from north to south and from east to west. Market Street, selected as the original line dividing the city into its northern and southern portions, is no longer a central thoroughfare, but the streets are numbered north and south from it, as they are also west from the river.

The chief eastern and western thoroughfares leading out from the central part of the city are Washington Avenue and Olive Street, with Franklin Avenue connecting with Easton Avenue to the north. South of Olive Street, Market connects with Manchester Avenue, running through the city southwestwardly, while Chouteau Avenue, the next thoroughfare south of Market, runs east and west to Forest Park. Broadway follows the course of the Mississippi from the River Des Peres at the extreme south to the extreme northern limit of the city. Grand Avenue, planned as a boulevard spanning the city on the west, is now almost centrally located. Jefferson Avenue, east of it, unites with Broadway on both north and south to form a complete thoroughfare. West of Grand Avenue—where the principal avenues and boulevards are interrupted by parks and places or by the various 'additions' made to the city independently of each other—thoroughfares are formed only by a connecting series of streets.

BUILDINGS. The old Walnut Street Cathedral is the most notable survival of the French period of the history of Saint Louis. The interior of the Church of Saints Peter and Paul, the oldest German Catholic church in the city (1848), is Gothic. The Broadway Court House (1839-62), the best example of the classic style in the city, is in the form of a Greek cross, surmounted by a dome 198 feet in height, with a rotunda 60 feet in diameter. The four circular galleries within the dome give opportunity for viewing the frescoes by Wimar; panels of "The Discovery of the Mississippi by De Soto," "The Founding of Saint Louis by Laclède," the Indian massacre of 1780, and a landscape panel. There are also figures of Law, Commerce, Justice, and Liberty. The only public building of the same school of architecture comparable in purity of style is the much costlier Federal Custom House and Post Office (1888). It has a frontage of 132 feet on Olive Street by 177 feet on Eighth and Ninth, with a height of 184 feet to the top of the

cupola surmounting its dome. The new City Hall, in Washington Square, described as Romanesque, distinctly suggests a French *hôtel-de-ville* of the sixteenth century. The blended Renaissance and later mediæval influences of Northern Europe again predominate in the architecture of the imposing Union Station, on Eighteenth and Market streets, directly west of the City Hall. The new buildings of the Washington University, the most extensive and complete in the city, are adaptations of the Tudor-Gothic fortified palace. Italian Renaissance is the style of the Museum of Fine Arts, whose façade, with sculptures by Kretschmar, is perhaps the most satisfactory in the city. The Protestant Episcopal Cathedral, dating from early in the second half of the nineteenth century, shows both in exterior and interior the influence of the Saxon style in modifying the Gothic. The Shaare Emeth Synagogue, one of the most impressive of the modern religious edifices, shows the Byzantine influence modifying the Gothic in the body of the building, to which is added a campanile of the earlier Italian Renaissance, adapted to the Gothic. The new Roman Catholic Cathedral, the Second Presbyterian Church, and the majority of the important church buildings erected since 1880 are either Gothic or Renaissance modifications of the Gothic.

Of business structures representative buildings are the Laclède, the Union Trust, the new Mercantile Library, the Board of Education and Public Library, the Oddfellows' Hall, the Rialto, the Commonwealth Trust, the Equitable, the Commercial, the Boatmen's Bank, the National Bank of Commerce, and the collection of buildings known as 'Cupples Station,' where a considerable part of the wholesale trade of the city is centred at the most advantageous point for handling freight. The Mercantile Club building is in the business centre. The buildings of the Saint Louis Club, the University, the Marquette, the Columbian, the Union, and other clubs away from the business centre, represent different styles of residence architecture. The new buildings of the Saint Louis University, the Central High School, the Young Men's Christian Association, and others of a public or semi-public character, have a general tendency to reproduce the styles of the palaces and unfortified public buildings of the fifteenth and sixteenth centuries in England and France. The Pilgrim Congregational Church, Saint George's (Protestant Episcopal), the Union Methodist Episcopal, the Grand Avenue Presbyterian, the Church of the Messiah (Unitarian), the Beaumont Street Baptist Church, and the several Jewish synagogues of the west end represent the more modern ecclesiastical architecture of the city.

For the buildings of the World's Fair of 1904, see SAINT LOUIS WORLD'S FAIR.

PARKS. The twenty-three public parks, places, and gardens of the city have a total area of 2183 acres, including that part of Forest Park temporarily used as part of the grounds of the Louisiana Purchase Exposition. Forest Park, the largest of these, dates from 1874. It is almost directly west of the business centre. Its area of 1371 acres represents a cost of \$2,304,669 for ground and improvements. When acquired by the city it was far from the principal residential section, but its attractiveness has exerted so

marked an influence that the residential section has grown toward it, and its beauties are reproduced in neighboring private residence-parks, or 'places.' For these, the number of which is not included in the total above, the city is remarkable.

The principal parks of the southwestern part of the city are Tower Grove and the Missouri Botanical Garden adjoining it. Both of these are a gift of the late Henry Shaw, whose interest in plants made the Botanical Garden's collection of native and foreign flora one of the most extensive in America. The garden, now maintained for the public by special commissioners, has an arboretum adjoining it, containing specimens of the American forest trees which will grow unprotected in the climate of Missouri. Tower Grove Park, with an area of 206 acres, ranks next to Forest Park as the driving park of the city. It is highly improved, with an impressive central gateway on the east, opening on a long avenue, which, as it divides the park, has the heroic bronzes by Von Mueller, cast in Munich during Shaw's lifetime, and by him presented to the city.

Carondelet Park (containing 180 acres) and O'Fallon Park (158 acres) rank next in area. Lafayette Park, with an area of 29 acres, is more centrally located in what was formerly the most important residential section of the southern part of the city. Up to the close of 1902, the total cost of the parks, acquired and improved at public expense, was \$4,011,862, inclusive of improvements and maintenance. This does not include the four parks managed by special commissioners.

The most interesting objects of art in the parks are probably the bronze statues of Shakespeare, Columbus, and Humboldt, by Von Mueller, in Tower Grove. That of Shakespeare is supported by a pedestal with bronze panels, giving in relief the grave scene in *Hamlet*, Lady Macbeth in the sleep-walking scene, Queen Catharine confronting her accusers, and Falstaff as impersonated by Ben De Bar. The recumbent portrait statue of Henry Shaw in the Shaw mausoleum in the Missouri Botanical Garden is by the same sculptor. A bronze statue of Thomas H. Benton in Lafayette Park is the work of Harriet Hosmer. On its pedestal are the words, "There is East, there is India," which constituted the climax of his speech made after the withdrawal of his opposition to the first transcontinental railroad. This statue, erected at the expense of the State, commemorates the completion of the railroad connecting Saint Louis with the Pacific Coast. Lafayette Park contains also a good bronze reproduction of Houdon's statue of Washington. Wellington Gardner's statue of Francis Preston Blair stands near the eastern entrance of Forest Park. J. Wilson MacDonald's statue of Edward Bates, Attorney-General in Lincoln's first Cabinet, is near the southeast corner of the same park. The marble statue of Schiller in Saint Louis Park is a reproduction of the portrait statue of the poet erected at his birthplace, Marbach. The striking bronze statue of General Grant, first erected on Twelfth Street, now stands in front of the southern entrance of the City Hall. It is the work of Robert P. Brinckhurst.

EDUCATION, LIBRARIES. The school system of Saint Louis is notable in several particulars, chiefly in its application of the theory of

manual training in connection with the work of Washington University, and in its pioneer work in illustrating the practical workings of the theories of Froebel. The school buildings represent a total cost of \$6,354,000. The number of teachers employed at the close of the fiscal year 1902 was 1724, with annual salaries of \$1,079,194. The number of pupils in 1902, including 10,096 in the kindergartens, was 84,774. The annual expenditure of \$1,681,907, out of a revenue of \$2,155,000 under the general fund, was for maintenance only, exclusive of expenditures for new buildings and improvements. The city has begun supplying free books, and it supports the free public library as an essential part of the system of public education.

Among the private institutions are Washington University (q.v.), with the Manual Training School and School of Fine Arts, University of Saint Louis (q.v.), Forest Park University for Women, the Christian Brothers' College, the Saint Louis College of Physicians and Surgeons, the Homeopathic Medical College of Missouri, the Missouri School for the Blind, the Kenrick Theological Seminary, and the Saint Louis Law School, now a department of Washington University.

The principal libraries are the Public and the Mercantile. Among minor libraries, that of the Missouri Historical Society is most important. The Mercantile Library, maintained by private subscription, occupies the upper portions of its own building on Broadway and Locust Street. It has more than 3000 members, and a total of 127,000 bound volumes. It is especially rich in Americana relating to the history of colonial Louisiana and the States and Territories formed from it. Among the objects of art in its possession are the marbles Beatrice Cenci, by Harriet Hosmer; the West Wind, by T. R. Gould; and portrait busts of Burns and Scott by William Brodie, R. S. A. Among its paintings are a series of the Indian studies by Catlin, and the most important of Bingham's canvases illustrating the life of the early West. The Public Library has 166,339 volumes (1903), with an annual circulation of more than a million volumes.

SOCIETIES, CLUBS, THEATRES. The Missouri Historical Society, the Academy of Science, the Medical Society, the Liederkrantz Society, and the Young Men's Christian Association are prominent among the many permanent organizations formed for other than social or business purposes. The German Turner and musical societies are important and are characteristic of influences which have affected the city. The principal clubs are the Saint Louis, the Mercantile, the University, the Noonday, the Marquette, the Columbia, the Country, the Office Men's (social), and others which, like the Commercial, are organized for business rather than social intercourse. There are also the Business Men's League, the Civic Federation, the Saint Louis Spanish Club, the Inter-state Commercial Club, and the Manufacturers' Association. Saint Louis has in addition several permanent political clubs occupying their own buildings.

The principal theatres are the Olympic, the Grand Opera House, the Century, the Imperial, the Crawford (Fourteenth Street), and the Columbia. The Grand Opera House has a seating capacity of 2200, and the Olympic 2400.

COMMERCE AND INDUSTRY. The railroad systems of which Saint Louis is a centre convey traffic from all parts of the United States and also from Mexico and Canada, though the country in which the city has fostered railroad development most in marketing its output lies south of Nebraska and west of the Mississippi. The twenty-four railroads of which it is a terminus have dwarfed the influence of the Mississippi as the determining factor of its trade without lessening the great advantage of direct river communication with tide water. The total annual shipments by rail and river were 11,159,848 tons for 1902. The total freight received, including coal imported for home consumption, reached 18,477,729 tons. With a capital and surplus of \$87,267,173, the banks and trust companies reported annual clearings of \$2,506,804,320 for 1902.

Though Saint Louis is important as a manufacturing city and markets its own industrial output, it is still more important commercially as a distributing centre for products representing the entire country. Its location makes it a point of clearing between manufactured products and the products of the soil for which they are exchanged. Its average annual receipts of grain are 70,437,000 bushels; cotton, 766,000 bales; cattle, 1,181,000 head; hogs, 1,494,000 head; coal, 5,648,000 tons; lead, 2,007,000 pigs; zinc and spelter, 2,357,000 slabs; hides, 56,237,000 pounds; wool, 26,378,000 pounds. The principal items of its annual sales (in millions of dollars) are: Dry goods, 120; groceries, 75; boots and shoes, 50; tobacco and cigars, 41; shell and heavy hardware, 35; woodenware, 10; lumber, 40; candy, 4; beer, 18; clothing, 7; furniture, etc., 33; agricultural machinery and vehicles, 20; iron, steel, and wagon materials, 15; electrical machinery and supplies, 30; drugs and druggists' sundries, 40; glass, glass-ware, and queen-ware, 5; terracotta and clay products and brick, 5; stoves and ranges, 3; paints and oils, 6; hats and caps and gloves, 5; saddlery and harness, 5. The figures in dollars given above for tobacco represent a gross volume of 83,593,000 pounds and support the claim of the city as 'the largest tobacco market in the world.'

The total number of manufacturing establishments in Saint Louis in the census year (1900) was 6732, with a capital of \$162,179,000 and an annual product of \$233,629,000. The most important items were manufactured products of tobacco, meat products, malt liquors, newspapers, books and periodicals, clothing, boots and shoes, brick and stone, railroad cars, bakery products, wagons and carriages, flour and grist-mill products, millinery, iron and steel, and furniture. The minimum annual output represented in any one of these lines is \$3,000,000; the maximum (for manufactured tobacco) is \$24,500,000. These figures do not include the manufacturing activities of the city's suburbs, both in Missouri and Illinois. East Saint Louis, the principal industrial suburb on the Illinois side of the river, is connected by the magnificent Eads Bridge for railroads, wagons, and foot passengers. (See *Bridge*.) The Merchants' Bridge connecting the Illinois terminals of Saint Louis railroads with the Union Station system of terminals is for railroads only. The Union Station covers about eleven acres of ground with its main buildings and adjacent sheds.

Saint Louis is a port of entry. Its exports are chiefly to Mexico, South America, and the West Indies. Its direct trade with the Philippines, mainly in malt liquors, has assumed some importance. The principal export shipments of flour and grain are to Central and South America, Cuba, England, Scotland, Ireland, Holland, and Germany. Exports to Europe consist largely of provisions. The principal items are dry-salt and sweet pickled meats, oleo, lard, and hides. Exports of agricultural supplies, hardware, electrical supplies, machinery, glass, etc., are mostly to Spanish America. The direct imports through the Saint Louis custom house were \$4,712,000 for the calendar year 1902.

ADMINISTRATION AND MUNICIPAL ACTIVITIES. Saint Louis has the combined administrative machinery of city and county. The municipal government is vested in a bicameral legislative body with local (ward) representation through the House of Delegates and more general representation through the Council, or Upper House; and in an executive department, consisting of the mayor and the departments under him. The heads of the more important departments are chosen by popular vote, the power to appoint heads of departments being left to the mayor only in those considered of less importance. The sheriff, coroner, civil and criminal courts, and police represent the county system. The police are not subject to the mayor, who has, however, the power of appointing justices for the city or police courts. Under the 'metropolitan system,' final control of the police is vested in the Governor of the State, but it is exercised through local commissioners of his appointment. The expense of this virtually independent department is paid on its own estimates from the city treasury. The management of the public schools through an elective school board is also independent of the mayor and the departments under him.

Direct control of public utilities extends only to the water-supply system, streets and sewers, public parks, and schools. The income from franchises in 1902 was \$205,000, out of total receipts of \$9,261,000, of which \$6,581,000 were from taxes and licenses, and \$1,756,565 from water rates. The net expense of maintaining the water service, exclusive of extensions, etc., was \$537,136. The disbursements for all purposes were \$8,470,000, including \$1,200,000 for public debt; \$1,623,000 for police; \$870,000 for the health department and the various public charities under it; \$765,401 for the fire department; \$585,000 for public lighting; \$438,720 for maintaining and improving streets; \$374,350 for the courts; \$180,000 for prisons; \$165,000 for elections and registration; and \$115,000 for parks. The bonded debt of the city, including new indebtedness incurred for the promotion of the Louisiana Purchase Exposition, reaches \$23,916,000. The total value of property as assessed for taxation is \$18,046,000.

The sewer system includes 530 miles of completed sewers, costing \$12,024,000. The water-works have a capacity of 120,000,000 gallons daily, while the daily consumption is less than 70,000,000. The electric wires already below the surface occupy about 170 miles of conduits. The street railroads, with a single-track mileage of 337, carry in average years more than 145,000,000 passengers.

The public charities comprise a city dispensary, city hospital, insane asylum, female hospital, poorhouse, and house of refuge; the last-named institution serving the double purpose of prison and reform school for youthful delinquents. A juvenile court for dealing with these offenders was introduced in 1903. The Missouri School for the Blind is maintained at the expense of the State, with none of the features either of an asylum or a reformatory. The city health department includes a department of experimental bacteriology, which serves in tracing and checking germ diseases, and in the care of the water supply.

At the close of the fiscal year 1902 the city had 451.5 miles of paved streets, of which 249.53 miles were paved with macadam and the rest with granite, asphalt, telford, brick and brick-block, etc. Of the total mileage of streets, reported as 884.16 (1902), there were still unpaved 432.66 miles.

POPULATION. The population was, in 1880, 350,518; in 1890, 451,770; in 1900, 575,238. From 1810, the date of the first Federal census, to 1880, the totals include with the city of Saint Louis the population of Saint Louis County, which in 1880 was separately enumerated at 31,888. The population of city and county prior to 1880 was as follows: 1810, 5667; 1820, 10,049; 1830, 14,125; 1840, 35,979; 1850, 104,978; 1860, 190,524; 1870, 351,189. The population of the town itself was, in 1799, 925; 1810, 1400; 1820, 4000; 1830, 4977; 1840, 16,469; 1850, 77,860; 1860, 185,587; 1870, 310,864.

The great growth between 1840 and 1850 had for one of its causes the German emigration following the revolutionary movement of 1848. This influence has been continuous. In 1900, 58,781 out of the total of 111,356 foreign-born residents of the city were natives of the German Empire. This was 52.8 per cent., exclusive of Austrians of German race. In 1900, 17.4 per cent. of the foreign-born population was of Irish nativity, 5.02 per cent. of English, and 4.03 of Russian. In that year Italy, Austria, Bohemia, and Poland had each less than three per cent. of the total of foreign-born residents. Although the total of foreign-born is comparatively small, the native population born of white foreign parents is 239,170, the native population born of native white parents being 189,251. The total colored population, including Chinese, was 25,853.

HISTORY. In 1764 Auguste Chouteau, then only fifteen years of age, acting under orders from Pierre Laclède Ligueste, established a fur-trading station at Saint Louis, and later in the same year Ligueste himself arrived and laid out a town which he predicted would become one of the largest cities in the country. At first called 'Laclède's Village,' the place soon was named Saint Louis in honor of Louis IX. of France. In 1762, by secret treaty, France had ceded all her territory west of the Mississippi to Spain, but the latter did not take possession until 1770, when Saint Louis became the capital of 'Upper Louisiana,' and Lieutenant-Governor Don Pedro Piernas took possession with a small body of Spanish troops. At that time the population was about 500. Though Spain continued in possession until 1803, the town remained essentially French. On May 26, 1780, a large force of Indians, instigated by the English, attacked the place, but

did comparatively little damage, though this year was afterwards known locally as 'L'année du grand coup.' In 1803 'Louisiana' was formally retroceded to France in pursuance of the Treaty of San Ildefonso (1800), but several months later the United States came into possession by virtue of the 'Louisiana Purchase' (q.v.). After this, immigration from the Eastern States was rapid, and Saint Louis increased greatly in size and importance. The first newspaper began publication in 1808, and in 1809 the town was incorporated. With the appearance of the first steamboat in 1815 a new epoch began for Saint Louis. John Jacob Astor opened here the 'Western Branch of the American Fur Company' in 1819, and the annual shipments soon amounted to \$200,000. Saint Louis was chartered as a city in 1822, though its exceptionally rapid progress did not begin until about ten years later. In 1849 a fire destroyed property valued at \$3,000,000, and an epidemic of cholera caused the deaths of 4000 of the 64,000 inhabitants. During the Civil War the sympathies of perhaps the majority of the people were with the South, and here in 1861 began the contest between the Unionists and the Secessionists for the control of Missouri. The Louisiana Purchase Exposition, which was to have been held here in 1903 to commemorate the acquisition of 'Louisiana' from France in 1803, was postponed to 1904. See SAINT LOUIS WORLD'S FAIR.

BIBLIOGRAPHY. SAINT LOUIS, ORDER OF. A French military order of merit with three classes, founded by Louis XIV. in 1693, dissolved during the Revolution, restored by Louis XVIII., and finally extinguished in 1830. The decoration, a white eight-pointed cross with lilies in the angles, bore the image of Saint Louis and the inscription *Lud. Magni. inst. 1693*. On the reverse was a flaming sword with the inscription *Bellum Virtutis Præmium*.

SAINT LOUIS, UNIVERSITY OF. A Roman Catholic institution under Jesuit control, in Saint Louis, Mo., established in 1829. It comprises the following departments: College, academy, commercial, military science, philosophy, medical, and science, medicine, and divinity, with a total enrollment in 1902 of 864 students, and a faculty of 106. The buildings are valued at \$900,000, the whole value of the college property being about \$1,200,000. In the same year the endowment was \$184,000, and the income \$42,150. The library contains about 43,000 volumes.

SAINT LOUIS WORLD'S FAIR. An international exposition, in Saint Louis, Mo., beginning April 30, 1904, and having for its object the cele-

On the hundredth anniversary of the acquisition of the Louisiana Territory by the United States. On June 4, 1900, Congress promised the sum of five million dollars toward the holding of an exposition, on condition that an additional ten million dollars be raised by Saint Louis, and in April, 1901, the Louisiana Purchase Exposition Company was incorporated with a capital of six million dollars. In June the site of the exposition was fixed at Forest Park, a tract of 112 acres of well-worked forest land within the city limits, and including about 110 acres belonging to Washington University, which, with its buildings, were leased to the Exposition Company. The architectural plan provided for fifteen large exhibition buildings, the main group of which was arranged in the form of a fan. The apex of the fan was formed by the Art Palaces, three massive buildings to remain after the exhibition, of which the central one was designed as a memorial building. Other notable structures with their dimensions were: The Electricity Building, 750 by 525 feet; the Varied Industries Building, 1200 by 525 feet, with a tower 400 feet high; the Machinery Building, 750 by 525 feet; the Transportation Building, 1500 by 525 feet; the Textiles Building, 750 by 520 feet; the Manufactures Building, 1200 by 525 feet; the Mines and Metallurgy and the Liberal Arts buildings, each 750 by 525 feet; and the Government Building, 800 by 175 feet. Thirty-four States and Territories made appropriations amounting to more than \$4,500,000, part of which was expended in special buildings. Foreign governments also were largely represented, and many of them erected special and typical structures: as, for instance, France, which reproduced the Petit Trianon of Versailles. The administrative system of the Exposition included four executive divisions: Exhibits, Exploitation, Works, and Concessions and Admission. The Division of Exhibits comprised the following fifteen departments: Education, Art, Liberal Arts, Manufactures, Machinery, Electricity, Transportation, Agriculture, Horticulture, Forestry, Mining and Metallurgy, Fish and Game, Anthropology, Special Economy, and Physical Culture. The formal dedication occurred on April 30, 1903.

SAINT LUCIA, *lwa-s'la*. The largest of the British Windward Islands, West Indies. It is situated 25 miles north of Saint Vincent and about the same distance south of Martinique (Map: West Indies, R 8). Area, 233 square miles. The island is volcanic and mountainous, with an active volcanic peak over 3000 feet high. The rainfall is abundant, and the mountains are covered with luxuriant tropical forests. The chief agricultural products are sugar, cocoa, logwood, coffee, and spices. By reason of the exceptionally good harbor at Castries, Saint Lucia has more shipping than any other British West Indian island, except Jamaica, which it nearly equals. The entries and clearings in 1901 amounted to 1,864,720 tons. Population, in 1891, 42,220; in 1901, 50,237, chiefly negroes. Capital, Castries (qv.). Saint Lucia was discovered in 1502 and colonized by the French in 1563. It changed hands between England and France a number of times, until it became permanently a British possession in 1803. In 1898 it suffered severely from a hurricane.

SAINT LUKE, THE ACADEMY OF (*Accademia di San Luca*). The academy of the fine arts at Rome. In the later Middle Ages there was a guild of painters at Rome, whose sanctuary was the small Church of San Luca, on the Esquiline. It first appears on record in 1478, when it renewed and revised its ancient statutes, and assumed the name "Università delle Belle Arti." The present academy, organized after the plans of the painter Muziano, was first recognized in a brief of Gregory XIII, in 1517, its immediate recognition having been prevented by the opposition of the elder society, which it finally absorbed. Under Sixtus V. Federigo Zuccari obtained a bull (1588) approving the new organization, which was placed under the patronage of Saint Luke, and endowing it with the revenues of the Church of San Martino, the name of which was changed to Santi Martino e Luca. The inauguration was postponed till November 14, 1593, under Clement VIII. The academy owed much to Zuccari, its first prince, who left it his fortune. In 1700 Clement XI. instituted and endowed the annual prizes of painting, sculpture, and architecture. The constitution of the academy was but slightly modified until 1818. At the head stood a prince, appointed annually, and this office was held by some of the most celebrated artists, like Maratta, Lebrun, and Canova. In 1818 Pius VII., following the advice of Canova, granted a new constitution, which has not been materially changed since the annexation of Rome to the Kingdom of Italy in 1870.

There are thirty-six academicians, chosen in equal numbers from among the painters, sculptors, and architects, besides foreign and honorary members; at the head of the academy is a president, elected annually. It also maintains a school of design, in which instruction in painting, sculpture, and architecture is given. Besides its private endowment, the academy receives a subsidy of 35,000 francs from the State. It has retained its quarters in the Via Bonella, near the Forum Romanum, where are located its schools and its valuable collection of paintings. The latter contains good examples of Gaspard Poussin, Claude Lorrain, Titian, Veronese, Salvator Rosa, Guido Reni, and the much-discussed "Saint Luke Painting the Madonna," formerly attributed to Raphael. The academy also possesses a small collection of sculpture, presented by the artists, and the valuable *Biblioteca Sarti*, presented in 1881. It has been of great influence and celebrity, the French and English academies having been modeled upon it. Consult Armand, *L'académie de Saint Luc à Rome* (Rome, 1866).

SAINT LUKE, GUILDS OF. Medieval associations of painters, under the patronage of Saint Luke, formed to protect the interests of their members. Engravers, printers, and members of other occupations related to bookmaking were later received into the guilds, which had a long existence in Holland and flourished particularly in Antwerp.

SAINT-MALO, *sān'má'ló'*. A seaport and the capital of an arrondissement in the Department of Ille-et-Vilaine, France, 51 miles north by west of Rennes; at the mouth of the Rance River, on the English Channel (Map: France, D 3). It is attractively situated on a rocky peninsula, and with its narrow winding streets and sixteenth-century ramparts has a very pic-

turesque appearance. A rolling bridge (Pont Roulant) connects Saint-Malo with the suburb of Saint-Servan across the harbor. The fifteenth-century parish church, a former cathedral, the fourteenth-century castle, the casino, museum, and library are noteworthy features. The town carries on a considerable trade in agricultural produce, coal, and lumber, has large cod-fishing interests in connection with Newfoundland, and regular steamship communication with the Channel Islands and Southampton. Ship-building and iron-working are also important industries. Population, in 1901, 11,486. Saint-Malo received its name from Saint Malo, a Welsh monk, who came here in the sixth century. It was at the zenith of its prosperity in the seventeenth and eighteenth centuries, when its traders amassed vast wealth as the result of their commercial and privateering ventures. The English attempted at various times to capture the town, but were unsuccessful. The tomb of Chateaubriand is on the island of Grand-Bey, a short distance from the town.

SAINT MARC, sãx mårk. The capital town of the Department of Artibonite, Haiti, forty-five miles northwest of Port-au-Prince, on Saint Marc Bay (Map: Antilles, L 5). Its chief export is coffee. Its municipal population is reported to be 20,000.

SAINT-MARC GIRARDIN, sãx'mårk' zhè-rãr'dãn', FRANÇOIS AUGUSTE (known as MARC GIRARDIN) (1801-73). A French author and journalist, born in Paris. He obtained a professorship in the Collège Louis-le-Grand in 1827 and in the same year began his long political and literary connection with the *Journal des Débats*. He was elected to the Chamber of Deputies in 1834, and took a prominent part in framing and securing the passage of the bill for secondary education in 1837, and upon his reelection to the Chamber in the same year was made a member of the Royal Council of Public Instruction. He retired from political life after the Revolution of 1848, and until 1871 gave himself up almost entirely to literary work. In the latter year he was returned to the National Assembly, elected vice-president, and became an active supporter of the policy of Thiers. Saint-Marc Girardin lectured on literature at the Sorbonne for more than thirty years. He published numerous works on history and literature, among which are, *Tableau de la marche et des progrès de la littérature française au XVIIème siècle* (1828); *Cours de la littérature dramatique ou de l'usage des passions dans le drame* (1843); *Essais de littérature et de morale* (1845); *La Fontaine et les fabulistes* (1867); *La chute du Second Empire* (1874); and *J. J. Rousseau, sa vie et ses ouvrages* (1875). Consult Tamisier, *Saint-Marc Girardin, étude littéraire* (1876).

SAINT MARK'S CHURCH (SAN MARCO) in Venice. Originally the chapel attached to the palace of the Doge and the national sanctuary of the Venetians, but since 1807 the Cathedral of Venice. It derives its name from the patron saint of Venice, the Apostle Mark, whose reputed relics were transported from Alexandria to Venice in 828. The church was built in the ninth century, and rebuilt after a conflagration in the tenth. It was a simple Romanesque structure of brick, nearly of its modern plan,

though without so extensive a narthex, but adorned with lines of colored brick and brick set in patterns, here and there; a very simple church in the form of a Greek cross with five low cupolas. In the eleventh century there began a series of alterations tending to make the church still more Oriental than it was originally. The low brick cupolas were covered and roofed by lofty domes of wood covered with metal; the mosaic decoration of the interior was carried much further; parts of the walls within were sheathed with slabs of alabaster; the decoration by incusted marbles and mosaics was carried into the exterior; and finally in the Gothic period (fifteenth century) the pinnacles, the crockets, and other florid adornment of the exterior were added. The result is the church as we have it to-day, the most splendid piece of polychromatic architecture in Europe, and more splendid even than Saint Sophia at Constantinople in its present condition.

The church is about two hundred and fifty feet long, east and west, including the great narthex, and one hundred and seventy feet from north to south over the transepts, and the small porches which, whether open or not, complete the arms of the cross. The west front has five great porches opening upon the Piazza di San Marco, and each porch so deep that the continuous flat roof above them affords a very ample balcony. The famous bronze horses which are supposed to have been brought from Constantinople and to be of antique make are set above the central porch. Of these five porches three are open, and on entering one of those doorways the visitor finds himself in the great narthex. This, in its complete extent, surrounds the western arm of the cross, that which would be the nave in an ordinary Western Romanesque church; but of the three vestibules or arms so made, one is occupied in part by the Baptistry and in part by the chapel called the Cappella Zen. The narthex is vaulted low, underneath a gallery which opens into the church; and these vaults so near the eye are covered with mosaics with many parts of the Bible history. Most of these are of early time, twelfth and thirteenth centuries, but immediately over the main doorway leading into the church is a magnificent Saint Mark from drawings by Titian.

On entering the church the impression is again that of a low and not impressive interior. Everything is near to the eye; the mosaics of the high vaults can be easily made out, although the church is not brightly lighted by day and is still more dim by night. It is, however, full of beautiful details, and these are combined with singular skill and singular good fortune to produce one of the most beautiful interiors in the world. Even when the styles differ widely, and disagreement or even discordant effects might be expected, the result is harmonious and pleasant to the eye. The high screen of the choir with a flight of steps leading to it; the row of statues which crowns this screen; the ciborium behind it, under which is the high altar, and behind which is to be seen at certain times the famous *pala d'oro*, an altar screen of Byzantine work in silver, silver gilt, enamel, and precious stones; the alabaster columns and sheathings of the walls, the shrines and side altars in other parts of the church; the deli-

care low relief of Byzantine style which fronts the parapet of the balconies and sometimes is incised in the walls; the very beautiful pulpits and font; and above all, the splendid harmony of color upon a ground of broken and varied gilding, the surface being made up of small tesserae, which are in different planes and reflect the light at different angles—all go to produce a result the most consummate that we can point to, of architectural effect produced by colored light and shade, with but little reference to the traditional proportions of any recognized style.

Besides the church proper, there are several minor chapels other than those mentioned, and on the south there is a very remarkable sacristy, to which is attached the famous treasury of Saint Mark's, which contains a precious collection of church plate, jeweled book-bindings, and other artistic treasures of the early Middle Ages. Consult: Ruskin, *The Stones of Venice* (London, 1851-53; reprint 1886); id., *Saint Mark's Rest* (Orpington, 1877-79); Hare, *Venice* (London, 1884); Boito, *The Basilica of Saint Mark in Venice*, trans. by Scott (Venice, 1888); and Kreutz and Ongania, *La Basilica di San Marco* (Venice, 1881-88), one of the most sumptuous publications, consisting of numerous photographs and chromo-lithographs on a large scale.

SAINT MARTIN, sãx mǎr'tǎn'. An island of the Lesser Antilles, situated 180 miles east of Porto Rico (Map: West Indies, Q 5). Area, 37 square miles. It is mountainous and destitute of forests and scantily watered, though it produces and exports some sugar, cotton, and tobacco. It belongs partly to France and partly to the Netherlands. Population, 1900.

SAINT-MARTIN, ALEXIS. See BEAUFONT, WILLIAM.

SAINT-MARTIN, LOUIS CLAUDE DE (1743-1803). A French mystic, who wrote under the pseudonym "Ph. Inc." or "Philosophe inconnu." He was born at Amboise; studied law and practiced at Tours; then entered the army, and for a time was stationed at Bordeaux. There Martinez Pasqualis began to influence him with his mystic laws of numbers, and, having come under Swedenborg's sway soon after, Saint-Martin left the army. His *Erreurs et vérité* (1782) presents Pasqualis's doctrine for the most part, while the *Nouvel homme* (1792) is tinged with the mysticism of Böhme, several of whose works Saint-Martin turned into French. The modern Martinists bear his name. Consult: Matter, *Saint-Martin, le philosophe inconnu* (Paris, 1864); Claassen, *Saint-Martin* (Stuttgart, 1891).

SAINT MARY AND ALL SAINTS, LINCOLN. See LINCOLN COLLEGE.

SAINT MARY LE BOW, or BOW CHURCH. A church on Cheapside, London, dating from the second half of the seventeenth century. It was built from Wren's designs on the site of an earlier church, supported by stone arches, whence its name. The lofty spire, 235 feet in height, contains the famous Bow Bells, which called Dick Whittington to return.

SAINT MARYS. A city in Anglaize County, Ohio, 22 miles northwest of Lima; on the Miami and Erie Canal, and on the Lake Erie and West-

ern and the Toledo and Ohio Central railroads (Map: Ohio, B 4). Near the city is a reservoir containing 17,600 acres, which supplies water for the Miami and Erie Canal. Saint Marys is primarily an industrial centre, its chief establishments including machine shops, woolen mills, and manufactories of vehicle wheels, lumber products, chains, strawboard, paper boxes, plate glass, pumps and air compressors, and flour. The government is administered by a mayor and a unicameral council. The water-works and the electric light plant are owned and operated by the municipality. Population, in 1890, 3000; in 1900, 5359.

SAINT MARY'S RIVER. The channel connecting Lake Superior with Lake Huron. It flows 40 miles southeastward on the boundary between the upper peninsula of Michigan and the Canadian Province of Ontario (Map: Michigan, J 2). It is divided by several large islands into two main channels, each of which has lake-like expansions from 2 to 10 miles wide. It falls 20 feet. Most of this descent occurs at the Saint Mary's Rapids, about one mile long, near the upper end. Transportation around the rapids was at first accomplished by a tramway along the Michigan shore, but this method was replaced in 1855 by a ship canal with locks built at a cost of \$1,000,000. (For illustration, see CANAL.) This was enlarged and improved by the United States Government in 1870-81 at a cost of \$2,150,000, and again further enlarged in 1889-96 at a cost of \$5,000,000. On the other side of the rapids a similar canal has been built by the Canadian Government. The volume of traffic passing through these canals is enormous, greatly exceeding in gross tonnage that of the Suez Canal. See GREAT LAKES.

SAINT MARY'S SEMINARY. A Roman Catholic institution in Baltimore, Md., established in 1791 by the Society of Saint Sulpice. It is a branch of the seminary established by the society in Paris in accordance with the decree of the Council of Trent. There are two departments, philosophy and theology—the former leading to the degrees of B.A. and M.A., the latter to the degree of Bachelor of Theology. The courses cover two and three years. The library contains about 31,000 volumes. The attendance in 1902 was 235, and the faculty numbered 15.

SAINT MAUR, CONGREGATION OF. See BENEDICTINES.

SAINT MAURICE (mô'rês') RIVER. A northern tributary of the Saint Lawrence River, Canada, 300 miles long. It rises in Lake Oskelania and enters the Saint Lawrence River at the city of Three Rivers, 9 miles above Lake Saint Peter (Map: Quebec, D 4). It is navigable near its mouth, and again for 75 miles between Grand Piles and the Hudson Bay station of La Tuque. It affords transportation for an extensive lumber region.

SAINT MICHAEL, mǐ'kəl. A village and port of entry in the Northern District of Alaska, 125 miles southeast of Nome; on the island of Saint Michael, in Norton Sound (Map: Alaska, C 3). It has steamship connection with Seattle, Wash. The village is the military headquarters of the Department of Alaska, and has considerable commercial importance as a shipping point for the Yukon mining district. Saint Michael

VENICE
PIAZZA, ST. MARK'S, AND CAMPANILE

was founded in 1833. Population, in 1890, 101; in 1900, 857.

SAINT MICHAEL, ORDER OF. (1) A French order, founded in 1469 by Louis XI., with 36 knights, afterwards greatly extended. Louis XIV. restricted the membership to noble families. The order ceased about 1830. Its motto was "Immensi Terror Oceani." The decoration was an eight-pointed cross with fleurs-de-lis, the medallion bearing a representation of the Archangel Michael and the Dragon. (2) A Bavarian order founded in 1693 by Elector Joseph Clement of Cologne, Duke of Bavaria. It was instituted to uphold the Catholic faith, but in 1837 became an order of merit. The decoration is an eight-pointed cross of blue enamel, bearing the image of Saint Michael, with a shield inscribed *Quis ut Deus*. The four arms of the cross bear the letters P. F. F. P. (*Principi Fidelis Faveo Patriam*).

SAINT MICHAEL AND SAINT GEORGE, ORDER OF. A British military and civil order of merit with three classes, founded by George III. in 1818. It was intended to commemorate the acquisition of Malta and was designed originally for British residents of the Mediterranean regions. The cross of the order, of white enamel, shows the Archangel Michael with the device *Auspicium melioris aevi*; on the reverse is an image of Saint George. See Plate of ORDERS.

SAINT MICHAEL'S, mī'kelz (SÃO MIGUEL). The largest and most important of the Azores (q.v.), and, with the exception of Saint Mary's (Santa Maria), the most eastern island in the group (Map: Spain, B 5). Area, 299 square miles. The island is mountainous, and rises in its highest summit to 3560 feet. There is an extensive export trade in wine, oranges, tea, and pottery. Population, in 1900, 125,183. Chief city, Ponta Delgada (q.v.).

SAINT MICHAEL'S MOUNT. A conical and isolated granite rock in Mount's Bay, Cornwall, England, 18 miles west of Falmouth. It communicates with the shore by a causeway 400 yards long, which is uncovered at low tide. The mount is 230 feet high, is about one mile in circumference, and is crowned by an old and picturesque abbatial castle, restored, and now used as a manorial residence. At the base of the mount is a small fishing village. Saint Michael was the British Dinsol and the Roman Ictis, and at an early period became the seat of a religious house. At the Conquest the Monastery of Saint Michael was annexed to the Abbey of Mont-Saint-Michel (q.v.) in Normandy, its more distinguished prototype. It long remained in the possession of the monks, but since 1660 has belonged to the Saint Aubyn family.

SAINT MORITZ. A watering place in the Upper Engadine, in the Grisons, Switzerland, 11 miles northeast of Maloja. It is frequented both as a summer and winter resort. Altitude, 6,033 feet; population, in 1900, 1578. It is just north of the Lake of Saint Moritz, and is the highest village in the Engadine. The views are beautiful. The Baths of Saint Moritz, situated about a mile to the south, with an elevation of about 5,823 feet, are among the best known in Switzerland. The waters contain alkaline salts and carbonic acid. There is a fine Kurhaus. The fame of Saint Moritz dates from 1589, when Par-

acelsus called notice to the excellence of its waters.

SAINT-NAZAIRE, sän'nä'zär'. A seaport and the capital of an arrondissement in the Department of Loire-Inférieure, France, 40 miles west of Nantes, at the mouth of the Loire River (Map: France, D 4). It has steamship connection with Newhaven and South American ports. The harbor is spacious and has undergone extensive improvements. Saint Nazaire is primarily a commercial city. The value of its trade in 1900 aggregated \$6,096,000, including exports to the amount of \$3,188,000. Farm and garden produce, fruit, wine, and silk and woollen goods constitute the leading shipments. The industrial interests are represented by iron foundries, ship building yards, and flour and lumber mills. Population, in 1901, 35,813.

SAINT NICOLAS, nek'ölä'. A town in the Province of East Flanders, Belgium, 13 miles west-southwest of Antwerp (Map: Belgium, C 3). It stands in the midst of the Pays de Waes, a densely peopled and productive agricultural district. A market is held in the great square of the town, one of the largest in Belgium. The manufactures include woollen and cotton goods, pins, lace, hosiery, etc. Population, in 1900, 30,484.

SAINT O'LAF, ORDER OF. A Norwegian order of merit, founded in 1847 by Oscar I. of Sweden. The decoration is a white cross bearing the Norwegian arms on a red ground, with the device *Ret og Sandhed* (Right and Truth) on the reverse.

SAINT-OMER, sän'tömär'. The capital of an arrondissement in the Department of Pas-de-Calais, France, 25 miles southeast of Calais, on the Aa River and the Neuf-Fossé Canal (Map: France, J 1). Its most interesting feature is the Church of Notre Dame, a thirteenth-century Gothic edifice. It has four portals, one of which is embellished with a Last Judgment. Other places of interest in the town include the ruins of the old Benedictine abbey, the Coste Military Hospital, occupying the site of an early Jesuit college, the Collège Saint Bertin, the Church of the Holy Sepulchre, and the museum. The commercial advantages have been greatly increased by the hydraulic lift in the Neuf-Fossé Canal. Considerable trade is carried on in manufactured articles, comprising pipes, paper, flour, liquors, hosiery, and textiles, and in farm and garden produce. Saint-Omer owes its origin to the churches and monasteries founded here in the seventh century by Omer, Bishop of Théronanne, and other ecclesiasts. Population, in 1901, 20,687.

SAINTON-DOLBY, san'ton dōl'bī. CHARLOTTE HELEN (1821-85). An English vocalist and composer, born in London. She studied at the Royal Academy of Music under Crivelli, and from her debut in 1841 to her retirement in 1870 was considered the leading oratorio and ballad singer in England, possessing a contralto voice of marvelous strength and beauty. She married the celebrated violinist Prosper Sainton in 1860. Among the many cantatas composed by her, perhaps the most popular was *The Story of a Faithful Soul*, which was produced in London, 1879.

SAINTONGE, sã'kɔ'zɔ'. A former province of Western France, now included within the Department of Charente-Inférieure (q.v.). Its capital was Saintes. See Map of France showing former provinces, under FRANCE.

SAINT-OUEN, sã'k'wã'n'. A suburb of Paris on the right bank of the Seine, one mile north of the city walls (Map: Paris and Vicinity). It has a famous race course in the former park of the Château of Saint-Ouen, where Louis XVIII., in May, 1814, signed the famous declaration promising a charter to France. Saint-Ouen has educational institutions, and is important for its manufactures of firearms, glass, sugar, perfumery, india-rubber, tinned foods, and varnish. There are extensive docks along the Seine. Population, in 1901, 35,436.

SAINT PAN'CRAS. A northern borough of London (q.v.), England, west of Regent's Park. It is a fashionable district; within its limits is Saint Pancras Station, the important terminus of the Midland Railway. The parish church in Euston Square, built in 1819, is a reproduction of the Erechtheum at Athens. Population of borough, in 1891, 234,379; in 1901, 234,912.

SAINT PAT'RICK, MOST ILLUSTRIOUS ORDER OF. An Irish order of merit founded by George III. in 1783 and consisting of the sovereign, the Lord Lieutenant of Ireland, who is grand master, and 22 knights companions of noble rank, in addition to a number of princes of the blood. The badge is a white oval shield showing the cross of Saint Patrick with a shamrock and three golden crowns. The motto is *Quis Separabit*. The ribbon is blue.

SAINT-PAUL, sã'n'pól'. A seaport on the northwestern coast of the French island of Réunion (q.v.), situated about 10 miles southwest of Saint-Denis. It is a good place of anchorage and contains a foundry, barracks, a college for priests, etc. Population, about 20,000.

SAINT PAUL. The capital of Minnesota and the county-seat of Ramsey County, situated on the Mississippi, just below Fort Snelling, at the mouth of the Minnesota River (Map: Minnesota, F 6). It is about nine miles below the Falls of Saint Anthony, reckoning from the City Hall, and about seven miles from the celebrated Minnehaha Falls. It is at the foot of the rapids and practically at the head of navigation, about 2300 miles from the mouth of the Mississippi. This point was naturally a trade centre in pioneer days. It tapped the great fur-bearing region through the Minnesota River, thus becoming an important station of the Hudson's Bay Company, and it was a natural depot for supplies brought up by river boats, and for produce taken back. This river traffic gave Saint Paul its first impetus as a centre of trade and transportation, just as the water-power of the falls a little farther up stream made Minneapolis pre-eminently a manufacturing point.

Saint Paul is picturesquely situated. Rising from both shores of the Mississippi 676 feet above sea level at low water, it extends over a series of terraces to the hills, from 100 to 200 feet higher. The first level on the left bank of the river is occupied by the Union Station, rail and yards, and terminals, wholesale houses, and factories; on the second level are the retail stores, public buildings, and hotels; and crowning

the upper terrace are the principal residential streets. Similarly on the right bank the first level is taken up by railroad yards and manufacturing plants; higher up are some retail business blocks, and then comes the residential section. The two banks are now connected by three fine wagon bridges and two railway bridges. Three more bridges span the Mississippi at Saint Paul, one at Fort Snelling, and two farther up connecting with Minneapolis. There is a splendid system of street railways operated by electricity generated mostly at the falls in Minneapolis. The lines in the two cities are operated practically as one system. Two double-track interurban routes join the network in the two cities, and a single line runs to Wildwood and Stillwater.

The city embraces an area of about 56 square miles. Of this area 1,204.42 acres, in 48 separate tracts, are devoted to park purposes. The largest and most beautiful is Como Park, between the Twin Cities, with an area of 415 acres, 142 of which are occupied by the pretty Lake Como. Como Park has a close rival in the Indian Mounds Park on the banks of the Mississippi below the city. Here on a bluff 200 feet high are several conical mounds, the summits of which command a view of the river as it sweeps by in a majestic curve. The park systems of the Twin Cities are connected by drives extending along the magnificent wooded gorge and the series of rapids below the Falls of Saint Anthony.

Saint Paul has numerous striking buildings. The finest is the new State Capitol, of white Georgia marble, standing on a lofty eminence. It has a magnificent dome and entrances. The new Post-Office, opposite Rice Park, and the massive City Hall and Court House, occupying an entire square on Wabasha and Fourth streets, are other edifices of merit. This city was among the first to construct tall, massive office buildings, good examples of which are the Pioneer Press, Germania Life Insurance, New York Life Insurance, Giffilan Block, the Manhattan, and Endicott buildings. Among other fine structures may be mentioned the Ryan Hotel, Newspaper Row, Capital Bank, and Crescent Creamery Company's building.

There are three free libraries: the City Library, of 54,550 volumes; the State Law Library, of 30,000 volumes; and the State Historical Library, with 70,000 volumes and a complete file of newspapers for Minnesota. The Agricultural College of the State University, with its model farm of 243 acres, and the Minnesota State Fair, are at Saint Anthony Park. There are, besides these public educational institutions, many private schools and colleges, among which are Hamline University (Methodist), Macalester College (Presbyterian), College of Saint Thomas and Saint Paul Seminary (Catholic), Concordia College (German Lutheran), Saint Paul's College (German Methodist), and two Lutheran seminaries.

COMMERCE AND INDUSTRY. Saint Paul is a great railroad centre. Twenty trunk lines operated in ten systems furnish transportation for the vast traffic going through the city. The steamboat business has shrunk to very small proportions, even the rafting of logs and lumber having fallen off greatly with the denudation of the northern pine forests. The Great Northern, Northern Pacific, and Chicago Saint Paul, Minneapolis and Omaha roads have large repair

shops here, these and the smaller shops of four other roads employing about 2500 men. Saint Paul is most important as a wholesale and jobbing centre, but it also has large manufacturing interests, ranking second among the cities of the State. It leads in the manufacture of boots and shoes, and of men's clothing. Among the large establishments are publishing houses, breweries, foundries and machine shops, and fur houses. In the census year of 1900 the various industries were capitalized at \$28,208,389, and had an output valued at \$38,541,030.

GOVERNMENT. Under a home rule provision inserted in the State Constitution in 1898, allowing all cities to frame their own charters through a commission of 15 freeholders appointed by the District Court, Saint Paul adopted a new charter in 1900. This kept the board plan which had been found to suit the city's needs. The council is bicameral, consisting of an assembly of nine members elected at large, and a board of eleven aldermen, chosen by wards, one from each. The city elections occur on the first Tuesday in May of the even-numbered years, when the voters choose a mayor, treasurer, comptroller, four justices of the peace, three constables, and the members of the council. At every other election, beginning with 1902, two municipal judges also are elected. The city departments are in charge of nine appointive boards: water-works, parks, police, fire, workhouse, public works, almshouse and hospitals, education, and library. The first five have five members each appointed by the mayor for five-year terms, one member going out of office each year, and are not paid. The two following are paid, there being three members on each board, one appointed by the mayor every year. The board of education has seven members, serving without pay for three years, being appointed by the mayor in rotation. The library board consists of nine members, who serve without pay, three being appointed by the District Court every year. The boards have as a rule entire charge of their respective departments. The council fixes the aggregate amount which each may spend annually, and beyond this no board can go. The mayor has, besides his large appointive powers, a veto on all acts of the council, which may be overruled on ordinary matters by a two-thirds vote in each Chamber; in matters requiring a two-thirds vote to pass, by a four-fifths vote; and on a measure to bond the city not to be ratified by the people, it is final.

The water-works were constructed in 1870 and acquired by the city in 1880 at a cost of \$4,049,854. Their value is now estimated at \$6,000,000. The water comes from a chain of spring-fed lakes on the high land north of the city, and is distributed through 252 miles of mains. The city has also an excellent sewer system, 176 miles in length, an efficient system of food and health inspection, two hospitals, and public baths.

FINANCE. The bonded debt on January 1, 1903, was \$7,878,100, and the floating debt \$1,674,042.50. The sinking fund was \$664,039.73. Real estate was assessed at \$73,799,715, and personally at \$16,289,410, making a total of \$90,089,155. The tax rate was \$31.00 per thousand. The total receipts from all sources for 1902 were \$5,263,470.98, while the disbursements were \$4,861,260.78, leaving a cash balance of \$402,201.20 on January 1, 1903.

POPULATION. Saint Paul has had an extraordinary growth. In 1850 there were 1112 inhabitants; in 1860, 10,101; in 1870, 20,030; in 1880, 41,173; in 1890, 133,156; and in 1900, 163,065. The census of 1900 showed the foreign population to be 28.7 per cent. of the total, distributed as follows: German, 27 per cent. of the total foreign born; Swedish, 21 per cent.; Irish, 10.1 per cent.; and the remainder distributed among 20 other nationalities. As many as 72.6 per cent. of Saint Paul's population were children of foreigners. Only 2263 were negroes.

HISTORY. Saint Paul derived its name from a rude log chapel erected near the corner of Third and Minnesota Streets, in 1841, by Father Lucien Galtier, a Catholic missionary sent here by Bishop Loras of Dubuque, who had visited the place in 1839. Previously the site had been known as *hunijska*, the Indian for 'White Rock,' also Saint Peter, from the river at whose mouth it stood, now called the Minnesota. It also bore the name of 'Pig's Eye,' after a certain evil-eyed French voyageur and border ruffian who erected a hut on the site in 1838 and engaged in selling spirits surreptitiously to the Indians and to the soldiers at the fort. The first steamboat visited Fort Snelling in 1823, bringing the Indian agent, Captain Tahaferro. In the next three years no less than fifteen steamers visited the place. The land was opened for settlement in 1837, and the following year Edward Phalen, William Evans, and John Hays, three discharged soldiers from the fort, took up claims in what is now the heart of the city. In 1848 Minnesota was cut from Wisconsin and left without a government. The settlers at Saint Paul called a meeting to assemble at Stillwater, and there it was agreed to ask Congress for a Territorial organization, and a compact was made giving Saint Paul the capital, Stillwater the prison, and Saint Anthony, now East Minneapolis, the university. Saint Paul received its first charter from the Territorial Legislature in 1854, its population then being 3000. Three years later the first constitutional convention met here to draft the present Constitution. Consult: Andrews, *History of Saint Paul* (Syracuse, 1890); Williams, *A History of Saint Paul and of Ramsey County* (Saint Paul, 1876); and Warner and Foote, *History of Ramsey County and City of Saint Paul* (Minneapolis, 1881).

SAINT PAUL DE LOANDA, de Bân'dã, or LOANDA. The capital of the Portuguese West African colony of Angola (q.v.), situated on the coast, in latitude 8° 48' S. and longitude 13° 13' E. (Map: Africa, F 5). Its harbor is rendered inaccessible to large vessels by the sandy bar at its mouth. Its climate is unhealthy. The trade, which exceeds \$5,000,000 per annum, is greatly facilitated by the railway line which connects Saint Paul with the interior. Population estimated at 10,000, including about 2000 whites.

SAINT PAUL'S CATHEDRAL, in London. The largest and most magnificent of all Protestant churches, and the most notable among English buildings of modern times. The site of the present building was occupied about 610 by a Christian church, probably of wood, dedicated to Saint Paul, which was destroyed by fire in 1087. From its ruins arose a much more splendid edifice—the immediate precursor of the present cathedral, and commonly known as 'Old Saint

1532. In 1539 the building suffered severely from fire, but was soon restored with greater magnificence, not finally completed till the latter part of the century. Old Saint Paul's was the largest church in the country, and the cloister was 290 feet square, with a beautiful chapter-house in the centre.

In 1666 the great fire of London destroyed the old cathedral, which had twice previously suffered serious damage from lightning and had fallen into dilapidation. Sir Christopher Wren (qv.) was at first directed to arrange for the repair of the ruined cathedral, but he opposed this course, and it was finally decided to abandon the effort and to clear away the site. The design at first prepared by the architect was disapproved by the clergy, and Wren was finally compelled to prepare a new design more nearly resembling Old Saint Paul's in plan, and this design, having been approved by King Charles II., was carried out, though with many changes of detail. The edifice was begun in 1675 and completed in 1710 under Queen Anne, during Wren's lifetime.

The design thus executed was a compromise, and most of its defects arise from the incompatibility of the mediæval plan forced upon the architect, with its excessive length and small bays, and the Italian or classical style of architecture in which it was carried out. In spite of all defects, however, it is a noble edifice and one of the finest creations of modern times. The spacious rotunda, as wide as the nave and side-aisles together, well suited to accommodate a vast congregation, rests on eight piers, and as many arches alternately of 38 and 22 feet span. It is in the treatment of the smaller or intermediate arches that the chief infelicity of the interior architecture is found, two superposed arches taking up the vertical space occupied by one of the larger arches, but in a manner exceedingly awkward and unsatisfactory. The nearly equal length of nave and choir prevents alike the impression of a long unbroken vista, and of a predominantly central domical structure to which all else is subordinated. The total length is 490 feet; the internal width across the three aisles is 94 feet; the transepts are 240 feet over all (not including their columnar porches); the dome is internally 108 feet in diameter and 216 feet high to the lunette at the crown. Externally the dome is 370 feet high to the summit of the cross.

The constructive skill displayed is of the highest order; particularly bold was the conception of the brick core which envelops the inner cupola and rises high above it to support the stone lantern which crowns the edifice. The inward contraction of the drum, devised partly for structural, partly for artistic reasons, is less successful. The outer shell of the dome is of wood, covered with lead. The effect of this dome is particularly successful, and it is admitted to be one of the finest in existence. It is the earliest example of a dome with a free-standing peristyle around the drum, later imitated in the Pantheon at Paris. The west front, as seen from Ludgate Hill, is most striking; the two campaniles group most harmoniously with the dome, and, together with the portico, produce a most pleasing and refreshing effect. This front is, however, open to criticism, as is also the second story of the flank of the exterior design. Both appear to indicate an upper story where there is none, and the

actual construction and true form of the building are not expressed at all.

Saint Paul's is the burial-place of many heroes and men of distinction, whose tombs are in the crypt, and whose monuments adorn the interior of the cathedral. Among these are Nelson and Wellington, Collingwood, Moore, Howe, and many other celebrated soldiers and sailors; Reynolds, Barry, Opie, West, Sir Christopher Wren, and other distinguished civilians. The style of many of these monuments displays those faults of ostentation and theatrical effect which are common in the sepulchral art of the eighteenth century, but a few among them show genuine artistic merit. Consult: Milman, *Annals of Saint Paul's Cathedral* (London, 1868); Simpson, *Saint Paul's Cathedral and Old City Life* (ib., 1895); Birch, *London Churches of the Seventeenth and Eighteenth Centuries* (ib., 1896); and Dimock, *Handbook of Saint Paul's Cathedral* (ib., 1900).

SAINT PAUL'S SCHOOL. A noted public school in London, England. It was founded in 1509 by John Colet, Dean of Saint Paul's. The first schoolhouse was erected in Saint Paul's churchyard and was destroyed by fire in 1666. It has since been rebuilt, in 1674, and again in 1824. In 1884 new school buildings were erected at West Kensington, a suburb of London, on 16 acres of ground. The school now has an attendance of over 600 boys, taught by 34 masters. The governors offer four exhibitions every year, ranging from £30 to £80, each tenable for four years at the universities of Oxford and Cambridge, and one of £50, at the Royal Academy, Woolwich. In 1900 a scheme for a day school for 400 girls, 39 of whom were to be foundationers, was adopted. Among those who studied at the school were Milton, Judge Jeffreys, the Duke of Marlborough, and Major André.

SAINT PAUL'S SCHOOL. A school for boys at Concord, N. H., incorporated in 1855. The founder was Dr. George C. Shattuck of Boston, who transferred to the trustees his country home with 55 acres of land, near Concord. The first rector was Rev. Henry Augustus Coit, who continued in that position until his death in 1895. The religious teaching and worship are those of the Episcopal Church. Saint Paul's has an active Alumni Association of about 3000, two literary societies, and a missionary society, and maintains a monthly paper, the *Horæ Scholastica*, the oldest school paper in the country. The buildings include a fine Gothic chapel, the Sheldon Library, with shelf room for 40,000 books, gymnasium, laboratory, and dormitories. It has athletic fields covering 70 acres suitably equipped. In 1903 the students numbered 332, and the library contained 16,000 volumes.

SAINT PETER. A city and the county-seat of Nicollet County, Minn., 75 miles southwest of Minneapolis; on the Minnesota River, and on the Chicago and Northwestern Railroad (Map: Minnesota, E 6). It is the seat of Gustavus Adolphus College (Lutheran), opened in 1876, and has a State Hospital for the Insane and a public library. Saint Peter is the commercial centre of an agricultural and lumbering region. Its industrial plants include a flouring mill, furniture factories, shirt and trouser factories, grain elevators, bottling works, woolen mills, etc. The government is vested in a mayor, chosen annually, and a council. The water works and electric-light plant are

ST. PAUL'S CATHEDRAL, LONDON

owned and operated by the municipality. Settled in 1854, Saint Peter was incorporated in 1858 and received a city charter in 1891. Population, in 1890, 3671; in 1900, 4302.

SAINT PETER PORT, commonly **SAINT PETER'S**. The chief town of Guernsey, Channel Islands (q.v.), defended by Fort George, on an overhanging hill, and by the historic Castle Cornet, built on a rocky islet now connected with the mainland by a breakwater (Map: France, D 2). The town rises in picturesque terraces on the east coast, and from its central position commands fine views of all the Channel Islands and the neighboring French coast. It carries on an important English and foreign trade, especially in locally grown market produce and fruit, and has commodious harbors with floating dock and building yard. The fine parish church is called the cathedral of the Channel Islands. Elizabeth College is a well-known educational establishment, and there are excellent markets, bathing places, parks, esplanades, and a well-equipped public library with museum, art, and technical schools. Population, about 18,000.

SAINT PETERSBURG. A government of Russia, bounded by the Government of Olonez, Lake Ladoga, and Finland on the north, Novgorod on the east, Pskov on the south, and Lake Peipus, Esthonia, and the Gulf of Finland on the west (Map: Russia, C 3). Area, 17,250 square miles, exclusive of the water area. The surface is mostly low. In the south are many lakes, streams, and marshes. The region is well watered along the boundaries as well as in the interior, the principal rivers being the Narova, the Neva, and the Volkhov. There is also an extensive canal system. (See *ЛАДОГА*.) The climate is moist and unsteady. The economic activity of the government is influenced greatly by the capital and the numerous summer resorts. The raising of cereals is inferior in importance to the gardening and dairying, and there are few manufacturing industries outside of the capital and Kronstadt. Population, in 1897, 2,107,691, including a considerable number of persons belonging to the Finnie race, besides German colonists, Jews, Poles, and various foreign elements.

SAINT PETERSBURG. The capital of the Russian Empire, situated on the delta of the Neva and at the eastern end of the Gulf of Finland, 400 miles northwest of Moscow (Map: Russia, D 3). The main part of the city lies on the left bank of the river. The remaining portion occupies the numerous islands formed by the arms of the stream. The principal islands are the Vasilyevsky, Peterburgsky, Aptekarsky, Petrovsky, Kamenny, Yelagin, and Krestovskiy. All of them are very low and steadily gaining in area owing to the gradual rising of the coast around the Gulf of Finland. The low situation of Saint Petersburg makes it liable to frequent inundations, caused usually by strong western winds, which prevent the discharge of the waters of the Neva. The construction of canals and the granite embankments have greatly alleviated the situation. The Neva and its arms and tributaries are spanned by numerous bridges, of which the most prominent are the Troitsky, the Alexander, the Palace, and the Nicholas.

The climate is very changeable, and on the whole unpleasant. The severe periods of cold during the winter are varied by warm westerly

gales, which raise the mean temperature above that of Moscow. The summers are hot and short, and the autumns are usually cold and damp. The mean temperature is about 15° F. in winter and about 65° in summer. The percentage of cloudiness is nearly 70.

TOPOGRAPHY. The main part of the city, on the left bank of the Neva, is regularly laid out in modern European style. Along the river are situated palaces and costly private residences, as well as the imposing Admiralty, surrounded by a beautiful garden. From the Admiralty, which stands in the centre of the city, radiate three long avenues: the splendid and fashionable Nevsky Prospect, the Voznessensky Prospect, and the Gorokhovaya Street. The principal squares of this part of Saint Petersburg are the Senate Square, with the famous equestrian statue of Peter the Great erected by Catharine II. in 1782; the Palace Square, with the Alexander Column—a great monolith of red granite, surmounted by the figure of an angel; and the Field of Mars, an immense parading ground embellished with a statue of Suvoroff. The pretentious monument to Catharine II. stands in front of the Amitchkoff Palace, and the equestrian statue of Nicholas I. in front of the Mariynsky Palace. In its architecture Saint Petersburg presents few striking features, although some of its palaces and churches are imposing in appearance.

The impressive Cathedral of Saint Isaac (1768-1858) is built in the shape of a Greek cross with gilded cupolas, magnificent peristyles, and fine columns of porphyry, malachite, and lapis-lazuli. Other prominent churches are the Cathedral of Our Lady of Kazan (1801-11), an imitation of Saint Peter's, with a richly ornamented interior, and the Cathedral of Saints Peter and Paul (1712-33), in the fortress of the same name, and containing the remains of the Russian monarchs since the time of Peter the Great; and the Alexander Nevsky Monastery in the eastern part of the city, the burial place of many of the most prominent literary men, composers, and artists of Russia.

Of the well-known palaces of Saint Petersburg (some of which contain extensive art treasures), the most notable is the Winter Palace—a vast structure of mixed style, facing the Neva. It dates from the reign of the Empress Elizabeth (1741-62), and was rebuilt after the fire of 1837. It contains a number of magnificent halls, decorated with war trophies, portraits of famous generals, and historical paintings. Other interesting palaces are the Amitchkoff, the residence of the heir apparent, the Mikhailovskiy, the Marble Palace, and the Taurida Palace, built by Catharine II. for Potemkin. Noteworthy public buildings besides the Admiralty are the General Staff, the Senate, the Gostimiy Dvor, and the old Mikhailovskiy Palace (now used as a school of engineers).

Connected with the mainland by the Troitsky Bridge is a small island occupied by the renowned fortress of Saints Peter and Paul, the nucleus of the capital and used as a State prison. On the Vasilyevsky Island are the exchange and the most important educational institutions, including the university. The Peterburgskiy Island is principally a residential section. The Aptekarsky Island has magnificent

and the islands. The remaining islands are covered with numerous parks and private gardens and have many summer residences. There are a number of summer resorts along the right bank of the Neva, while the mainland north of the main arm of the Neva is occupied by industrial establishments and workmen's dwellings.

Saint Petersburg has a unique system of markets and trading centres, in which nearly all of the retail trading is carried on. There are twelve of the former and two of the latter, all belonging to the city and constituting a source of profit to the municipal treasury. In the two trading centres called Gostinny Dvor and Apraxine Dvor, well known all over Russia, clothing and footwear are chiefly sold. In the markets all sorts of food-stuffs constitute the chief article of trade.

EDUCATIONAL INSTITUTIONS, COLLECTIONS, AND CHARITIES. Saint Petersburg is the intellectual centre of Russia. It is more influenced by Western civilization than any other part of Russia. Besides the university (see SAINT PETERSBURG, UNIVERSITY OF) there are the Technological Institute, the Military Academy of Medicine, the Military Academy of Law, the Nicholas Military Academy, the institutes of forestry, mining, and civil engineering, the Imperial Historico-Philological Institute, the Alexander Lyceum, the Greek Orthodox and Roman Catholic academies, the 'corps of pages,' and the archaeological institute.

There are also institutions for the higher education of women in medicine and philosophical and exact sciences. Among the special schools mention should be made of the conservatory of music, founded and directed for some time by Rubinstein. The Imperial Public Library (1,330,000 volumes and some 27,000 manuscripts) is inferior in size only to the Bibliothèque Nationale and the British Museum. Its nucleus is the Zaluski Library, which was seized by Suvaroff at Warsaw in 1794. Other important libraries are those of the Academy of Sciences (about 400,000 volumes and 13,000 manuscripts) and the Asiatic Museum. There are also a number of interesting archives in charge of the Holy Synod and the various Ministries. The Hermitage contains one of the most prominent galleries of paintings in the world. There are about 1700 canvases. The Flemish and Dutch schools (including about 40 Rembrandts), the Spanish collection (with especially the works of Velazquez and Murillo), and the French school, with its Claudes, are richly represented. The Hermitage has also an important collection of sculptures, an extensive collection of Scythian, Greek, Egyptian, Assyrian, and Russian antiquities, collections of engravings and coins, and a valuable library. The Academy of Art contains a valuable array of Russian paintings and works of modern French landscapists. The Alexander III. Museum, opened in 1895, is devoted chiefly to old Christian and old Russian works of art. The most noteworthy of the scientific organizations are the Academy of Sciences, to which are attached the observatories at Pulkova (q.v.) and Vilna, and the botanical gardens, the Russian Geographical Society, with branches in Siberia and the Caucasus, the Russian Historical Society, the Archaeological Society, the Physico-Chemical Society, and the Free Economic Society.

There are over 300 philanthropical societies,

maintaining more than 600 charitable institutions, including about 150 asylums for children, 90 poorhouses, and about 100 dispensaries and nurseries; also model tenements, lodging houses, etc. The hospitals are maintained mostly by the central Government and the municipality.

COMMERCE AND INDUSTRY. The capital forms with its suburbs one of the largest manufacturing centres of Russia, being inferior only to the industrial region of Moscow. Of special importance are the textile, metal, and rubber industries. Important also are the tobacco, leather, and various stone products. In 1898 the large industrial interests were represented by over 90 stock companies, with an annual output of over \$100,000,000. These, however, indicate only a part of the industrial activity, since there are a very large number of small industrial establishments, engaged mostly in the production of food products, articles of apparel, small metal and woolen wares, leather goods, etc.

In the early part of the nineteenth century Saint Petersburg had over 50 per cent. of the total foreign trade of Russia. During the last quarter of the nineteenth century the total trade of Saint Petersburg absolutely decreased, although the imports show a considerable absolute increase. For the two years of 1883 and 1898, for instance, the exports amounted approximately to \$62,000,000 and \$47,000,000, and the imports to \$46,000,000 and \$73,000,000 respectively. The principal exports are agricultural and dairy products and lumber; the imports are composed of coal, metals, various foodstuffs, and manufactures. By the construction of the sea canal to Kronstadt the port of Saint Petersburg has been made accessible to the largest vessels. The incoming shipping of these two places in 1899 amounted to over 1,600,000 tons. Only about 5 per cent. of the vessels carried the Russian flag. Saint Petersburg is the strongest financial centre of Russia, and an important one in Europe. Its principal financial concerns are the Imperial Bank, the International Commercial Bank, and the Saint Petersburg Discount Bank.

ADMINISTRATIVE AND MUNICIPAL FUNCTIONS. The administration is largely in the hands of the central Government. There is, however, a municipal council elected by a very small number (about 7000) of property-owners for four years. The municipality and the central Government own most of the public utilities, including the water-works (which have lately been provided with a filtering plant), the street railway lines, the ferries, docks, and harbors, and the telephone lines. The street cleaning is only done in part by the city, and the sewerage is far from adequate. Electricity is used only to a limited extent. There are as yet no electric or cable street railways. The annual budget balances at over \$9,000,000. The revenue is derived principally from taxes on real estate and on business, and from the income on municipal property and undertakings. The principal expenditures are on education, service of the debt, maintenance of public works, and charities.

POPULATION. The population increased very rapidly during the nineteenth century. In 1800 it was 220,000; in 1864, 539,122; in 1897, 1,132,677; and in 1900, 1,248,739. It is now (1903) estimated at over 1,500,000. The suburbs, which are economically dependent on the city, had a

population of 190,635 in 1900. Some peculiar features of the population are the large proportion of persons born outside of the city (about two-thirds of the total), the excess of the male sex (19.5 per cent. in 1897), and the predominance of the peasant class, which constituted over one-half of the total in 1897. The Russians form about 90 per cent. of the population. The death rate was 27 per thousand in 1886-95 and 24 in 1897. The percentage of illegitimate births is very great (27.7 per cent.).

HISTORY. In 1300 the Swedes founded at the mouth of the Neva the settlement of Landskrona, which was destroyed by Novgorod (q.v.) in the following year. During the fourteenth century a number of settlements were founded along the river by Novgorod. The territory remained in the possession of that city and later of Moscow until the seventeenth century, when the Swedes succeeded in recovering the region around the mouth of the Neva, and founded the town of Nyön, at the junction of the Okhta with that river, and the fortress of Nyönshanz on the opposite shore. In 1703 the fortress was taken by Peter the Great, who in the same year laid the foundations of the fortress of Saints Peter and Paul, the nucleus of the future capital. The foundation of Saint Petersburg marked a revolution in the history of Russia, as it signaled the definite assumption by that Empire of a place among the Baltic Powers, and its entrance upon the stage of Western politics. With his usual directness and energy Peter I. divided the supervision of the work of building the city between himself and his lieutenants, and by 1712 sufficient advance had been made to permit the transfer of the royal family from Moscow. Thousands of peasants were ordered from the rural districts to the new capital, and a special tax was imposed to meet the expenses. A scarcity of masons was met by an order forbidding the erection of stone buildings throughout the rest of the Empire, and all proprietors of over 500 serfs were compelled to build residences in the new capital and spend the winter season there. During the reigns of Catharine I. and Peter II. the Russian population of the capital decreased considerably. Anna Ivanovna revived many of the measures of Peter I., and Elizabeth Petrovna, following the policy of her predecessor, greatly increased the population of the capital and added much to its architectural beauty. Catharine II. also took great interest in the growth of Saint Petersburg, and enriched it by many beautiful palaces, some of them intended for her favorites.

Consult: Haffner, *Petersburg in seiner Vergangenheit und Gegenwart* (Saint Petersburg, 1866); Elaroff, *Saint-Petersbourg et ses environs* (ib., 1892).

SAINT PETERSBURG, DECLARATION OF. An agreement between the Great Powers by which harsh conditions of war were to be mitigated. In December, 1868, a conference of delegates representing Austria-Hungary, Bavaria, Belgium, Denmark, France, Great Britain, Greece, Italy, the Netherlands, Persia, Portugal, the North German Confederation, Russia, Sweden, Norway, Switzerland, Turkey, and Württemberg was held at Saint Petersburg, upon the invitation of the Russian Government, for the purpose of considering the existing rules of war with the view of ameliorating the hardships of

warfare. A declaration was agreed upon and signed by the delegates present affirming that the only legitimate object of war should be to weaken the military force of the enemy, which could be sufficiently accomplished by disabling the greatest possible number of men, which object is exceeded by the employment of arms that uselessly aggravate the sufferings of disabled men or render their death inevitable. The employment of such arms was declared to be contrary to the laws of humanity in view, and consequently the signatory Powers agreed to renounce in case of war among themselves the use of any explosive projectile of less weight than 400 grams (14 ounces avoirdupois) or one charged with fulminating or inflammable substances. The United States took no part in this convention, and has never acceded to it.

SAINT PETERSBURG, UNIVERSITY OF. An institution which had its inception in the teachers' institute established under Catharine II., although Peter the Great previously planned the establishment of a university in his new capital. In 1803 the budget for a contemplated university was confirmed by Imperial edict. The teachers' institute was known as the 'Pedagogical Institute' from 1804 to 1816, when it was reorganized as the 'Higher Pedagogical Institute,' with 27 teachers, divided into the sections of philosophy-jurisprudence, physics, mathematics, and history-literature. At the same time it received the right to confer degrees, thus placing it practically on a university basis. In 1819 an Imperial edict transformed the institution into a university. In 1902 the university consisted of the following faculties: (1) History-philology, (2) physics-mathematics, (3) law, and (4) Oriental. The attendance was 3775. The library contained 144,574 volumes, 306,727 pamphlets, and a collection of 9349 manuscripts, including a large number on Chinese literature. The university includes, among other institutes, the Museum of Fine Arts and Antiquities, a large collection of coins, astronomical and meteorological observatories, and a botanical garden.

SAINT PETER'S CHURCH (at Rome). The largest Christian place of worship. It is closely connected with the Palace of the Vatican and in this capacity it has always been used, especially for the great festivities of the Church. The present church succeeded the Basilica of San Pietro in Vaticano, one of the original basilicas of Rome and the largest of all. This is still the official title of the church, and distinguishes it from the other churches in Rome which are dedicated to Saint Peter. The plan and general character of the old basilica are preserved in the drawings engraved for the folio volume prepared to illustrate Bunsen's *Die Basiliken des christlichen Rom* (1843). It was a five-aisled basilica, with a large forecourt or atrium, and a baptistery and some other minor structures attached to the building. During the long residence of the popes at Avignon (1309-1376) the basilica was much defaced and partly ruined, and it appears to have been about 1450 that Pope Nicholas V. undertook the rebuilding in the taste of the time. A design was made by Bernardo Gambarelli, more commonly called Rossellino, but of this design very little was ever put into execution.

The first pope to take up the work with vigor was Sixtus IV. (1471-1484), who employed Bramante to make an entirely new design for the church. His design is preserved; it includes a great central cupola around which the nave and aisles are grouped. He died in 1514, and his successor as chief architect was Raphael, having as his immediate assistants the able architects Giuliano da San Gallo and Baldassare Peruzzi (q.v.). It seems that they changed the plan to a Latin cross. In 1546 the work was put into the hands of Michelangelo Buonarroti, who returned to the Greek cross, and followed Bramante's main lines of the work, building upon the great piers of the earlier architect. (See MICHELANGELO.) He carried up the vaults and pendentives and all that even now exists leading up to the great cupola, and he made during his lifetime a model in wood of the cupola itself, which is preserved, and which was very closely followed in the actual construction. Until his death in 1564 Michelangelo controlled the work. The cupola seems to have been completed about 1590 under the direction of Giacomo della Porta and Domenico Fontana. The final dedication of the church was in 1626. The great colonnades inclosing of Piazza di San Pietro, one of the most effective compositions of the late neo-classic style, was carried out by Bernini (q.v.) about the middle of the seventeenth century.

The entrance front, which in this church faces the east instead of the west, as is more usual, had not been carried very far. This unfortunate neglect made it the more easy for Carlo Maderna to undertake his final and most unfortunate changes. Appointed architect in 1605, he returned to the idea of the Latin cross, which always had many friends among the clergy for ritualistic reasons. The addition made in this way to the church is in itself an enormous building. Carlo Maderna's front, on the Piazza di San Pietro, is not at all a fine design; architects of all schools are agreed upon that; but it could be endured as a tolerable piece of the *decadenza*. The serious mischief done is this, that one has to be half a mile from the church in order to see the cupola aright from the east. The great Piazza di San Pietro, about one thousand feet long, does not give nearly sufficient opportunity to retire from the front in order to see the cupola. Thus the most important part of the church can only be seen aright by him who will pass around to the west and northwest of the church and get permission to enter the Papal gardens there. From a point well chosen in that region the huge cupola rises from its substructures, themselves enormous in scale, and the whole group, the mass, the artistic conception embodied in these enormous combinations of cut stone is in its main outlines one of the finest conceptions of modern times.

The interior of the church is disfigured by exaggerated ornamentation and with strong contrast of light and dark. Thus when one enters the church for the first time the most plainly visible thing is apt to be the adornment of the great piers by cartouches, picked out in strong contrast of light and shade on the dark marble surface. In ways like this the great proportions of the building are dwarfed, and to this is to be added the natural acceptance of the clas-

sic system of proportion, in which the architectural members are always of the same relative size, so that a single acanthus leaf in the capitals of the nave may be five feet long. The proportions of the interior, though far from perfect, are, on the whole, however, still to be received as in accordance with a fairly rational architectural tradition. The church grows on the spectator continually, and the effect of the great cupola when seen from within is one of the most striking and most charming pieces of architectural decorative work in existence.

The church is crowded with altars, mosaics, tombs, shrines, statues, fountains, and other works of art, inasmuch that it forms a museum of the sculpture and the architectural decorative work of three centuries. The most prominent of the accessory structures inside the church is the great bronze Baldacchino, as lofty as most church towers, and covering the high altar. Beneath this is a shrine or confessionary. The crypt has been carefully guarded through all the change of plan and through the centuries of constantly renewed work on the building. It contains many precious monuments and fragments of the original Basilica of Saint Peter, of which it marks the level, ten or twelve feet below that of the modern church. Consult: Geymüller, *Les projets primitifs pour la basilique de Saint Pierre de Rome* (Paris, 1880); De Lorbac, *Saint Pierre de Rome* (ib., 1879); and Letarouilly, *Le Vatican et la basilique de Saint Pierre à Rome* (ib., 1882).

SAINT PETER'S COLLEGE. A college at Cambridge, England, commonly called Peterhouse, the oldest college in the university. It was founded in 1284 by Hugh de Balsham, Bishop of Ely, for a master and fourteen fellows. It was the outgrowth of an attempt by the Bishop to introduce certain secular scholars into the Hospital of Saint John in 1280. This ended in the transfer of those scholars to certain hostels near the Church of Saint Peter, which was appropriated to the new foundation, and gave it the name it bears. (See SAINT JOHN'S COLLEGE.) Peterhouse consists of a master and ten fellows, lecturers, tutors, and officers, honorary fellows, twenty-two scholars, and six exhibitioners, and some sixty undergraduates in all. There are eleven livings in the gift of the college.

SAINT-PIERRE, sān'pé'är'. A seaport on the southern coast of the French island of Réunion (q.v.), connected by rail with Saint-Denis, the capital. It has lost its commercial importance since the opening of the Port des Galets, but has a number of sugar mills and canning establishments. Population, 27,520.

SAINT-PIERRE. Previous to 1902 the most important city on the island of Martinique (q.v.), French West Indies (Map: Antilles, R 7). It lay at the head of an open bay on the northwest coast of the island, and at the foot of Mont Pelée. It was an attractive and well-built town, and had a cathedral, a college, a fine botanical garden, a theatre, and several handsome public buildings. The harbor was an open roadstead, but the town had considerable commerce, the exportation of sugar and rum being especially important. The population in 1901 was 26,011.

On May 8, 1902, the entire city and the neighboring hamlets were destroyed by an explosive

ST. PETER'S CHURCH AND PART OF THE VATICAN
FROM A PHOTOGRAPH

eruption of Mont Pelée. (For a description of the volcano and the nature of the eruption, see PELÉE, MONT.) As only a few of the inhabitants had taken warning from the activity of the volcano on the preceding days, practically the entire population of the city perished, the number of victims, including those in the surrounding districts, being estimated at 30,000. Only two persons actually in the city at the time of the eruption escaped death, one being a prisoner in the city jail.

SAINT-PIERRE, JACQUES HENRI BERNARDIN DE (1737-1814). A French novelist, essayist, and engineer, born at Havre, and educated at Caen. He made a voyage to Martinique, became an engineer, entered the army, was dismissed for insubordination, and for some years led a wandering life, appearing at Malta, Saint Petersburg, Warsaw, Dresden, and Berlin. In 1765 he went to Paris and essayed literary work, but in 1768 he obtained a Government post in Ile de France, where he remained till 1771. On his return he associated much with Rousseau, on whom he modeled his character and his style. For the rest of his life he remained in France, publishing *Voyage à l'Île de France* (1773), *Études de la nature* (1783-88), *Paul et Virginie* (1787), and *La chaumière indienne* (1790). His *Harmonies de la nature* appeared posthumously. In 1792 he became superintendent of the Botanical Garden of Paris. He was professor of morals at the Normal School in 1794 and became a member of the Institute in 1795. Saint-Pierre's significance lies solely in the realm of imagination and sentiment, which is often childlike, sometimes childish. *Paul et Virginie* came at the right moment. Cloyed with wit, the Parisian literary generation of that time sought refuge in feeling. Saint-Pierre entered into the heritage of the novelist Rousseau, receiving and transmitting more of his romantic sentiment and sympathy with nature than any other. *Paul et Virginie* attempts to realize Rousseau's 'state of nature' in a tropical Arcadia, and the death of the heroine comes just in time to save the idyll of innocent childhood from the sickly sentimentality on whose verge it often hangs trembling. Stylistically, Saint-Pierre's influence has been very great. He was the first in France to treat landscape, with intent, as the background of life. Saint-Pierre's *Works and Correspondence* were edited with a *Life* by Aimé Martin, who married his widow (Paris, 1818-20). Consult: Ezeure, *Bernardin de Saint-Pierre* (ib., 1891); Maury, *Étude sur la vie et les œuvres de Bernardin de Saint-Pierre* (ib., 1892); and Arvède Barine, *Bernardin de Saint-Pierre* (ib., 1891, Eng. trans., Chicago, 1893).

SAINT-PIERRE, JACQUES LEGARDEUR DE (1698-1755). A French soldier and explorer, born in Normandy in 1698. He entered the French service as an ensign of marines, and was shortly afterwards sent to Canada. In 1750 he was sent to explore the Northwest and to search for a route to the Pacific. He ascended the Saskatchewan River to a place he called 'Rock Mountain,' and there built Fort La Jonquière. Soon after his return he was ordered to the Ohio Valley region, and in 1754 was commander of Fort Le Beuf on French Creek. In the following year Saint-Pierre commanded the Indian allies in Dieskan's expedition into New York, and was

killed in the battle of Lake George. An account of his explorations in the West, entitled *Journal du sieur Maury du voyage de Jacques Legardeur de Saint-Pierre, chargé de la découverte de la Mer du Nord*, is preserved in the British Museum, and was published in the collection of John Gilmary Shea (New York, 1862). Consult also Parkman, *A Half-Century of Conflict* (Boston, 1892; later ed. 1897).

SAINT-PIERRE AND MIQUELON, *san'pî-er' and mi-ke-lon'*. A French colony, 47 miles off the southern coast of Newfoundland, consisting of the three islands of Saint Pierre, Ile aux Chiens, and Miquelon, with a total area of 93 square miles (Map, Newfoundland, D 6). They are rocky and barren, but are of great importance as the centre of the French cod-fisheries. In 1901 the industry engaged over 3600 persons, and the exports of fish and fish products amounted in the same year to over \$2,000,000. The imports nearly equaled the exports. Saint Pierre, the capital, has cable connection with Europe and America, and regular steam communication with Boston and Halifax. The colony is administered by a Governor and is represented by a Deputy in the French Chamber. Population, in 1897, 6352, including over 700 British subjects. The islands were ceded to Great Britain by France together with Newfoundland in 1713, but were recovered at the conquest of Canada, and after changing hands several times finally returned to France in 1816.

SAINT-POL-DE-LÉON, *san'pôl-de-lé-on'*. A town in the Department of Finistère, France, half a mile from its port, Rempoul, on the English Channel, and 13½ miles by rail northwest of Morlaix. It is noted for a Romanesque Gothic cathedral dating from the twelfth century, with two granite spires 180 feet high, and for the fourteenth-century Chapelle de Notre Dame de Creizker, with a fine central tower and spire 252 feet high, and other interesting features. The town was an episcopal see from the sixth century until the suppression of the bishopric in 1790. Population, in 1901, 7846.

SAINT-PORCHAIRE, *pâr'shâr'*. POTTERY OF. A famous ware first examined and recorded about 1830, and entitled 'Faïence Henri Deux,' because of the occurrence in its ornamentation of the letter 'H' and crescents which were supposed to be the badge of Diane de Poitiers. Only about fifty-three pieces are known to exist, of which one or two are in Russia and the remainder are about evenly divided between France and England. The South Kensington Museum and the Louvre Museum, as also the Musée de Cluny in Paris, contain each several perfectly representative specimens.

The peculiarity of the pottery is that its decorations are almost entirely by incrustation, pieces of dark red or dark brown clay inlaid in the yellowish white of the body. The shapes have been cut out by little dies strongly resembling bookbinders' stamps, and after the incrustation has been made, the whole has been brought to a smooth surface and covered with a thin transparent glaze. Enamels are used with great moderation.

SAINT-PRIVAT, *pré'vá'*. BATTLE OF. A name often given to the battle of Gravelotte (qv.).

SAINT-QUENTIN, kân'tân'. The capital of an arrondissement in the Department of Aisne, France, 25 miles north by east of Paris, on the Somme River (Map: France, K 2). One of the chief attractions of the town is the Church of Saint Quentin, which dates from the twelfth century. It is a Gothic structure, and is especially noted for its highly adorned interior. The Hôtel de Ville, a fourteenth-century edifice, with its curiously constructed council hall, is also noteworthy. Saint Quentin is of considerable industrial importance and the surrounding region, too, has large manufacturing interests. The leading products are cotton and woolen textiles, sugar, engines, billiard balls, machinery, etc. Population, in 1901, 50,278. The Roman name for Saint Quentin was Augusta Veromanduorum. It suffered greatly from the attacks of the Northmen during its early history. Here on August 10, 1557, the Spaniards under Emmanuel Philibert of Savoy won a great victory over the French under the Constable de Montmorency, and here, on January 19, 1871, the Prussians administered a crushing defeat to the French under Faidherbe.

SAINT RE'GIS. A settlement of Catholic Iroquois on the south bank of the Saint Lawrence River, on both sides of the boundary line between Canada and the United States, being partly in Huntingdon County, Quebec, and partly in Franklin County, New York. The Iroquois name is Akwesasne. The village was established about the year 1755 by a party of Catholic Iroquois from Caughnawaga, Quebec. Being chiefly of Mohawk descent, the Indians all speak that language. They are expert basket-makers, and neglect farming for that industry, which proves quite remunerative. They number in all about 2500, of whom 1320 are on the Canadian side.

SAINT RO'NAN'S WELL. A novel by Scott (1824), a picture of life at a small watering-place, with Clara Mowbray's tragic story as a background. Its best feature is the character of Meg Dods, the innkeeper.

SAINT-SAËNS, sän'sän', CHARLES CAMILLE (1835—). A French composer, born in Paris. At the age of seven he became a pupil of Stamaty (piano); in 1847 he joined Benoit's class at the Conservatory, and in 1849 won the second and in 1851 the first organ prize. He competed unsuccessfully for the Prix de Rome, but secured the appointment of organist of the Church of Saint Méry (1853), resigning it in 1858 to become organist of the Madeleine. After 1870 he devoted himself entirely to composition, concert, and recital work. His first important compositions were the symphonic poems, *Phaëton*, *Le rouet d'Omphale*, *La jeunesse d'Hercule*, and *La danse macabre*, which last was especially popular. His operas have been the least successful of all his works, although they bear strong evidence of his originality and genius. With Massenet he has shared the reputation of being the most classical French composer of his generation. His instrumentation, which shows the influence of Berlioz, is strikingly brilliant and original. In 1881 he became a member of the Institute. In 1894 he was made a commander of the Legion of Honor. His works include (besides those already mentioned) the operas, *La princesse juive* (1872); *Le timbre d'argent*

(1877); *Samson et Dalila* (1877); *Etienne Marcel* (1879); *Henry VIII.* (1883); *Proscrit* (1887); *Ascanio* (1890); *Phryné* (1893); *Préfigonde* (first three acts by Guiraud, last two by Saint-Saëns, 1895); ballets and incidental music; three symphonies, the one in C minor declared by Lavignac to be the finest example of orchestration ever written; several oratorios, concertos for piano and other instruments, chamber music, songs, and church music.

SAINTS'BURY, GEORGE EDWARD BATEMAN (1845—). An English critic and literary historian, born at Southampton, October 23, 1845; educated at King's College School, London, and at Merton College, Oxford. He was classical master in Elizabeth College, Guernsey (1868-74), and head master of Elgin Educational Institute (1874-76). He settled in London as a journalist and miscellaneous writer (1876-95), and was appointed professor of English literature in the University of Edinburgh (1895). Saintsbury shows a wide knowledge of literature, foreign as well as English, and his judgments, based on sound principles, are expressed in a very readable style. Among his numerous publications are a *Primer of French Literature* (1880); *Dryden*, in "English Men of Letters" (1881); *Short History of French Literature* (1882); *Marlborough* (1885); *Elizabethan Literature* (1887); *Essays in English Literature, 1780-1860* (first series, 1890; second series, 1895); *Essays on French Novelists* (1891); *Nineteenth Century Literature* (1896); *The Flourishing of Romance and the Rise of Allegory* (1897); *Sir Walter Scott* (1897); *A Short History of English Literature* (1898); *Matthew Arnold* (1899); the exhaustive *History of Criticism and Literary Taste in Europe* (1900 et seq.); and *The Earlier Renaissance* (1901).

SAINT-SERVAN, sër'vä'n'. A seaport in the Department of Ille-et-Vilaine, Northern France, less than a mile from Saint Malo (Map: France, E 3). It is mostly a modern town with a handsome town hall and a triangular tower of the seventeenth century. Population, in 1901, 12,597.

SAINTS' EVERLASTING REST, THE. A religious work by Richard Baxter (1650), used by many generations as a devotional book. Its clear and beautiful style, little antiquated by the lapse of two hundred years, and the manly vigor of its piety have made it an English classic.

SAINT-SIMON, sän'sé'môn', CLAUDE HENRI, Comte de (1760-1825). A French socialist. He entered the army at sixteen, and came to America, where he served with distinction in the campaign against Cornwallis. On his return to France he was made colonel, but in 1785 he resigned from the military service and traveled extensively in Holland and Spain. He had already conceived his mission in life to be "to study the progress of the human mind in order to work thenceforth for the perfecting of civilization." He took little part in the great Revolution of 1789, but, though a noble himself, voted to abolish titles of nobility. He made a considerable fortune during this period by purchasing the confiscated estates of the émigrés. About this time he contracted a marriage which proved unhappy and was afterwards dissolved. His fortune was soon exhausted by his extravagant mode of living,

and he was obliged to work as a copyist. Ill health compelled him to give up even the pittance he could earn in this way, and he found himself reduced to a condition of abject poverty. His family finally settled upon him a small pension. In 1823 he attempted suicide. Supported by his friends, he devoted himself again to his propaganda, and succeeded in gaining numerous disciples, the most famous of whom were Augustin Thierry and Auguste Comte. He died in 1825.

The chief doctrines of Saint-Simon are as follows: (1) The rules of science should be applied as rigorously to the study of social facts as to the study of facts of a physical nature. (2) Through true science thus applied, the condition of humanity, and especially of the poorest class, can be improved, mentally, physically, and morally. (3) To industry—the *ensemble* of producers—should be given the political power heretofore held by the proprietary and military classes. (4) Society should be reorganized, taking labor for the basis of the entire hierarchy. (5) To this new society only producers should be admitted, and idleness should be proscribed. "No man has a right to free himself from the law of labor." (6) In this society workers should be rewarded according to merit. (7) Laborers must unite and centralize their social forces in order to attain their common end. (8) The three institutions—religion, the family, property—must all be reorganized upon new bases. These doctrines were further developed by the followers of Saint-Simon into the social philosophy called after its founder Saint-Simonianism. This school of socialism insists especially upon the abolition of the law of inheritance, upon the socialization of the instruments of production, and upon a system of distribution based upon the merits of the individual.

The following are the principal works of Saint-Simon: *Lettre d'un habitant de Genève à ses contemporains* (1802); *Introduction aux travaux scientifiques du XIX^e siècle* (1807); *Réorganisation de la société européenne* (1814); *L'industrie, ou discussions politiques, morales et philosophiques* (1817); *Du système industriel* (1821-22); *Catéchisme des industriels* (1822-23); *Opinions littéraires, philosophiques et industrielles* (1825); *Nouveau christianisme: dialogue entre un conservateur et un novateur* (1825); *Exposition de la doctrine de Saint-Simon* (1830-32). His complete works have been collected and comprise 19 of the 47 volumes entitled *Œuvres de Saint-Simon et d'Enfantin* (Paris, 1865-78).

SAINT-SIMON, LOUIS DE ROUVROY, Duke of (1675-1755). A noted French writer of memoirs. He was carefully trained, entered the army in 1692, resigned his army commission in 1702, and repaired to the Court of Louis at Versailles. He had considerable diplomatic aptitude, and in 1704 he proposed a method of ending the Spanish War of Succession, which formed, in part, the basis

for the Treaty of Utrecht. After Louis XIV.'s death (1715) Saint-Simon had a seat in the Council of the Regency, and was instrumental in the degradation of Madame Montespan's sons, the Duke of Maine and his brother (August 26, 1718), an event to which he devotes seventy-seven pages of his *Mémoires*. He was sent in 1721 on an embassy to Madrid to ask the hand of the Infanta for Louis XV. In 1723 he left Versailles for his country seat at La Ferté, near Chartres, where he passed his remaining years. Saint-Simon's *Mémoires*, written from memoranda begun about 1699 and developed into notes (1734-38), were given their final form from 1739 to 1752, and impounded for the Foreign Office in 1761. Charles X. gave the manuscript to General de Saint-Simon, and an edition appeared in 1830, followed by Chénel's (30 volumes) in 1856, and by Boislisle's final and full edition (30 volumes), begun in 1871. The preliminary notes for the *Mémoires* were made in an interlarded copy of Dangeau's *Journal*, and were printed in 19 volumes in 1854. Other manuscripts of Saint-Simon were locked in the Foreign Office till 1880, when those concerning the Spanish Embassy were printed. Eight more volumes appeared in 1890-92, but the *Mémoires* are alone of striking interest. They are, as Saint-Simon calls them, "straightforward, truthful, candid, inspired with honor and integrity," though often misinformed and distorted by prejudice, for Saint-Simon was a vigorous hater, with a certain puritanic sternness that could grow fierce at the persecution of the Huguenots, pitiful over the sufferings of the peasantry, and bitter over the infamies to which in his view Madame de Maintenon (whom he hated intensely) degraded the Church. He saw behind the sham façade of Louis's grandeur "a reign of blood and brigandage," and he discerned no less clearly the masks of individual character, so that his *Mémoires* afford an inimitable portrait gallery. He writes without art, he is confused, ungrammatical sometimes, yet he makes the reader share in the action as no other memoir-writer has ever done.

BIBLIOGRAPHY. There is an abridged English translation of the *Mémoires* by Bayle Saint John, *The Memoirs of the Duke of Saint-Simon in the Reign of Louis XIV. and the Regency* (London, 1857). Consult also: Collins, *The Duke of Saint-Simon*, in "Foreign Classics" (Edinburgh, 1880); Sainte-Beuve, *Causeries*, vols. iii., xv. (ib., 1857-62); id., *Nouveaux lundis*, vol. x. (ib., 1863-72).

SAINT SOPHIA, Church and Mosque of. A celebrated structure at Constantinople. The first church of this name was built by the Emperor Constantine, on the occasion of the translation of the seat of empire to Byzantium, and is so called as being dedicated to the *Hagia Sophia* (holy wisdom), or the Logos. The building of Constantine was subsequently rebuilt and enlarged by his son Constantius; this second church of Constantius, having been destroyed in 404, was rebuilt by Theodosius the younger in 415; and it lasted unaltered till the battle of the factions of the circus, under Justinian, in 532, in which year it was totally destroyed. The present building is substantially that which was erected by Justinian in expiation of this sacrilege. It was consecrated in 537, and occupied less than seven years in its erection. Ten thousand workmen are said to have been employed

ing. The materials were supplied from every part of the empire, including columns and marbles from pagan monuments. Untold sums were lavished upon its decoration and the sacred furniture with which it was adorned. The church is the masterpiece of Byzantine architecture, and one of the epoch-making buildings of the world. Its architect was Anthemius (q.v.).

The building may be described as a square of 241 feet, forming interiorly a Greek cross, and surrounded in the interior by a woman's choir or gallery, supported by magnificent columns. In the centre rises a dome, supported at the front and back by two great semi-domes, which in their turn rest upon smaller semi-domes, and on the sides by heavy buttresses, the whole presenting a series of unexampled beauty. The height of the dome is 175 feet. The building is approached by a double porch, which is about 100 feet in depth. The whole of the interior was richly decorated with marbles and mosaics. Even in the reign of Justinian, a further reconstruction of the building became necessary, the dome having fallen in in consequence of an earthquake in 558, but this may be said to have been the last important change in the structure within the Christian period of Constantinople.

On the occupation of that city by the Turks in 1453, Saint Sophia was appropriated as a mosque. All its purely Christian fittings and internal structures were swept away. The Christian emblems were either mutilated or covered from view by a coating of plaster. The latter course was adopted throughout the building in the case of mosaic pictures, containing representations of the human figure, which the Koran proscribes as unlawful, and thus the mosaics have in great part escaped destruction. The Sultan Abdul Medjid having ordered a complete restoration of the building, the mosaics were accidentally brought to light, and, with the consent of the Sultan, accurate copies were made of all of these interesting relics of antiquity. The interior of the building at present is restored for Mohammedan worship, the Christian decorations being again carefully covered up. Consult: Salzenburg, *Altchristliche Baudenkmäler Konstantinopels* (Berlin, 1854); Pulgher, *Les anciens églises byzantines de Constantinople* (Vienna, 1878-80); Adamy, *Architektonik der altchristlichen Zeit* (Hanover, 1884); Lethaby and Swainson, *The Church of Sancto Sophia* (London, 1894); and Barth, "Konstantinopel," in *Berühmte Kunststätten* (Leipzig 1901).

SAINT STANISLAS, stán'is-lás, ORDER OF. A Russian order of merit, of Polish origin, having been founded by King Stanislas II. in 1765. After the partition of Poland it lapsed, and was restored in 1815 by the Czar Alexander as King of Poland. The decoration is an eight-pointed red enameled cross with gold eagles between the arms. The white medallion is surrounded by laurel and bears the initials S. S. (Sanctus Stanislas).

SAINT STEPHEN, stē'ven, ORDER OF. A royal Hungarian civil order with three classes, founded in 1764 by Maria Theresa. The King of Hungary is the grand master and only nobles are eligible for membership. The decoration is a green enameled cross with the crown of Saint Stephen, has a red medallion on which is a green mountain with a crown bearing a silver

apostolic cross, and the inscription, *Publicum meritum Præmium*. See Plate of ORDERS.

SAINT THOMAS, tòm'as. An island in the Gulf of Guinea. See SÃO THOMÉ.

SAINT THOMAS. One of the Danish West Indian islands (see WEST INDIES, DANISH), situated 36 miles east of Porto Rico, in latitude 18° 20' N. and longitude 64° 56' W. (Map: West Indies, P. 5). It is about 13 miles long from east to west and covers an area of 33 square miles. It has a hilly surface, and rises in its highest summit, West Mountain, to an altitude of 1555 feet. The principal formations are porphyry and granite. The climate is hot but steady, and the mean annual temperature is 78° F. Earthquakes are frequent. The economic importance of the islands has disappeared with the abolition of slavery (1848), which was essential to the sugar industry. At present the island produces chiefly rum, and is important on account of its situation, which makes it especially suitable for a coaling station. Population, in 1901, 11,012, mostly descendants of negro slaves. English is the predominant language. Capital, Charlotte Amalie (q.v.). The island was discovered by Columbus in 1493; passed to the Danish West India and Guinea Company in 1671; and was taken over by the Crown in 1754.

SAINT THOMAS. Capital of Elgin County, Ontario, Canada, a railway junction, 15 miles south of London and 75 miles southwest of Hamilton (Map: Ontario, B. 5). It has manufactures of various sorts, the most important of which is car-building. Population, in 1901, 11,485.

SAINT-VICTOR, sán'vek'tór', PAUL DE (1827-81). A French critic. He replaced Théophile Gautier in 1855 as dramatic and art critic on the *Presse*. After ten years of brilliant work on this paper he wrote for Girardin's *Liberté* (1866-69) and the *Moniteur Universel* (1869-81). His most picturesque effort is *Barbares et bandits* (1871), and his other works, mostly made up of his journalistic writings, include *Hommes et dieux* (1866), his masterpiece; *Les femmes de Goethe* (1869); *Victor Hugo* (1885); *Le théâtre contemporain* (1889); and *Les dieux et les demi-dieux de la peinture* (1863, with Gautier and Houssaye). Consult Deljant, *Paul de Saint-Victor* (Paris, 1887).

SAINT VINCENT. An island of the British West Indies, belonging to the colony of the Windward Islands, and situated about 25 miles south of Saint Lucia (Map: West Indies, R. 8). It is oval in shape, with an area of 132 square miles. It is of volcanic origin, and traversed from north to south by a ridge or mountain range which rises near the northern end in the active volcano of La Soufrière to a height of 3700 feet. The climate is healthful and equable, the temperature ranging between 90° and 65°. The rainfall is abundant, the mountains are covered with forests, and there are many fertile valleys. The chief products are arrowroot, cocoa, cotton, fruits, and spices. The sugar industry has been steadily declining. Population, in 1891, 41,054; in 1900 (estimated), 44,600, chiefly negroes. The capital is Kingstown (q.v.). Saint Vincent was discovered in 1498 by Columbus. In 1797 most of the native Caribs, who had been left in possession of the island, were transferred to Ruanan in the Gulf of Honduras. The island has re-

THE MOSQUE OF ST SOPHIA

cently suffered from two disasters following in rapid succession. In 1898 it was swept by an unusually violent hurricane, and in May, 1902, large parts of it were devastated by the eruption of La Soufrière (q.v.), occurring simultaneously with that of Mont Pelée (q.v.) in Martinique. About one-third of the island was laid waste. Several villages were destroyed, and about 1500 persons were killed.

SAINT VINCENT, CAPE. See CAPE SAINT VINCENT.

SAINT VINCENT, JOHN JERVIS, Earl of. A British admiral. See JERVIS, JOHN.

SAINT VINCENT DE PAUL, SÄN VÄN SÄN' de pöl, SOCIETY OF. A society of Catholic laymen founded in Paris in 1835 by Frédéric Ozanam (q.v.), with the object of visiting the poor and suffering at their dwellings and dispensing to them relief, promoting the elementary and religious instruction of poor children, distributing moral and religious books, and undertaking any other charitable work to which its resources are adequate. It is entirely unsectarian in its methods of operation. The headquarters are in Paris, where the affairs of the society are administered by a president-general and a council-general. There are other subdivisions of the society, such as the superior council, the central council, and the particular council, each having its sphere of authority strictly defined. The superior council has jurisdiction over countries or sections thereof, into which the society has been introduced; the particular council is subject to the superior council, and generally has supervision over the affairs of a diocese, while the conference has charge of parish work.

SAINT VITUS'S DANCE. See CHOREA.

SAINT VLADIMIR, Russ. pron. vlá-dy-mér, ORDER OF. A Russian civil order of merit with four classes, founded by Catharine II. in 1782. The decoration is a red cross with the initial of the saint.

SAINT VLADIMIR, UNIVERSITY OF. See KIEV.

SA'IS (Lat., from Gk. Σάις, Coptic *Sai*). A city of ancient Egypt, on the right bank of the Canopic branch of the Nile, in latitude 30° 57' N., near the site of the modern village of Sa el-Hager. It was the capital of the Saitic nome, and is mentioned in very early times as the seat of worship of the goddess Neith (q.v.), whom the Greeks identified with Athene. Under the Twenty-sixth Dynasty, founded by Psammetichus I. (q.v.), the city became the capital of Egypt, and was adorned with many splendid buildings. Herodotus speaks with special admiration of a shrine or chapel, hewn from a single block of granite, which Aahmes II. caused to be made near Elephantine and transported to Saïs. In the remarkable revival of art, letters, and ancient religious customs which took place under the Twenty-sixth Dynasty, Saïs became famous as a centre of culture and as the seat of an important theological school. The *Book of the Dead* (q.v.) seems to have been the subject of special study, and in the Saitic revision of this interesting collection the chapters composing it were for the first time arranged in a fixed order. Under the Ptolemies the city declined in importance, though it was prob-

ably an episcopal see in early Christian times. The buildings of the Saitic Pharaohs are now marked by heaps of rubbish, and Mariette's excavations upon the site were unproductive. Consult: Wilkinson, *Manners and Customs of the Ancient Egyptians* (London, 1878); Wiedemann, *Ägyptische Geschichte* (Götting, 1848); Budge, *A History of Egypt* (New York, 1902).

ŚAIVAS, śhī'vāz. Worshipers of the Hindu deity Siva (q.v.). They are divided into many sects, most of which represent decadent schools of philosophy. Most of the Yogins, or ascetic philosophers, were and are Śaivas, and the ascetics called *Īrḍharabāhus* and *Āśānukhās* (i.e. those who held up the arms and the face respectively till they became stiff) are usually of this class. On the other hand, many of the so-called Śaivas, such as the *Jangamas* (Wanderers) and *Dandins* (Staff-bearers), are not necessarily such. In the earliest period there are noticeable two marked tendencies in the Śaiva cult, its democratic disregard of caste and its psychic philosophy. The Śaiva sects have been drawn for the most part from the two extremes of India's social life. The lowest and most unintelligent mendicants, understanding only asceticism, generally belong to this, as do, for the reason just stated, the philosophers; while the rich middle classes, especially those of North India, are followers of Vishnu (q.v.). The Paramahansa, 'highest-soul' Śaivas, are the most spiritual, though the modern representatives are often more conspicuous for nudity and stolidity than for anything else. One of the oldest of the Śaiva sects is that of the Aghoris, cannibals devoted to the most disgusting practices, but known as Śaivas for fifteen centuries. Many of the Śaivas are Saktas (q.v.). Consult: Wilson, *Sketch of the Religious Sects of the Hindus* (Calcutta, 1846); Barth, *Religions of India* (Boston, 1882); Hopkins, *Religions of India* (ib., 1895).

SAJOUS, sā'zhōw', CHARLES EUGENISTE (1852—). An American physician, born at sea, off the coast of France. He came to America in 1861, and studied medicine at Jefferson Medical College, Philadelphia. Professor of laryngology at the Pennsylvania School of Anatomy (1880-84), he lectured on the same subject at the clinic of the Jefferson Medical College from 1884 to 1890, but his more important work, beginning in 1888, was as editor-in-chief of the *Annual and Analytical Cyclopaedia of Practical Medicine*. In his especial branch, laryngology, Dr. Sajous wrote *Diseases of the Nose and Throat* (1886), and invented several valuable operating tools.

ŚAKA, śhī'kā. An important system of reckoning time in India, used over practically the entire country, and the one exclusively employed in astronomical works. According to native tradition it was invented by King Salivahana, also called Saka, in A.D. 78, and the era is consequently sometimes called by his name. It begins, like the Samvat (q.v.) year, on the full moon of the month Chaitra, which corresponds to March-April, is luni-solar in character, and is generally reckoned in expired years, so that the Saka date given represents the year last completed. Christian dates are reduced to Saka by the subtraction of 78 from the Christian year. Consult Sewell and Dikshit, *The Indian Calendar* (London, 1896).

SAKAI, sá'kái. One of the aboriginal peoples of the Malay Peninsula, regarded by practical ethnologists as true 'Negrito' in type. The best representatives of the stock are found in the interior of the peninsula, particularly in southeastern Perak and northwestern Pahang. Physically the Sakai are undersized, with dolichocephalic skulls, dark brown skins, frizzly or woolly hair, and rather thick lips. They are still nomads, except at a few points on the west coast, where regular relations with the Malays have led to small plantations of rice and sugar cane. Elsewhere they are found in small family groups (mostly two or three families), with patriarchate rule, but copartnership of man and wife on a monogamic basis. Their houses are very primitive in character, and in the regions where tigers abound platforms are built in the trees. The language may be described as monosyllabic with a strong agglutinative tendency, and is divided into several dialects, of which two only are known to any extent. It contains a number of Malay loan-words. Consult: Stevens, *Materi-ahen zur Kenntnis der wilden Stämme auf der Halbinsel Malakka* (Berlin, 1892); Schmidt, *Die Sprachen der Sakei und Semang auf Malacca und ihr Verhältnis zu den Mon-Khmer Sprachen* (The Hague, 1901).

SAKAI, sá'kái. An important manufacturing city in the Prefecture of Osaka, Japan, situated on Osaka Bay, six miles southwest of Osaka (Map: Japan, D 6). Its chief manufactures include cotton goods, cotton rugs, sake, bricks, cutlery, and cosmetic powders. Population, in 1898, 50,203.

SAKALAVA, sá'ká-lá'vá. A negroid people living in a number of tribes in the western part of Madagascar. Physically they closely resemble the Bantu negroes of Africa, but exhibit many results of crossing with the Malay inhabitants of the rest of the island. Their culture also is very similar to that of their African neighbors. The weight of authority is in favor of an African origin of the Sakalava, though some competent investigators regard them as Melanesian immigrants. See MADAGASCAR.

SAKANDERABAD, sá'kán'dér-á-bád'. A town of Hyderabad, India. See SECUNDERABAD.

SAKATA, sá'ká'tá. A seaport in the Prefecture of Yamagata, Japan, situated on the western coast of Honshu, about 100 miles south of Akita (Map: Japan, F 4). It has an extensive trade in rice. Population, in 1898, 21,937.

SAKE, sá'ká. The rice beer of the Japanese. It contains only a small percentage of alcohol, but in some of its forms is very intoxicating through the presence of fusel oil. There are many varieties, differing in strength, color, and flavor. The best comes from the Province of Setsu. Sake is used freely as a beverage, and in the ceremonies connected with Confucianism and Shinto. At elaborate feasts it is customary for the host to drink a cup of sake with each of his guests.

SAKHALIN, sá'ká-lyón'. See SAGHALIEN.

SAKI (South American name). A monkey of the South American genus *Pithecia*, allied to the howlers, but characterized by the inclination forward of the lower incisor teeth, much as in lemurs. They have a thumb and the tail is not prehensile. Associated with them in these charac-

teristics are the Uakari monkeys, which, however, differ greatly in their very short tails and otherwise. Most of them have long, soft hair, which has a wig-like appearance on the head, forms a long, divided beard beneath the chin, and makes the long tail bushy. Five or six species are known, all small, retiring, sober in their behavior, and confined to the valleys of the Amazon and Orinoco. One is the Brazilian 'couxió' (*Pithecia satamis*), which is everywhere blackish brown; another is the 'couxia,' or red-backed saki (*Pithecia chiropotes*), marked by a large dorsal patch of reddish brown. The best known one, perhaps, is the blackish, 'hairy,' or Humboldt's saki, or 'parauacu.' It is speckled gray, and has a heavy hood of hair overhanging the face. Consult Bates, *A Naturalist on the Amazon* (London, 2d ed., 1892). See MONKEY; and Plate of AMERICAN MONKEYS.

SAKKARA, sák-ká'rá. A village of Egypt, noted for its ancient mausolea and pyramids. See SAQQARA.

ŚĀKTAS, shák'táz (Skt. *śakta*, worshiper of the divine energy, especially the female principle of divinity, from *śakti*, power). In Hindu religion, the worshipers of any of the female representations of the divine power. In its special and usual sense, the word is applied to the worshiper of the female energy or wife of Siva (q.v.) alone; and the Saktas properly so called are, therefore, the votaries of Durga, or Devi, or Uma. Originally, however, the mother-goddess worshiped by the Saktas has nothing to do with Siva or any other god. She was herself, as Durga, Parvati, Kali, or simply as Great Mother, the matriarchal deity of the Dravidians; but subsequently by the Aryans she was regarded merely as the female principle of an androgynous god. As such, the goddess Sakta, 'female power,' became synonymous with the female principle in life, and the worship of this principle, though sometimes loftily conceived, led to the grossest licentiousness. The works from which the tenets and rites of this religion are derived are known by the collective term of *Tantras* (q.v.), but since in some of these works the ritual enjoined did not comprehend all the impure practices recommended in others, the sect became divided into two leading branches, the *Dakṣiṇācārin*s and the *Vāmācārin*s, the followers of the right-hand and the left-hand ritual respectively.

The Dakṣiṇācarins are the only respectable Saktas. They profess, indeed, to possess a ritual as pure as that of the Vedas. Their priests, however, are not required to know any Veda, and they differ in their practice from the Vedic cult in the method of performing sacrifices. The Vāmācarins, on the other hand, adopt a ritual of the grossest impurities. They profess the desire to become one with the deity by means of mystic rites; but in reality these rites are simply orgies of lust, except where the object of the worshiper is to obtain *siddhi*, magical power, in which case recourse is had to mystic formulas at midnight in a cemetery. This worship is not a degeneration, as has sometimes been held. It is a survival of the same primitive mother-worship that once obtained among all the Dravidians as among the Semites. Some Saktas are not Saivas (q.v.), but the majority belong to this class. See SIVA and SAIVAS, with the literature cited under the latter title.

ŚAKUNTALĀ, śhā-kun'tā-lā. A legendary Hindu nymph. Her name occurs in the *Yajur-veda* (see *VEDA*) and the *Satopatha Brāhmaṇa*, she is the subject of an episode of the *Mahābhārata* (q.v.), and is mentioned in the *Parāṇas* (q.v.). She is best known, however, as the heroine of Kalidasa's *Abhijñānasakuntalā*, or *Sakuntala Recognized*. The principal features of the legend of Sakuntala, as narrated in the *Mahābhārata*, are the following: She was the daughter of the saint, Viśvāmitra, and the Apsaras, or water-nymph, Menaka. Abandoned by her parents, she was adopted by the sage Kanva, who brought her up in his hermitage as his daughter. While King Dushyanta was hunting in the forest, he came by chance to the hut of Kanva, saw Sakuntala, and fell in love with her. He married her and promised her that the son she would bear him should be the heir to his throne, and that he would take her as his queen to his royal city. After the birth of her child, she remained at the hermitage until the boy was six years old; but Dushyanta, unmindful of his promise, did not send for her. Kanva, therefore, directed her to go to the residence of Dushyanta. This she did, but when she arrived at his palace she was repudiated by the King until a voice from heaven assured him that Sakuntala had spoken the truth, and that he saw before him his lawful son. Thereupon he recognized her as his queen, and her son as his heir, whom he named Bharata, and who became the founder of the race of the Bharatas. In the drama Kalidasa modified the legend so as to show that the obstacle to her recognition was the consequence of a curse which Sakuntala had incurred from a wrathful sage, who had considered himself treated with scant hospitality by her on one occasion when he had visited Kanva's hermitage. See *KALIDASA*.

ŚĀKYAMUNI, śhā'kyā-myū'nē. A name of the founder of the Buddhist religion. See *BUDHISM*.

SAL (*Shorea robusta*). An East Indian tree of the natural order Dipterocarpaceae, highly valued for its timber, which resembles teak in properties and uses. The great forests of the southern Himalayas, which in some places has been cut down, have passed under the care of the Government for preservation. Several related species native to India and the Philippine Islands are important timber trees.

SALA, sā'lā. A town of Sweden, situated on the Northern Railroad, 55 miles northwest of Stockholm (Map: Sweden, G 7). It is important on account of its silver mine, which has yielded a large output for centuries, and still produces yearly over 30,000 ounces of silver. Population, in 1900, 6593.

SALA, GEORGE AUGUSTUS HENRY (1828-95). An English journalist, born in London. He came to America in 1863 as special correspondent for the *Daily Telegraph* of London; and in 1864 published *America in the Midst of the War*. He acted as correspondent to the same paper at the Paris Exposition (1867); during the Franco-German War (1870-71); in Spain, Paris, and Venice (1866-67); in Russia (1876); and in Australia (1885). He twice visited the United States as lecturer (1879 and 1885). Sala's pretentious style is finely ridiculed by Matthew Arnold in *Friendship's Garland*. Among Sala's popular books of travel, made up mostly from his

contributions to the *Daily Telegraph*, are *A Journey Due North* (1859); *A Trip to Barbary* (1866); *From Waterloo to the Peninsula* (1867); *Rome and Venice* (1869); *America Revisited* (1882); *A Journey Due South* (1885); *Thoughts I Have Seen* (1894); and the most interesting *Life and Adventures* (1895). His social satire is best represented by *Twice Round the Clock* (1859). He also wrote several popular novels: *The Babbington Peccage* (1860); *Captain Dangerous* (1863); and *Quite Alone* (1864).

SALAAM, sā-lām' (Ar. *salām*, peace, from *salama*, to be safe). The common salutation among Mohammedans to those of their own faith; to non-Mohammedans a different form is used. The full salutation is *as-salam 'alaikum*, 'peace be unto you,' and the proper reply is *wa-'alaikum as-salam*, 'and unto you peace.' The giving of the salaam is a duty recommended by Mohammed; the reply is obligatory. Consult Lane, *Manners and Customs of the Modern Egyptians*, ch. viii. (London, 1836).

SAL'ADIN (SALAH-ED-DIN YUSUF IBN EYUB) (1137-93). Sultan of Egypt and Syria, born at Tekrit of Kurdish blood. After a life of pleasure and study he accompanied his uncle, Shirkuh, about 1166, on an expedition dispatched by Nureddin, Sultan of Syria, to reinstate Shawir, the expelled Vizier of Egypt. When the latter, some years later, threw off his allegiance to Nureddin, Shirkuh made a second invasion of Egypt, overthrew Shawir, assumed the vizierate, and, dying soon after, was succeeded by Saladin (1169). The last of the Fatimite caliphs died in 1171 and Saladin became absolute ruler of the country, though he did not proclaim himself Sultan till after the death of Nureddin in 1174. Between 1174 and 1183 Saladin wrested Syria and most of Mesopotamia from the successors of Nureddin. During these conquests he also warred against the Christians, but without success. In 1187 he made a great onslaught upon the Kingdom of Jerusalem, and in July a desperate battle was fought on the shores of Lake Tiberias, which ended in the total defeat of the Christians. Guy de Lusignan, King of Jerusalem, the grand master of the Templars and Hospitallers, and an immense number of prisoners fell into Saladin's hands. The capture of Tiberias, Acre, Jaffa, and Beirut, with many other places, was followed by the surrender of Jerusalem in October. Tyre alone held out against Saladin until relieved by Conrad of Montferrat. The armies of the Third Crusade, under Richard the Lion-hearted and Philip II. of France, retook Acre after a memorable siege of two years (1191), but, owing to the discussions between Richard and Philip, the great object of the Crusade, the recovery of Jerusalem, was left unaccomplished. Richard entered into a three years' armistice with Saladin by which the coast from Jaffa to Tyre was left to the Christians (1192). Saladin died at Damascus, March 3, 1193. In Saladin the warrior instinct of the Kurd was united to a high intelligence; and even his opponents did not deny him the noblest qualities of chivalry, courage, fidelity to treaties, greatness of soul, piety, justice, and moderation. He was not a mere soldier, but also a wise administrator. Consult: Stanley Lane-Poole, *Saladin and the Fall of Jerusalem* (New York, 1898); Gaston Paris, *La légende de Saladin* (Paris, 1893); Yusuf ibn Rafi, *The Life*

1885. *Journal du Comité de la Palestine Pilgrims' Federation*. London, 1899: Marin, *Histoire de l'Égypte, de l'Égypte et de Syrie* (Paris, 17).

SALADO, sa-lá'ño, Río. A river of Northern Argentina. It rises among the Andean ranges in the northwestern part of the country, and flows southeast through the Gran Chaco till it joins the Paraná River opposite the city of Paraná, after a course of about 1000 miles (Map: Argentina, E 9). It is a shallow, un-navigable, and very sluggish stream, meandering over the plain and frequently dividing into a network of channels and backwaters, which during floods are merged into large shallow lagoons. At low water it evaporates so rapidly as to become brackish in its lower course, whence its name, which means 'salt river.'

SALADO, Río. A river of Western Argentina. It rises on the slope of the Andes in the Province of Catamarca, and flows southward in a rambling course over the plains, parallel with the mountains, from which it receives a number of tributaries (Map: Argentina, D 11). It is about 1000 miles long, and was formerly the most important member of the Colorado River system. Now, however, it never reaches the Colorado, but is lost by evaporation in the extensive salt marshes 80 miles north of that river. There are evidences that the process of desiccation of the surrounding plains is still going on.

SALAD PLANTS. Vegetables whose green parts are used for human food. The plants so employed may be divided into three groups:

CARDUON (*Cynara Cardunculus*).

Piquant, or warm salads such as cress, nasturtium, watercress, and mustard; bitter, of which dandelion, chicory, and endive are typical; and neutral, to which belong such characterless plants as corn salad. Lettuce really belongs to the second group, but when properly grown the bitter flavor is so greatly modified that it approaches the neutral group. The other bitter salads mentioned are similarly improved in flavor. Celery, which also belongs to the bitter group, and lettuce are unquestionably the leading salads in America, thousands of acres being annually devoted to their cultivation.

Cardoon, which is grown in much the same way as celery, is rarely cultivated in the United States, but is popular in Europe. It grows somewhat larger than most varieties of celery.

In general salads require a very rich, light, well drained, fibrous, loamy soil well exposed to the sun. To be in best condition they must be quickly grown, gathered when in prime vegetative vigor, before any indications of going to seed are manifested, and placed upon the table in the shortest possible time after gathering, before they have lost any of their crispness. See articles upon the various vegetables mentioned above.

SAL'AL. A shrub. See GAULTHERIA.

SALAMANCA, sa-lá-mán'ká. The capital of the Province of Salamanca, in the old Kingdom of Leon, and one of the oldest and most famous

university towns of Spain, situated on the Tormes River, 195 miles northwest of Madrid (Map: Spain, C 2). It is built on three hills surrounded by a dreary, treeless plain with a climate severe in winter and very hot in summer. It is surrounded by a wall, parts of which are very old, and a Roman bridge of 27 arches, more than half of which belong to the original structure, crosses the Tormes. The town still has a mediæval aspect, with narrow, crooked streets lined with stately and venerable structures. In the centre of the town is the large Plaza Mayor, the finest of its kind in Spain; it is surrounded by colonnades and by lofty buildings, among which is the town hall. Though a large part of the town was destroyed during the French occupation in 1812, there are still in existence 25 churches, some of which date from the eleventh and twelfth centuries, such as the old cathedral, a massive structure begun in 1100. Immediately adjoining it stands the new cathedral, begun in 1509 and finished in 1733. It is essentially late-Gothic, and has an imposing interior. Opposite the cathedrals stands the university building (see SALAMANCA, UNIVERSITY OF), begun in 1415, with an elaborately decorated plateresque facade. Of the 25 colleges and numerous old convents the greater number are in various states of ruin, many having been entirely destroyed by the French. Among other interesting buildings are the Casa de la Salina, now occupied by the Provincial Assembly, and the Church of San Estéban, both dating from the fifteenth century, and both having elaborate plateresque facades, and the Casa de las Conchas, whose facade is ornamented with shells. Industrially and commercially Salamanca is unimportant. Population, in 1887, 22,199; in 1900, 25,019.

Salamanca was known in ancient times as *Elmantica* or *Salumantica*. About B.C. 220 it was captured by Hannibal, who, according to the tradition, spared the city on account of the heroism of its women. It was taken and retaken several times by the Arabs. The town became especially important after the founding of its university in the thirteenth century.

SALAMANCA. A Mexican town of the State of Guanajuato, situated on the right bank of the Lerma River, 28 miles south of the city of Guanajuato (Map: Mexico, H 7), and on the Mexican Central Railroad. It is an important glove and cotton manufacturing centre, and contains an establishment for the manufacture of porcelain. The first settlement in the town was made by the Augustinian Fathers in 1616. Its population, in 1895, was 13,121.

SALAMAN'CA. A village in Cattaraugus County, N. Y., 62 miles south of Buffalo; on the Allegheny River, and on the Pennsylvania, the Erie, the Buffalo, Rochester and Pittsburg, and other railroads (Map: New York, B 3). It is situated in a rich farming region, and has a large trade in lumber and important railroad interests. There are railroad repair shops and yards, and various manufactures, including furniture, leather, and lumber products. The government is vested in a village president, chosen annually, and a council. Settled in 1860, Salamanca was incorporated in 1878. Population, in 1890, 3692; in 1900, 4251.

SALAMANCA, UNIVERSITY OF. A Spanish university, one of the greatest and most re-

SALAD PLANTS

1. CORN SALAD (*Valerianella olitoria*).
2. CHICORY (*Cichorium Intybus*).
3. DANDELION (*Taraxacum officinale*).

4. WATER CRESS (*Nasturtium officinale*).
5. ENDIVE (*Cichorium Endivia*).
6. LETTUCE (*Lactuca sativa*).
7. CELERY (*Apium graveolens*).

nowned of Europe from the fifteenth to the seventeenth century. Founded by Alfonso IX. of Leon (c.1230), and refounded by Saint Ferdinand of Castile in 1242, it came into prominence in the reign of Alfonso X. (q.v.) (1252-82), surnamed the Astronomer. Its chief distinction was in the field of the canon and civil law. Owing to financial difficulties, it led a somewhat checkered existence, but was in alliance with and favored by the Papacy, and in some measure supported by it. Its rise to distinction began in the fifteenth century, and in the two succeeding centuries, particularly in the sixteenth, it was one of the dominating schools of Europe. Here Columbus explained his discoveries, and here the Copernican system was early accepted and taught. From the middle of the sixteenth century, when the number of students reached 6000, the university sank in size and prestige. It was reorganized in 1769-77, but suffered much from the political disturbances of the nineteenth century. Its present organization dates from 1857. It had in 1901 a budget of 150,000 pesetas, about 1200 students, and a library of some 80,000 volumes and 1000 manuscripts.

SALAMANDER (Lat. *salamandra*, from Gk. *σαλαμάνδρα*, *salamandra*; connected with Pers. *samandar*, *salamandar*). A genus of European tailed Amphibia which inhabit water only in their tadpole state, and return to it only to deposit their eggs, generally living in moist places, as under stones, roots of trees, etc. The general form is very similar to that of newts (q.v.), but the tail is round, not flat. Salamanders feed on worms, slugs, snails, and insects. They are inert, sluggish, and timid creatures and are perfectly harmless. The spotted salamander (*Salamandra maculosa*), six or eight inches long, black, with bright yellow stripes on its sides, and livid blue beneath, is widely spread throughout Europe. The black salamander (*Salamandra atra*) is much smaller, black, the body and tail ringed, the tail almost as if formed of beads. It is abundant in the Alps and mountains of Southern Germany. Other species are found in Spain, Italy, etc., and in Asia. The genus is not represented in the United States. 'Salamander,' however, in the United States is the common name for all the Urodela.

SALAMANDER. A German drinking term of uncertain significance. The custom to which the name is applied, called *cœrcitium salamandri*, originated with the students of Heidelberg about 1830. At the command of the president, the drinking vessels are rubbed about in a circle on the table and emptied. The participants then rattle the glasses on the table and finally set them down with a simultaneous crash. The salamander is the most formal method of drinking a health.

SALAMIS (Lat., from Gk. *Σαλαμίς*, modern name *Kuluri*). A mountainous island of Greece, off the Coast of Attica, in the Gulf of Egina. It resembles a horseshoe in shape, the opening being to the west. On the northeast it is separated from Attica by a strait about one mile in width, and on the north by the Bay of Aulis, while at the northwest it approaches close to the Megarian coast. In the northeast of the island was the ancient town of Salamis, near the modern Ambelaki, on the bay opposite the Attic coast. The area is about 36 square miles, and the

population about 4600. The island is rocky and mountainous, scantily wooded, and barren, though the coast districts and valleys yield a little grain and wine. Salamis was early an object of strife between the Athenians and Megarians, but after long wars the former secured it early in the sixth century B.C., and from that time it was a part of Attica. Its chief celebrity is due to the decisive naval battle fought between the Persians and Greeks in the strait between the long northeastern promontory of the island and the coast of Attica (B.C. 480). The Greek fleet, under the command of Themistocles and Eurybiades, gathered at the island on the advance of Xerxes against Athens, and is said to have intended withdrawal to the Isthmus when Themistocles persuaded Xerxes to blockade the straits during the night, and in the morning enter them for battle. The result was the complete defeat of the Persians, whose superior numbers and unwieldy vessels were unavailing in the narrow waters.

SALAMIS. An ancient ruined city in the middle of the eastern coast of Cyprus, the most important place on the island (Map: Turkey in Asia, E 5). It had a famous temple of Zeus. Its king, Enagoras (410-364), united Cyprus into one kingdom. The city fell to the Romans in 58 B.C. It was destroyed by an earthquake, and rebuilt by Constantine the Great, named Konstantia, and again made the capital of the island. It was laid waste by the Arabs. The village Hagios Sergios is near its ruins.

SALAMMBÔ' *sâ-lâm'bô*. A novel by Gustave Flaubert (1862). The scene is laid in Carthage in the time of Hannibal, whose sister is the title character. The story is brilliantly realistic, and contains descriptions of great power, dealing often with the weird and bizarre.

SAL AMMONIAC (abbreviation of Lat. *sal ammoniac*, salt of ammonium). The chloride of ammonium (NH₄Cl). It is of great value in medicine, chemistry, and the arts. It is obtained from the ammoniacal water of gas works, by adding sulphuric acid and then sublimating the sulphate thus formed with sodium chloride. It may be obtained on a small scale by adding hydrochloric acid to a solution of ammonia. In nature it is found in volcanic regions, as an efflorescence on the surface of rocks or as a sublimate in fissures, crystallized or forming crusts, or stalactites. It occurs as colorless, odorless, translucent fibrous masses, having a bitter saline taste, is freely soluble in water, and has a specific gravity of 1.45. In medicine it is used as an expectorant in bronchitis and pneumonia, being a favorite ingredient of cough mixtures; as a diaphoretic, diuretic, and alterative in rheumatism; as a cholagogue in various derangements of the liver; and as an alterative in neuralgia. In catarrhal inflammations of the gastro-intestinal tract it is used to some extent. See AMMONIA.

SALANG, *sû-ling'*, or **JUNKSEYLOH,** *jûnk'sâ-lôh'*. An island in the Bay of Bengal, belonging to Lower Siam, situated at the northern entrance to the Straits of Malacca and separated by a narrow strait from the Malay Peninsula (Map: Siam, C 5). It has an area of about 290 square miles and has rich tin deposits which are mined by Chinese and exported to the adjacent British settlements. Population, 42,000.

SALANGANE (Fr. from *salangue*, the native name of Linnæus's SWIFT). An East Indian species of the genus *Collocalia*, of which 13 species are known in the Malayan and Australian regions. All are diminutive in size, dark-colored above and white below, with the appearance and habits of swifts; and are of interest mainly because their nests are in demand among the Chinese as the basis of a soup regarded as a luxury. These swifts breed in large companies in scattering caves, attaching their small half-cup-like nests to the rock in the dark interiors of crevices and caverns. They have a glue-like consistency, and are formed mainly of a glutinous saliva produced by the bird, with which is frequently mixed other materials, as bits of straw, feathers, etc. The principal species is *Collocalia fuciphaga*. See PLATE OF SWIFTS AND THEIR NESTS.

SALARY GRAB. In United States history, the term popularly applied to the general increase of the salaries of Federal officers in 1873. The act of Congress of March 3d of that year provided that the salary of the President should be increased from \$25,000 to \$50,000 per year, that of the Chief Justice of the Supreme Court should be \$10,500 instead of \$8,500, that of the Vice-President, Cabinet officers, associate justices, and Speaker of the House \$10,000 instead of \$8,000, that of Senators and Representatives in Congress \$7,500 instead of \$5,000, and that of employes of both Houses according to similar proportions. The chief objection to the act was that as regards members of Congress it was made retroactive for a period of two years. This feature aroused great popular indignation throughout the country, and the law was repealed by the act of January 20, 1874, as regarded all its beneficiaries except the President and the justices.

SALAYER, sà-l'yer (or **SALEYER**) **ISLANDS.** A group of islands in the Malay Archipelago, belonging to the Netherlands, and situated south of Celebes (Map: East India Islands, F 6). Area, about 270 square miles, of which 250 square miles are covered by Salayer Island, the largest in the group. They are composed mainly of coralline limestone covered with very fertile soil, and are well forested with valuable timber. The chief products are tobacco, potatoes, indigo, and cotton, and excellent horses are exported to Celebes, with which there is regular steamship connection. The population of the group is about 80,000, chiefly Mohammedan Malays engaged in commerce, fisheries, and preparation of trepang.

SALDANHA, sál-dá'nyá, João CARLOS, Duke of (1791-1876). A Portuguese statesman, a grandson of Pombal, born at Arinhaga. He studied at Coimbra, served against the British, and was made a prisoner in 1810. On his release he went to Brazil, where he was employed in the military and diplomatic services. He returned to Portugal after the declaration of the independence of Brazil. He became Minister of Foreign Affairs in 1825, and was Governor of Oporto in 1826-27. He joined Dom Pedro against the usurper Dom Miguel, with whom he concluded the convention of Evora. In 1835 he was made Minister of War and president of the Council, but resigned in the same year. After the revolution of 1836, which he had instigated, he

went into exile until recalled in 1846, when he formed a Ministry, which fell in 1849. In 1851 he organized a new revolt and became chief Minister as the leader of a coalition party formed of Septembrists and dissatisfied Chartists. He remained in power until the accession of Pedro II. in 1856, and was subsequently Minister to Rome (1862-64 and 1866-69). He became Prime Minister once more for a few months in 1870 (May-August), and was sent in 1871 to London as Ambassador, where he died.

SALE. A town in Cheshire, England, suburban to Manchester (q.v.). Population, in 1891, 9600; in 1901, 12,000.

SALE or **SALES** (AS. *sala*, from *sellan*, Goth., OHG. *saljan*, to give, sell; connected with Lith. *sulyti*, to proffer, offer). A contract whereby the absolute or general ownership of property is transferred from one person to another for a money consideration, or loosely for any consideration. In the latter case the transaction is more accurately called a barter, trade, etc. The term *sales* is used specifically by legal text writers of such transfers of personal property, the treatises on that subject being commonly said to treat of 'the law of sales.' For the treatment of the subject in relation to land, or real property, see CONVEYANCE; DEED; REAL PROPERTY.

SALE OF PERSONAL PROPERTY. A sale of personal property is often spoken of as a 'bargain and sale' or an 'executed contract of sale,' to distinguish it from a contract to sell; that is, from a contract to transfer general ownership in the future. At common law this contract could be oral or written. By the Statute of Frauds (q.v.) a contract for the sale of goods must be in writing if the price exceeds a specified sum, unless there is an acceptance and receipt of a part of the goods, or a part payment of the price. The general rule has been laid down by our courts that where a bargain is made for the purchase of specific existing goods, and no stipulation is made about payment and delivery, the ownership passes at once to the buyer, and the right to the price passes to the seller. In Roman law a sale was treated as a conveyance, and tradition, i.e. actual delivery, was necessary to the transfer of title. Again, Roman law required the payment of the price by the purchaser as a condition of title's passing, unless it was waived by the parties. Modern European codes, although founded on the Roman law, generally reject the latter rule, while continuing the former.

The difference between a sale and various business transactions of a similar character is perfectly clear in principle, although at times there is practical difficulty in determining to what class a particular venture belongs.

In rare instances the general ownership of personal property passes for a price without a contract. This is sometimes called a *quasi* sale. It occurs when one who has taken another's property without his consent is sued in trover (q.v.) for the value, and pays the judgment. Upon such payment it is generally held that title is to be treated as vesting in the wrongful taker, as of the date of taking.

REQUISITES OF A VALID SALE OR CONTRACT TO SELL. These are four: Competent parties; mutual assent; the existence of the personal property; and a price in money. The first two requisites have been considered, at sufficient length, in the article on contracts (q.v.). The last one has

been referred to in a preceding paragraph. It is, therefore, necessary to discuss here only the third. In case of a bargain and sale, the thing sold must then be in existence. At times, persons declare that one sells and the other buys specified property which they know is not in existence. This can take effect, in our law, only as a contract to sell; for it is accounted an elementary principle that a man cannot grant personal property in which he then has no interest or title. Accordingly, if, before this contract to sell has been executed by transferring the ownership to the buyer, a creditor of the seller levies an execution (q.v.) on the property, such creditor will be able to keep it. In this country it is generally held that the owner of property can make a valid bargain and sale of its product, growth, or increase, even before that comes into actual existence.

WHEN TITLE PASSES. In case of a bargain and sale, title passes when the contract is made. In the case of a contract to sell, title is to pass in the future. If the parties clearly and definitely state the time or condition of passing title, no difficulty arises. In the hurry and rush of modern business life, however, such definiteness is often neglected.

Rule 1. Where there is a contract for the sale of specific goods and the seller is bound to do something to the goods, for the purpose of putting them into a deliverable state, the title does not pass until such thing is done. In England, it does not pass until the buyer is notified that the thing is done.

Rule 2. When there is a contract for the sale of unascertained or future goods by description, and goods of that description and in a deliverable state are unconditionally appropriated to the contract, either by the seller with the assent of the buyer, or by the buyer with the assent of the seller, the title thereupon passes to the buyer. Such assent may be express or implied, and may be given either before or after the appropriation is made.

The difficult questions under this rule are, first, whether the required assent has been given; and second, whether the appropriation is unconditional. The principal examples of a conditional appropriation are afforded by shipments of goods C. O. D., and under bills of lading (q.v.) which make the goods deliverable to the seller or his agent or his assignee. If the seller takes a bill of lading, making the goods deliverable to the buyer, and does not require payment for the goods as a condition of title's passing, the appropriation is unconditional, so far as he is concerned. Then the question arises whether the buyer has assented to such appropriation. Generally speaking, he does assent where he orders goods to be sent to him by a common carrier, *provided* the goods sent are of the kind and quality which he ordered.

It is often quite important to determine whether title passed at the time of shipment; for if it did, any loss or injury of the goods during their transit must be borne by the buyer, the general rule being that the risk of loss or harm goes with the title, unless the parties have otherwise agreed.

CONDITIONS AND WARRANTIES. One of the most perplexing topics in the law of sales is that of warranty (q.v.). In most of our jurisdictions, many of the seller's engagements are

termed implied warranties, although they are actually treated as conditions in the decision of cases. The English Sale of Goods Act of 1893 (56 and 57 Viet., c. 71) has simplified this topic by defining 'condition' and 'warranty,' by classifying the various engagements of the seller, and by describing the consequences of their breach. It is believed that these provisions of the statute are an accurate codification of common law principles, although it must be admitted that in a few of our States different doctrines obtain. A condition is either a statement or a promise which forms the basis of the contract of sale. See **CAVEAT EMPLOI; MARKET OVERT; STOPPAGE IN TRANSIT.**

Consult: Blackburn, *A Treatise on the Effect of the Contract of Sale* (London, 1885); Campbell, *The Law Relating to the Sale of Goods* (ib., 1891); Chalmers, *The Sale of Goods Act* (ib., 1896); Benjamin, *The Sale of Goods* (Boston, 1899); Burdick, *The Law of Sales of Personal Property* (ib., 1901).

SALE, GEORGE (1697-1736). A translator of the Koran. He was admitted to the Inner Temple in 1720 and afterwards practiced as a solicitor. He early began the study of Arabic and acquired a thorough mastery of the language and a close acquaintance with Mohammedan thought and customs, although he never left his native land. From 1726 till 1734 he was connected with the Society for the Promotion of Christian Knowledge, for which he prepared an Arabic translation of the New Testament besides acting as legal adviser, business manager, and in other capacities. His translation of the Koran, published in London in 1734 and many times reprinted, was the first adequate translation of the Koran ever made and is considered by many the best in any language at the present time. The material incorporated from Mohammedan authorities renders it a commentary as well as translation, and the notes and preliminary discourse are still of great value.

SALE, SIR ROBERT HENRY (1782-1846). A British soldier, popularly known as the hero of Jelalabad. He was born in England, and was the son of Colonel Sale, of the East India Company's service. He took active part in the Burmese War of 1824-26, distinguishing himself at Rangoon, Bassein, and especially at Prome. In 1838 he was given command of the First Bengal Brigade of the army on the Indus in the Afghan Expedition, and was severely wounded while leading the storming party at Ghazni. In 1840 he was sent to Kohistan against Dost Mohammed Khan, and, after the capture of several fortresses, forced him to surrender at Purwan. When the Afghans rose against the British at the close of 1841, Sale, after forcing his way through the Khurd-Kabul, Tezen, and Jagdalak passes, was driven back upon Jelalabad, where he was besieged by Akbar Khan, the son of Dost Mohammed. In April, 1842, he made a sortie and routed the Afghans, capturing their ammunition, guns, and camp. He was relieved by Pollock, commanding the punitive expedition against the Afghans, and participated with him in the recapture of Kabul. Sale was mortally wounded fighting against the Sikhs at Mukli in 1846.

SALEM. The capital of a district of the same name in the Province of Madras, India, 207 miles southwest of the city of Madras, on the

English troops under Colonel Leslie, sent from Boston to destroy supplies stored at Salem, was met at North Bridge and forced to retire, this being one of the first instances in the colonies of armed resistance to Great Britain. For many years after the Revolution, Salem was an important commercial centre, and it was by Salem merchants that American trade was opened with China, Japan, Africa, and Brazil. But, the depth of the harbor being insufficient for vessels of large draught, Salem's trade was gradually transferred to Boston and New York. Salem was incorporated as a town in 1630 and was chartered as a city in 1836. Consult: Felt, *Annals of Salem* (Salem, 1845-49); Osgood and Batchelder, *Historical Sketch of Salem* (ib., 1879); Upham, *Salem Witchcraft, with an Account of Salem Village* (Boston, 1867); Webber and Nevins, *Old Naumkeag* (Salem, 1878); Nevins, *Witchcraft in Salem Village* (ib., 1892); and a sketch in Powell, *Historic Towns of the New England States* (New York, 1898).

SALEM. A city and the county-seat of Marion County, Ill., 70 miles east of Saint Louis, Mo.; on the Baltimore and Ohio Southwestern and the Chicago and Eastern Illinois railroads, and the terminus of the Illinois Southern (Map: Illinois, D 5). It is surrounded by a section noted for the production of apples, and engaged also in farming and stock raising. There are coal deposits and mineral springs in the vicinity. Flour is the principal manufactured product. Population, in 1890, 1493; in 1900, 1642.

SALEM. A city and the county-seat of Essex County, Mass., 16 miles northeast of Boston; on Massachusetts Bay and on the Boston and Maine Railroad (Map: Massachusetts, F 2). It is situated on a narrow peninsula. Salem is intimately connected with the history of the colonial period, and its quaint old houses and irregular streets are of great interest. Hawthorne's birth-place and early home, the custom-house where he wrote the preface to *The Scarlet Letter*, and the home of Roger Williams are especially noteworthy. Other features include three attractive parks; the Willows, the Common, and Mack Park; the Essex Institute, with interesting paintings and relics, and a library of 100,000 volumes and 400,000 pamphlets; the Salem Athenaeum, with a library of 32,000 volumes; the Peabody Academy of Science, the home of the East India Museum; and the public library, with 40,000 volumes. One of the educational institutions is a State Normal School. There are in the city an almshouse, the Bertram Home for Aged Men, Home for Aged Women, City Orphan Asylum, and Salem Hospital, besides two other hospitals. Formerly noted for its commercial importance, Salem is at present primarily an industrial city, the various industries having in the census year 1900 an invested capital of \$7,450,935, and an output valued at \$12,257,449. Boots and shoes, cotton goods, leather, machinery, and lumber products constitute the leading manufactures. The government is vested in a mayor, chosen annually, and a bicameral council, and in subordinate officials, who are either elected by the council or chosen by popular vote. For maintenance and operation, the city spends annually about \$552,000, the main items being: for schools, \$418,000; interest on debt, \$52,000; streets, \$52,000; charities, \$47,000; police department, \$38,500; municipal lighting, \$37,000; and fire department, \$35,000. The water-works are owned by the municipality. Population, in 1890, 30,801; in 1900, 35,956.

Salem (the Indian Naumkeag), after Plymouth, the oldest town in Massachusetts, was first settled by Roger Conant and his associates in 1626. In 1628 Governor John Endicott at the head of a small company came hither from England and in 1629 the present name was adopted. In 1692 the witchcraft delusion appeared in the district later set apart as Danvers, and in the six months from March to September nineteen persons were charged and one old man was pressed to death. On February 26, 1775, a small body of

English troops under Colonel Leslie, sent from Boston to destroy supplies stored at Salem, was met at North Bridge and forced to retire, this being one of the first instances in the colonies of armed resistance to Great Britain. For many years after the Revolution, Salem was an important commercial centre, and it was by Salem merchants that American trade was opened with China, Japan, Africa, and Brazil. But, the depth of the harbor being insufficient for vessels of large draught, Salem's trade was gradually transferred to Boston and New York. Salem was incorporated as a town in 1630 and was chartered as a city in 1836. Consult: Felt, *Annals of Salem* (Salem, 1845-49); Osgood and Batchelder, *Historical Sketch of Salem* (ib., 1879); Upham, *Salem Witchcraft, with an Account of Salem Village* (Boston, 1867); Webber and Nevins, *Old Naumkeag* (Salem, 1878); Nevins, *Witchcraft in Salem Village* (ib., 1892); and a sketch in Powell, *Historic Towns of the New England States* (New York, 1898).

SALEM. A city and the county-seat of Salem County, N. J., 38 miles south by west of Philadelphia; on the Salem River, near its confluence with the Delaware, and on the West Jersey and Seashore Railroad, and the Salem and Philadelphia Steamboat Line (Map: New Jersey, B 4). It is an attractive residential place, and has the John Tyler Library, with 11,600 volumes, and the Friends' Select Graded School. The surrounding region is engaged in farming. Salem is an important industrial centre, its principal establishments including glass works, fruit and vegetable canneries, and manufactories of oilcloth, wall paper, hosiery, women's garments, iron castings, machinery, and carriages. The government, under the revised charter of 1868, is vested in a mayor, elected every three years, and a unicameral council. The water-works are owned and operated by the municipality. Population, in 1890, 5516; in 1900, 5811.

Settled in 1675 by John Fenwick and a company of Quakers, Salem was incorporated as a town in 1695, and became a city in 1858. During the Revolution it was alternately occupied by British and American troops. Consult Johnson, *An Historical Account of the First Settlement of Salem* (Philadelphia, 1839).

SALEM. A city in Forsyth County, N. C., 112 miles west by north of Raleigh; on the Southern and the Norfolk and Western railroads (Map: North Carolina, B 1). It is the seat of the Salem Female Academy and College (Moravian), opened in 1802. Salem is chiefly a residential city adjoining Winston, the county-seat, the two municipalities forming practically one industrial community. (See WINSTON.) Under the revised charter of 1891, the government is vested in a mayor, elected biennially, and a unicameral council. Salem was founded by a body of Moravians in 1766 and was for many years distinctively a church community—the church having complete charge of secular as well as ecclesiastical affairs. Count Zinzendorf drew up the plans on which Salem was laid out. Population, in 1890, 2711; in 1900, 3642.

SALEM. A city in Columbiana County, Ohio, 70 miles southeast of Cleveland; on the Pittsburg, Fort Wayne and Chicago, and the Pittsburg, Lisbon and Western railroads (Map: Ohio, J 4). It has a public library. Salem is the centre of a coal-mining region, and manufactures

cornices, engines, steel, wire nails, pumps, tools, feed cutters, riveting machines, china, stoves, tile, brick, furniture, etc. The government is vested in a mayor chosen biennially, a unicameral council, and boards of public service and public safety. Settled in 1807 Salem was incorporated as a village in 1830, and was chartered as a city in 1887. It was a station of the underground railway (q.v.) before the Civil War. Population, in 1890, 5780; in 1900, 7582.

SALEM. The capital of Oregon, and the county-seat of Marion County, 52 miles south of Portland; on the Willamette River, and on the Southern Pacific Railroad (Map: Oregon, C 5). It is situated on ground rising gradually from the river, and has wide and beautifully shaded streets. The State Capitol, a handsome building surmounted by a high dome, occupies a site overlooking the city. Other prominent structures are the Federal building, city hall, courthouse, State Penitentiary, State Insane Asylum, and the opera house. Salem is the seat of Willamette University, originally founded by the Methodist Episcopal Church as an Indian school and opened as a university in 1844; the Academy of the Sacred Heart; and a large Indian Training School. The State School for Deaf Mutes, the State Institute for the Blind, and the State Reform School also are here. The State Library has 25,000 volumes, and there are also in the city Masonic and Odd Fellows libraries. Salem is surrounded by a region having extensive fruit, hop, and wheat interests, and is of considerable industrial importance. Flour, woollens, foundry and lumber products, and machinery constitute the leading manufactures. The government is vested in a mayor, elected biennially, and a unicameral council. Population, in 1900, 4258.

Salem was laid out in 1844 near the site of a Methodist mission, established ten years earlier. It was chartered as a city in 1853. In 1864, by a popular vote, it was made the permanent State capital, though the Legislature had previously met in the city, and in 1857 the Constitutional Convention had been in session here.

SALEM. A town and the county-seat of Roanoke County, Va., seven miles west of Roanoke; on the Roanoke River, and on the Norfolk and Western Railroad (Map: Virginia, D 4). The scenery afforded by the Alleghany and Blue Ridge Mountains in the vicinity of Salem is very beautiful. The town is the seat of Roanoke College (Lutheran), opened in 1853; and has a Lutheran and a Baptist orphanage. Farming, stock-raising, and fruit-growing are the leading industries of the surrounding district. There are deposits of iron, and several sulphur springs. Salem manufactures leather, wagons, agricultural implements, machinery, brick, mattresses, woolen goods, etc. The government is vested in a mayor, chosen biennially, and a unicameral council. The water-works and electric light plant are owned and operated by the municipality. Settled in 1802, Salem was incorporated in 1836, and received its present charter in 1892. The town stands on land originally granted by George III. to Andrew Lewis. Population, in 1890, 3279; in 1900, 3412.

SALEMI, sà-là'mò (Lat. *Halicarn*). A city in the Province of Trapani, Sicily, 64 miles by rail southwest of Palermo (Map: Italy, G 10). It is situated on a hill 1450 feet above the sea

and four miles west of the railway station. It has a ruined castle, a library, a technical school, and a gymnasium, and markets grain, wine, oil, and cattle. Population (commune), in 1901, 17,904.

SALERATUS (Neo Lat., formerly *sal acetosus*, acetated salt). A name applied to potassium bicarbonate, which was formerly much used in cooking, as sodium bicarbonate (cooking soda) is used at present. It may be made by passing carbonic acid gas through a solution of potassium carbonate (K_2CO_3) as long as any gas is absorbed, then filtering the liquid and evaporating to crystallization. Potassium bicarbonate ($KHCO_3$) is a colorless and odorless compound. It still finds some use in medicine.

SALERNO, sà-lè'rno (Lat. *Salernum*). The capital of the Province of Salerno (formerly Principato Citereio), Italy, and the seat of an archbishop. It is beautifully situated at the head of the Gulf of Salerno, 34 miles southeast of Naples (Map: Italy, J 7). The principal street is the Corso Garibaldi along the water front. The harbor is protected from sand by a mole. There are good hotels, a municipal theatre, three hospitals, and normal, classical, and technical schools. The medical school of Salerno was the doyen of medical faculties in Europe. (See **SALERNO, SCHOOL OF**.) The Cathedral San Matteo was built by Robert Guiscard (q.v.) and dedicated in 1084, but suffered by the restoration of 1768. Along the walls of the atrium are fourteen ancient sarcophagi used for Christian burials by the Normans. The bronze doors made in Constantinople date from the eleventh century and in the interior are ancient mosaics and frescoes. On the hill above the town are the ruins of a Lombard castle. Salerno markets wine, oil, fruit, cotton, tobacco, and silk, and manufactures cotton and woolen goods. The ancient *Salernum*, which at the time of the Second Samnite War still belonged to the Samnites, became later a Roman colony. After the fall of the Western Empire the town was successively held by the Lombards, the Normans, and the houses of Hohenstaufen and Anjou. Population (commune), in 1881, 31,245; in 1901, 42,727. Consult Schipa, *Storia del principato longobardo di Salerno* (Naples, 1887).

SALERNO, GULF OF, or GULF OF PESTUM. An arm of the Mediterranean Sea, on the western coast of Italy, southeast of the Bay of Naples (Map: Italy, J 7). It is 36 miles wide at its entrance, and sweeps inland for 24 miles. On its shores are the towns of Amalfi and Salerno.

SALERNO, SCHOOL OF. A once famous medical school at Salerno, Italy. As early as the tenth century Salerno was famous for its numerous physicians. Ordericus Vitalis (q.v.), who first mentions the medical school, ascribes to it an ancient origin, but the attempt to trace its inception to Saracen influence has been refuted by Henschel, Darenberg, and De Renzi. After the middle of the eleventh century the system of medicine known as 'Methodism' in vogue at Salerno, whose chief representative in antiquity was Cælius Aurelianus, gave way to that of 'Humorism,' based on Hippocrates and Galen, and from this time dates the Medical Renaissance. In 1253 the faculties of Naples were transferred to Salerno, thus transforming it into a univer-

of Salerno. The school continued to flourish until the thirteenth century, when the Salernitan school, having realized the impossibility of further progress, began to disintegrate. Women studied and practiced medicine, and were participating and contributing to the introduction of Arabic medicine into the medical institutions was the main feature of the school. In the beginning of the fourteenth century its prestige had completely passed away, and henceforth its decline continued until in 1811 it was reduced to a mere gymnasium, and in 1817 it ceased to exist.

SALES. See **SALE.**

SALES, SAINT FRANCIS DE. See **FRANCIS DE SALES.**

SALEYER (sâ-lî'yer) ISLANDS. A group of islands near Celebes. See **SALAYER ISLANDS.**

SALÉZA, sâ'lâ'zâ', ALBERT (1867-). A French operatic tenor, born at Bruges. He was educated at the Paris Conservatory and made his debut at the Opéra Comique in 1888. He created the rôles of Encas in Berlioz's *Prise de Troie* and Richmond in Salvayre's *Richard III.* at Nice, in which city he sang from 1889 to 1891. The following year he was engaged in the Grand Opéra, Paris, and appeared in the first performances of Reyer's *Salammbô* and Verdi's *Otello*. In 1898 he made his American debut, and was especially successful in his interpretations of Italian rôles.

SALFORD, sâlf'fôrd. A municipal county and Parliamentary borough in Lancashire, England, virtually a portion of the city of Manchester (Map: England, D 3). It possesses an older municipal history than its larger neighbor, having obtained its first charter in 1231, and a charter of incorporation in 1844. Several railway viaducts and 16 bridges connect it with Manchester. The borough covers an area of eight square miles; it has fine libraries, a museum and art gallery in the beautiful Peel Park, one of four parks with a total area of 83 acres. Population, in 1891, 198,139; in 1901, 220,956. Consult: Darbyshire, *Old Manchester & Salford* (Manchester, 1887); *The Official Handbook of Manchester and Salford* (Manchester, 1899).

SALGÓTARJÁN, shôl'gô-tôr-yân. A town of Hungary, in the County of Nógrád, 78 miles by rail northeast of Budapest. The coal-mining interests are important and the town has iron works. There are, for working men, a hospital, baths, and schools. Population, in 1900, 13,552.

SALICIN (from Lat. *salix*, willow), $C_{11}H_{14}(OH)CH_2(OC_6H_7O_2)$. A member of the group of organic compounds to which the term glucosides is applied by chemists—a group which is specially characterized by the fact that each of its members, when exposed to the action of dilute acids or of ferments, takes up water and breaks up into sugar and other compounds. Salicin occurs in the bark of the various species of willow and poplar. It may be obtained in small, colorless, glistening prisms of an intensely bitter taste, which are readily soluble in hot water and in alcohol, moderately soluble in cold water, and insoluble in ether and chloroform. If introduced into the body, salicin is decomposed with formation of salicylic acid, which is then readily absorbed, probably in the form of its sodium salt. The physiological action of salicin is therefore in almost all respects identi-

cal with that of salicylic acid (q.v.). Salicin, however, has a much less irritating effect on the stomach, and a much weaker depressing effect on the heart, than free salicylic acid.

SALIC LAW (*Lex Salica*). One of the earliest of the so-called 'laws of barbarians,' which were put into written form in very corrupt Latin between the middle of the fifth and the beginning of the ninth century, and which set forth the customary law of the different German tribes. The Lex Salica contains a part of the law governing the Salian or Merovingian Franks. A prologue of much later date than the Lex itself places its composition in a period in which the Franks were governed by many chiefs (*proceres*); but from internal evidence the Lex is believed to have been drawn up in the reign of Clovis and near the close of the fifth century (A.D. 486-496). It consists largely of tariffs of 'compositions' to be paid for various injuries, and it deals mainly with what we should call the law of torts and crimes and the law of procedure. Of its original 65 titles, only six or seven are devoted to the law of family, property and inheritance. The older manuscripts contain the so-called 'Malberg gloss'—interpolated Frank words and phrases, which serve in some cases to explain the Latin words, in other cases to indicate the formal words to be employed in legal proceedings.

During the following three centuries much new matter was inserted by private copyists, a fact which renders the reconstruction of the original text more or less uncertain. A revised text, dating from the Carolingian period, in which the Latin was purged of its worst barbarisms and the Malberg gloss eliminated, is known as the Lex Emendata. The term 'Salic law' is often applied exclusively to that part of the law which relates to inheritance by women. The paragraph reads as follows: "But of Salie land, no portion of the inheritance shall come to a woman; but the whole inheritance of the land shall come to the male sex." It is evident that there is no question here of a woman's inheriting the throne, as is popularly supposed. The term Salic law was first employed, in this sense, in connection with the exclusion of women from the throne in France in the fourteenth century, during the struggle between Philip VI. and Edward III. of England for the French crown. This law was introduced into Spain by Philip V. in 1714, but was revoked again by Ferdinand VII. in 1830.

The best text is Hessels, *Lex Salica* (London, 1880). The literature, which is extensive, is cited in Brunner, *Deutsche Rechtsgeschichte* (Leipzig, 1887), i., pp. 293 et seq.; Violette, *Précis de l'histoire du droit français* (Paris, 1885), pp. 95 et seq.; and in Esmein, *Cours élémentaire d'histoire du droit français* (Paris, 1892), pp. 103 et seq.

SALICYLATES (from Lat. *salix*, willow). **MEDICAL USES OF THE.** The chief salicylates are those of sodium and lithium, together with methyl salicylate or in the form of oil of wintergreen. They are employed in the place of salicylic acid, because they are less irritating to the stomach, less depressing to the heart, and less liable to give rise to the disagreeable train of symptoms called *salicylism*. The more marked of these are ringing in the ears, deafness, partial

blindness, headache, vomiting, and delirium. The chief use of the salicylates is in rheumatism, in many acute cases of which they seem to possess a specific effect. The sodium salt is more effective in acute, the lithium salt in chronic rheumatism. When given in rheumatic fever, sodium salicylate and salicylic acid cause a fall of temperature, and marked relief from pain, and it is thought they diminish the likelihood of the cardiac complications so characteristic of this disease. (See RHEUMATISM.) Salicylate of sodium is used with success for causing the absorption of pleural effusions, in conjunction with purgatives and diuretics. In quinsy and true tonsillitis, especially of rheumatic origin, the salicylates will often prevent suppuration, shorten the attack, and promptly relieve the pain and swelling.

Mercury salicylate has the properties of a mercurial rather than those of salicylic acid and is employed as a hypodermic injection in urgent cases of syphilis. *Bismuth salicylate* is an intestinal antiseptic much used in Europe. See SALICYLIC ACID.

SALICYLIC ACID, $C_6H_4(OH)COOH$. An important compound of carbon, hydrogen, and oxygen, existing in combination in various plants. It is the chief component of oil of wintergreen, which is obtained by distilling the blossoms of the *Gaultheria procumbens*; it is likewise combined in the volatile oil of betula, obtained by distilling the bark of the sweet birch (*Betula lenta*). Salicylic acid is employed in the manufacture of certain dyestuffs; and as it has no odor and acts as a powerful anti-septic, it is extensively used for the preservation of various articles of food, such as eggs, milk, fruit, pickled vegetables, etc. It is also added to wine and beer to check fermentation, and thus to prevent the formation of deleterious products. In small quantities the acid is perfectly harmless. If the food, however, is very poor, it requires a rather large amount of acid to mask its disagreeable qualities and keep it fit for sale. Now, the combined effect of spoiled food and a great deal of the acid may be more or less injurious; and therefore the addition of salicylic acid to beer has, in several European countries, been forbidden by law. The salts of salicylic acid do not possess the antiseptic properties of the acid. The salt most commonly used is the salicylate of sodium, a white powder very soluble in water and having a sweetish, saline taste. The acid, or preferably its sodium salt, is used in medicine for a variety of purposes. It is a specific for many cases of acute rheumatism, producing rapid cessation of pain and a lowering of febrile temperature. In many persons, however, the acid itself and its salts are liable to produce peculiar symptoms known as *salicylism*: there is ringing in the ears, headache, irregular pulse, etc. Continued administration of the drug to such persons may cause violent delirium and eventually death.

Salicylic acid is manufactured either from oil of wintergreen or from carbolic acid (phenol). Oil of wintergreen is composed mainly of methyl salicylate, the ethereal salt or ester formed by the combination of methyl alcohol with salicylic acid. When the ester is boiled with caustic potash, it decomposes into its constituents, and thus the acid is obtained in the form of its potassium salt. Hydrochloric acid readily takes up the metal of the latter, setting free its

salicylic acid, which may then be rendered pure by recrystallization from alcohol. At present, however, salicylic acid is manufactured mostly from phenol. Phenol (carbolic acid) combines with caustic soda, yielding sodium phenate; and when the latter is heated to 120° to 140° C. (250° to 285° F.) with carbonic acid gas under pressure, or preferably with liquid carbonic acid in closed iron vessels, the sodium salt of salicylic acid is produced. This salt is decomposed with hydrochloric acid, and the salicylic acid set free is purified by recrystallizing from ordinary alcohol or by distilling with a current of steam.

When heated with lime, salicylic acid loses the elements of carbonic acid and is reconverted into phenol. Pure salicylic acid is a white crystalline substance, very soluble in alcohol, sparingly soluble in water, and having a sweetish-sour taste. Its presence in a given article is usually detected by means of ferric chloride, which imparts to solutions of the acid an intense violet coloration.

SALIDA, sâ-lî'dâ or -lî'dâ. A city in Chaffee County, Colo., 97 miles west by north of Pueblo; on the Denver and Rio Grande Railroad (Map: Colorado, E 2). It is situated in a section noted for its mineral wealth and for its rich agricultural lands. There are a smelting plant and repair and construction shops of the Denver and Rio Grande Railroad. Salida Academy, a public library, and the Denver and Rio Grande Hospital are features of the city. The water-works are owned by the municipality. Population, in 1890, 2586; in 1900, 3722.

SALIENT (Fr. *salient*, from Lat. *saliens*, pres. part. of *salire*, to leap). In heraldry (q.v.), a lion represented in the act of springing on its prey.

SALIENT. See FORTIFICATION.

SALIERI, sâ-lyâ'rê, ANTONIO (1750-1825). An Italian composer, born in Legnano. In 1765 he entered the San Marco singing school, Venice, and shortly afterwards went to Vienna as a pupil of Gassmann. In 1770 he produced his first opera, *Le donne letterate*, with great success. He was a very popular composer in his time, but is now almost entirely forgotten. His chief fame was as a composer of dramatic and church music. Of his operas *Les Danaïdes* (1784) and *Turco* (1787) are considered the best. He wrote in all 46 operas, 3 oratorios, 8 cantatas, 2 symphonies, and many miscellaneous compositions. Among his pupils were Beethoven and Schubert. He died in Vienna.

SALIGRAMI, sâl'lê-grâ'mê. A river of India. See GANDAK.

SALII, sâl'i-i (Lat., dancers). A Roman priesthood, consecrated to the service of the war-god. They appear to have existed in both the early communities that combined to form the city of Rome, those of the Palatine (*Salii Palatini*) serving Mars, those of the Quirinal (*Salii Collini* or *Quirinalis*) originally Quirinus. Later the joint body was regarded as under the protection of Jupiter, Mars, and Quirinus. The Salii were performers of the war-dances in honor of the god. Each body numbered 12, and each had its own head and ritual. They wore the old military garb, a blood-red tunic, breastplate, and pointed helmet, and carried a sword, and especially the sacred shields and spears, kept always

in the year 1870 was said to be one of the finest in the world. Their chief work was to give the *G. squarrosus* in the autumn of 1870. The opening of the campaigning in the year 1871. The *Tristram* in October, when the *Tristram* was for the closed campaign were in the year 1871.

SALINA, sa'le'na. One of the Lipari Islands (Map).

SALINA. A city and the county-seat of Saline County, Kan., 100 miles west of Topeka; on the Smoky Hill River, and on the Union Pacific, the Missouri Pacific, the Chicago, Rock Island and Pacific, and the Atchison, Topeka and Santa Fe railroads (Map: Kansas, E 3). It is the seat of Kansas Wesleyan University (Methodist Episcopal), opened in 1886. The city also has the Salina Normal University, Saint John's School, a public library, Oak Dale Park, and a fine Government building. Salina is the commercial centre of a farming and stock-raising region. There are several grain elevators, two large wholesale groceries, and manufactories of flour, carriages, and foundry products. The government is vested in a mayor, elected biennially, and a unicameral council. Salina was settled about 1860, incorporated as a city of the third class in 1870, and received its present charter as a city of the second class in 1878. Population, in 1890, 6149; in 1900, 6074.

SALINAS, sa'le'nas. A city and the county-seat of Monterey County, Cal., 118 miles southeast of San Francisco; on the Southern Pacific Railroad (Map: California, C 3). It is the centre of a fertile section producing sugar beets, potatoes, and wheat, and having important dairying and stock-raising interests. Flour and machine-shop products constitute the leading manufactures. The Spreckels Beet Sugar Factory, one of the largest concerns of its kind in the world, is four miles from the city. Population, in 1890, 2339; in 1900, 3304.

SALINA STAGE. A subdivision of the Silurian system receiving its name from Salina, N. Y., and comprising a series of shales and marls with beds of rock salt and gypsum. The rocks are of most importance in New York, Ohio, and Pennsylvania, where they are the basis of an extensive salt industry. See SILURIAN SYSTEM.

SALINS, sa'lan'. A watering-place in the Department of Jura, France, 30 miles south by west of Besançon, on the Furieuse River (Map: France, M 5). It is situated amid picturesque scenery and has numerous mineral springs. The extensive thermal establishment in which the salt of the springs is also prepared for the market is one of the chief buildings in the town. Population, in 1901, 5525.

SALISBURY, sal'zbur-i, or NEW SARUM. The capital of Wiltshire, England, an episcopal city on the Avon, at its junction with two affluents, 81 miles west-southwest of London, and 23 miles northwest of Southampton (Map: England, E 5). The town dates from 1220, in which year the cathedral was founded. The cathedral, the principal building of Salisbury, is one of the finest specimens of early English architecture. It was completed in 1285. The spire is the "most elegant in proportions and the loftiest in England." Its height from the pavement is 406 feet. The cathedral is 473 feet long; height in

the interior, 81 feet; width of great transept, 203 feet. It is in the form of a double cross, is perfect in its plan and proportions, and in the main uniform in style. The west front is beautiful and graceful, though now stripped of statues, with which it was once enriched. Other interesting buildings are the bishop's palace, the deanery, the King's house, the hall of John Halle, and the Poultry Cross with six arches built in 1330. There are a fine museum, several important educational institutions, and many charities. The town maintains its water supply, markets, river baths, technical school, public library, sewage farm, and two cemeteries. The trade is chiefly agricultural; cutlery and woolen manufactures, formerly important, are abandoned. Population, in 1891, 15,500; in 1901, 17,100. Consult White, *Salisbury Cathedral* (London, 1896).

SALISBURY. A town in Litchfield County, Conn., 63 miles northwest of Hartford; on the Housatonic River, and on the Philadelphia, Reading and New England Railroad (Map: Connecticut, B 2). It is attractively situated in a region noted for its numerous lakes and the general beauty of its scenery. It has a State School for Imbeciles, Hotchkiss School for Boys, and the Scoville Memorial Library, with over 6000 volumes. Iron-mining and farming are important industries; and there are manufactures of cutlery, cutlery handles, car wheels, and various foundry products. Population, in 1890, 3420; in 1900, 3489. Settled in 1722, and laid out ten years later, Salisbury was incorporated as a town in 1741. Ethan Allen lived here for some years prior to the Revolution. Consult Rudd, *An Historical Sketch of Salisbury* (New York, 1899).

SALISBURY. A town and the county-seat of Wicomico County, Md., 100 miles southeast of Baltimore; on the Wicomico River and on the Baltimore, Chesapeake and Atlantic and the New York, Philadelphia and Norfolk railroads (Map: Maryland, P 7). It has large lumber interests, repair shops of the Baltimore, Chesapeake and Atlantic Railroad, and extensive canning establishments. Flour, baskets, fertilizers, and lumber products also are manufactured. Under the charter of 1888 the government is vested in a mayor, chosen biennially, and a unicameral council. Population, in 1890, 2905; in 1900, 4277.

SALISBURY. A city and the county-seat of Rowan County, N. C., 118 miles west of Raleigh; on the Southern Railway (Map: North Carolina, B 2). It is the seat of Livingstone College (African Methodist Episcopal Zion), opened in 1882; of the colored State Normal School, and various secondary institutions. The national cemetery here contains 12,145 graves, including 12,035 of unknown dead. Salisbury is in a farming and fruit-growing section, and has shops of the Southern Railway, and manufactories of cotton, hosiery and knit goods, wooden ware, foundry and lumber products, felt mattresses, braided cord, and brick. The water-works are owned by the municipality. A Confederate military prison was situated in Salisbury during the Civil War. Population, in 1890, 4418; in 1900, 6277.

SALISBURY, EDWARD ELBRIDGE (1814-1901). An American Orientalist and philologist, born in Boston. He graduated from Yale in 1832 and after a further course of theology there, studied

Oriental languages in Paris and Berlin. In 1841 he was appointed professor of Arabic and Sanskrit at Yale. In 1854 he surrendered his Sanskrit work to Whitney, remaining professor of Arabic until 1856. He endowed the Sanskrit professorship of the college, and later gave his Oriental library to the university. He was a prolific contributor on Oriental languages and literatures to the *Journal of the American Oriental Society*, of which he was the leading spirit for many years. Consult Hopkins, *India, Old and New* (New York, 1901).

SALISBURY, ROBERT ARTHUR TALBOT GASCOYNE-CECIL, third Marquis of (1830-1903). An English statesman, born at Hatfield, Hertfordshire, February 3, 1830; a lineal descendant of Lord Burleigh and Robert Cecil, first Earl of Salisbury. He received his bachelor's degree at Christ Church, Oxford, in 1849, and in 1853 was elected fellow of All Souls' College. In the same year he entered Parliament as the representative of Stamford. With the year 1859 he began to be considered as a distinct force among the Conservatives. In 1865 his elder brother died and he became heir to the marquise and assumed the courtesy title of Viscount Cranborne. In the Derby Ministry of 1866 Lord Cranborne was taken into the Cabinet as Secretary of State for India. He had made a thorough study of the problems which this office presented, but after holding the office for less than a year resigned because of his opposition to the Reform Bill brought in by his colleagues. In 1868 his father died and he was transferred to the House of Lords as Marquis of Salisbury. In 1869 he became chancellor of the University of Oxford. This was a distinct recognition of his attitude toward Church questions, for from his entrance into public life he had been a vigorous defender of the Church of England. From 1868 to 1874, the period of Gladstone's first Ministry, Salisbury was not a very conspicuous figure in politics, but when the Conservatives, under Disraeli, returned to power in 1874, Salisbury again entered the Cabinet as Secretary of State for India. He was almost the only Minister who heartily supported the new Premier's imperialist policy. Because of his agreement with his chief on this point and his knowledge of Eastern affairs, he was chosen in 1876 as the British representative to the Conference of Constantinople, which was called with a view of forcing reforms upon the Porte. Two years later Lord Derby withdrew from the Cabinet and Salisbury took his place as Secretary of State for Foreign Affairs. In this capacity he accompanied Lord Beaconsfield as plenipotentiary to the Congress of Berlin, but gained little glory from the mission, as he seemed to have been entirely subservient to the Premier and his jingo policy. Upon the death of Lord Beaconsfield in 1881 Lord Salisbury was chosen leader of the Conservative Party, and after the resignation of the Gladstone Ministry in June, 1885, became head of the Government, taking for himself the Department of Foreign Affairs. The Conservatives went out of office in January, 1886, only to come back in July, after the adoption of Home Rule by Gladstone had disrupted the Liberal Party, and sent a large faction under Lord Hartington and Joseph Chamberlain into the Conservative ranks. In 1887 Lord Salisbury once more assumed as Premier charge of foreign affairs. He went

out of office in 1892 and again returned to power in 1895. In 1900 he was succeeded in the Foreign Office by Lord Lansdowne, remaining, however, at the head of the Cabinet as Lord Privy Seal. On July 11, 1902, Lord Salisbury resigned his office and was succeeded by his nephew, Arthur Balfour. During his long tenure of office Lord Salisbury attained a leading position among European diplomats, his policy being characterized in general by a spirit of moderation which brought him much criticism from those Englishmen who viewed with jealous eyes the development of ambitious world policies by the Continental Powers. Events of international importance in which Lord Salisbury was concerned were the misunderstanding with the United States concerning Venezuela in 1895-96, the adjustment of the difficult question of Crete (1897), as well as the delimitation of the British and German spheres of influence in Africa (1890). Toward the end of his tenure of office Lord Salisbury withdrew somewhat from the public eye, partly as the result of old age, but partly because the militant spirit of the new imperialistic Conservatism found a more aggressive leader in the person of Joseph Chamberlain, who from the outbreak of the South African War was by all odds the most predominant figure in the Cabinet. Lord Salisbury died August 22, 1903. Among English statesmen he ranks high, not for any one great quality or particular achievement, but because of the success that during nearly fifteen years of Imperial rule attended his policy of conservative caution. In tastes and sentiments an aristocrat, he did not shrink from expressing his disapproval of democracy, in his characteristically cynical but witty fashion. For his biography, consult: Puling (London, 1885); Traill (ib., 1891); Aitkin (ib., 1901); and How (ib., 1902).

SALISBURY, ROLLIN D. (1859-). An American geologist and educator, born at Spring Prairie, Wis., and educated at Beloit College, where he graduated in 1881. He served for two years as an instructor in the academy attached to Beloit, and from 1884 to 1891 was professor of geology in the college, except during a period of two years (1887-88) spent in foreign study. After a year's service on the faculty of the University of Wisconsin he was called to the chair of geographic geology at the University of Chicago, where in 1898 he was appointed dean of the Ogden School of Science. In 1883 he became connected with the United States Geological Survey, and in 1891 joined the New Jersey Geological Survey with especial charge of the surface geology of that State. Besides the annual reports of the New Jersey Geological Survey from 1882 to 1890 he wrote: *Physical Geography of New Jersey* (1896); *Geography of Chicago and Its Environs* (with W. A. Allen, 1899); *The Geography of the Region Around Devil's Lake and the Dalles of Wisconsin* (with W. W. Atwood, 1900); and *The Driftless Area of Southwestern Wisconsin*, with T. C. Chamberland (*Sixteenth Annual Report of the United States Geological Survey*).

SA'LISH. A North American tribe. See FLATHEAD.

SALISHAN STOCK. An important linguistic group whose tribes, with many dialectic variations, held nearly all the southern half of

tribes, including, with the opposite coast of Vancouver Island, together with nearly all of the coast and west in Washington and north-west in Oregon and Idaho, besides one or two (Columbia) tribes along the Oregon coast. There is a great probability that the tribes now classed among the Wakashan (q.v.) stock of Vancouver Island, with the more northern Haultank, will ultimately be proved to be of the same connection. They may be classed roughly in two groups: the fishing tribes of the coast and Puget Sound region, and the root and berry gatherers of the interior. Their primitive characteristics were of a very low order. They had no agriculture, and there could hardly be said to have been any form of government. The clan system was unknown. The houses were usually large communal dwellings of split cedar boards. Among the coast tribes the dead were usually laid away in canoes set upon posts in the woods, and slaves were sacrificed near the spot, being sometimes bound and left thus to starve to death. There was constant petty warfare among the various small bands, the weapons being clubs and bows, with protective body armor of toughened hide or strips of wood. Scalping was not practiced, but the slain were frequently beheaded. Head-blattening was common among nearly all the tribes, particularly near the coast, as was also the curious custom of potlatch (q.v.). All the dialects are exceptionally harsh and difficult in pronunciation, and but little study has yet been made of them. The Chinook jargon (q.v.) was also in use as a regular trading medium. The majority of their tribes now retain but few of their aboriginal characteristics. Among the eighty or more tribal divisions may be mentioned the Bellacoola, Clallam, Colville, Flathead or Salish proper, Kalispel, Lake, Lummi, Nisqually, Okinagan, Puyallup, Quinault, Sampoil, Shushwap, Skokomish, Songeesh, Spokan, Tulalip. Their present numbers are about 20,000, nearly equally divided between the United States and British Columbia.

SALIS-SEEWIS, *Ger. pron.* zä'läs-zä'vös; *Fr.* sä'lés' sä'vös', JOHANN GAUDENZ, Baron von (1762-1834). A Swiss poet, born in Bothmar Castle, near Malans, Grisons. In 1779 he went to Paris and entered the Swiss guards, in which he advanced rapidly. He returned to Switzerland in 1793, married the 'Berenice' of his poems, and took a prominent part in Swiss politics, becoming leader of the patriots and inspector-general of their forces. In 1817 he retired to his estate at Malans. His poems were first published in 1793, and a twelfth enlarged edition appeared in 1839. With Matthiesson he represents the sentimental nature poets, but ranks as less sentimental, more individual, and more objective than his colleague. His "Silent Land," in Longfellow's translation, is well known to English readers. For his biography, consult Röder (Saint Gall, 1863) and Frey (Frauenfeld, 1889).

SALIVARY GLAND (Lat. *salivarius*, relating to saliva, from *saliva*, spittle; connected with Grk. *σάλιον*, *salion*, Russ. *slina*, Gael. *seile*, spittle). A gland which conveys certain secretions into the mouth, where, when mixed with the mucus secreted by the mucous membrane, they constitute the ordinary or mixed saliva. There are three pairs of salivary glands: The

parotid gland is the largest of the three glands occurring on either side. It lies upon the side of the face immediately in front of the external ear, and weighs from half an ounce to an ounce. Its duct is about two inches and a half in length, and opens into the mouth by a small orifice opposite the second molar tooth of the upper jaw. The walls of the duct are dense and somewhat thick, and the caliber is about that of a crow-quill. (For structure, see GLAND.) The *submaxillary gland* is situated, as its name implies, below the jaw-bone, and is placed at nearly equal distances from the parotid and sublingual glands. Its duct is about two inches in length, and opens by a narrow orifice on the top of a papilla, at the side of the frenum of the tongue. The *sublingual gland* is situated, as its name implies, under the tongue, each gland lying on either side of the frenum of the tongue. It has a number of excretory ducts, which open separately into the mouth.

True salivary glands exist in all mammals except the Cetacea, in birds and reptiles (including amphibians), but not in fishes; and glands discharging a similar function occur in insects, many mollusks, etc. In insects and vertebrates this fluid is chiefly diastatic in character, changing starch to sugar. In mollusks an œsophageal gland, called 'salivary,' secretes an acid fluid, which, like the hydrochloric acid of the vertebrate stomach, is chiefly antiseptic in its function. Certain special glands pour their secretions into the buccal cavity, such as the spinning-glands of caterpillars and the glands of the swifts (q.v.) that supply the material of their nests. For the chemical and physical characters of the saliva, see DIGESTION.

The most common disease of the parotid is the specific inflammation commonly known as mumps (q.v.). These glands may also become acutely inflamed during some of the infectious diseases (e.g. scarlet fever, smallpox, or typhoid), and in these cases they readily go on to suppuration, requiring early incision. Many of the tumors develop in this site, some of great malignancy, and they present serious difficulties to operative interference. The facial nerve is especially liable to injury during operation, with resulting facial paralysis. At times the excreting duct becomes occluded by a calculus and a troublesome salivary fistula follows unless it is promptly removed. Increase of secretion, deficiency of secretion, or an acid or fetid change present annoying complications in different diseases. See SALIVATION.

SALIVATION (Lat. *salivatio*, from *salivare*, to spit, from *saliva*, spittle), or **PTYALISM**. An excessive secretion of saliva, due to irritation of the salivary glands, and usually attended with soreness and swelling of the mucous membranes of the mouth and throat. It is commonly induced by mercury or its compounds in excessive and long continued dosage, but may arise from other drugs, notably pilocarpine, potassium iodide, muscarine, cantharides, copper, gold, and tobacco. Certain diseases also are provocative of an increased salivary flow, among which may be mentioned parotitis, quinsy, hydrophobia, senry, hysteria, stomatitis, trigeminal neuralgia, and dental irritations, including the process of dentition itself. It is an occasional phenomenon of pregnancy and menstruation. Apparent sali-

vation may occur in facial paralysis, diphtheritic paralysis, chronic bulbar palsy, and idiocy; this is due rather to an inability to retain the secretion than to overproduction. When due to mercury, salivation is manifested by a metallic taste, a foul-smelling breath, and tenderness on pressure of the jaws and teeth. The gums and tongue are red and swollen, the latter coated heavily and showing the imprint of the teeth. In severe cases the gums may bleed and ulcerate, the teeth become loosened, and the cheeks and mouth become gangrenous. Pain, sleeplessness, fever, and constitutional depression may be extreme. For the treatment of mercurial salivation, see MERCURY and SYPHILIS.

SALLE, sál, JEAN BAPTISTE DE LA. See LA SALLE.

SALLEE, sál-lé', or **SLA**. A seaport of Morocco, situated at the mouth of the Bu Regreb, opposite Rabat (Map: Africa, D 1). It is noted for its fine carpets. The chief export is wool. Sallee was formerly notorious as the haunt of pirates. Population, about 10,000.

SALLOW. A popular name for various species of willow.

SALLUST (GAIUS SALLUSTIUS CRISPUS) (B.C. 86-34). A Roman historian, born at Amiternum, in the Sabine country. Though of a plebeian family, he rose to official distinction, first as quaestor about B.C. 59, and afterward as tribune of the people in 52, when he joined the popular party against Milo, who in that year had killed Clodius. His reputation for morality was never high; and his intrigue with Milo's wife is assigned as the cause of his being expelled in 50 from the senate, although his attachment to Cæsar's party is a more plausible reason of his expulsion. In the Civil War he joined the camp of Cæsar; and in 47, when Cæsar's fortune was in the ascendent, he was made prætor-elect, and was consequently restored to his former rank. When in Campania, at the head of some of Cæsar's troops, who were about to be transported to Africa, he nearly lost his life in a mutiny. In 46, however, we find him engaged in Cæsar's African campaign, at the close of which he was left as Governor of Numidia. His administration was sullied by various acts of oppression, particularly by his enriching himself at the expense of the people. He was, for these offenses, accused before Cæsar, but seems to have escaped being brought to trial. His immense fortune, so accumulated, enabled him to retire from the prevailing civil commotion into private life, and devote his remaining years to those historical works on which his reputation rests. He died in B.C. 34. His histories, which seem to have been begun only after his return from Numidia, are: First, the *Catiline* or *Bellum Catilinarium*, descriptive of Catiline's conspiracy in 63; second, the *Jugurtha*, or *Bellum Jugurthinum*, describing the war between the Romans and Jugurtha, the King of Numidia. These, the only genuine works of Sallust which have reached us entire, are of great but unequal merit. The quasi-philosophical reflections which are prefixed to them are of no value, but the histories themselves are powerful and animated, and contain effective speeches of his own composition, which he puts into the mouths of his chief characters. With its literary excellence, however, the value of the *Jugurtha* stops, as in military, geographical, and even

chronological details, it is very inexact. Of Sallust's lost work, *Historiarum Libri Quintus*, only fragments exist, some of which were found as late as 1886. Sallust has the merit of having been the first Roman who wrote what we now understand by history. The most convenient edition of the complete text of Sallust's works is that of Eussner (Leipzig, 1893). There are also good editions by Jordan (Berlin, 1887) and Dietsch (Leipzig, 1884); and of the *Catiline* and *Jugurtha* by Capes (Oxford, 1884). The most accessible translations are those of Watson (New York, 1859) and Mongan (1864).

SALLUST, GARDENS OF. The beautiful gardens laid out by the historian Sallust on the Quirinal Hill, later the favorite residence of several Roman emperors, who adorned them with magnificent works of art. The gardens survived until recently where the Villa Massimo stood.

SALLY-PORT. In fortification, usually a cutting made through the glacis by which a sally may be made from the covered way. The term has also been applied to the postern leading from under the rampart into the ditch. The sally-port was an important feature of all the old castles and fortified buildings of Europe. See FORTIFICATION.

SALMASIUS, sál-má's-hi-ús, CLAUDIUS, or CLAUDE DE SAUMAISE (1588-1655). A French classical scholar and Protestant, born April 15, 1588, at Saumur-en-Anjou, France. After studying at Paris and Heidelberg he was made professor at Leyden (1631), but, in part because of the sensation caused by his *Defensio regis pro Carolo I.* (1649) and Milton's fierce rejoinder, he accepted an invitation to Stockholm (1650), whence he returned in 1651 with shattered health to Leyden. He died September, 1655, at Spa. Salmasius had immense but ill-digested learning. He was a great encyclopedist, but with little method, and weak as a textual critic. He is remembered for his discovery of the Greek *Anthology* of Kephalaos at Heidelberg (1606), for editions of *Scriptores Historie Auguste* (1620), and for *Pliniane Exercitationes in Solinum* (1629), *De Lingua Hellenistica* (1643), *De Usuris* (1638), and *De Re Militari Romanorum* (1657). Salmasius's *Life and Letters* appeared at Leyden (1656). Consult: Masson, *Life of Milton*, vol. iv. (London, 1858-79); Crenzer, *Opuscula Selecta*, vol. ii. (Leipzig, 1854); and Saxius, *Onomasticon*, vol. iv. (Utrecht, 1775-83).

SALMON (OF., Fr. *saumon*, from Lat. *salmo*, salmon, leaper, from *salire*, Gk. ἀλλεσθαι, *hállēs-thai*, to leap). A large fish (*Salmo salar*) of the northern oceans, ascending rivers annually to spawn. The name 'salmon' is also used for other more or less closely related species, and it gives the name to a family, the Salmonida, to which salmon, trout, whitefish, and various related forms of fishes belong. Although a small family, comprising less than 100 species, this group stands first in popular interest from almost every point of view. The following are the chief external characters of the salmon family:

Body oblong or moderately elongate, covered with cycloid scales of varying size. Head naked. Mouth terminal or somewhat inferior, varying considerably among the different species, those having the mouth largest usually having also the strongest teeth. (See illustration under FISH.) Maxillary provided with a supplemental bone,

ray, and a lateral margin of the upper jaw. Gill-rakers present. Opercula complete, and the gill-opening moderate length. Pectoral fin of moderate length, beginning in the middle of the length of the body. Ventrals well developed. Caudal fin forked. Anal fin moderate or rather long. Ventral fins nearly median in position. Pectoral fins inserted low. Lateral line present. Outline of belly rounded. Vertebrae in large number, usually about 60. Skeleton not strongly ossified. The stomach in all the Salmonidee is siphonal, and at the pylorus are many (15 to 200) comparatively large pyloric caeca. The air-bladder is large. The eggs are usually much larger than in fishes generally, and the ovaries are without special duct, the ova falling into the cavity of the abdomen before excretion. The large size of the eggs, their lack of adhesiveness, and the readiness with which they may be impregnated, render the Salmonidee peculiarly adapted for artificial culture.

The Salmonidee belong to the order of Isospondyli, the most primitive and least specialized of the orders of Teleostei or bony fishes. In their group, these fishes represent a high degree of development, adaptation to swift rivers and the need of complex instincts. The Salmonidee are peculiar to the North Temperate and Arctic regions, and within this range they are almost equally abundant wherever suitable waters occur. Some of the species, especially the larger ones, are marine and anadromous, living and growing in the sea, and ascending fresh waters to spawn. Still others live in running brooks, entering lakes or the sea when occasion serves, but not habitually doing so. Still others are lake fishes, approaching the shore or entering brooks in the spawning season, at other times retiring to waters of considerable depth. Some of them are active, voracious, and gamy; while others are comparatively defenseless, and will not take the hook. They are divisible into 10 easily recognized genera—*Coregonus*, *Argyrosomus*, *Plecoglossus*, *Brachymystax*, *Stenodus*, *Hucho*, *Oncorhynchus*, *Salmo*, *Cristivomer*, and *Salvelinus*.

The Atlantic salmon (*Salmo salar*) is the most familiar, although commercially not the most important of the various species properly called salmon. It is the only black-spotted salmonid found on the Atlantic seaboard of America. (For illustration, see Colored Plate of AMERICAN FOOD FISHES, accompanying article FISH AS FOOD.) In Europe, where black-spotted trout (*Salmo fario*) and salmon trout (*Salmo trutta*) also occur, the true salmon may be distinguished by the fact that the teeth on the shaft of the vomer mostly disappear with age. From the only other species (*Salmo trutta*) positively known which shares this character, the salmon may be known by the presence of but 11 scales between the adipose fin and the lateral line.

The salmon of the Atlantic is, as already stated, an anadromous fish, spending most of its life in the sea, and entering the streams in the fall for the purpose of reproduction. The time of running varies much in different streams and also in different countries. As with the Pacific species, these salmon are not easily discouraged in their progress, leaping cascades 10 or 12 feet in height, and other obstructions; or, if these prove impassable, dying after repeated fruitless attempts. The young salmon, or 'parr,' is

hatched in the spring. It usually remains about two years in the rivers, descending at about the third spring to the sea, when it is known as 'smolt.' The dusky cross-shades found in the young salmon or parr are characteristic of the young of nearly all the Salmonidee. In the sea it grows much more rapidly, and becomes more silvery in color, and is known as 'grilse.' The grilse rapidly develop into the adult salmon; and some of them, as is the case with the grilse of the Pacific salmon, are capable of reproduction. After spawning, the salmon are very lean and unwholesome, in appearance, as in fact, and are then known as 'kelts.' The Atlantic salmon does not ascend rivers to any such distances as those traversed by the quinnat and the blue-back; its kelts for the most part survive the act of spawning. As a food-fish, the Atlantic salmon is similar to the quinnat salmon, although rather less oily. The average weight of the adult is probably less than 15 pounds. The largest one recorded was taken on the coast of Ireland in 1881, and weighed 84¾ pounds.

The salmon is found in Europe between the latitudes of 45° and 75°. In the United States it is now rarely seen south of Cape Cod, although formerly the Hudson and numerous other rivers were salmon streams. The land-locked forms of salmon, abundant in Norway, Sweden, Maine, and Quebec, which cannot, or at least do not, descend to the sea, should probably not be considered as distinct species. Comparison has been made of numerous specimens of the common land-locked salmon (*Salmo salar*, var. *sebago*) from the lakes of Maine and New Brunswick with land-locked salmon (*Salmo salar*, var. *hardini*) from the lakes of Sweden, and with numerous migratory salmon, both from America and Europe. While showing minor distinctions, especially in size and habit, they are structurally identical. The differences are not greater than would be expected on the hypothesis of recent adaptation of the salmon to lake life. We have, therefore, on our Atlantic coast but one species of salmon (*Salmo salar*).

The numerous other species of the genus *Salmo* are usually known as 'trout,' although, except for the better development of the vomer and greater backward extension of the series of teeth upon it, there is no technical character of any importance to distinguish the Atlantic salmon from the true, or black-spotted trout. But the salmon reaches a larger size than any of these, and it is regularly anadromous. On the other hand, the running of trout up the rivers to spawn is irregular, and most individuals are land-locked, as are also certain dwarf varieties of the salmon (as the Sebago salmon and the ouananiche of Saint John's River, Quebec).

Most trout, however, enter the sea when they can. These sea-run individuals often grow large and look like salmon, and, like the salmon, they enter the rivers to spawn. They do not, however, ascend the streams with as much energy, nor do they go as far, the instinct in these respects being much less perfect. To the large species entering the sea, intermediate in structure between trout and salmon, the name 'salmon-trout' is applied in England. The species so named (*Salmo trutta*) is considered by some as doubtfully distinct from the ordinary brown trout of Europe (*Salmo fario*). Other species which may be properly called salmon-trout, hav-

SALMON AND TROUT (WESTERN)

1. SALMON-TROUT or STEELHEAD (*Salmo Gairdneri*).
2. COLUMBIA RIVER TROUT (*Salmo mykiss*, var. *Clarkii*).
3. HUMPBACK SALMON (*Oncorhynchus gorbuscha*).

4. QUINNAT SALMON (*Oncorhynchus tshawytscha*).
5. BLUEBACK SALMON (*Oncorhynchus nerka*); female.
6. BLUEBACK; old male in breeding dress.

ing the size, appearance, and habits of *Salmo trutta*, are the steelhead of California and Oregon (*Salmo Gairdneri*), the kawamasu of Japan (*Salmo Peryi*), and the mykiss of Kamchatka (*Salmo mykiss*). These differ in no important respect from ordinary black-spotted trout, and the young in the rivers are known as 'trout.' Indeed, it is not certain that the various species of trout are not originally land-locked salmon-trout, and it is probable that a change of environment of relatively few years might transform the one into the other. This remark does not apply to the red-spotted forms known as 'charr' in England and as 'brook trout' or 'speckled trout' in America. These belong to a distinct genus, *Salvelinus*. See Trout.

The salmon of the Pacific diverge considerably from the Atlantic salmon, and still more from the forms called 'trout.' The six known species of these fishes are placed in a distinct genus, *Oncorhynchus*, which agrees with *Salmo* in general characters, and in the structure of its vomer, but differs anatomically in the increased number of anal rays, branchiostegals, pyloric caeca, and gill-rakers. The species of *Oncorhynchus* differ, further, in their highly specialized reproductive instincts, all individuals, male and female, dying after spawning. The character most convenient for distinguishing *Oncorhynchus*, young or old, from all the species of *Salmo* is the number of developed rays in the anal fin. These in *Oncorhynchus* are 13 to 20, in *Salmo* 9 to 12.

The species of *Oncorhynchus*, anadromous salmon confined to the North Pacific, was first made known in 1768 by that most exact of early observers, Steller, who described and distinguished them with perfect accuracy, under their Russian vernacular names. These Russian names were in 1792 adopted by Walbaum as specific names in a scientific nomenclature; and the six species of Pacific salmon may be called: (1) Quinnet, Chinook, or king salmon (*Oncorhynchus tshawytscha*); (2) red salmon, blueback, or sukkegh (*Oncorhynchus nerka*); (3) silver salmon or coho (*Oncorhynchus kisutch*); (4) dog salmon, calico salmon, or haiko, the saké of Japan (*Oncorhynchus keta*); (5) humpback or pink salmon (*Oncorhynchus gorbuscha*); (6) masu (*Oncorhynchus masou*) of Japan. These species, in all their varied conditions, may usually be distinguished by the characters given below.

The quinnet salmon (*Oncorhynchus tshawytscha*) has an average weight of 22 pounds, but individuals weighing 70 to 100 pounds are occasionally taken. It has about 16 anal rays, 15 to 19 branchiostegals, 23 (9 + 14) gill-rakers on the anterior gill arch, and 140 to 185 pyloric caeca. The scales are comparatively large, there being from 130 to 155 in a longitudinal series. In the spring the body is silvery, the back, dorsal fin, and caudal fin having more or less of round black spots, and the sides of the head having a peculiar tin-colored metallic lustre. In the fall the color is often black or dirty-red, and the species can then only be distinguished from the dog salmon by its technical characters.

The blue-back salmon (*Oncorhynchus nerka*) usually weighs from five to eight pounds. It has about 14 developed anal rays, 14 branchiostegals, and 75 to 95 pyloric caeca. The gill-rakers are more numerous than in any other salmon, usually about 39 (16 + 23). The scales are larger, there being 130 to 140 in the lateral line. In the

spring the form is plumply rounded, and the color is a clear bright blue above, silvery below, and everywhere immaculate. Young fishes often show a few round black spots, which disappear when they enter the sea. Fall specimens in the lakes are bright red in color, hook-nosed and slab-sided, and bear little resemblance to the spring run. Young spawning male grise are also peculiar in appearance, and were for a time considered as forming a distinct genus. This species appears to be sometimes land-locked in mountain lakes, in which case it reaches but a small size, and is called 'koko' by the Indians.

The silver salmon (*Oncorhynchus kisutch*) reaches a weight of three to eight pounds. It is silvery in spring, greenish above, and with a few faint black spots on the upper parts only. In the fall the males are mostly of a dirty red. The dog salmon (*Oncorhynchus keta*) reaches an average weight of about nine pounds. In spring it is dirty silvery, immaculate, or sprinkled with small black specks, the fins dusky. In the fall the male is brick-red or blackish, and its jaws are greatly distorted. The humpback salmon (*Oncorhynchus gorbuscha*) is the smallest of the species, weighing from three to six pounds. Its scales are much smaller than in any other salmon. In color it is bluish above, the posterior and upper parts with many round black spots. The masu (*Oncorhynchus masou*) is thus far known only from the rivers of Northern Japan. It is very much like the humpback salmon, but may be known at sight by the absence of black spots on its tail.

The blueback abounds in Fraser River and in all the streams of Alaska; the silver salmon in Puget Sound; the quinnet in the Columbia and the Sacramento; and the dog salmon in some of the streams to the northward and especially in Japan. All of the five American species have been seen in the Columbia and Fraser rivers; all but the blueback in the Sacramento, and all in waters tributary to Puget Sound. Only the quinnet has been noticed south of San Francisco, as far as Carmelo River. The king salmon and blueback habitually 'run' in the spring, the others in the fall. The usual order of running in the rivers is as follows: *tshawytscha*, *nerka*, *kisutch*, *gorbuscha*, *keta*. The economic value of the spring-running salmon is far greater than that of the other species, because they can be captured in numbers when at their best, while the others are usually taken only after deterioration. To this fact the worthlessness of *Oncorhynchus keta*, as compared with the other species, is partly due. Its flesh at the best, however, is soft and mushy.

The habits of the salmon in the ocean are not easily studied. King salmon and silver salmon of all sizes are taken with the seine at almost any season in Puget Sound; this would indicate that these species do not go far from the shore. The king salmon takes the hook freely in Monterey Bay, both near the shore and at a distance of six to eight miles out. We have reason to believe that these two species do not necessarily seek great depths, but probably remain not very far from the mouth of the rivers in which they were spawned. The blueback and the dog salmon probably seek deeper water, as the former is seldom taken with the seine in the ocean, and the latter is known to enter the Straits of Fuca at the spawning season, therefore coming in from

run of the fall of the king salmon (1900-1901) at the last of March; it lasts, with a few modifications and interruptions, until the actual spawning season, August to November, the time of running and the proportionate amount in each of the subordinate runs varying with each different river. In the Sacramento the run is greatest in the fall, and greater in the summer than in spring. The spring salmon ascend only those rivers which are fed by the melting snows from the mountains, and which have sufficient volume to send their waters well out to sea. Those salmon which run in the spring are chiefly adults (supposed to be mostly four years old). It would appear that the contact with cold fresh water, when in the ocean, in some way causes them to run toward it, and to run before there is any special influence to that end exerted by the development of the organs of generation. High water on any of these rivers in the spring is always followed by an increased run of salmon. The manner of spawning is probably similar for all the species. Usually the fishes pair off; the male, with tail and snout, excavates a broad, shallow 'nest' in the gravelly bed of the stream, in rapid water, at a depth of one to four feet; the female deposits her eggs in it, and after the exclusion of the milt the pair cover them with stones and gravel. They then float down the stream tail foremost, never swimming down stream or making any effort to reach the sea. In the course of from a day to a week or two all of them, both males and females, die, regardless of the distance of their spawning beds from the sea. The young hatch in from 120 to 180 days.

The salmon of all kinds in the spring are silvery, and the mouth is about equally symmetrical in both sexes. As the spawning season approaches the female loses her silvery color, becomes more slimy, the scales on the back partly sink into the skin, and the flesh changes from salmon-red, and becomes variously paler from the loss of oil, the degree of paleness varying much with individuals and with inhabitants of different rivers. In the Sacramento the flesh of the quinnat, in either spring or fall, is rarely pale. In the Columbia a few with pale flesh are sometimes taken in spring, and a good many in the fall. In Fraser River the fall run of the quinnat is nearly worthless for canning purposes, because so many are 'white-meated.' In the spring very few are 'white-meated,' but the number increases toward fall, when there is every variation, some having red streaks running through them, others being red toward the head and pale toward the tail. The red and pale ones cannot be distinguished externally, and the color is dependent upon neither age nor sex. There is not much difference in the taste, but there is no market for pale-fleshed salmon.

As the season advances, the difference between the males and females becomes more and more marked, and keeps pace with the development of the milt, as is shown by dissection. The males have (1) the premaxillaries and the tip of the lower jaw more and more prolonged, both of the jaws becoming finally strongly and often extravagantly hooked, so that either they shut by the side of each other like shears, or else the mouth cannot be closed. (2) The front teeth become very long and canine-like, their growth proceeding very rapidly, until they are often one-

half inch long. (3) The teeth on the vomer and tongue often disappear. (4) The body grows more compressed and deeper at the shoulders, so that a very distinct hump is formed; this is more developed in the humpback and dog salmon, but is found in all. (5) The scales disappear, especially on the back, by the growth of spongy skin. (6) The color changes from silvery to various shades of black and red, or blotchy, according to the species. The distorted males are commonly considered worthless, rejected by the canners and salters, but are preserved by the Indians. These changes are due solely to influences connected with the growth of the reproductive organs. They are not in any way due to the action of fresh water. They take place at about the same time in the adult males of all species, whether in the ocean or in the rivers. At the time of the spring runs all are symmetrical. In the fall all males, of whatever species, are more or less distorted.

As already stated, the economic value of any species depends in great part on its being a 'spring salmon.' It is not generally possible to capture salmon of any species in large numbers until they approach the rivers, and the spring salmon enter the rivers long before the growth of the organs of reproduction has reduced the richness of the flesh. The fall salmon cannot be taken in quantity until their flesh has deteriorated; hence, the dog salmon is practically almost worthless, except to the Indians, and the humpback is little better. The silver salmon, with the same breeding habits as the dog salmon, is more valuable, as it is found in the inland waters of Puget Sound for a considerable time before the fall rains cause the fall runs, and it may be taken in large numbers with seines before the season for entering the rivers. The quinnat or Chinook salmon, from its great size and abundance, is more valuable than all the other fishes on our Pacific coast outside of Alaska taken together. The blueback, a little inferior in flesh, much smaller and far more abundant when Alaska is considered, is worth more than the combined value of the three remaining species of salmon. The pack of blueback salmon for 1903 is valued at \$8,000,000, the catch of the quinnat at nearly \$4,000,000.

The fall salmon of all species, but especially of the dog, ascend streams but a short distance before spawning. They seem to be in great anxiety to find fresh water, and many of them work their way up little brooks only a few inches deep, where they perish miserably, floundering about on the stones. It is the prevailing impression that the salmon have some special instinct which leads them to return to spawn on the grounds where they were originally hatched, but there is no evidence of this. It seems more probable that the young salmon hatched in any river mostly remain in the ocean within a radius of 20 to 100 miles of its mouth. These, in their movements about in the ocean, may come into contact with the cold waters of their parent river, or perhaps of any other river, at a considerable distance from the shore. In the case of the quinnat and the blueback, their 'instinct' seems to lead them to ascend these fresh waters, and in a majority of cases these waters will be those in which the fishes in question were originally spawned. Later in the season the growth of the reproductive organs leads them to approach the shore and search for fresh waters, and still the chances are

that they may find the original stream. But undoubtedly many fall salmon ascend, or try to ascend, streams in which no salmon were ever hatched.

Commercially speaking, the two principal species of Pacific salmon are unquestionably the most valuable fishes in the world. The market value of the entire salmon catch on the West coast of the United States, including Alaska, has reached nearly \$20,000,000 annually, and this vast amount is represented chiefly by the two species, the Chinook and blueback, the catch of the four other species being in comparison insignificant. The annual catch of salmon in Puget Sound has reached to more than \$4,000,000, and consists chiefly, as in Alaska, of bluebacks. The run of quinnats begins in the Columbia River as early as February or March. At first the fishes travel leisurely, moving up only a few miles each day. As they go farther and farther up-stream they swim rather more rapidly. Those that enter the river first are the ones which will go farthest toward the headwaters, many of them going to spawning beds in the Salmon River in the Sawtooth Mountains of Idaho, more than 1000 miles from the sea. In the Yukon the quinnat ascends to Caribou Crossing, 2250 miles from the sea. Those which go to the headwaters of the Snake River in the Sawtooth Mountains spawn in August and early September; those going to the Big Sandy in Oregon, in July and early August; those going up the Snake River to Upper Salmon Falls, in October; while those entering the small lower tributaries of the Columbia or the small coastal streams spawn even as late as December. Observations made at various places indicate that whatever the spawning beds may be, spawning will not begin until the temperature of the water has fallen to 54° F. If the fish reach the spawning grounds when the temperature is above 54°, they wait until the water cools down to the required degree. The spawning act extends over several days.

It has been often stated and generally believed that the salmon receive many injuries by striking against rocks and in other ways while en route to their spawning grounds, and as a result from these injuries, those which go long distances from the sea die after once spawning. An examination of many salmon at the time of arrival on their spawning beds in central Idaho showed most fishes to be entirely without mutilations of any kind, and apparently in excellent condition. Mutilations, however, soon appeared, resulting from abrasions received on the spawning beds while pushing the gravel about or rubbing against it, and from fighting with each other, which is sometimes quite severe. See illustration under DOG SALMON.

The blueback salmon is found from the coast of southern Oregon northward, especially in the Columbia, Quinnalt, and Skagit rivers. It enters the Fraser in enormous numbers, and is by far the most abundant and valuable salmon in Alaska. In the Columbia River it is called 'blueback;' in the Fraser it is the 'sockeye,' 'sawkeye,' or 'sau-qui;' in Alaska it is the red salmon or 'redfish;' while among the Russians it is the 'krasnaaya ryba.'

The death of all the individuals of all the species of the West coast salmon after once spawning is in no manner determined by distance

from the sea. The cause is deep-seated in its nature and general in its application, and the same as that which compasses the death of the Ephemera or Mayfly after an existence of but a few hours, or of all annual plants at the end of one season.

Other groups within the Salmonidae are elsewhere considered, under CHAR, TROUT, WHITEFISH, and certain specific names, as CISCO, NAMYACUSH, etc.

SALMON. sá'mún, GEORGIA (1819-1904). An Irish mathematician and divine, born in Dublin. He was educated at Trinity College in that city, where he became a fellow at the age of twenty. He took orders, and in 1866 became professor of theology. He wrote extensively on theology, his works including an *Introduction to the Study of the New Testament* (7th ed. 1894); *Un-miraculous Christianity* (2d ed. 1888); and *The Infallibility of the Church* (2d ed. 1891). But he is best known for his masterly treatises on mathematics, his text-books being the most advanced that have appeared in English in his generation. These works are: *Treatise on Conic Sections* (6th ed. 1879); *Treatise on Higher Plane Curves* (3d ed. 1879); *Treatise on Analytic Geometry* (1848); *Treatise on Analytic Geometry of Three Dimensions* (4th ed. 1882); *Lessons Introductory to the Modern Higher Algebra* (1859; 4th ed. 1885). These mathematical works have been translated into several languages, and the German editions of Fiedler are especially well known.

SALMOND. sá'mónd, STEWART DINGWALL FORDYCE (1838—). A Scotch educator, born at Aberdeen. He was educated at the University and Free Church College, Aberdeen, and at Erlangen University, and was assistant professor of Greek and examiner in classics at Aberdeen University from 1861 until 1867. In 1876 he became professor of systematic theology and exegesis of the Epistles in the United Free Church College, Aberdeen, and he was made principal of the college in 1898. His original works include: "Commentary on the Epistle of Peter," in *Schaff's Popular Commentary* (1883); "Commentary on the Epistle of Jude," in *Pulpit Commentary* (1889); *The Christian Doctrine of Immortality* (1895); and he also prepared translations of many of the minor Latin writers.

SALMON DANCE. A dance of the Karok, Yurok, and Tolowa tribes of American Indians, held in the spring when the salmon begin to run up the rivers. The chief actor is an Indian who is deputized to retire into the mountains and perform a two days' fast, while the people dance. On his return, gaunt from fasting, the people hide themselves, believing that to look upon him

the salmon dance goes to the river, takes the salmon and divides it. The remainder of the salmon is divided equally. No man is allowed to keep the salmon for ten days in case of extreme necessity.

SALMO NEUS (Lat., from Gk. Σαλμονεύς). The word is not wished to be thought a god, but imitated Jove's thunder by driving his chariot over a brazen bridge, and lightning by flames kindled in all directions. For this imitator he was killed by lightning.

SALMON FISHING. This sport demands the exercise of all the skill and experience which the experienced angler may possess. It is universally admitted that of all the delights of an angler's experience there is nothing comparable with that of rising and hooking a salmon. A first essential is the knowledge of the habits of the fish and the position of rod and tackle that will be equal to the strength and courage of the salmon. No arbitrary rule can be laid down in the selection of a rod, as much will depend upon the skill, strength, and experience of the fisherman; usually, a 17-foot rod is considered long enough for ordinary casting. A moderately thick line will be required if a powerful rod is employed. A casting line, i. e. the gut line connecting the reel line with the fly, must be selected according as the water is clouded or clear, a finer line being selected for the clearer water. It is in the selection of flies that the greatest differences of opinion exist regarding salmon fishing. Some anglers employ different patterns for every month of the fishing season, others certain patterns or types for certain localities, while still others believe that certain shades of color are necessary for certain days. The consensus of opinion seems to be that the question of color is more important than that of pattern. There is almost as much divergence of opinion regarding hooks, a question which, like that of 'flies,' must be left to the choice of the angler. From the casting of the fly to the gaffing and landing of the fish no definite rule may be said to apply. Consult Cholmondeley-Pennell, *Fishing*, in the Badminton Library (London, 1885). See FLY-CASTING; FISHING.

SALMON-KILLER. See STICKLEBACK.

SALMON RIVER. A stream of Idaho. It rises in the Sawtooth Mountains, in the south central part of the State, and after a circuitous, mainly westward, course, empties into the Snake River, 50 miles above Lewiston (Map: Idaho, A 3). It is about 400 miles long, and throughout its length it flows in a deep, cañon-like valley, whose steeply sloping sides rise from 3000 to 4000 feet above it.

SALMON-TROUT. See SALMON.

SALM-SALM. zäl'm/zäl'm'. FELIX. Prince (1828-70). A German soldier of fortune, born at Anhalt. He was educated at the cadet school near Berlin, and, after serving in the Prussian and Austrian armies, came to the United States in 1861. At the beginning of the Civil War he was appointed to the staff of Gen. Louis Blécher and later was commissioned colonel of the Fifth New York Volunteers, a German regiment. In 1864 he was appointed to the command of the Sixty-eighth New York Volunteers, and the next year was made brigadier-general and served as post commander at Atlanta. At the end of the war he went to Mexico, where

he became one of Emperor Maximilian's aides and chief of his household. Soon after Maximilian's execution he returned to Europe, reëntered the Prussian service as major in the Grenadier Guards, and was killed at Gravelotte. He published an account of his experiences in *My Diary in Mexico, Including the Last Days of Emperor Maximilian* (1868). Consult Princess Salm-Salm, *Ten Years of My Life* (New York, 1875).

SALOL (from *salicyl* + *phenol*). The salicylate of phenol, a white crystalline powder, nearly tasteless and odorless, almost insoluble in water, but soluble in alcohol, ether, and chloroform. It is very slightly or not at all dissolved in the stomach, but in the alkaline intestinal secretion is split into 36 parts of phenol and 64 of salicylic acid. This fact is utilized in testing the muscular activity of the stomach. In the healthy stomach salol should pass into the intestine, and after decomposition there appear in the urine as salicyluric acid within one-half to three-quarters of an hour. If this reaction cannot be obtained within an hour after administration of salol there is probably some such condition as dilatation or atony of the stomach. The test for salicyluric acid is the addition to the urine of a few drops of ferric chloride, which gives a reddish-violet color with that acid. The physiological effects of salol are practically the same as those of salicylic acid (q.v.), which is formed by its decomposition in the intestine, but the ringing in the ears and other cerebral symptoms are less marked and frequent, and gastric disturbance is rare on account of its insolubility in the stomach. Aside from these advantages it is inferior to sodium salicylate in the treatment of acute rheumatism. It is of value as an intestinal antiseptic in colitis and similar affections. For the relief of pain it is often combined with phenacetine in cases of influenza.

SALOME (Lat., from Gk. Σαλώμη). The name of several women mentioned in later Jewish history or the New Testament. (1) The wife of Alexander Jannæus, King of the Jews B.C. 104-78. When her former husband, Aristobulus I., died she released his brother, Alexander Jannæus, from prison and gave him her hand in marriage. At his death she reigned as Queen until her death in B.C. 69. Unlike her husband, she favored the Pharisees, and her prosperous reign was considered by them the golden period of the Maccabean era. (2) A sister of Herod the Great, intensely jealous of any rivalry touching her influence with her brother. She was a wicked, unscrupulous woman, several times married and divorced. (3) The daughter of Herodias, second wife of Antipas, and granddaughter of Herod the Great. Her skillful dancing induced Antipas to make the rash vow that led to the death of John the Baptist (cf. Mark vi. 17 et seq.). She married Aristobulus, one of the numerous descendants of Herod, ruler of Lesser Armenia. (4) Wife of Zebedee and mother of the Apostles James and John. She was one of Jesus' most devoted friends, though somewhat over-ambitious for her sons' advancement in the coming Messianic kingdom. Some suppose that she was sister to Mary, the mother of Jesus (cf. Matt. xx. 20-23; xxvii. 56; Mark xv. 40-41, xvi. 1, and possibly John xix. 25.)

SALOMON, sä'ló món, JOHANN PETER (1745-1815). A German-English musician, born at Bonn. When young he was attached to the service of Prince Henry of Prussia, for whom he composed several operas. In 1781 he visited Paris and afterwards London, where he settled for the rest of his life. His series of subscription concerts in London in 1790 were notable. He produced the twelve symphonies of Haydn, known as the "Salomon Set." His compositions include songs, part songs, violin solos, and concertos. Two years before his death he founded the London Philharmonic Society. He was interred in Westminster Abbey.

SALOMON ISLANDS. See SOLOMON ISLANDS.

SAL'OMONS, Sir DAVID (1797-1873). An English merchant, legislator, and writer, born in London, of Jewish parentage. He early engaged in commerce in London, was one of the founders of the London and Westminster Bank in 1832, and was elected a sheriff for London and Middlesex in 1835. As Jews had not formerly been considered eligible for the shrievalty, a special act of Parliament was passed to establish the legality of his election. He was instrumental in securing the passage by Parliament in 1845 of a bill enabling Jews to hold municipal offices, and in 1847 was chosen alderman of Cordwainer ward. In 1851 he was elected as a Liberal to Parliament from Greenwich, but refused to take the prescribed oath. In 1858 the oath prescribed for members of Parliament was altered so that a Jew could take it without violating his conscience, and from 1859 continuously until his death Salomons represented Greenwich. In 1855 he was elected Lord Mayor of London, and in 1869 was created a baronet. His publications include: 1 *Defense of Joint-stock Banks* (1837); *The Monetary Difficulties of America* (1837); *An Account of the Persecution of the Jews at Damascus* (1840); *Parliamentary Oaths* (1850); and *Alteration of Oaths* (1853).

SALON, sä'lón'. A town of the Department of Bouches-du-Rhône, France, 20 miles northwest of Aix. The fourteenth-century Church of Saint Lawrence contains the tomb of the astrologer Nostradamus. Near by, at Lancon, is a Roman camp in good preservation. Olive oil and soap are manufactured, and there is also a trade in almonds. Population, in 1901, 12,872.

SALON (Fr., drawing-room). A room devoted to the reception of company, and hence a periodic reunion for conversational and social purposes. Such reunions have been very common in Paris, and have had a marked influence not only upon literature and manners, but also upon politics. The first salon proper was that of the Hôtel de Rambouillet (q.v.). Immediately after the cessation of political turmoil Mlle. de Scudéry (q.v.) began her famous Saturday evenings in the Rue de Beauce, which were attended by Conrart, Mönage, Balzac, Mme. de la Suze, and Mme. de Sévigné, but were looked down upon by the nobility. The real successor of the Marquise de Rambouillet was Mme. de Sablé, who at her salon succeeded in bringing together the aristocracy of intellect and that of birth. Salons now began to multiply, and the system flourished until the middle of the nineteenth century. In the seventeenth century, besides those already men-

tioned, the salons of Ninon de l'Enclos and Mme. Scarron (afterwards de Maintenon) were specially famous; in the eighteenth, those of Mme. du Deffand, of Mlle. de Lespinasse, of Mme. Geoffrin, of Mme. de Turpin, of Mme. Necker, and of Mme. Roland; and in the nineteenth, those of Mme. de Staël, of Mme. Recamier, of Mme. Vierge le Brun, of Mme. de Genard, and of Mme. Molé were among the most conspicuous. There were salons which were distinctly political, or literary, or philosophic, but the greater number aimed rather at an eclecticism which afforded meeting places for all sorts of talents and all shades of belief or unbelief. Consult: Bassanville, *Les salons d'autrefois* (Paris, 1862-70); Wharton, *Salons Colonial and Republican* (Philadelphia, 1900).

SALON, THE PARIS. The title by which the annual exhibition of paintings, sculpture, engravings, etchings, pastels, and water colors is known, and which is held in the Palais de l'Industrie, Paris, from May 1st to June 22d. The exhibition is open to living artists of whatever nationality, subject to their works meeting with the acceptance of the jury of experts elected by the votes of the exhibitors themselves. Those who have received the requisite number of medals or other recompenses at previous exhibitions are placed *hors concours*, and their works are exempt from examination by the jury. The prizes, consisting of various medals and the Prix de Rome (q.v.), are within the gift of the same jury, and are the object of eager competition.

Annual exhibitions by members of the Royal Academy were first held at the Palais Royal in 1667, and in 1669 they were transferred to the Salon Carré of the Louvre, whence they obtained their name. The Revolution abolished the special privileges of the members of the Royal Academy, and in 1791 opened the doors of the Salon to all French artists. In 1855 the Salon for the first time was held at its present quarters in the Palais de l'Industrie.

Previous to 1872 the Salon was in charge of the artist members of the Institute, but the preponderance of architects among them led the Government, in 1872, to put it in charge of the exhibitors themselves, organized as the Société des Artistes Français. Dissensions consequent upon the awards at the exposition of 1889 resulted in the formation of the Société Nationale des Beaux-Arts, which holds an independent exhibition in the Champs de Mars from May 15th to July 15th each year. The Paris Salon is the precursor of the similar exhibitions in London and elsewhere.

SALONA. Now a village in Dalmatia, near Spalato (q.v.); formerly an important city of the Roman Empire. Diocletian was born in it and retired to it after his abdication. Many remains of the Roman occupation have been brought to light in recent years.

SALONIKI, sä'lón-iké (Turk., *Salanik*). The capital of a vilayet of the same name and the second seaport in European Turkey, situated at the northern end of an inlet of the Gulf of Saloniki, about 140 miles south of Sofia (Map: Balkan Peninsula, D. O.). It lies partly on the flat coast of the inlet and partly on the slopes of Mount Kissos. It is still partly surrounded by white walls, and is commanded by the citadel of Heptapyrgion or Seven Towers. Saloniki,

of the city, and the remains of an ancient theatre of considerable interest. The city is situated across the former Via Egnatia (the main thoroughfare to Constantinople and Thebes) and is crossed by three archways of brick and stone, with marble slabs and decorated with carvings. The other arch, attributed to Vespasian, was demolished in 1867. The portico with caryatides, known as Las Incantadas, is believed to be the entrance to a hippodrome. The walls of the city along the water have been demolished and replaced by a magnificent quay, at the eastern end of which is the White Tower or the Tower of Blood, a remnant of the ancient fortifications.

The mosques of Saloniki are mostly of Byzantine origin and are characterized by great splendor. The Mosque of Saint Sophia is modeled after the famous mosque of the same name in Constantinople, and is crowned by a vast dome with beautiful mosaics. The Rotonda, the former Church of Saint George, also deserves special mention for its mosaics. Saint Demetrius is interesting for the originality of its interior arrangement.

The principal manufactures are morocco leather and leather products, cutlery and arms, flour, cotton yarn, bricks and tiles, and soap. By its situation Saloniki is remarkably well adapted for a great commercial seaport. The new harbor opened in 1901 is protected by a breakwater over 1800 feet long, and has a quay over 1470 feet long, with a long pier at each end. The chief exports of Saloniki are grain, animals and animal products, silk cocoons, wool, tobacco, opium, manganese, etc. The chief imports are textiles, sugar, coffee, tobacco, chemicals, and iron goods. The commerce of Saloniki (excluding the coasting trade) amounted in 1900 to nearly \$18,400,000, of which the exports represented about \$6,000,000. The trade is chiefly with Great Britain and Austria-Hungary.

The population is estimated at about 100,000, of whom the Jews form over 50 per cent, and the Mohammedans about one-third. The predominating language is Ladino, a corrupted Spanish, introduced by the Jews.

Saloniki is the ancient Thessalonica (q.v.). Throughout nearly the whole of the Middle Ages it belonged to the Byzantine Empire. It has been in the hands of the Turks since 1430.

SAL'OP. A colloquial name for the English county of Shropshire (q.v.).

SALPA (Lat., from Gk. *σαλπη*, *salpē*, sort of stock-fish). A barrel-shaped ascidian existing either as small, separate individuals or forming a colony or chain consisting of large individuals. Salpa is pelagic, one species occurring in abundance off the shores of southern New England, while the others mostly live on the high seas all over the tropical and subtropical regions of the globe. The hermaphroditic aggregated or chain salpa differs from the solitary asexual form in being less regularly barrel-shaped and without the two long posterior appendages of the latter. Salpa reproduces parthenogenetically, as in some crustaceans and insects, exhibiting a true case of alternation of generations (q.v.) of the kind called "metagenesis." Consult Brooks, "The Genus Salpa," in *Memories of the Biological Laboratory of Johns Hopkins University*, vol. ii. (Baltimore, 1893).

SALPÊTRIÈRE, *sâl'pâ'trê'ar'*. An old ladies' home and hospital in Paris. Begun by Louis XIV. in 1656 upon the site of the Petit Arsenal, the Salpêtrière has been added to continually, until to-day the forty-five buildings which cover its grounds accommodate over 5000 people—probably the largest institution of its kind in Europe. A large part of its population are superannuated female employees of the Government and there are a very large number of insane women. The hospital was used as a prison during the French Revolution.

SAL PRUNELLE. See SALTPETRE.

SALSETTE. An island on the west coast of British India, situated immediately north of Bombay, with which it is connected by a causeway, and separated from the mainland by a channel less than a mile wide. The area is about 241 square miles. It is chiefly notable for a number of remarkable caves found at Kenery in the middle of the island. They are nearly a hundred in number, are all excavated in the face of a single hill, and contain elaborate carvings, especially representations of Buddha, many of them of colossal size.

SALSIFY (Fr. *salcifs*, dialectic *sercifi*, OF. *sercifi*, *cercheffi*, from It. *sassafrica*, goat's-beard, from Lat. *sarum*, rock + *fricare*, to rub), OYSTER PLANT, or VEGETABLE OYSTER (*Tragopogon porrifolius*). A biennial plant of the natural order Composite, indigenous to the Mediterranean region and cultivated in Europe, America, and Australia for its edible spindle-shaped root, 8 to 12 inches long and about an inch in diameter at the top. It requires a deep, rich soil, and is cultivated like parsnips, like which it may be left in the ground during the winter. In the second season it produces many-branched flower stalks three or four feet high bearing terminal heads of purplish flowers. A yellow-flowered variety of salsify (*Tragopogon pratensis*) is a weed both in Europe and America.

SALT (AS. *scalt*, Goth. *salt*, OHG. *salz*, Ger. *Salz*, salt; connected with Lat. *sal*, Gk. *ἅλς*, *hals*, OIr. *salann*, Lett. *sāls*, Ochurch Slav. *solī*, salt). The chloride of sodium, known mineralogically as halite (q.v.), containing 60.41 per cent. of chlorine and 39.59 per cent. of sodium. The principal sources of salt are the ocean, salt lakes, subterranean brines, and deposits of rock salt. Since all river waters carry alkalis in solution, the accumulation of dissolved materials may become very great when the rivers enter a reservoir which has no other outlet than by evaporation. It is in this way that the brines of salt lakes have been formed, and the salt of the ocean probably has been derived also from the wash of the lands. The degree of concentration of such brines depends upon a number of factors, such as the volume of the reservoir, amount of water supplied, rate of evaporation, and the time during which the process has been carried on. In the Caspian Sea the dissolved salt amounts to only 0.63 per cent., while the Mediterranean contains 3.37 per cent., the Atlantic Ocean (average) 3.63 per cent., and the Dead Sea 22.30 per cent. When the water evaporated exceeds that entering the reservoir, the solution may become saturated, and the salts will then be deposited in the order of their solubility, such slowly soluble substances as gypsum being precipitated

first, and salt, which is very soluble, being deposited last. The drying up of lakes or the evaporation of sea water in inclosed bays has thus led to the formation of rock salt deposits. These deposits are frequently interstratified with beds of shale, which it is supposed were laid down during periods of high water when the streams washed an unusual quantity of sediment into the lake or bay.

DISTRIBUTION AND PRODUCTION. The occurrence of salt is widespread both as regards its geographical and geological distribution. In the United States the most productive deposits are found in New York, Pennsylvania, Virginia, West Virginia, Ohio, Michigan, Illinois, Kansas, Louisiana, and Texas. Important quantities of salt are won also from the waters of Great Salt Lake in Utah and from those of San Francisco Bay in California. In New York the salt is obtained from beds of the Salina series, where it exists as lens-shaped deposits of rock salt which attain an extreme thickness of 250 feet. Since the beds outcrop in the central part of the State and dip southward, some of the more southern deposits lie at a depth of 2,700 feet. The Salina formation also carries salt in Michigan at a depth of from 1600 to 2200 feet. The great source of salt in this State, however, as well as in Ohio, is the Lower Carboniferous, from which the brines sometimes have an added value owing to the presence of bromine. In West Virginia the salt occurs in the Lower Carboniferous along the Kanawha and Ohio rivers. Kansas has recently attained importance as a producer of both brine and rock salt, which is extracted from beds that lie along the contact of the Permian and Triassic systems at a depth of from 450 to 1000 feet. The extensive deposits occurring on Avery Island and the island of Petit Anse, La., are of recent geologic age.

The production of salt in the United States has increased very rapidly. The output in 1881 was 6,200,000 barrels (of 280 pounds), valued at \$4,200,000; in 1891 it was 9,987,945 barrels, valued at \$4,716,121; and in 1901 it amounted to 20,566,721 barrels, valued at \$6,617,449. A considerable portion of the output in recent years has been converted into the various soda products. The production by States in 1901 was as follows:

PRODUCTION OF SALT IN THE UNITED STATES IN 1901

	Barrels	Value
New York.....	7,286,320	\$2,089,834
Michigan.....	7,729,041	2,437,657
Kansas.....	2,087,791	614,365
Ohio.....	1,153,535	455,924
California.....	601,659	133,656
Utah.....	334,484	326,016
West Virginia.....	231,722	94,732
Other States.....	1,141,569	465,245
Total.....	20,566,721	\$6,617,449

In Europe the most notable deposits of salt are found in the Cheshire district of England; at Stassfurt, Brunswick, and Hanover, Germany; Wieliczka, Bohemia, and Hallstadt, Austria; Máramaros, Hungary; the Crimea and the Donetz basin, Russia; and Cardona, Spain. The mines of Wieliczka, near Craow, are famous for their great antiquity and the unusual size of the underground workings. France and Italy are extensive producers of salt from sea water.

The production of salt by the principal countries of the world in 1900 was as follows:

WORLD'S PRODUCTION OF SALT IN 1900

	Short tons
United States.....	2,921,768
United Kingdom.....	2,081,709
Canada.....	62,655
Germany.....	1,719,385
France.....	1,199,675
Austria-Hungary.....	572,642
Russia (1899).....	1,852,861
Italy.....	104,715
Spain.....	495,965
India.....	1,123,641
Japan (1899).....	656,814
Other countries.....	81,717
Total.....	12,291,877

EXTRACTION METHODS. The simplest method of obtaining salt is by the evaporation of sea water, but this is seldom practiced except in those countries which have no supplies of subterranean brines or rock salt. It consists in conducting sea water into shallow tanks or pools and then evaporating the water by the sun's heat. After the gypsum has crystallized out the concentrated brine is pumped into another vat where the salt evaporates. Subterranean brines are extracted by driving wells through which they are then pumped to the surface. Brine salt is also obtained from rock salt deposits by a process of solution. In this case a well is bored down to the salt stratum in the same manner as one bored for petroleum (q.v.). After the drilling has been completed, it is customary to case the well with a pipe. Inside of this there is put a second tubing, which usually extends to a lower depth than the outer pipe. The water is forced down between the outer and inner tubing, dissolves out the salt, and comes up through the inner tube. In some cases several wells are bored, the water being forced down one and the brine up the other. On reaching the surface it is discharged into settling tanks, in order to allow the suspended clay to settle. The brine is then pumped to the evaporating vats, which are either tanks with movable roofs, so that the salt can be evaporated by solar heat, or else are placed over furnaces, or hot pipes, and the water evaporated by artificial heat. The latter is the prevalent method.

In the solar process the brine is pumped into a series of tanks, in the first of which after standing for a while it becomes yellowish, due to the escape of carbonic acid gas and the precipitation of the iron. In the next series of tanks the gypsum separates, and these are known as the lime tanks. The brine remains here until the salt crystals begin to separate, indicating that the point of saturation is being approached. The brine or pickle is now drawn over into a third series of tanks, in which the salt forms on the bottom, and is removed by means of rakes several times during the season. The solar process is chiefly adapted to the manufacture of the coarser grades of salt. The finer grades, such as table salt, are produced by the use of artificial heat in the evaporation of the brine. This is carried on either in iron tanks or kettles. A tank is about 20 to 24 feet wide, 100 feet long, and 12 inches deep. The tanks rest on brick arches and the heat is supplied from grates set at one end of the tank and somewhat underneath it. Two pans are usually operated in connection with each other, known

the front and the back pan. The brine passes from the latter to the former, the supply being constant, the supply decrease due to evaporation. The amount of the salt is sometimes controlled by means of the soft scorp, or other material during the process of evaporation. In the kettle process the brine is evaporated in kettles having a capacity of about 120 gallons. In the bottom of the kettle there is set a pan having a vertical handle. This is for the purpose of catching the gypsum and iron which separate first. When these substances have been precipitated the pan is carefully withdrawn.

In the mining of rock salt the deposits are worked by the usual shafts and chambers, and the product when brought to the surface is either shipped in large lumps or put through a breaker, which is a building containing a series of crushers, toothed rolls, and screens, for the purpose of breaking up the salt and separating it into the various sizes.

Salt has been and still is used to some extent as a fertilizer. It belongs to the class of soil amendments or improvers. (See MAXUBES.) Since it supplies no essential element of plant food, its value as a soil improver is probably due to its physical action (attraction for water, etc.), or to its ability to set free inert plant food in the soil. See COMPOSTS.

SALT, Sir Titus (1803-76). An English manufacturer, born at Morley, in the West Riding of Yorkshire. He learned the wool-stapling business, and in 1824 entered into partnership with his father at Bradford. He was the first to make practical use of Donskoi wool in worsted manufacture, and in 1836 he introduced alpaca to the British market. In 1853 he opened a great factory a few miles from Bradford, on the River Aire, about which there soon grew up the town of Saltaire. His factories were built with special regard to warmth, light, and ventilation, and in the town he erected hundreds of model dwellings, a public dining hall, factory schools, public baths, and other conveniences. He was created a baronet in 1869. Consult: Balmgarnie, *Life of*

Sir Titus Salt, and Holyrod, *Saltaire and Its Foundry*.

SALTA, sál'tá. A northwestern province of Argentina, bordering on Bolivia and Chile (Map: Argentina, D 8). Area, 45,000 square miles. The western half is occupied by Andean ranges, while the eastern part belongs to the Gran Chaco. It is abundantly watered and contains a considerable area of agricultural land. Grain, sugar, and various kinds of fruit are raised successfully. The mountains contain gold, silver, copper, and other minerals, but the principal occupations of the inhabitants are agriculture and cattle-raising. Population, in 1900, 131,938. Capital, Salta.

SALTA. The capital of the Province of Salta, Argentina, situated among the mountains, 135 miles northwest of Tucumán (Map: Argentina, D 8). The town is well built with paved streets, and has a cathedral, a national college, and a normal school. A railroad runs to Buenos Ayres and an important trade is carried on with Bolivia. Population, in 1895, 16,672; in 1901 (estimated), 17,500.

SALT BUSH. See ATRIPLEX.

SALT-CAKE. A name applied to the crude sodium sulphate obtained when sodium chloride is treated with sulphuric acid. See SODA.

SALTILLO, sál-tel'yó, or LEONA VICARIO. The capital of the State of Coahuila, Mexico, situated on the plateau 5200 feet above sea-level and 45 miles southwest of Monterey, on the Mexican National Railroad (Map: Mexico, H 5). It is regularly laid out, and has a handsome church, a college, an atheneum, and the Madero Institute, containing a library. The chief industries are the manufacture of blankets and shawls, cotton cloth, and flour. The town is an important trade centre. Population, in 1895, 26,801. Saltillo was founded in 1586 as an outpost against the Apaches. Near the city is Buena Vista, the scene of a battle between the Mexican and the United States forces in 1847.

SALTIRE. One of the ordinaries in heraldry (q.v.).

SALT LAKE CITY. The capital of Utah and the county seat of Salt Lake County, near the Jordan River and 12 miles southeast of Great Salt Lake; 676 miles west by north of Denver (Map: Utah, B 1). The Union Pacific, the Rio Grande Western, the Utah Central, and other railroads enter the city. Salt Lake City holds a unique place among the towns of the United States as the headquarters of the Latter Day Saints, generally known as Mormons (q.v.). It is situated in a spacious valley, more than 4300 feet above the sea, and surrounded by mountains. To the east is Fort Douglas (q.v.), a United States Government military post, with an extensive reservation. There are hot sulphur springs in the vicinity, and on the shores of Great Salt Lake (q.v.) are several bathing resorts, of which Saltair and Garfield Beach are the most popular. The city has an area of more than 51 square miles. It is laid out on a grand scale, the streets being broad and regular, and pleasantly shaded. Irrigation ditches line the thoroughfares. Lawns and gardens add to the general attractiveness. Many of the wards contain public squares. Liberty Park has an area of 110 acres.

Near the centre of the city is the Temple Block (square), containing the Temple, the Tabernacle, and the Assembly Hall—all together forming the official seat of the Mormon Church. The Temple, the most beautiful of the imposing edifices erected by the Mormons, was begun in 1853 and was finished in 1893 at an estimated cost of \$4,000,000. The structure is of granite, 186 by 99 feet, and each end is surmounted by three lofty towers. The highest spire supports a figure of the Mormon angel Moroni. The Tabernacle is an elliptical building, 250 by 150 feet, having a roof similar in shape to a turtle-shell. It is noted for one of the largest self-supporting arches in the world and for its great organ. Its acoustic properties are superb. The auditorium seats several thousand persons. Among other buildings connected with the Mormon Church are the former residences of Brigham Young, the Lion House, the Beehive House, and the Gardo House, the tithing storehouse, and also the large establishment of Zion's Co-operative Mercantile Institution, whose annual sales are said to amount to more than \$4,000,000. A monument in honor of Brigham Young is one of the features of Salt Lake City. The city and county building, costing \$900,000, is the most noteworthy of the public edifices. Other prominent structures are the Salt Lake Theatre, the Exposition Building, the State Penitentiary, and Holy Cross and Saint Mark's hospitals. The University of Utah (q.v.) is in Salt Lake City, also a State Normal School. The private institutions for secondary education include All Hallows' College (Roman Catholic), Gordon Academy (Congregational), the Latter Day Saints' College, Rowland Hall (Protestant Episcopal), and the Salt Lake Collegiate Institute (Presbyterian). There are several libraries, of which the most important, aside from those belonging to the educational institutions, are the Public, with some 14,000 volumes, and the State Law Library, with 10,000.

Salt Lake City is the most important town between Denver and the Pacific Coast. Its interests are mainly commercial, the city being the distributing centre for a vast and rich mining, stock-raising, and farming country. The productiveness of the region is secured by means of irrigation. The city is the headquarters of several large mining companies, and has smelters and mineral mills. Its industrial importance, however, is comparatively small, the various manufacturing in the census year 1900 having had only \$4,049,000 capital and an output valued at \$6,109,000. Among the leading establishments are car shops, breweries, confectionery factories, boot and shoe factories, foundries and machine shops, lime and cement works, saddlery and harness factories, looking-glass and picture frame factories, tobacco, cigar, and cigarette factories, lumber mills, etc. Electric power is used by many of the factories, as well as by the electric lighting and the street railway plants. The power is electrically developed from a mountain cataract some 35 miles from the city.

The government is vested in a mayor, elected every two years, a unicameral council, and administrative officials, the majority of whom are appointed by the mayor with the consent of the council. The city attorney, treasurer, auditor, recorder, and justices of the peace, however, are chosen by popular vote. The city spends annu-

ally for maintenance and operation about \$790,000, the principal items being: schools, \$265,000; interest on debt, \$168,000; streets, \$60,000; fire department, \$13,000; police department, \$10,000; water works, \$37,000; municipal lighting, \$31,000. The water-works, built in 1871, are the property of the municipality. The system has cost more than \$1,400,000. It now comprises 150 miles of mains. The net debt of the city in 1902 was \$3,505,866; the assessed valuation, \$23,692,318. The population in 1860 was \$236; in 1870, 12,854; in 1880, 20,768; in 1890, 41,843; in 1900, 53,531.

The city was founded in 1847 by the Mormons under Brigham Young, who, leaving the Missouri River on April 7, arrived at this point on July 24. It was organized as a city in 1851, and until 1868 was called Great Salt Lake City. About one-third of the inhabitants now are 'Gentiles.' Consult: Bancroft, *History of Utah* (San Francisco, 1889); Jones, *Salt Lake City* (Salt Lake City, 1889); Powell (editor), *Historic Towns of the Western States* (New York, 1901). See MORMONS.

SALT-MARSH CATERPILLAR MOTH. A moth (*Leucarecton usara*) found in New England and so named because its larva, a hairy caterpillar, feeds on the salt grass of the marshes. See Colored Plate of Moths.

SALTO. sal'tó. The capital of the department of the same name, Uruguay, on the left bank of the River Uruguay, 260 miles northwest of Montevideo, with which it has railway connection (Map: Uruguay, F 10). Here steamers from Montevideo and Buenos Ayres transship their cargoes for Southern Brazil, either by rail or river transportation. The chief industries are leather manufacturing, the salting of meats, and boat-building. Commercially Salto ranks second to Montevideo in the Republic. It was founded in 1817, and its present population is about 13,000.

SALT OF TARTAR. A commercial name for crude potassium carbonate.

SALTONSTALL. sal'ton-stal. GRONX (1666-1724). A colonial Governor of Connecticut, born at Haverhill, Mass. He graduated at Harvard in 1684, and in 1691 was ordained pastor of the First Church (Congregational), at New London, Conn. He soon became prominent in politics and was elected Governor of Connecticut in 1707, to fill the unexpired term of Governor Winthrop, and was thereafter reelected until his death. It was largely due to him that Yale was removed from Saybrook to New Haven.

SALTPETRE (OF. *salpêtre*, Fr. *salpêtre*, from Lat. *sal*, salt + *petra*, from Gk. *πέτρα*, rock), or NITRE. A mineral potassium nitrate crystallizing in the orthorhombic system. It is found native in certain soils of Spain, Egypt, and Persia, and especially in East India, although in relatively small quantities. Still smaller deposits, of local importance only, are found in various parts of the world. In the United States such deposits occur in caves in Kentucky and elsewhere in the Mississippi Valley, as well as in Tennessee. Saltpetre occurs but seldom in strata, being for the most part a product continually formed by the action of atmospheric air upon nitrogenous organic matter in the presence of bases. The process of refining consists in bringing the nitre into solution and adding potas-

the residue, a small amount of sulphuric acid may be present. Chile saltpetre is purified by solution, and thus, on boiling, the impurities are formed on the surface containing the soluble substances that may be present. When the steam ceases to rise the liquid is allowed to settle and the clear portion is run off into coolers, from which the nitre separates as minute fibrous crystals which are finally washed to remove all adhering mother liquor. Much of the commercial saltpetre is now made from 'Chile saltpetre' (see below) by means of potassium chloride. Potassium nitrate is readily soluble in water. When heated to about 340° C. (644° F.) it fuses without decomposition, forming a thin liquid, which, cast into molds, solidifies to a white, translucent, fibrous mass known as *sal ponce*. It finds extensive use in the arts, as in the manufacture of gunpowder and other explosives, and a small proportion is employed in the making of fireworks and matches; also it serves as a preservative for foods, as a flux in assaying, as an ingredient of certain fire-extinguishers, and in medicine.

Chile saltpetre, or cubic nitre, is the mineral sodium nitrate that is found native along the western coast of South America, especially in Northern Chile and Bolivia, where it occurs in beds several feet in thickness. The commercial article is prepared by lixiviation of the crude material with boiling water, concentration, and crystallization. The resulting salt contains from 92 to 97 per cent. of pure sodium nitrate.

SALT RANGE, or KALABACH. A mountain range of the Punjab, India, between the Indus and the Jhelum (Map: India, B 2). It is a rugged chain of rocky and barren peaks from 2000 to 5000 feet high, and is noted for immense deposits of pure rock salt.

SALTS. Compounds formed by the substitution of metals for the hydrogen of acids. See ACIDS; DISSOCIATION; CHEMISTRY (historical section).

SALTS, SMELLING. A preparation of carbonate of ammonia with some of the sweet-scented volatile oils, used as a restorative by persons suffering from faintness. The pungency of the ammonia is all that is useful, the oils being added to make it more agreeable. Oils of lavender, lemon, cloves, and bergamot are those chiefly used.

SALT SPRING. A common term for subterranean saline waters which reach the surface through natural or artificial passages. Aside from their unusually large content of dissolved minerals salt springs possess no distinctive features of interest. See SPRING and SALT.

SALTUS, sál'tūs, EDGAR EVERTSON (1858—). An American novelist and journalist, born in New York City. He received his education in Saint Paul's School, Concord, N. H., and later in the Sophomore and the Universities of Munich and Heidelberg. He graduated from the Columbia Law School in 1880. His first published works were biographical and philosophical: *Baltzar* (1884); *The Philosophy of Disenchantment* (1885); and *The Anatomy of Vegetation* (1886). Later he wrote much fiction, dealing chiefly with contemporary fashionable life: *Mr. Incon's Misadventure* (1887); *The Truth About Tristram Varick* (1888); *Lib* (1888); *A Transaction in*

Hearts (1889); *The Pace that Kills* (1889); *A Transient Guest* (1889); *Love and Love* (1890); *Mary Magdalen* (1891); *A Story Without a Name* (1891); *Imperial Purple* (1892); *Madame Sapphira* (1893); *Enthralled* (1894); *When Dreams Come True* (1895). An elder brother, FRANCIS SALTUS SALTUS (1849-89), was a poet, traveler, and linguist, whose first volume, *Honey and Gall*, appeared in 1873. After his death his poems were edited in four volumes by his father.

SALTYKOFF, sál'ti-kòf', MIKHAIL. A Russian writer. See SITCHERIN.

SALTZMANN, zálts'mán, KARL (1847—). A German marine and landscape painter, born in Berlin. He was for three years a pupil of Herman Eschke, then studied at Düsseldorf, and after traveling through Holland and Italy, settled in Berlin. Some coast and harbor views in Holland, as well as delineations of the agitated sea, e.g. "Entrance to Harbor of Kolberg" (1878, collection of German Emperor), had already furnished proof of his remarkable talent, when the chance came to him of accompanying Prince Henry of Prussia on his trip around the world in 1878-80. Of several pictures resulting from that tour may be mentioned "Corvette Prince Adalbert in the Strait of Magellan" (1833, Breslau Museum), and "In the Pacific Ocean" (1888, German Emperor). In the suite of Emperor William II. he visited Saint Petersburg in 1888, Norway in 1889 and later, and from these and other journeys resulted such subjects as "William II. Whaling in Norway" (1892), "Surrender of Danish Ships at Eckernförde" (1894, Kiel Museum), "Opening of Kaiser-Wilhelm Canal" (1896), and "Sailing Vessel in Drift-ice" (1898). The National Gallery in Berlin contains "Cruiser Leipzig at Saint Helena" (1893) and "Mancuvre of Torpedo-Boats." In 1888 Saltzmann was awarded the great gold medal at Berlin; in 1894 he became instructor, and in 1896 professor at the Academy.

SA'LUS. The Roman goddess of health, corresponding to the Greek Hygieia. She had a temple on the Quirinal Hill dating from B.C. 307. She is represented with a rudder and globe or pouring a libation on an altar encircled by a serpent.

SALUTATI, sál'tá-tá'té, or **SALUTATO**, Coluccio DE' (1330-1406). An Italian humanist. In 1375 he was appointed Chancellor of Florence, and in that capacity he exercised great influence throughout Italy. His State papers were written in elegant Latin. Among his writings were biographies of Boecaccio, Petrarch, and Dante, and a translation into Latin of part of the *Divina Commedia*. He also directed the publication of Petrarch's epic, *Africa*. Collections of his epistles appeared at Rome in 1741 and 1742. Consult Tiraboschi, *Storia della letteratura italiana*, vol. xii. (Florence, 1805-13).

SALUTATIONS (Lat. *salutatio*, from *salutare*, to salute, from *salus*, health, prosperity, from *salvus*, safe; connected with Skt. *sarva*, whole, entire). The employment of formal and prescribed methods of address when one person encounters another. Such greetings were formerly graduated according to rank; in recent times, with increasing democracy, they have grown less and less precise. Salutations may be made either by words or gestures. With respect to the verbal formulas they may be classified

under several heads. (1) The expression of a desire for the prosperity of the person accosted. This depended originally on the belief that a wish for good or evil might be effective in bringing about the state of things desired and produce a corresponding effect on the individual toward whom it was directed. We have a simple example in the expression 'Your health!' used in drinking. (2) The offering of a prayer for the well-being of any one, which is continued in our 'good morning,' 'good night,' which are abbreviations for 'God give you good morning,' etc. (3) Expressions of gratitude, admiration, or honor. Here belongs the 'plural of majesty,' applied first to kings, and by degrees made general.

Terms of respect like 'your Honor,' 'your Majesty,' 'your Grace,' 'your Excellency,' have been appropriated to particular degrees of rank. It is only a more ancient variety of the preceding use when an idea of adoration is introduced of which a survival is seen in the title of 'Reverend' applied to clergymen. Gestures may be regarded as arising in the first place from the animal impulses, as in the pleasure of contact which induces patting the cheek or hand, embracing, and the like. The manifestation of such enjoyment exhibits much variation; thus kissing is by no means a universal human practice, but is rather confined to certain peoples. There are likewise attitudes of subservience, implying that the inferior puts himself at the disposal of the superior. Here belong our customs of bowing and courtesying, of lifting the hand in salute, and the kneeling and prostration still practiced in the Orient. Denudation is a movement symbolic of resignation of one's goods to a ruler, and survives perhaps in the customs of lifting the hat or removing the glove before shaking hands.

SALUTES. Military courtesies rendered by non-commissioned officers and men to commissioned officers, and among the latter by juniors to seniors in rank, also the compliments paid by the military or naval services of a nation to the ruler or representative of another nation. All army officers salute on meeting and in making or receiving official reports, the junior saluting first, except when the salute is introductory to making a report to the representative of a common superior, as the adjutant, officer of the day, etc., when the officer making the report salutes first. Enlisted men unarmed salute with the hand farthest from the officer. Officers are always saluted whether in uniform or not. Enlisted men unarmed, whether covered or uncovered, salute before addressing an officer, and again after receiving a reply. In the English army this detail differs to the extent that soldiers uncovered always salute by standing simply to attention. Soldiers in the United States Regular Army are required to salute, in the prescribed form, officers of the navy, marines, volunteers, and militia, just as they would their own officers. When the national or regimental color standard unencased is carried past a guard or other armed body the salute is given, and the field music sounds 'to the color.' Officers and men armed salute in the manner prescribed for such arm, or if unarmed, make the salute by uncovering. British regulations differ again here in that under no circumstances, save in church and during a part of the burial service, do officers or men uncover.

SALUTES WITH CANNON are fired between sun-

rise and sunset only, Sundays usually excepted, and the national flag is displayed. The national salute of 21 guns is accorded to the President on his arrival and departure from a military post or naval vessel, no other personal salute being allowed in his presence. The number of guns prescribed for other officials is as follows: The Vice-President, 19; Ambassador, 19; Secretary of War, Secretary of the Navy, or other Cabinet officer, Chief Justice, Governor General, Governor of State or Territory, or Island, President of the Senate, Speaker of the House of Representatives, committee of Congress, admiral, or general, 17; Assistant Secretary of the Navy, Envoy Extraordinary, vice admiral, or lieutenant general, 15; minister resident, rear admiral, or major general, 13; chargé d'affaires, commodore, or brigadier general, 11; consul general, 9; consul, 7; vice-consul, or commercial agent, 5.

In the navy salutes are of various kinds. A junior or inferior salutes a senior or superior by touching his cap. Other salutes are firing of guns, manning of yards, dipping of colors, etc. Men in boats salute by lying on their oars or tossing them. In the United States and in most other services 6-pounder guns are used for saluting when the ship has pieces of that calibre. When a man-of-war fires a salute to a foreign flag or a foreign officer the salute is returned gun for gun; but if the salute is to an officer of the same service the latter only returns the number of guns to which the junior is entitled by his rank. The salute by dipping of colors is made by a man-of-war only in answer to a similar salute made by a merchant vessel. As few modern men-of-war have yards, manning the yards is no longer a common usage.

SALUZZO, sà-lu'zò. A city in the Province of Cuneo, Italy, at the foot of the Alps, near the right bank of the Po, 18 miles by rail north-northwest of Cuneo (Map: Italy, B 3). It has a semi-Gothic cathedral, begun in 1480. The manufactures are silk fabrics, leather goods, iron ware, and hats. The chief trade is in grain, wine, and cattle. The Marquisate of Saluzzo, created in the first half of the twelfth century, lasted till 1548, when the city was seized by the French, who gave it up to Savoy in 1601. Population (commune), in 1901, 16,394.

SALVADOR, sàlv'à-pòr'. The smallest and most densely populated republic of Central America, bounded on the north by Honduras, on the east by Honduras and the Gulf of Fonseca, on the south by the Pacific Coast, and on the northwest by Guatemala (Map: Central America, C 4). Its area is 8135 square miles.

TOPOGRAPHY. Along the northern border extends the great Sierra Madre of Central America, with many peaks ranging from 6000 to 8000 feet, culminating in that of Cneaguatique. Parallel with this and about 30 miles to the south extends a lower range, or rather elevated tableland, marked by clusters of volcanic peaks, of which Izaleo (q.v.) is the most noted. There are deposits of gold, silver, copper, and lead in the eastern part of the Republic, iron in the western, and coal in the Lempa Valley. There are about 150 mines in operation. Between the main ranges is a tableland diversified by short mountain spurs and drained largely by the Lempa, the chief river of the Republic, and the San Miguel. This lofty valley constitutes its most fertile, most

land and most populous portion. Between 1,000 and 2,000 feet, and the coast lies a series of low hills, and by short rocky spurs that occasionally reach the shore. These plains are for the most part marshy and unhealthy during the rainy season. In addition to the rivers mentioned the La Paz and Goussorán are of interest in connection with the boundaries of Guatemala and of Honduras. The lakes are almost wholly of volcanic origin; Guiza, belonging partly to Guatemala, and Hopango are the most notable. The principal harbor, La Unión Bay, an arm of the Gulf of Fonseca, is the best in Central America. Earthquakes and volcanic eruptions are common. Hot and cold mineral springs are found in all parts of the country.

CLIMATE. The lower areas below 2000 feet, designated as 'hot lands,' are torrid and generally subject to fevers. Lying between 2000 and 5000 feet are the 'temperate lands,' enjoying an even and delightful climate. The rainfall is somewhat less than in adjacent States, but sufficient, the rainy season lasting from May to October.

For Flora and Fauna, see these titles under AMERICA. In general Salvador resembles the rest of Central America in its vegetable and animal life. Among its special flora may be mentioned the *houtiborill*, whose product is known as 'Peruvian balsam;' the *pita*, whose fibre is used for thread, cordage, and cloth; and the *yucca*, utilized for the manufacture of starch. A moderate supply of cabinet and building timber exists, and many important medicinal and dye plants are annually exported. Native rubber trees abound, but wasteful methods are employed in extracting the product.

AGRICULTURE. The mountain valleys and tablelands are deeply covered by an alluvial soil which renders this section the richest agricultural region of Central America. By far the most important crop is coffee, which is grown everywhere in the Republic between the altitudes of 1500 and 4000 feet. The crop in 1901 amounted to 55,600,000 pounds. A fine quality of indigo, sugar for home consumption, tobacco, rice of the dry, upland variety, a little cacao, and the usual beans, corn, potatoes, vegetables, and fruits for local use, constitute the chief agricultural products. The cultivation of cotton is being encouraged by a Government export bounty. There is excellent pasturage, and during recent years many improvements have been made in the breeds of cattle.

MANUFACTURES. Aside from the simple household industries the manufactures of Salvador are not important. There are, however, sugar refineries and distilleries, whose products are largely for home consumption, saw mills, starch factories, cordage works, and mills for cleaning coffee.

TRANSPORTATION AND COMMUNICATION. A narrow-gauge railroad of some 60 miles connects the port of Acajutla with Sonsonate, Santa Ana, and San Salvador. Four steamship lines connect the ports of the Republic with those of the United States, Europe, and South America. Salvador has been a member of the postal union since 1879 and enjoys a fair local service.

COMMERCE. The exports for 1900 amounted to \$9,132,958, of which amount coffee contributed \$7,132,958, other exports in order of importance were indigo, balsam, silver coin and bullion, tobacco, and sugar. Owing to the absence of

Atlantic ports, fruits are not largely exported. In 1901 515 vessels entered the various ports and the same number cleared; the value of dutiable imports was \$6,537,876, and the exports of dutiable imports was \$10,956,045. The chief imports were cottons, spirits, ironware, machinery, jewelry, drugs and perfumery, silks, woolsens, earthenware and glass, and flour.

GOVERNMENT. Salvador has a centralized republican government under a constitution last revised in 1886. The executive power is vested in a President, elected by popular vote to serve four years, and assisted by a Cabinet of four Ministers. The legislative branch consists of a single House, composed of three members from each of the fourteen departments, elected annually. The judicial power is vested in a supreme court at the capital, and in five district courts, with local municipal justices. Each of the fourteen departments is in charge of the Governor, appointed by the national executive. The *alcaldes* and other municipal officers are elected by popular suffrage.

FINANCE. The Government receipts for 1901, largely from import and export duties and liquor excises, amounted to \$6,556,722, and the expenditures for the same year to \$7,640,891. The foreign debt in 1899, amounting to £726,420, was in that year assumed by the Salvador Railway Company; the internal debt in 1901 amounted to \$8,325,905. There are four banks of issue, with a total note circulation of \$1,673,854. The Government issues no notes, but in 1899 took control of the mint erected in 1892 by a private company. An attempt to introduce the gold standard in 1892 was unsuccessful, as was a later enactment in 1897. The Salvadorean peso varied in value from \$0.46 in January, 1901, to \$0.35 in April, 1903. The metric system was legally adopted in 1885, but the old Spanish measures are almost universally used.

DEFENSE. See under ARMIES. Salvador has one small cruiser.

POPULATION. The population of Salvador in 1901 was 1,006,848 (493,893 males and 512,955 females), an average of 139 to the square mile. Five per cent. of the population is reported as white, 55 per cent. as Indian, and 40 per cent. as of mixed blood. The capital is San Salvador (q.v.), a name often incorrectly applied to the Republic. The State religion is Roman Catholic, but other sects are tolerated. The elementary schools in 1893 numbered 585, with an average attendance of 29,427; above these are three institutes for secondary instruction, and in the capital there are a higher college for women, a polytechnic school, two normal schools, and a university, with faculties of pharmacy, jurisprudence, natural science, medicine and surgery, and civil engineering. There are public hospitals in eleven cities, asylums and training schools for orphans of both sexes, and the fine Rosales Hospital, costing \$3,500,000, in San Salvador.

HISTORY. After the conquest of Central America by Alvarado in 1524-25 Salvador formed part of the Captaincy-General of Guatemala. When Mexico threw off the Spanish yoke in 1821 the Central American provinces accomplished the same result without bloodshed. For a time Salvador and her sister provinces formed a part of the ephemeral empire of Iturbide. After his overthrow and until 1839 it was one of the States of the Central American Federation, but since the dissolution

of this, Salvador has usually opposed the successive attempts to unite Central America.

SALVAGE (OF, *salvage*, from *salvay*, *sauver*, Fr. *sauver*, to save, from Lat. *salvare*, to save, from *salvus*, safe). In maritime law, an allowance in money which is awarded by courts of admiralty to those who voluntarily save a ship or her cargo from loss by peril of the sea (when it may be called *civil salvage*), or recover them after capture (when it is termed *military salvage*). The service rendered in salvaging must be voluntary and not one which the person rendering it is under a legal duty to perform. The services of salvors must be rendered within the admiralty jurisdiction in order to entitle those rendering them to receive salvage, as the right to salvage is not recognized by the common law.

When the salvors are in possession they have a certain qualified property right in the ship, which does not, however, extinguish that of the owners, but gives them the right to continue the salvage service to the exclusion of other would-be salvors. Where the first set of salvors are themselves assisted by a second set, the salvage is divided according to the respective merits of the parties; but the law favors the first salvors, and only great peril of the first set or final abandonment of the vessel or cargo by them will justify interference on the part of a second.

The amount of the salvage to be paid is not fixed by any rule of law or statute, but rests within the discretion of the admiralty judge who awards the amounts due as salvage. The following considerations, however, are of great weight in determining what amount shall be paid as salvage: (1) The dangers from which the property is saved. (2) The danger to the salvors. (3) The value of the property saved. (4) The value of the property risked by the salvors. (5) The labor, time, and skill expended by the salvors. (6) The risk run by the salvors of not saving the property and consequently of not being remunerated for their labor.

Higher salvage will be usually decreed in derelict cases than where an intention of returning to the vessel temporarily abandoned is clear. While there is no absolute law regarding the distribution of salvage, the owners of the salvor vessel receive usually one-third, the master twice as much as the mate, the mate double a seaman's share, and those who navigate the saved ship into port, or otherwise take the greater risk, double the share of those who remain on the salvor vessel. A claim to salvage may be barred by a contract, not extortionate or unconscionable, to pay a fixed sum for the aid to be given. In such case the rights of the parties are determined by the contract and not by the maritime law of salvage, and the salvors may recover for services rendered whether they are successful or not. Another bar is the existence of a custom of rendering assistance

among vessels of the same class, as in the steambort navigation of the Mississippi. Salvage adjustments are made and enforced in England by the Court of Admiralty and in the United States by the United States District Courts. Salvors have a lien on the property saved, which takes precedence over all others and may be enforced in admiralty by a proceeding *in rem*, or the salvors may at their option proceed against the owner of the property saved by a proceeding *in personam*. See ADMIRALTY; LIENS; MARITIME LAW; DERELICT; PRIZE.

SALVANDY, sãlvã'ndé', NARCISSE ACHILLE, Count de (1795-1856). A French statesman and historical writer, born in Condom (Gers). He took part in the campaigns of 1813 and 1814, and subsequently in the *Journal des Débats* attacked the reactionary policy of the Government. He was Minister of Public Instruction in 1837-39 and 1845-48. Ambassador to Madrid from 1841 to 1843, and to Turin from 1843 to 1845. In addition to his political and other fugitive writings, he published the novel *Don Alonzo, ou l'Espagne* (1824), *Histoire de Pologne avant et sous le roi Jean Sobiesky* (1827-29), *Soixante mois, ou La révolution et les révolutionnaires* (1831), and other works.

SALVATIERRA, sãlvã'té-ãr'ã. A Mexican town in the State of Guanajuato, on the River Lerma and on the Mexican National Railroad, 18 miles south of Celaya (Map: Mexico, J 7). Its most important manufactures are those of cotton goods. Its population, in 1895, was 11,008. The parish church, Nuestra Señora de las Luces, is one of the best in the bishopric. The town was founded in 1613 during the viceroyalty of the Count of Salvatierra, and two centuries later, April 16, 1813, was the scene of a bloody contest between the royal forces under Iturbide and the independents commanded by Ramón Rayón.

SALVATION ARMY, THE. A religious organization aiming to evangelize the masses who are outside of the influence of the churches. It was founded in England by William Booth (q.v.), who began open-air meetings in East London in 1865, independent of ecclesiastical connections, but himself still keeping in touch with church people, and finally established the 'East London Mission' in an old wool house in Bethnal Green. The name of 'Christian Mission' was assumed in 1869, and that of 'Salvation Army' in 1878. Military terms were substituted for the ecclesiastical designations which were first adopted. Uniforms were devised for the laborers, which were intended to be distinctive but plain and inconspicuous, and not to depart too noticeably from the usual costume. Hence they vary in different countries and are adapted to the national dress.

The doctrines of the Salvation Army are in harmony with those of the orthodox churches. No distinctions are recognized except those of individual ability and piety; and women serve in all duties on precisely the same plane as men. Conventionalities are thrown aside and all permissible devices are adopted and practices followed that will attract popular attention. The system of government and the nomenclature are absolutely military. The local districts and stations are provinces, districts, posts, etc.; the bodies of the working force are corps; the officers are the general, commandants, colonels, majors,

of the delta of the Irrawaddy (Map: Asia, I 5). It is over 1500 miles long. Almost the entire course of the river is through a narrow valley with steep sides; its flow is often extremely swift, and it is frequently interrupted by rapids caused by rocky reefs extending across the channel. Its basin is narrow, and the tributaries are nearly all very short, some of them entering the main stream by cataracts. Consequently the river is of little importance for commerce. In Lower Burma, however, it is regularly navigated in stretches by steam launches.

SALYANY, sál-yá'ně. A town in the Russian Government of Baku, Transcaucasia, situated on the Kur (Map: Russia, G 7). It is the centre of the fisheries of the Kur. Population, in 1897, 12,120, chiefly Tatars.

SALZBURG, zált-'bóörk. A duchy and crownland of Austria, bounded by Upper Austria on the north, Tyrol and Bavaria on the west, Tyrol and Carinthia on the south, and Styria and Upper Austria on the east (Map: Austria, C 3). Area, 2767 square miles. Salzburg is one of the most mountainous regions of Austria. The Hohe Tauern, which rise on its southern frontier, branch off into numerous high spurs running northward and are separated from one another by deep valleys. The northern part is covered by a continuation of the Salzburg Alps and contains a number of isolated mountains, some of them exceeding 9000 feet in altitude. The chief river is the Salzach, a tributary of the Inn, which drains almost the entire area of the region. There are a large number of mountain lakes, some of them situated at a very high altitude and of remarkable picturesqueness. The mountainous surface of Salzburg makes it unfavorable for agriculture, and the proportion of arable land is very limited. The cultivation of cereals is of minor importance and the crops do not suffice for the domestic demand. Cattle-raising receives considerable attention. Salzburg is rich in minerals and especially in salt, of which it supplies over 8 per cent. of the total output of Austria. Iron, gold, and copper are also mined to some extent. The manufacturing industries are limited and consist chiefly of glass, iron, and marble works. The house industries are confined to the manufacturing of coarse cloth, stockings, and linen. There is a State tobacco factory, employing over 400 men. Salzburg has a local Diet of 26 members and sends 6 representatives to the Austrian Reichsrat. The population in 1900 was 193,247, principally German Catholics. Capital, Salzburg (q.v.).

The town of Salzburg, built on the site of the Roman Juvavum, was made the seat of a bishopric in 696. In 798 the see was erected into an archbishopric. It gradually came into possession of an extensive district, and the archbishops of Salzburg occupied a prominent position among the ecclesiastical princes of the Holy Roman Empire. The archbishops expelled the Jews in 1498 and some 30,000 Protestant subjects in 1731-32. In 1802 the see was secularized and Salzburg became a temporal principality under Ferdinand, the dispossessed Grand Duke of Tuscany. In 1805 it passed to Austria, and in 1810 to Bavaria, and in 1814 was permanently united with Austria.

SALZBURG. The capital of the Crownland of Salzburg, Austria, charmingly situated amid

mountainous scenery on the Salzach, 73 miles east-southeast of Munich (Map: Austria, C 3). The old town on the left bank of the river, with its narrow streets, flat-roofed houses, but beautiful squares and fountains, is dominated by the Hohen Salzburg citadel, on the Monchsberg, at an altitude of about 400 feet (1780 feet above sea level), reached by a cable railway. Four iron bridges connect the old with the modern section of the town. A bronze statue of Mozart, who was born here, adorns one of the spacious squares. The site of the ancient fortifications is now occupied by a handsome residential quarter. Among the interesting churches are the seventeenth-century late Renaissance cathedral, the twelfth-century Romanesque Saint Peter's, and the thirteenth-century Franciscan Church with an imposing Gothic tower. In the Benedictine Abbey of Saint Peter there is a library of over 40,000 volumes. The secular edifices include the Grand Ducal Palace, the Government buildings—the former university buildings, and the Mirabell-Schloss, an ancient archiepiscopal palace, with a valuable geological collection. Of special interest are the ancient burial ground of Saint Peter and the Summer Riding School, with galleries hewn out of the solid rock. Among the educational institutions are the Museum Carolino-Augustum, containing a valuable collection of antiquities and a library of over 50,000 volumes; a theological faculty, two upper gymnasia, a normal school, a priests' seminary, and a public library of over 65,000 volumes. Interesting features in the vicinity in addition to the fortress of Hohen-Salzburg, already alluded to, are the Capuzinerberg, with the Capuchin monastery, the Gaisberg, all commanding magnificent views, and the castle Hellbrunn, with gardens, theatre, etc. Population, in 1900, 32,934. For history, see SALZBURG above. Consult: Zillner, *Geschichte der Stadt Salzburg* (Salzburg, 1885-90); Bühler, *Salzburg und seine Fürsten* (Reichenhall, 1895).

SALZBURG FESTIVAL. An Austrian musical festival held annually at Salzburg, where the works of Haydn and other classic composers are rendered with scrupulous exactness. It ranks among the representative festivals of the world. See MUSICAL FESTIVAL.

SALZKAMMERGUT, zált-'kám'mér-góót. An alpine district covering the extreme southern portion of the Austrian Crownland of Upper Austria, together with parts of Styria and Salzburg. It is celebrated for its varied and picturesque scenery, embracing a series of beautiful lakes bordered by lofty, steep, and forest-covered mountains. The most noted of the lakes is the Traun, an expansion of the River Traun, which flows through the district. The principal resorts are Ischl and Gmunden. The Salzkammergut, as its name implies, is famous also for its immense salt deposits.

SALZMANN, zált-'mán. CHRISTIAN GOETHE (1744-1811). A German educator, born in Sömmerda, Thuringia, and educated for the Church at Jena. He was pastor at Rohrborn (1768-72) and then deacon at Erfurt, where he first proclaimed his belief in natural religion and his theory of isolation as a factor in moral education. In 1781 he was called to the Philanthropinum in Dessau to be teacher of morals and religion. Three years afterwards he started at Schleierfenthal a school which celebrated its cen-

tenant in 1884. His more important books are the manual *Kirchschichten* (1780), with directions for giving education; *Karl von Karlsberg* (1788), and *Konrad-Kepler* (1794), pedagogical treatises comparable to Pestalozzi's *Leonard und Gertrude*; and a *Lehrbuch* for the teacher, the *Kirchschichten* (1806), showing the obverse of the *Kirchschichten*. Consult the memoir published by the school (Leipzig, 1884).

SALZWEDEL, záltz'vá'dél. A town of the Province of Saxony, Prussia, 110 miles southeast of Bremen, on the navigable Jeetze, a tributary of the Elbe (Map: Prussia, D 2). It has some edifices interesting for their architecture and a valuable museum of prehistoric relics. The manufacture of pins, machinery, leather, and chemicals, and the weaving of damask and linen are the principal industries. Population, in 1900, 10,189. Salzwedel (1070-1170) was the capital of Altmark, the nucleus of the Prussian State.

SAMAIN, sá'máin', ALBERT VICTOR (1858-1900). A French poet, born at Lille. He studied at the Lycée and became an employee in the Prefecture of the Seine, a position which he held until his death. His first poems appeared in the *Mercure de France*. These were collected in 1893 as *Le jardin de l'enfance*, to which was afterwards added *L'anne poëme* (1897). His other published volumes include *Aux flancs du ras* (1898), *Le chariot d'or*, and the lyric drama *Polyphème* (1901). His melancholy, refined verse is noted for its melody.

SAMALE, sá-má'lá. A Malay people on Samal Island, Davao Bay, Southern Mindanao. See PHILIPPINE ISLANDS.

SAMANÁ, sá'má'ná', or SANTA BARBARA DE SAMANÁ. A seaport of Santo Domingo, situated on the north shore of the large Bay of Samaná, 64 miles northeast of Santo Domingo. It is the outlet for the fertile Vega Real, and exports coconuts, bananas, and cacao. Population, 5000.

SAMANG, sá-má'ng'. A tribal group in the Malacca Peninsula. See SEMANG.

SAMANI, sá-má'né, and **DILEMI**, dí'lá-mé. Two Persian dynasties of minor importance. The Samani, who traced their descent to the Sassanide (q.v.), destroyed the Saffarids in A.D. 900, when Aur, the sixth Saffarid monarch, was conquered by Ismail ibn Ahmad, the third ruler of the Samanid line, who established the real power of his house. Ismail extended his sway over Transoxania, Balkh, Herat, Seistan, Khorasan, Gurgan, Tabaristan, and Rai, but the Caspian provinces were lost in the reign of his son and successor, Ahmad II, who died in 913. There were eleven monarchs of this dynasty: Ahmad I. (c.813-864); Nasr I. (874-892); Ismail (848-907); Ahmad II. (died 913); Nasr II. (died 942); Nuh I. (died 954); Abd-al-Malik I. (died 961); Mansur I. (died 976); Nuh II. (captured 997); Mansur II. (blinded 999); and Abd-al-Malik II. (dethroned 999). After the death of Abd-al-Malik his brother, Ismail-al-Muntasir, maintained a resistance against the Alid dynasty, the conquerors of the Samanids, until 1004, when he fell a victim to treachery. The history of Persia during the century of Samani power offers few events of importance. The dynasty was a peaceful one, encouraging literature rather than conquest. Among the noteworthy names in Per-

sian literature who flourished during this period were Rudagi (q.v.), Daqiqi (q.v.), and Firdausi (q.v.), who began his great epic, the *Sháh-námah*, at the Samanid Court.

The Dilemi, who came from the Province of Dilem, on the Caspian Sea, and ruled the Province of Gurgan, were founded by Mardawi (928-935), who was murdered in a mutiny at Isfahan. The line had eight other rulers: Vashmgir (935-967), the younger brother of Mardawi, three times driven from his throne, which he thrice regained by the help of his ally, the Samanid Nuh I.; Bistun (976); Kabus (976-1012), opposed by his son and successor, Minochir; Minochir (1012-29); Anushirvan (1029-43); Dara or Iskander (1043-c.1060); Kaj Kaus, who wrote his *Qabús-námah* in 1080 or 1082 for the guidance of his son and successor, Gilanshah; and Gilanshah (1082-c.1090), who was captured by the Seljuk Sultan Malikshah. (See SELJUKS.) Consult: Mirchond, *Histoire des Samanides*, translated by Defrémery (Paris, 1845); Justi, *Iranisches Namenbuch* (Marburg, 1895); Horn, "Geschichte Iran in islamitischer Zeit," in Geiger and Kuhn, *Grundriss der iranischen Philologie*, vol. ii. (Strassburg, 1900).

SÁMAR, sá'már. One of the Philippine Islands, the easternmost of the Visayan group. It is situated between latitudes 10° 42' and 12° 43' N. and between longitudes 124° 12' and 125° 49' E., and is bounded on the north, east, and south by the Pacific Ocean, and on the west by the Visayan Sea (Map: Philippine Islands, K 8). On the northwest it is separated from the southeastern extremity of Luzon by the Strait of San Bernardino, 11 miles wide, and on the southwest the Strait of San Juanico, one mile wide, separates Sámar from Leyte. It is roughly oval in shape, narrowing into a long, pointed peninsula in the southeast, and has an extreme length from northwest to southeast of 156 miles, with an average breadth of 50 miles. Its area is 5488 square miles, including about 150 small dependent islands covering 290 square miles. It ranks third in size among the islands of the archipelago.

The coasts of Sámar are more finely indented than those of any other island in the archipelago. The eastern coast, which is not very well known, is especially cut up into numerous small inlets and headlands, and is fringed with islets and rocks. Nearly the whole surface of the island is rough and hilly, though nowhere exceeding 2000 feet in altitude. The mountain region of the interior forms a forest-covered and little exposed wilderness.

The mineral wealth of Sámar has not been well explored and is not yet being exploited, partly owing to the hostility of the natives in the interior. Coal, gold, copper, and cinnabar are, however, reported in quantities of commercial value. The climate and soil of the island are well suited to the production of all the staple crops of the archipelago, and the output of hemp is very large, the normal amount annually exported previous to the insurrection of 1896 being 28,000,000 pounds. In 1899 the export of hemp amounted to 21,000,000 pounds. Sugar, rice, and coconuts are also raised in large quantities, while coffee, cacao, tobacco, and cereals are among the minor products. Mechanical industries are still undeveloped, though sugar and coconut oil are manufactured to some extent.

There are practically no roads in the island, and means of communication are confined wholly to the waterways along the coasts and the rivers, most of the latter being navigable for native boats. All the towns and nearly all villages are situated on navigable water, and there is a considerable coasting trade. The inhabitants, whose number was estimated in 1901 at 195,386, are almost of pure Visayan stock, and speak the Visayan language. The island with its dependent islets forms a single province, whose capital is Catbalogan (q.v.).

Samar was one of the last of the Visayan islands to remain in active insurrection against the United States, and its pacification presented considerable difficulties, as the natives burned their villages and took refuge in the pathless wilderness of the interior. Not till the beginning of 1902 did sufficient American forces arrive to begin active operations in the field, and on February 18th Lukban, the chief leader of the Visayan insurgents, was captured. His successor, Guerverra, surrendered with all his followers to General Smith in April, and in June, 1902, civil government was inaugurated in the island. Consult the authorities referred to under PHILIPPINE ISLANDS.

SAMARA, sā-mā'rá. A government of Eastern Russia (Map: Russia, II 4). Area, over 60,300 square miles. The region is divided by the Samara, a tributary of the Volga, into two parts, of which the northern is largely hilly and abundantly watered, while the southern has the character of a steppe with a slight elevation in the southeast. The principal river of Samara is the Volga, which forms its western boundary for a distance of over 600 miles. Samara has a fertile black soil, exhausted somewhat by wasteful methods.

Agriculture is the principal occupation, and a considerable proportion of the product is exported. There are over 10,000,000 acres under cultivation, chiefly under wheat, rye, oats, and potatoes. The German colonists cultivate tobacco on an extensive scale. Famines are not infrequent. The annual value of the manufactures is only about \$5,000,000. The population in 1897 was 2,763,478, of whom the Russians formed about 70 per cent.

SAMARA. The capital of the government of the same name in Eastern Russia, situated at the junction of the Samara with the Volga, about 740 miles southeast of Moscow (Map: Russia, II 4). It has an excellent port and immense grain storehouses. The chief industry is milling. There are a seminary for teachers, a seminary for priests, and a public library with a museum of antiquities. The trade in grain, flour, tallow, hides, wool, and horses is very extensive. Samara was founded as a fort in 1586. Population, in 1897, 91,672.

SAMARANG, sā'má-rāng'. The capital of the residency of the same name in Java, situated on the northern coast, at the mouth of the river of Samarang, and about 250 miles east-southeast of Batavia (Map: East India Islands, D 6). It is an important commercial centre, although its harbor is very defective and practically inaccessible during the monsoon. Population, in 1897, 84,244, including 3355 Europeans.

SAMARIA. The central division of ancient Palestine (q.v.).

SAMARIA (Heb. *Shāmāriān*, probably watch or guard, Aramaic *Shamariyān*, Gk. *Σαμάρεια*, *Samarēia*, *Σαμαρείαν*, *Samēriān*, *Σαμαρείαν*, *Somariān*, *Σαμαρείων*, *Samaraiōn*, Lat. *Samaritania*). A city of ancient Palestine (Map: Palestine, C 3), which, early in the ninth century B.C., was made by Omri the capital of the kingdom of Israel. According to I. Kings xvi. 23-24, after reigning six years at Tirzah, Omri bought the site from one Shemer, and named the city which he built there after the original owner. It was situated on a hill of more than 300 feet elevation, isolated on all sides except the east. It was about six miles northwest of Shechem and commanded the road northward to the plain of Esdraelon and westward to the coast. It was thus well adapted for a fortified capital. Under Ahab the city became a centre of Baal worship. The Syrians laid siege to it during the reign of Ahab (I. Kings xx. 1), and again in the time of Joram (II. Kings vi. 24 et seq.), but did not capture it. It was invested by Salsmaneser, King of Assyria, and, after a siege of three years, was taken by his successor, Sargon, in B.C. 722. (See SAMARITANS.) Samaria was captured by Alexander the Great (B.C. 331), who killed many of the inhabitants and replaced them with Macedonian colonists. It was taken and completely destroyed by John Hyrcanus (B.C. 120), but was soon rebuilt and remained in the possession of the Jews till Pompey restored it to the descendants of the expelled Samaritans. It was fortified by Gabinius. Augustus gave the town to Herod the Great, who rebuilt it with much splendor and called it Sebaste, after the Emperor (*Σεβαστή*, from *Σεβαστός* = Augustus). Philip the Evangelist preached Christianity in Samaria (Acts viii. 5), and in the third century it was an episcopal see. A Greek bishop still derives his title from Sebaste. After the Mohammedan conquest of Palestine the importance of Sebaste declined. It is now a small village (*Sebastiyeh*), with but few relics of its former greatness.

SAMARITAN LANGUAGE AND LITERATURE. The Samaritan belongs to the Semitic languages and may be grouped with the western Aramaic dialects, although it contains strong admixtures of Hebrew. It is no longer spoken, but is still studied by a few priests in the small Samaritan community (see SAMARITANS) at Nablus, where the common speech is now Arabic. The dialect is interesting from a philological point of view, both because of its antiquity and of its 'mixed' character. Its history may be traced back to the fourth century B.C., but its beginnings belong to a still earlier date. That it survived the Arabic conquest is due to the sacred character which it acquired in the eyes of the Samaritans by virtue of the translation of the Pentateuch into their dialect. The alphabet is a direct derivation of the Phœnician and more antique in character than the ordinary Hebrew letters. Its phonology presents some peculiar characteristics, the most pronounced being the practical loss of guttural sounds, which leads to considerable confusion in the writing of words containing guttural letters. Its morphology presents no unique features, while its vocabulary contains many foreign words borrowed from Arabic, Latin, and Greek. The literature is of small extent and of little value. Besides the Samaritan Pentateuch and Targum (see SAMARI-

2. The Pentateuch, which consists of chronicles, liturgical books, and legends. The chronicles include: (1) The *Chronicle of Abulfath*, an Arabic chronicle, written by a Jew, probably in the thirteenth century, which is contained in the canonical Book of Joshua, and which contains many secondary additions, that charge the Jews with being the oppressors of the Samaritans, and that, at the time of Eli, apostates from the faith. The narrative is continued to A.D. 350, when it abruptly ends. (2) The *Chronicle of the Generations*, professedly written by Eleazer ben Anan, 1142, and afterwards continued by many hands; it gives a calculation of sacred times, the age of patriarchs, and a list of high priests. (3) The *Chronicle of Abulfath*, written about the middle of the fourteenth century, is drawn from the two previous works, with additional legendary matter. The liturgies and hymns belong to different periods. The Samaritans have also produced a number of commentaries, theological tracts, and grammatical works, written in Arabic. Consult: Petermann, *Brevis Lingua Samaritana Grammatica* (Berlin, 1873); Kohn, *Zur Sprache, Literatur und Dogmatik der Samaritaner* (Leipzig, 1876); id., *Samaritanische Studien* (Breslau, 1868); Nutt, *Fragments of a Samaritan Pentateuch* (London, 1874).

SAMARITAN PENTATEUCH. A recension of the commonly received Hebrew text of the Pentateuch, used by the Samaritans, and their only canonical book of the Old Testament. None of the manuscripts that have reached Europe is older than the tenth century. The variants which it presents from the Masoretic text are mostly of a trifling nature, representing chiefly different fashions of spelling. There are, however, more important differences, such as the occurrence of Gerizim. (See EBAL AND GERIZIM.) In the figures of Genesis v. and xi. are likewise discrepancies between the Masoretic and the Samaritan recension, which appear to be due to varying traditions. There is also one essential alteration respecting the Pentateuchal ordinances, Exodus xiii. 6, where the Samaritan Pentateuch has "six days shalt thou eat unleavened bread," instead of "seven." The Samaritan Pentateuch was printed in the Paris and London polyglots, and an edition in square Hebrew characters was published by Blayney (Oxford, 1790), but a critical edition is still a desideratum. In the absence of such an edition it is difficult to do more than to speculate on the age and origin of the work, but there is no reason to suppose that it is earlier than the fourth century B.C., and it may even belong to the third. The translation of the Samaritan Pentateuch into the Samaritan idiom above referred to (the Samaritan Targum) is ascribed by the Samaritans to their high priest Nathaniel, who died twenty years before Christ, but it can hardly be older than the fourth century A.D. It follows the Hebrew original very closely. A critical edition of it was published by Petermann and Vollers (Berlin, 1872-91). Consult: Gosenius, *De Pentateuchi Samaritanorum Origine, Indole, et Auctoritate* (Halle, 1815); Nutt, *Fragments of a Samaritan Pentateuch* (London, 1874).

SAMARITANS. A term used to designate the inhabitants of the Province of Samaria after the Assyrian conquest, and in later times the members of a religious community having its centre in Shechem (Nabulus) and the neighbor-

ing Mount Gerizim. The territory of Samaria became for the first time a distinct political organization after Gilead and Galilee had been captured by the Assyrians in B.C. 734. In B.C. 722 the independence of this State was lost. The city of Samaria was probably taken by Shalmaneser IV., but Sargon claims the victory and undoubtedly carried away a part of the population, according to his own account 27,290 persons. The bulk of the Israelitish population remained in the land subject to the same tribute as before (*Display Inscription*, 24). In B.C. 720 Samaria united with Hamath, Arpad, Simyra, and Damascus in an unsuccessful rebellion. A number of Arabian tribes such as the Tamudi, Hadidi, Marsamani, and Hayapa were settled in the district of Samaria by Sargon in B.C. 715. According to II. Kings xvii. 24, the King of Assyria brought men from Babylon and from Cuthah and from Ava and from Hamath and Sepharvaim, and placed them in the cities of Samaria. It is probable that this King of Assyria was Asshurbanipal (B.C. 668-626). This is undoubtedly the King meant by "the great and noble Asnapper," who, according to Ezra iv. 9-10, brought a number of Elamitish and Babylonian peoples into the Province of Abar Nahara, or Trans-Euphratene. Such deportations would be natural after the conquest of Elam in B.C. 645, and the quelling of Shamash-shum-ukin's insurrection in Babylon, Cutha, and Sippara in B.C. 648. The statement in Ezra iv. 2 that the people of the land had been brought up by Esarhaddon is from the hand of the chronicler and deemed by some scholars unhistorical. The inhabitants of the Province of Samaria in the Chaldean and Persian periods were consequently made up of the descendants of the Israelites, who had never been deported, and of the Arabs, Babylonians, and Elamites settled there by Sargon and Asshurbanipal. The Israelites naturally continued the worship of Yahweh and retained the local traditions and the household gods honored by their fathers. The others added the worship of 'the god of the land' to their veneration of the gods of their fathers. But the gradual assimilation of the foreigners to the native stock involved the ascendancy of the Yahweh cult.

It has been supposed, on the ground of the chronicler's statement in Ezra iv. 1-5, that the Samaritans desired to participate in the building of the temple in Jerusalem, but were refused permission to do so, and therefore conceived a hatred of the Jews. There is no mention, however, of the Samaritans, and the historical narrative is subject to grave doubts. In order to show that the completion of the temple was prevented by enemies until the second year of Darius, the chronicler refers to a letter sent to Xerxes and another sent to Artaxerxes by Tabeel, neither of which is given, but produces *in extenso* the text of letters written by Rehum and Shimshai to Artaxerxes, by Tatnai and Shethar-boznai to Darius, by Cyrus, and by Darius. These letters, found in Ezra iii.-vi., are written in Aramaic. There is no indication in them which of the several kings who bore the names Xerxes, Artaxerxes, and Darius is intended, and even the most plausible construction leaves the impression that these documents should be considered in the same light as the numerous spurious decrees and official documents in Daniel, Esther, Maccabees, Aristæus, and Josephus. The

most valuable historical work in Hebrew from the Persian period is the Memoirs of Nehemiah. It has been supposed that Sanballat, Tobiah, and Geshem, the enemies of the Judean governor, were Samaritans. The text rather suggests that Sanballat, the Horonite, was a Moabite from Horonaim, that Tobiah was an Ammonite and Geshem was an Arab. (See SANBALLAT.) Only a single phrase in Nehemiah iv. 2, by which "his brothers" is explained by the addition, "that is, the army of Samaria" (according to the Greek version), can be urged in favor of the former view, and this phrase is probably a late gloss.

According to Josephus (*Ant.* xi. 7, 2; 8, 2 sqq.), Sanballat, a Githæan, was sent to Samaria as satrap by Darius III. (B.C. 336-330), and was permitted by Alexander to build a temple on Mount Gerizim, where he made Manasseh, his son-in-law, high priest. This Manasseh is evidently identical with the unnamed son of Joiada in Nehemiah xiii. 28, who was the son-in-law of Sanballat and was driven away by Nehemiah. His cousin, Jaddua, the son of Johanan, Joiada's brother, was high priest in the time of Darius III. (Neh. xii. 22) and Alexander (Josephus, l.c.). There is no reason to doubt the concurrent testimony of the Chronicler and Josephus as to the high priest in the days of Darius III. and Alexander. But it is necessary, if this be accepted, to assume that Nehemiah and Sanballat began their enmity in the reign of Artaxerxes II. (B.C. 404-359) and that Sanballat in his old age was Satrap of Samaria. The temple on Mount Gerizim was therefore, in all probability, built in B.C. 332, though no doubt there existed long before this time a shrine upon this mountain. How much of the older Israelitish literature was preserved in Samaria in the Persian period is not known, nor to what extent the Yahweh-worshipping communities there kept in touch with their kinsmen in Judea. Their deep interest in the Mosaic period and the religious associations of their own sacred places would naturally render them anxious to possess every document known to them as claiming Mosaic authorship. An evidence of such a desire to know and to practice what Moses taught is the fact that the Pentateuch, probably in the form given to it by the editorial activity of Ezra (see HEXATEUCH), was accepted by the Samaritans. The consciousness of worshipping Yahweh in the place where he had commanded that an altar should be built and benedictions pronounced (see EBAL AND GERIZIM) must have given a strong impetus to the Samaritan movement. It is not likely, however, that the centralization of the cult could be carried out everywhere in the province. The city of Samaria seems to have been hellenized at an early date, and the same is true of Scythopolis. Nor is it probable that those who lived in the Egyptian town of Samaria mentioned in papyri from the reign of Ptolemy II. (B.C. 285-247) were adherents of the Shechemite faith. Jews and Samaritans may indeed have disputed about the legitimate place of a Yahweh sanctuary in the time of Ptolemy VII. Philometor (B.C. 181-145), though it is not likely that this discussion was held before the King and that the deported Samaritans were put to death. It is generally recognized that no edecree can be given to the alleged request of the Samaritans to Antiochus IV. (B.C. 175-164) for permission to dedicate their temple to Zeus Xenios (*Ant.*, xii. 5). II. Maccabees vi. 2 knows

of no such request. While the Samaritans did not take a part in the Maccabean revolt, they profited from it at first, as the Seleucid rulers abandoned their policy of suppressing the native cults. The worship of Yahweh on Mount Gerizim could consequently be resumed. But the expansion of the Jewish power proved disastrous to the Samaritans. Jonathan seemed possession of three districts, Ephraim, Lydda, and Ramathaim (cf. Macc. xi. 34); and John Hyrcanus destroyed the temple on Mount Gerizim. In B.C. 107 the entire Province of Samaria became Jewish territory, after the fall of the city. Though the temple on Gerizim was not rebuilt, it is probable that a smaller shrine existed there even during the Asmonean period. Pompey, in B.C. 63, restored Samaria and Scythopolis as free cities, and Gabinius (B.C. 57-55) rebuilt Samaria and permitted Samaritans to dwell in the city. It was rebuilt on a still grander scale by Herod (B.C. 37-1) and given the name Sebaste in B.C. 27.

Even the city of Shechem was not uninfluenced by foreign thought. An evidence of this is the rise of sects, such as the Essenes, Sabaitans, Gorthenes, and Dositheans. The Essenes show so marked a kinship to Neo-Pythagoreanism that it must be accounted for either by direct influence or by a common Oriental source; and the Dositheans seem to have derived from Greek philosophy the notion of the eternity of matter, while they adhered to the traditional idea of the future and rejection of the doctrine of a resurrection or the immortality of the soul. It is not probable that Dositheus regarded himself as the Messiah, nor can this be affirmed of either of the political leaders who in A.D. 36 and in A.D. 66 were punished by Pontius Pilate and Coranus, or of Simon of Gitta, perhaps the most influential Samaritan thinker of all time. It is probable that the repudiation of the sects led the great body of the Samaritans nearer to the Pharisaic party. Especially after the fall of Jerusalem in A.D. 70 the intense zeal for the law formed a bond of union, and the participation of the Samaritans in the revolt under Hadrian tended to improve the relations. Eminent Jewish teachers, such as Rabbi Akiba and Rabbi Simon ben Gamaliel, regarded them as co-religionists and their land as clean. In 195 Jews and Samaritans seem to have taken sides together with Pescennius Niger against Septimius Severus, and as a consequence Shechem was severely punished. During the third century the attitude of the Jews changed. In the reign of Diocletian (284-305) Rabbi Abaha held that the Samaritans should be treated as pagans. Christianity gradually won its way into Shechem. Bishops of Neapolis and Sebaste were present at the Council of Nicea (325). During the fifth and sixth centuries the Samaritans were subject to cruel persecutions by the Christian emperors, leading to revolts under Zeno in 484 and Justinian in 529. From the Imperial decrees against them it is evident that Samaritans lived in Egypt and Cyrenaica in Rome and Constantinople, as well as in Syria. Arabic writers such as Masudi (died c.950), Biruni (died 1038), and Shahrastani (born 1086), speak of Samaritan communities in Assyria and Egypt. After the capture of Jerusalem by the Crusaders in 1099, Nablus freely accepted Christian rule, which continued until Saladin's victory of Lake

1174; in 1187, The Mamelukes of Egypt ordered the Samaritans to wear red turbans in 1244. According to Suyuti and Al Fathi, and Wilford, and Erdonsei in 1336 found such in use. In 1616 Nabulus with the rest of Syria passed under Turkish rule. In answer to letters sent by Joseph Scaliger, epistles were forwarded to him in 1590 from Samaritans in Gaza and Cairo. Pietro della Valle in 1616 and 1625 found Samaritans not only at Nabulus, but also in Cairo, Gaza, Damascus, and Jerusalem. In 1672 Robert Huntington visited Nabulus, where he found thirty Samaritan families. As he was able to read the Samaritan letters and assured them that there were Israelites in England, he left the impression that there were Samaritans in that country. They consequently opened a correspondence with the Sons of Israel, the Samaritans in the cities of the Franks, or more particularly "their brethren, descendants of Israel and Samaritans living in the city of Oxonia." Thomas Marshall answered these letters on behalf of the brethren in Oxford between 1672 and 1685. Three letters were also sent to Ludolf (1685-1689). Niebuhr found Samaritans at Nabulus, Jaffa, Jerusalem, and Damascus in 1766. A letter to Corameez in 1808 states that there were 200 Samaritans in Shechen and Jaffa. A number of letters were written by the Samaritans to Silvestre de Sacy between 1808 and 1826, and during the reign of Louis Philippe an appeal was made by them to the French Government. Robinson visited Nabulus in 1832, Bargès in 1854, and Petermann in 1872. At present fewer than 200 persons survive of the Samaritans, all in Nabulus (q.v.).

While the Samaritans have at all times agreed in recognizing the authority of the law only, and in regarding Mount Gerizim as the only legitimate place of worship, they have manifestly changed their opinion on many other questions under the influence of foreign thought. Thus there is no reason to doubt the practically unanimous testimony of early writers that the Samaritans did not accept the doctrines of a resurrection or the immortality of the soul. But, surrounded as they were by Jews, Christians, and Mohammedans looking forward to a resurrection of the dead, it is not strange that later they should have adopted this belief. It is found in the *Carmina Samaritana*, in the Chronicles of Abulfath, and in the letters to European scholars. Since the Samaritans rejected the prophetic books and the Psalms in which Jewish exegesis especially found references to the Messiah (q.v.), they could not share the hope of a king, a son of David. But Deuteronomy xviii. 18 suggested the coming of a prophet like unto Moses. In the earliest testimony to a Samaritan Messiah (John iv. 25) his character is that of a prophet. In later times the Messiah was called the *Ta'eb*, or 'The Returning One.' It is found in Abulfath, the Songs, and especially in the Gotha Code, 963. Many interpretations of the law, also found among Sadducees and Karaites, have no doubt preserved old traditions. But the limitation of levirate marriage to betrothed virgins, the stricter regulations as to intercourse with pregnant women, and the purification of unclean places by fire, seem to point to Indian and Persian influence. The Samaritans of Nabulus go in pilgrimage to Mount Gerizim annually for each of the three great feasts. They offer sacrifice only

at the Passover. See SAMARIA; SUECHEM; SAMARITAN LANGUAGE AND LITERATURE; SAMARITAN PENTATEUCH.

SAMARKAND, sām'ēr-kānd'. A territory in Russian Turkestan, bounded by the Territory of Syr-Darya on the north and northeast, by the Territory of Ferghana on the east, and by Bokhara on the south and west (Map: Persia, L 1). Area, estimated at over 26,000 square miles. The southern part, which belongs to the Pamir Alai mountain system, is exceedingly mountainous and reaches an altitude of over 18,000 feet, with passes above 12,000 feet. Elevations of 7000 feet are found in the northeast. The northern part of the territory belongs partly to the barren and waterless Famine Steppe and partly to the desert of Kizil-Kum. The principal river is the Zerafshan, which drains with its numerous tributaries the southern part of the territory and feeds the irrigation canals which are so essential to agriculture in Samarkand. The Syr-Darya flows through the northeastern part of the territory. There are also numerous salt lakes, of which Tuz-khan yields large quantities of salt. The climate is hot, dry, and changeable in the lower parts of the territory and severe in the mountainous regions. The mean annual temperature at Samarkand, the capital, is about 55° F. The precipitation is very scanty, and malaria is peculiar to some of the valleys. Samarkand is believed to possess great mineral wealth.

The agricultural land of Samarkand is found principally in the south, along the Zerafshan and its tributaries. The holdings are small and the price of land very high. There are at present in the territory over 1,000,000 acres of land reached by irrigation, and a considerable proportion of it yields two crops a year. The principal products are wheat, barley, and other cereals

Cotton and rice are raised in increasing quantities. Sericulture and viticulture are also attaining great importance. Stock-raising is carried on principally by the nomadic Kirghizes. Silk and woolen goods are produced by the natives, and there are a number of large cotton gin mills and flour mills. Cotton and cereals are the principal exports. The population of the territory in 1897 was 857,847, almost exclusively Moslem medans. The Uzbeqs form over two-thirds of the total population.

SAMARKAND. The capital of the territory of the same name in Russian Turkestan, the mediæval capital of Timur, and one of the most famous cities of Central Asia, situated about 5 miles south of the Zerafshan, with which it is connected by a number of canals, on the Transcaspian Railway, and about 140 miles east of Bokhara (Map: Persia, K 2). It lies at an altitude of over 2200 feet. Samarkand consists of the native city and the new Russian town, separated from each other by the citadel. The native city is still partly surrounded by a wall, and its magnificent architectural monuments testify to its former splendor. Its centre is the vast square of Righistan, around which stand three of the madrasahs, for which Samarkand is famous.

Northeast of the square of Righistan stands the ruined madrasah of Bibi-khan, attributed to one of Timur's wives. It incloses a number of mosques and a mausoleum over the graves of the wives of that ruler. The mausoleum with the tombs of Timur, his teacher, and relatives, is crowned with a beautiful dome of blue tiles, and the interior of the room which contains the tombs is ornamented with arabesques and gold inscriptions. The finest mosque of Samarkand, and one of the finest in Central Asia, is that of Shah-Zindeh, outside of the city walls, among the buildings of the summer palace of Timur. It is held in high veneration on account of the remains of Shah-Zindeh (a companion of Timur), which it contains, and its interior decorations are probably the most beautiful in Central Asia.

The buildings of the citadel are now used by the Russians for military purposes. The environs of the city are full of ancient ruins. The Russian part of Samarkand is well built, having many modern public buildings. The industries of the native population are important, and their products comprise cotton and silk goods, wine, leather goods, pottery, and silver and gold wares. The bazaars are still extensive and picturesque, but the commercial importance of the city has decreased since the extension of the Transcaspian Railway to Tashkent and Andizhan. The chief exports are cotton, rice, silk and silk goods, fruit, hides, and wine. In 1897 Samarkand had a total population of 54,900.

Samarkand is identified with the ancient Marakanda, the capital of the Persian Province of Sogdiana, which was destroyed by Alexander the Great in B.C. 329. In the seventh century it was conquered by the Arabs, under whose rule it became a great religious and intellectual centre. Conquered and pillaged by Genghis Khan in the early part of the thirteenth century, Samarkand was restored by Timur at the close of the fourteenth century, and attained its greatest magnificence as the residence of the great conqueror. After the breaking up of the empire of Timur, Samarkand passed to the Emir of Bokhara, from whom it was wrested by Russia in 1868.

SAMAROW, zä'mä-röv, GRIGOR. A pseudonym of the German novelist Oskar Meding (q.v.).

SAMARSKITE (named in honor of the Russian Samarski). A mineral composed of the oxides of a number of rare metals, including cerium, yttrium, columbium, tantalum, etc. It has a vitreous to resinous lustre, and is of a dark or black color. It occurs with the older rocks, and is found in the Hinen Mountains, in the Urals, in Norway, in Sweden, and in the United States at various localities in Mitchell and McDowell counties, N. C. The mineral finds some use in commerce for the mantle employed by the Welsbach light, although the difficulty in obtaining the required oxides in a pure condition prevents any very great demand for it.

SĀMAVĒDA, sä'mä vä'dä (Skt., tune-Veda). The name of the third Veda (q.v.).

SAMBAR (from Skt. *sambara*, sort of deer). The largest of Oriental deer (*Cervus unicolor*). It is from 4 to 5 feet high and wears remarkably large and heavy antlers. These spread sometimes to a width of 36 inches, and have very large,

A SAMBAR STAG.

much roughened beams with only two tines, one near the extremity and the other a broad tine set at an acute angle. Its range covers nearly the whole Oriental region, and it is everywhere a deer of the forests. Its hair is coarse and wiry, and forms a mane on the neck; and its color is dark brown, lighter on the buttocks and ventral surfaces. The fawns are not spotted, as is usual with deer. In the Malayan Islands there occur several small sambar-like deer, which are believed by many to be related to the mainland species. One of these doubtful species (*Cervus Philippinus*) belongs to the Philippine and Ladrones Islands, and is scarcely 24 inches tall, and has the brow tines shorter than the terminal prongs. Another closely related Philippine deer is *Cervus Alfredi*, which is larger and has a coat spotted—yellow upon chocolate brown—at all seasons. Consult Lydekker and other authorities cited under DEER.

SAMBATION, or **SABBATION** (Heb., from *Shabbāth*, Sabbath). A mystic river of Jewish legend. The earliest references are found in Josephus and Pliny. The former (*Bel. Jud.*, vii. 5. 1) says that Titus visited such a river

in the Talmud, where E. of E. is said and that it is observed on the seventh day. Pliny (*Nat. Hist.*, vi, 18) relates, in connection with other rivers, that "in Judea there is a river which flows up every sabbath." Both Talmuds refer to it, and the Midrash Rabba to Genesis (s. 11) takes it as a proof of the divine ordinance concerning the Sabbath. In later legend the river became the miraculous protection of the exiles against their enemies. The most extensive form of the story is found in the narrative of 'Eldad' (ninth century, printed in Jellinek's *Beth Hama'asch*, iii, 6, Leipzig, 1853-57). Various attempts have been made to locate this strange stream, and it has been identified especially with the Zab in Assyria. Doubtless the story is based on the report of an intermittent stream in some part of the world. The elements of the legend are found in the Alexander Romance (*Pseudo-Callisthenes*), where a river flowing three days with water and three days with sand is assigned to Egypt. There is also a reference to the river as existing in India in the legend of Prester John. Consult: Hamburger, *Rechtencyclopädie des Judentums*, vol. ii., p. 1071 (Strelitz, 1883); a very full discussion may be found in Lewin, *Wo waren die zehn Stämme Israels zu suchen* (Pressburg, 1901).

SAMBOR, sām'bōr. A town in the Crownland of Galicia, Austria, on the Dniester, 47 miles southwest of Lemberg (Map Austria, H 2). It manufactures oil and linen, and trades in flax, hemp, agricultural produce, and cattle. Population, in 1900, 17,927, mostly Poles.

SAMBOURNE, EDWARD LINLEY (1845—). An English caricaturist and designer. He was born in London, and educated at the City of London School and at the College of Chester. He was intended for the engineering profession, but, his drawings having attracted the attention of Mark Lemon in 1867, Sambourne was employed by *Punch*, with which journal he has since been connected, having become its chief cartoonist January 1, 1901.

SAMBRE, sām'br'. A river of Belgium. It rises in the extreme northern part of France, in the Department of Aisne, flows northeastward, and enters the Meuse at Namur after a course of 118 miles (Map: Belgium, C 4). It is navigable 100 miles to Landrecies in France, whence the Canal de la Sambre connects it with the Oise. It flows through a very populous region, and forms an important part of the internal waterways of France and Belgium.

SAMBUCUS. See **ELDER**.

SAMEACA, sā'mā-ā'kā. Aborigines of Basilan Island, Sulu Archipelago. See **PHILIPPINE ISLANDS**.

SĀMKHYA. A system of Hindu philosophy. See **SĀNKHYA**.

SAMNITES. An ancient people of Samnium or Sabinium, in the mountainous region of Middle and Southern Italy. As their name indicates, they were an offshoot of the Sabines, and belonged to the old long-headed prehistoric race. They comprised four divisions: (1) the Caraceni, on the north, whose capital was Antidema; (2) the Pentri, in the centre, most powerful of all, with their capital Bovianum; (3) the Caudini, in the southwest; (4) the Hirpini, in the south, capital Beneventum. The earliest account of the Samnites relates to their conflict with the

Oscans, whose speech they adopted. On the founding of Rome the Samnites took sides against the city. See **ROME**.

SAMOAN ISLANDS, or **SAMO'A** (formerly **NAVIGATORS' ISLANDS**). A group of islands in the Pacific Ocean, belonging partly to the United States and partly to Germany, and extending from about latitude 13° to 15° S., and from longitude 168° to 173° W. They lie about 4200 miles southwest of San Francisco. The group comprises altogether 14 islands, of which only Savaii (660 square miles), Upolu (340 square miles), Tutuila (54 square miles), and the Manua group (26 square miles) are important. The total area is about 1100 square miles. The islands are all volcanic and mountainous, rising in Savaii to a height of 5413 feet. Savaii shows signs of recent volcanic activity. The region along the coast, however, supports a luxuriant vegetation, and the other islands are forest-clad to the summits of the mountains. The coasts are high and steep, but offer no very good harbors. Earthquakes are frequent, but seldom severe.

The climate is tropical, with a mean temperature of 80° in December and 70° in July. The rainfall is abundant, but the islands are subject to severe hurricanes. The flora is similar to that of other Polynesian groups, and the fauna is extremely limited. The only indigenous mammal is a species of rat, but there are several reptiles, including four species of snake. Among the birds the most remarkable is a species of ground pigeon, the *Didunculus strigirostris*, which is interesting as being a link between the African *Treronina* and the dodo. It is, however, becoming extinct.

The wealth of the islands consists principally in their rich vegetation. The soil is of extraordinary fertility and well watered. The staple product is copra, which is produced on a large scale on European plantations, and which constitutes almost the sole article of export. Fruit is also an important product, and cacao is cultivated on an increasing scale. Aside from agriculture there are few industries. The imports and exports of the German portion of the Samoan group in 1901 were \$373,898 and \$241,808 respectively. The trade of the American island of Tutuila amounted in the same year to over \$100,000, the exports representing less than one-fourth. The chief port of the group is Apia (q.v.), on Upolu, but the best harbor is Pago-Pago, in Tutuila (q.v.).

To Germany belong Savaii and Upolu (qq.v.) and the adjacent islets; and to the United States, Tutuila (q.v.) and the Manua group. German Samoa is administered by an Imperial Governor and a native chief, assisted by a native council. The American possessions are in charge of a naval Governor. There are a number of primary schools maintained by Protestant and Roman Catholic missions. The population of German Samoa in 1900 was 32,612, of whom 347 were European, principally German, British, and American. American Samoa has an estimated population of 5800.

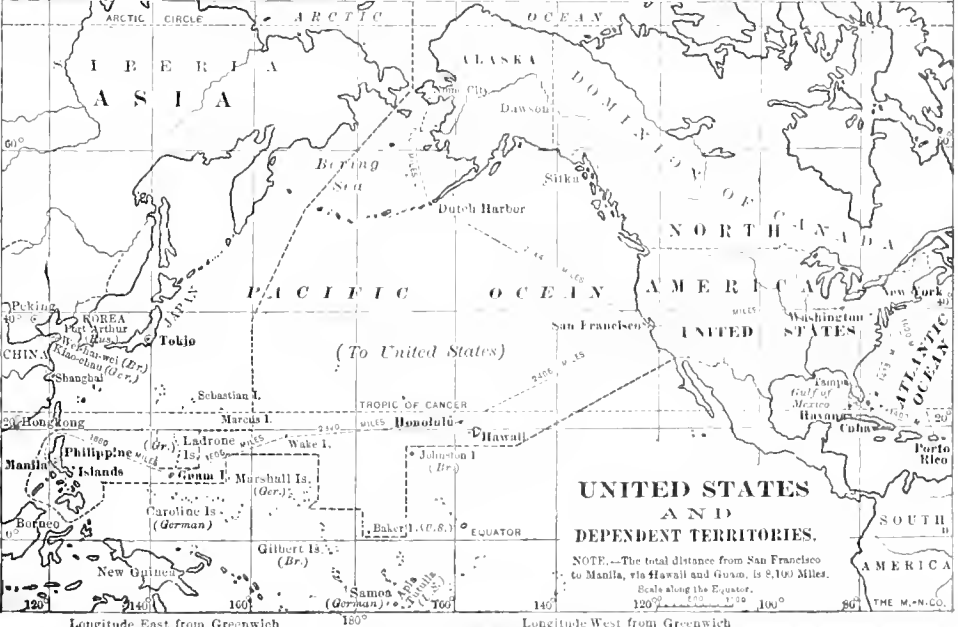

The natives are typical Polynesians linguistically and physically. Their somewhat lighter skin and alleged 'Caucasoid' features have led some ethnologists to class them as 'Indonesian' and to assume their affinity with the white race of the Eurasian continent, together with the other Eastern Polynesians—Tongans, Marqne-

saus, Hawaiians, Tahitians, etc. Like many other Polynesian peoples, the Samoans are often quite good-looking and are generally well-formed. Tradition and legend make the Samoan Archipelago the centre from which a large portion of the island-world of the Pacific was peopled. The Samoans have always been noted as sailors and boat-builders. They are famous for their legends and tales. Though they have practically all become Christians, the European and later American colonization has not been altogether to their benefit. In matter of population they seem to be about holding their own. Beneath the acquired new religion and borrowed culture survive many old traits and habits. The ancient arts and inventions of the natives are, however, disappearing before the labor-saving devices of the whites.

HISTORY. The Samoan Islands are probably identical with the Baumann's Islands, discovered by the Dutch navigator Roggveen in 1722. In 1768 Bougainville gave the name of Navigators' Islands to the group. Christianity was introduced by John Williams in 1830. The various islands were ruled by independent chiefs, who acknowledged, however, the nominal authority of a king elected from one of the noble families. After 1868 the islands became subject to continual disturbances, owing to the struggle between rival candidates for the throne. These dissensions were fostered by the representatives of the three foreign Powers possessing considerable interests in Samoa—Germany, Great Britain, and the United States. In 1888 interests hostile to the Germans brought about the election of Mataafa as opposition King to Tamasese, and civil war broke out. Mataafa made himself master of Apia, and in December defeated a small force of German marines. The German consul's truculent action nearly brought on war between the Powers, but a conference was finally called to adjust the difficulties. The Act of Berlin, June 14, 1889, proclaimed the independence and neutrality of the islands and guaranteed the natives full liberty in the election of their King. The interests of the Europeans were to be protected by the creation of a Supreme Court, consisting of a Chief Justice, and the erection of Apia into a municipality, the president of which, as well as the Chief Justice, was to be nominated by the three powers. In 1898 King Malietoa Laupepa died, and Mataafa was elected his successor by an overwhelming majority of the people. The election was contested by Malietoa Tamm, a nephew of the dead King, who was declared by Chief Justice Chambers, an American, rightful King. Fighting thereupon ensued between the forces of Malietoa and Mataafa, who now enjoyed German support. The latter was victorious, and in January, 1899, was recognized as provisional ruler of the islands. In March the United States man-of-war *Philadelphia* arrived at Apia. Rear-Admiral Kautz, after conferring with the representatives of the other Powers, refused to lend further recognition to the Government of Mataafa. The German consul issued a proclamation in favor of Mataafa, who accordingly maintained his attitude of resistance. On March 15th the villages around Apia were bombarded by the British and American ships. Germany again showed herself conciliatory, and by the agreement of December 2, 1899, between Germany, Great Britain, and the United States, the

Samoan Islands were partitioned between Germany and the United States. Great Britain received compensation in the Solomon and Toga Islands. On March 16, 1889, a tidal wave destroyed the American and German fleets in Apia roadstead. Of the American vessels, the *Triton* and the *Vandalier* were sunk, and the *Vesper* cast on shore, the loss of life being 52 officers and men. Consult: Turner, *Samoa a Hundred Years Ago* (London, 1881); Robert Louis Stevenson, *A Foot-note to History* (London, 1892).

SAMOS (Lat., from Gk. Σάμος; Turk. *Susam Adassi*). An island off the western coast of Asia Minor, separated by a strait (called by the Turks Little Bosphorus), about one mile in width, from the rocky promontory of Mycale, of which its mountains are a prolongation. Its length is about 30 miles; its mean breadth about 8 miles. A range of mountains runs through the whole island, attaining its greatest height at the west, where Mount Kerkis (the ancient Ceretes) reaches an elevation of 1725 feet. Samos is still, as in ancient times, well wooded. Though mountainous toward the north and west, the east and south contain fertile and well-watered ground, and the island exports considerable quantities of grapes, wine, oil, carob beans, and hides; its mountains furnish quarries of marble, and zinc, lead, iron ore, emery, lodestone, and ochre are to be found. The ancient city of Samos was in the southern part of the island, near the modern Tigani, where can still be seen the remains of the great moles of the harbor, the ancient fortifications, and the aqueduct cut through the mountain for Polycrates by Eupalinos. About four miles away was the celebrated Heraum, or temple of Hera, one of the largest Greek temples known to Herodotus, but of which only scanty remains are now visible. Excavations begun in 1902 by the Greek Archaeological Society are said to have shown that it had two rows of Ionic columns on the sides and three at the ends, and that its dimensions were 54.5 by 109 meters. On the north coast lies the modern capital, Vathy, which derives its name from its deep (Gk. *βαθός*, *bathys*) harbor. The population of the island in 1896 was 49,733, mostly Greeks.

The early Greek settlers of the island were said to have come from Epidaurus, and the worship of Hera certainly points to a connection with Argolis. In the early history of the Ionic Confederation Samos seems to have held a prominent place. The inhabitants were bold seamen and built up a large commerce with Asia Minor, the Black Sea, Egypt, and the west. Its greatest splendor was reached under the tyrant Polycrates (q.v.) in the latter part of the sixth century B.C. After his death the island suffered severely from civil strife and the Persians. In B.C. 479 it joined the Greeks and became a member of the League of Delos, and later a free ally of Athens. A revolt in B.C. 440 led to its reduction to the position of a vassal of Athens, but it received renewed privileges in the later years of the Peloponnesian War, when it proved a faithful ally of the Athenian democracy, and was the headquarters for the Athenian fleet. After the fall of Athens it was occupied by Lysander, who established an oligarchical government. By the Peace of Antalcidas (B.C. 387) the island passed into the possession of Persia. In B.C. 365 it was again conquered by the

... who expelled the inhabitants, and sent a large body of Athenian cleruchs, who retained their possession till driven out by the Persians after the death of Alexander the Great. From this time the island appears but seldom in history. It took the side of Antiochus and Artabardates against Rome, and in B.C. 81 was joined to the Province of Asia. Under the Byzantine emperors it was of some importance. In 1450 it passed into the hands of the Turks. When the War of the Greek Revolution broke out none were more ardent and devoted patriots than the Samians; and deep was their disappointment when, at the close of the struggle, European policy assigned them to their former masters. The island, however, was placed in a semi-independent position in 1832, when it was constituted as a tributary principality, under a 'Prince of Samos,' who is a Greek Christian appointed by the Sultan, and a national council, which regulates the assessment of the tribute and the internal affairs of the island. The annual tribute amounts to 300,000 piastres. Under this government the island has rapidly increased in population and enjoys a thriving trade. Consult: Panoika, *Res Samiorum* (Berlin, 1822); Guérin, *Description de l'île de Patmos et de Samos* (Paris, 1856); Fabricius, in *Mittheilungen des archaologischen Instituts* (Athens, 1884), on the aqueduct of Eupalimus; Tozer, *Islands of the Egean* (Oxford, 1890).

SAMOS'ATA. The ancient name of Samsat (q.v.).

SAMOTHE'RIMUM (Neo-Lat., from Gk. Σάμος, *Samos*, Samos + *θηρίον*, *thērion*, diminutive of *θήρ*, *thēr*, wild beast). An extinct giraffe, found fossil in Pliocene deposits of the island of Samos, in the Turkish Archipelago. See SIVATHERIUM.

SAMOTHRACE (Lat., from Gk. Σαμοθράκη, *Samothrakē*), or THRACIAN SAMOS. An island in the north of the Egean, northeast of Lemnos (*Stallene*). It belongs to Turkey. It is a rugged and mountainous mass, about 8 miles long by 6 miles broad. Its principal summit (5240 feet) is the highest point in the Greek archipelago. From it the *Iliad* describes Poseidon as watching the battles around Troy, and in spite of the intervening Imbros, the white summit can be seen from that point. During classical times the island plays no part in history, except as the chief seat of the mysteries of the Cabeiri (q.v.). In 1457 it was occupied by the Turks. An attempt to join in the Greek revolution led, in September, 1821, to a savage massacre of the scanty population. At present the island contains but one town of any size, Chosa, situated in a valley a short distance from the shore. The ancient town can still be identified by its fortifications, and the site of the ancient temples has been carefully explored. The first excavators in 1863 and 1867 were French, and their great prize was the superb Nike of Samothrace, now in the Louvre, a very fine example of the Attic school of the end of the fourth century. More important was the thorough clearing of the sanctuary in 1873-75 by the Austrians. Consult: Tozer, *Islands of the Egean* (Oxford, 1890); Conze, *Reise auf den Inseln des thrakischen Meeres* (Hanover, 1860); and especially, Conze, Hanemann, and Niemann, *Untersuchungen auf Samothrake* (Vienna, 1875); and Conze, Hanemann, and Brendelort, *Neue Untersuchungen auf Samothrake* (ib., 1880).

SAMOYEDS, sā'mô-yèds. A branch of the Finno-Ugric (Finnic) section of the Ural-Altaic stock of the Mongolian race, inhabiting the tundras of Northeastern Europe and Siberia. As Samoyed peoples are usually reckoned the following: Yurak, nomads of the tundras of the Arctic Ocean from the European limit of the Samoyeds to the Asiatic (Yenesei); Tawgy, east of the Yurak to Khatanga Bay; Yeneseian Samoyeds, on the tundras of the lower Yenesei, between the Yurak and the Tawgy; the so-called 'Ostyak-Samoyeds' of the wooded country on the Obi and its tributaries between Tym and Tchulym; the Soyotes of the Sayan mountain country, etc.; the Mators, on the river Tuba, north of the Sayan Mountains; the Koibals, on the upper Yenesei; the Karagass, on the Uda in the Sayan country; the Kamassinz, about Abakansk and Kansk, between the Angara and the Yenesei. The Yurak and Tawgy are reindeer nomads chiefly, the Ostyak-Samoyeds fishers and hunters for the most part, the Yeneseian Samoyeds partly reindeer nomads, partly hunters and fishers. The nomadic Samoyeds are tent-dwellers, the others live in huts known as *yurts*. The Samoyeds are strongly Mongoloid in physical type, with short stature, brachycephalic head, oblique eyes, and straight hair. Their culture, except where Russian and Chinese influence is felt, is comparatively primitive. There is evidence that they once occupied a much greater territory than at present, particularly to the south, but were driven back by Tatar invasions. The number of the Samoyeds is estimated at about 17,000 of whom about one-third live in European Russia. Consult: Castrén, *Ethnologische Vorlesungen über die altasiatischen Völker* (Saint Petersburg, 1857); Müller, *Der uralische Volksstamm* (Berlin, 1837); Pauly, *Description ethnographique des peuples de la Russie* (Saint Petersburg, 1862).

SAMPHIRE (*Crithmum*). A genus of plants of the natural order Umbelliferae. Common samphire (*Crithmum maritimum*), a perennial, 1½ feet high, is a native of the Mediterranean region of Europe growing chiefly on rocky cliffs near the sea. It is used in pickles and salads for its piquant, aromatic taste. It is easily cultivated in ordinary garden soil. Golden samphire (*Inula crithmoides*), of the natural order Compositae, is similarly used.

SAMPSON, WILLIAM THOMAS (1840-1902). An American naval officer, born at Palmyra, N. Y. He graduated at the United States Naval Academy in 1861, and during the following three years was an instructor at the Academy. In June, 1864, he became executive officer of the iron-clad *Patapsco* of the Charleston blockading squadron, and was on board when that vessel was destroyed by a submarine torpedo, although he himself escaped unhurt. The ten years immediately after the Civil War were spent by him partly at sea and partly as an instructor at the Naval Academy. From 1879 to 1882 he commanded the *Saratoga* on the Asiatic station, was then for a period in charge of the Naval Observatory, and from 1886 to 1890 was superintendent of the Naval Academy, which under his direction reached a higher standard of efficiency than ever before. When, in 1890, the *San Francisco*, the first modern steel cruiser of the new navy, was put in commission, Sampson, who had reached the grade of captain in the preceding year, was assigned to her command, retaining it until 1892.

From January, 1893, until May, 1897, he was chief of the Bureau of Ordnance, played a conspicuous part in the building up of the new navy, and came to be recognized as one of the world's greatest authorities on ordnance. To him more than to anyone else was due the adoption of the superimposed turret. After the destruction of the battleship *Maine* in Havana Harbor on February 15, 1898, he was appointed president of the naval court of inquiry to investigate the occurrence. Soon afterwards Sampson was appointed, as acting rear-admiral, to the command of the North Atlantic Squadron. He attained the rank of commodore in regular line of promotion on July 3, 1898. On the same day Admiral Cervera's Spanish squadron was destroyed off Santiago by the ships under Sampson's command, although Sampson himself was absent until the battle was practically over. After the war he served as a Cuban commissioner, was promoted rear-admiral on March 3, 1899, and until September, 1901, was in command of the Boston (Charlestown) Navy Yard. He was retired from active service February 9, 1902. The closing years of his life were clouded by the controversy between his friends and the supporters of Admiral Schley over the question of the command of the fleet during the battle of Santiago, the friends of the latter asserting that in Sampson's absence the credit of the victory belonged to Schley (q.v.).

SAMSAT, sām'sāt, ancient **SAMOSATA**. A village in the Vilayet of Aleppo, Asiatic Turkey, on the Euphrates, 130 miles northeast of Aleppo (Map: Turkey in Asia, II 4). It was the ancient capital of the Syrian Kingdom of Commagene. The place is inhabited by Kurds.

SAMSHUI, sām'shwē' (Chin., Three Waters). A hien or prefectural city and open port of China, in the Province of Kwang-tung, situated about 30 miles west-northwest of Canton at the point where the Si-kiang or 'West River' joins the Pe-kiang or 'North River' to form the Chu-kiang or 'Pearl River,' on which Canton is situated (Map: China, D 7). The city itself, which has a population of about 50,000, stands about half a mile back from the river bank, and is in a state of semi-decay. It was opened to foreign trade in 1897 in accordance with a treaty made earlier in the year with Great Britain. The native junk trade is immense, and there is a considerable native canning industry here of rice-birds, soles, quail, etc.

SAMSKĀRA, sāms-kā'rā (Skt., completion). The name of the forty essential rites of the first three castes of Hindus. They are the ceremonies to be performed at the procreation of a child, the parting of the mother's hair in the sixth or eighth month of her pregnancy to cause the infant to be a male, on the birth of the child before dividing the navel string, the ceremony of naming the child on the tenth or twelfth day, feeding him with rice in the sixth month, the tonsure in the third year, investiture with the Brahmanical cord in the fifth, eighth, or sixteenth year when he is intrusted to a guru (q.v.) to receive his religious education, the four vows on beginning the study of the Vedas, the ritual bath and return home on the completion of the course, marriage, the five great offerings, the seven small offerings, the seven libations to the fire, and the seven Soma sacrifices. Other texts make certain additions to this list. Consult: Jolly, *Recht und*

Sitte (Strassburg, 1896); Hillebrandt, *Ritual Literatur* (ib., 1897).

SAM'SON (Heb. *Shimshōn*, from *Shimsh*, sun). An early Hebrew hero whose story is found in the Book of Judges, chs. xiii. xvi. It is stated that he was the son of Manoah of Zorah, of the tribe of Dan. Manoah's wife was barren, but an angel appeared to her and provided a son, who should be a Nazirite, i.e., a 'consecrated one.' The angel appears a second time at Manoah's prayer and repeats his instructions. No razor is to touch the boy's head. The child is born, and his hair endows him with a supernatural strength. His first feat is his tearing a lion, when on his way to ask a Philistine woman in marriage. Returning the same road, to celebrate his wedding, he finds a swarm of bees in the lion's carcass, and from this propounds a riddle, which, through his wife's treachery, costs thirty Philistines their lives. He leaves his wife for a while and on returning to her finds that she has been given in marriage to another. In revenge he burns the fields of the Philistines by letting loose into them 300 foxes, to whose tails he has attached firebrands. The Philistines in retaliation burn his wife and her house, and Samson avenges this deed by a great slaughter. He escapes to Judean territory, but allows himself to be handed over to the Philistines; by means of his strength he bursts the ropes with which he was tied, and obtaining the jawbone of an ass, kills a thousand Philistines. Betrayed by a harlot at Gaza, Samson's next deed consists in carrying the doors of the city gates with the posts and bars to the top of a mountain at Hebron. Finally he is betrayed by his paramour, Delilah, in the valley of Sorek, to whom he reveals that the source of his strength is his hair. While he is asleep Delilah causes his locks to be shorn and hands him over to the Philistines. His eyes are put out and he is forced to perform servile labor. His hair, however, grows again, and on the occasion of a festival at which Samson is exhibited as a spectacle to the people he pulls down the pillars of the house in which the Philistines had assembled, burying the multitude with himself in the ruins. His body is placed by his relatives in the family sepulchre between Zorah and Eshtaol. The narrative ends with the statement that he judged Israel for twenty years.

Modern critics regard the chapters which contain the Samson story as representing the same circles which produced the Yahwistic narrative of the Hexateuch. (See HEXATEUCH; ELOHIST AND YAHWIST.) Chapter xiv. is thought to show traces of some editorial revision. While thus held to be derived from a single literary source, the narrative is thought to have been pieced together from a number of tales originally independent of one another; chapter xvi., more particularly, represents a supplement added after the narrative had already been closed in an earlier form. In this chapter Samson appears to be at the mercy of harlots and paramours, whereas in chapters xiii.-xv. he is the faithful husband of one wife. Despite the legendary character of the exploits related of Samson, there is no doubt an historical background to the narrative. Samson belongs to the tribe of Dan and to that portion of it whose seat lay to the west of Jerusalem. His adventures with the Philistines reflect the struggle between the Danites and Philistines

and the latter that ultimately led to the victory of the Danites (not necessarily in the extreme north. (See DAN.) It is possible that they have lived, indeed, after the manner of the Danites to the north, and to have been 'brought to the triumph' which did not lead them into marriage alliances with the Philistines, while still preserving their hatred of the latter in opposition to the foreign yoke, and striving at various times to cast it off. That he is represented as a 'Nazirite' is due to the desire to invest him with a religious character. The real 'Nazirites' (q.v.) of the Old Testament are men of a quite different type from Samson. Consult Trayer, *The Golden Bough*, i, 370 et seq.; ii, 283 et seq.; iii, 390 et seq. (2d ed., London, 1900). For the Samson story in general, consult the commentaries of Judges, chapters xiii-xvi., by Moore, Badde, Nowack, and Bertheau; Doornieck, "De Samsoneage," in *Theologisch Tijdschrift*, vol. xxviii. (Leyden, 1894); for the mythological interpretation, consult Goldzinger, *Der Mythos von den Hebräern* (Leipzig, 1876; Eng. trans., London, 1877); Steinthal, "Die Sage vom Samson," in *Zeitschrift für Volkspsychologie*, vol. ii. (1861); Sonntag, *Der Richter Samson* (Duisburg, 1890).

SAMSON AGONISTES, ἀγώνιστής. A dramatic poem by Milton (1671). The final triumph of the blind champion of Israel over his enemies, the Philistines, is told in the form of the Greek drama. Handel composed an oratorio "Samson" (1743), with a libretto arranged from the poem.

SAMSUN, sām-sōon' (Lat. *Amisus*, from Gk. Ἀμισός). An important seaport in the Vilayet of Trebizond, Asiatic Turkey, situated on the southern coast of the Black Sea, about 90 miles southeast of Sinub (Sinope) (Map: Turkey in Asia, G. 2). It is badly built and unhealthy. Its commerce is increasing and amounted in 1900 to over \$6,000,000. The chief imports are various manufactures, and the exports consist mainly of cereals, flour, and tobacco. Its population is estimated at 13,000. The ancient town of Amisus, which was 1½ miles northwest, was an important Greek settlement.

SAMUEL (Heb. *Shēmū'ēl*, name of God, perhaps in the sense of 'son of God'). The son of Elkanah and Hannah, a 'judge' and 'prophet,' who plays a prominent part in Hebrew history just prior to the establishment of the monarchy. The story of Samuel is told in the first of the two books of the Old Testament which bear his name. Modern scholars who think that these books are a compilation find each of the two sources in the account given of Samuel. (See SAMUEL, BOOKS OF.) In the older narrative he is represented as a 'seer,' attached to a town in the hill country of Ephraim, who is consulted by Saul while in search of the lost asses of his father (ch. ix. 1). Samuel, who has been informed by Yahweh of Saul's coming, receives him cordially and invites him to a sacrificial meal. On the following morning he announces to Saul that Yahweh has designed him to be the deliverer of the Hebrews from the oppression of the Philistines and privately anoints him. Three signs are given to Saul by means of which to test the truth of Samuel's words. The signs are fulfilled and soon the occasion presents itself which enables Saul to raise the siege of Jabesh-Gilead, and amid much enthusiasm he is crowned king. The later narrative is not only much fuller, but accords to Samuel the prominent position that he

occupies in biblical tradition. It begins with the vow made by Hannah, the barren wife of Elkanah, on the occasion of a visit to the sanctuary at Shiloh, to devote the child that is born to her through Eli to the service of Yahweh. Samuel is born, and after being weaned is handed over to the care of Eli. While engaged in the service of the sanctuary, Yahweh appears to him in the night and announces the approaching downfall of the house of Eli in consequence of the sins committed by the wicked sons of the priest. The defeat of the Israelites by the Philistines at Aphek seems to be the catastrophe meant by the prophecy, though in connection with this event and the subsequent restoration of the ark there is no mention of Samuel. When Samuel next appears he has assumed the rôle of a general adviser to whom the people look for advice; he exhorts them to turn from their idolatrous practices and his intercession with Yahweh brings about the discomfiture of the Philistines. Samuel, moreover, is portrayed as a 'judge' administering justice throughout Israel through a yearly circuit which embraced the chief sanctuaries—Bethel, Gilgal, and Mizpah. On the approach of old age, Samuel associates his two sons with him, but the latter, like the sons of Eli, did not resemble their father. For this reason and because they wanted to be like other nations, the people demand that a king be set over them. Samuel at first opposes the request, which he regards as an act of rebellion against Yahweh, but finally yields, and at a gathering of the people in Mizpah directs that lots be cast for the king. The choice falls on Saul, the son of Kish, the Benjamite. A farewell speech practically closes the public career of Samuel, who, however, lives long enough to announce to Saul that the kingdom will be taken from him because of his disobedience to Yahweh's command. (See SAUL.) He anoints David and after that retires from public gaze. He dies at Ramah and is buried there.

Bearing in mind the general religious character of the later narrative (as set forth in the article SAMUEL, BOOKS OF), it is not surprising to find incidents introduced which are intended to illustrate the narrator's conception of Israel's past. So the supposed opposition of Samuel to the kingdom merely reflects the general point of view maintained in the Pentateuch, which likewise looks with disfavor upon the whole period of royalty and regards its institution as the fatal step in Israel's history. The scene, therefore, between Samuel and the people in which he rebukes them for desiring a king (I. Sam. viii. 10-18) may contain but a slight historical kernel or even be a purely fanciful elaboration. In like manner many scholars regard the farewell speech of Samuel (I. Sam. xii.) as unhistorical and believe that legendary embellishments form a factor in many of the other incidents related of him. Nevertheless they agree that the narrative correctly estimates the importance of the position held by Samuel and the scope of his influence. In many respects he reminds us of Moses, and he is certainly the most striking personage in Hebrew history between Moses and David. Consult the chapters on Samuel in the Hebrew histories of Stade, Wellhausen, Piepenbring, Guthe, and others.

SAMUEL, BOOKS OF. Two of the so-called historical books of the Old Testament. Originally they formed one work, but were divided into two books in the Septuagint and Vulgate and the

same division has been made by Hebrew editors since Bomberg. In the Septuagint they are called the First and Second Books of Kings. The name is taken from Samuel (q.v.), the principal figure in the opening chapters. The books begin with the high-priesthood of Eli and close with the death of David; four main divisions may be noted: (1) the establishment of the monarchy by Samuel (I, i. xv.); (2) the narrative of Saul and David and the history of Saul's reign to his death (I, xvi.-II, viii.); (3) David's reign (II, ix.-xx.); (4) an appendix (II, xxi.-xxiv.). The period covered by the work is, roughly, one hundred years, c.1077-977 B.C.

In the opinion of modern critics the books were composed according to the general plan of ancient historiography; that is, they are a compilation of several documents more or less skillfully pieced together with editorial comment and additions revealing the point of view from which the compiler or compilers regarded the past. The compilatory hypothesis accounts for alleged duplication of incidents, contradictions, and inconsistencies in the work as it stands. For example, it is believed that we have two accounts of the choice of Saul as king, two versions of David's introduction to Saul, two narratives of the death of Saul; but little effort seems to have been made to harmonize the chief sources at the disposal of the compiler of these sources; the older is characterized by its graphic style, and by the simple straightforward manner in which events are narrated, the later by the introduction of religious views which reflect the standards of a later age and by judgment of events according to those standards. The older narrative may be assigned approximately to the ninth century B.C. and is the work of a writer who belongs to the same school as the Yahwist in the Hexateuch (see ELOHIST AND YAHWIST); the later one belongs to the eighth century and bears traces of the school of thought to be distinguished in the Elohist. Some scholars (as Budde) go so far as to identify these two narratives with the Yahwist and Elohist respectively, but this is not probable. The first combination of the two sources by a redaction took place in the seventh century before the reforms instituted by Josiah (B.C. 621), but in the present form of the two books we may detect a subsequent recension made with the view of bringing the narrative into accord with the religious standpoint of Deuteronomy. This was done mainly by the addition of summaries at the end of important sections and by the expansion of certain incidents which lent themselves to a 'homiletical' sentiment. Other additions were made by a later school of editors of the fifth and fourth centuries B.C., while after the separation of the Books of Samuel from the Books of Kings, the appendix (II, Sam. xxi.-xxiv.) was added to the former embodying miscellaneous fragments, and to this late period likewise belongs the insertion of the psalm known as the Song of Hannah (I, Sam. ii. 1-10).

For the detailed analysis, the distribution of the two main sources, and other problems, consult the commentaries of Thenius-Lühr (Leipzig, 1898); Klostermann (Munich, 1887); Keil (Leipzig, 1875); H. P. Smith (*International Critical Commentary*, New York, 1899); the introductions to the Old Testament by Driver, Kuenen, Cornill, Bleek-Wellhausen, and Kautzsch;

Wellhausen, *Text der Bücher Samuëlis* (Berlin, 1871); Driver, *The Hebrew Text of Samuel* (Oxford, 1890); Budde, *Richter und Samuel* (Gießen, 1890); Budde's text in the *Sacred Books of the Old Testament* (Leipzig, 1891). See SAMUEL; SAUL; DAVID; KINGS, BOOKS OF.

SAMURAI, sa'mū'ra'i' (Jap., guard). The military class in Japan during the feudal period, or a member of that class. Originally the term denoted the soldiers who guarded the Mikado's Palace; later it was applied to the whole military system and included: (1) the *shōgun* or commander-in-chief; (2) the *daimios* or territorial nobles; and (3) their retainers, the privileged two-sworded men, the fighting men, the gentlemen, and the scholars of the country. In 1868 the shōgunate, and in 1871 the whole feudal system were abolished; the daimios returned their lands to the Emperor, and they and their retainers were granted pensions. The practice of wearing swords was prohibited. Finally in 1878 the names daimio and samurai were changed to *kazoku* or 'nobility,' and *shizoku* or 'gentry' respectively. See BRISBONO; DAIMIO. Consult Knapp, *Feudal and Modern Japan* (Boston, 1876).

SAMVAT, sam'vāt (abbreviated form of Skt. *saṃvatsara*, year). The most important system of reckoning time in India. The era is in use in Northern India generally except in Bengal. According to native tradition, the Samvat year was introduced by King Vikrama (q.v.) in B.C. 57. A Samvat given date represents the year last completed. Christian dates are reduced to Samvat by adding 57 to the Christian year. Consult Sewell and Dikshit, *The Indian Calendar* (London, 1896).

SANA, or **SANĀA**, sā-nā'. The capital of the Turkish Vilayet of Yemen, Arabia, situated in a beautiful valley at an altitude of 7300 feet (Map: Turkey in Asia, Q 12). The city is surrounded by high brick walls, and dominated by the fortress of Jebel Nigein. The old white-washed palace of the Imams, now the residence of the Turkish Governor, is a prominent feature. There are numerous mosques, public baths, and caravan-erais. The city has excellent bazaars, and there is a flourishing trade in aloes, skins, coffee, indigo, and gum arabic. There are manufactures of carpets, arms, jewelry, silks, and cottons. Sana was taken by the Turks in 1872. Population, estimated at 50,000.

SAN ANDRÉS TUXTLA, sān ān-drās' tux'tlá. A Mexican town of the State of Vera Cruz, 83 miles southeast of the city of that name and 16 miles from the Gulf coast (Map: Mexico, I, 8). The town is situated in a fertile valley producing in abundance maize, sugar cane, cotton, coffee, and other tropical products. Its population in 1895 was 8855.

SAN ANGELO. A town and the county seat of Tom Green County, Texas, 299 miles northwest of Austin; on a branch of the Concho River, and on the Gulf, Colorado and Santa Fe Railroad (Map: Texas, D 4). It is important chiefly as a shipping centre for a cattle-raising and farming section, and has some manufactures. Cattle, wool, and pecans are the principal articles of commerce. Population, in 1890, 2615; in 1900, about 4000.

SAN ANTONIO. The largest city of Texas, situated 80 miles south by west of the State capital, Austin (Map: Texas, E 5). The Southern Pacific, the International and Great North-

of the Santa Fe, Kansas and Texas, and the Missouri Pacific and Missouri Pass railroads centre

at an elevation of 651 feet; average annual temperature 68°, with a relative humidity of 65, and an annual rainfall of 26.76 inches. There are 125 streets, 71 of which are macadamized, and 11 paved with asphalt, mesquite blocks, and burned brick. Some twenty parks and plazas add much to the charm of the city.

Some various objects of interest include Fort San Houston (q.v.), second in size among the military posts of the United States; Breckenridge Park, comprising 200 acres of semi-tropical woodland along the upper course of the San Antonio River; and San Pedro Park, of 40 acres. The river and San Pedro Creek flow through the central portion of the city and unite within its limits. The city hall, the court-house, the Federal building, the Carnegie Library, and the combined market house and convention hall are noteworthy. Of buildings of historic interest, mention may be made of the famous Alamo (q.v.), San Fernando Cathedral, the Veramendi Palace (one of the Spanish survivals, the scene of the death of Milam in 1835), and, within easy reach on the San Antonio River, the ruins of four of the early Franciscan missions, dating from the period 1720-50.

As a resort for those afflicted with pulmonary diseases, the city has long been noted. Within the past few years it has become favorably known for the curative properties of its hot wells.

San Antonio in 1903 had 143 manufacturing establishments, employing from 10 to 575 persons each. There are large breweries, flouring mills, machine shops, foundries, iron works, and cement works. The wholesale houses control to a great extent the trade of southwest Texas and portions of Northern Mexico. The industries are largely dependent upon the stock interests of this section, but with the greater development of the agricultural possibilities through irrigation, they are becoming each year more diversified and more important. San Antonio is a leading live-stock market.

The government is vested in a mayor and board of aldermen, elected biennially, who control the various administrative departments, except that of public schools, which is under a non-partisan board, chosen at a separate popular election. The assessed valuation of the city in 1902 was \$31,600,000. The total disbursements for the year ending May 31, 1902, were \$894,483, of which some \$170,000 were for special street improvements, \$56,322 for the police department, \$48,800 for the fire department, and \$80,300 for schools. The schools receive also a large appropriation from the State fund. A private corporation is paid annually about \$28,500 for street lighting, and \$24,000 is expended in like manner for water. The water supply is exceptionally good and is obtained from 12 artesian wells, which furnish the 110 miles of mains with 35,000,000 gallons a day. There are also 19 other wells in the city, with a combined daily capacity of 41,000,000 gallons. In 1897 the city installed a system of 75 miles of sewers at a cost of \$500,000.

The first permanent settlement within the limits of the modern city occurred in 1718, although there may have been temporary parties of Spanish *vaqueros* in the vicinity a few years

previous. In that year occurred the double founding of the mission of San Antonio de Valero and of its accompanying *presidio* of San Antonio de Bexar. These three colonizing elements—ranchmen, missionaries, and soldiers—were joined in 1831 by a colony of 56 persons from the Canary Islands, who formed the first regular municipal organization in Texas, known as the *villa* of San Fernando de Bexar. In 1809 the villa was raised to the rank of a city. Three battles were fought here during the Gutierrez-Magee filibustering expedition of 1813, because of which and of the succeeding proscription San Antonio lost nearly two-thirds of its population. Under Mexican rule its affairs were materially improved, but American migration thither was insignificant. In 1835 the Texan patriot army under Austin invested the place, and on December 9th, after a brilliant assault led by Milam, it capitulated. Here on March 6, 1836, occurred the storming of the Alamo, when the entire garrison of that mission fortress, after a desperate resistance, was massacred by the Mexican dictator, Santa Anna. After the decisive battle of San Jacinto, American pioneers pressed into the region, closely followed by the Germans in the next decade. In 1861 the city was the scene of the surrender of General Twiggs, of the Department of Texas, to the Committee of Safety appointed by the Secession Convention. In 1878 the first railroad reached the city, and since then its growth has been rapid. The population in 1870 was 12,226; in 1880, 20,550; in 1890, 37,673; in 1900, 53,321. Consult: Corner, *San Antonio de Bexar* (San Antonio, 1890); and the files of the *Texas Historical Quarterly* (Austin, Texas, 1897—).

SAN ANTONIO DE LOS BAÑOS, sán án-toño-é dá lós bá-nyós. A town of Cuba, in the Province of La Habana, situated on the Havana-Guanajay Railroad, 15 miles southwest of Havana (Map: Cuba, C 3). It is a summer resort, and has mineral springs and baths. Population, in 1899, 8178.

SANBALLAT (Heb. *Sanballat*, from Bab. *Sin-uballit*, Sin [the moon-god] gives life). An opponent of Nehemiah, at one time Governor of Samaria, builder of the temple on Mount Gerizim, and father-in-law of the first Samaritan high priest. (See SAMARITANS.) Probably he was a native of Horonaim in Southern Moab. According to Josephus (*Ant.* xi, 7-8) Sanballat was sent as satrap to Samaria by Darius III., Codomanus (B.C. 336-330). When his son-in-law, Manasseh, was driven away by Nehemiah, he promised to secure for him high-priestly power and dignity and to make him governor of all the territory he himself possessed if he would retain his daughter as his wife. As Sanballat was advanced in years, Manasseh expected to receive these favors from Darius. When, contrary to his expectations, Alexander proved stronger than Darius, Sanballat sent troops to aid him in the siege of Tyre and was permitted to build the temple on Gerizim and to instate his son-in-law as high priest, after which he died, in B.C. 332. It is possible that he was Governor of Moabitis before he was sent to Samaria. From Nehemiah's memoirs we learn that Sanballat grieved when he heard of Nehemiah's arrival (ii, 10); that he was angry when the walls were repaired and planned an attack (iv, 7, 8); that he invited Nehemiah

to a meeting in one of the villages of Ono, which Nehemiah refused to attend (vi. 2-4); that he sent a letter to Nehemiah in which he threatened to report what he had heard from Geshem and others, that the walls were being repaired as a preparation for rebellion and that prophets were appointed to proclaim Nehemiah as king (vi. 5-8); and that he hired Shemaiah, Noadiah the prophetess, and others to trouble the Governor of Jerusalem (vi. 10-14). While all this clearly reveals Nehemiah's suspicions and furnishes good ground for supposing that Sanballat feared the effect of the fortification of Jerusalem and was hostile to Nehemiah, it supplies no evidence of violence, bad faith, or falsehood on his part. Shemaiah's act may have been one of genuine friendship or of mistaken zeal. Consult the commentaries on Ezra and Nehemiah; Koster's, *Het herstel van Israel in het perzische tijdvak* (Leyden, 1893); Marquart, *Fundamente israelitischer und jüdischer Geschichte* (Göttingen, 1896); Torrey, *The Composition and Historical Value of Ezra-Nehemiah* (Giessen, 1896); Schmidt and Cheyne, articles "Nehemiah," in the *Biblical World* (Chicago, 1899); Cheyne, *Jewish Religious Life After the Exile* (New York, 1898); Winckler, *Athorientalische Forschungen* (Berlin, 1899); Sellin, *Studien zur Entstehungsgeschichte der jüdischen Gemeinde* (Leipzig, 1901).

SAN BENEDETTO PO, sän bän'ä-det'tò pò. A town in the Province of Mantua, Italy, near the Po, 12 miles southeast of Mantua (Map: Italy, E 2). It has an eleventh-century Benedictine monastery with a church built in 1542. Bricks and wine are manufactured. Population (commune), in 1901, 10,790.

SAN BERNARDINO, bär'när-dē'nò. A city and the county-seat of San Bernardino County, Cal., 63 miles east of Los Angeles, on the Southern Pacific and the Atchison, Topeka and Santa Fe railroads (Map: California, E 4). The vicinity is noted for its beautiful scenery and healthful climate, and for its mud, hot water, and sulphur baths. There are a public library and a handsome court-house. Fruit, hay, and alfalfa are extensively cultivated in the surrounding region, which also has mining and stock-raising interests. The shops of the Atchison, Topeka and Santa Fe Railroad employ 850 men. There are also lumber mills, a box factory, foundries, and machine shops. The government, under the charter of 1883, is vested in a president and board of trustees, who hold office for two years. San Bernardino was founded in 1851 by a company of Mormons, who wished to establish a way station for emigrants to Utah by way of the Pacific. The city stands on or near the site of an abandoned mission of the same name. In 1854 it was incorporated, but on the withdrawal of the Mormons in 1857-58 its importance decreased, and it was disincorporated in 1861. In 1863 its charter was restored. Population, in 1890, 4012; in 1900, 6150.

SAN BERNARDINO, STRAIT OF. One of the two principal passages through the Philippine Archipelago (Map: Philippine Islands, J 7). It separates the island of Sámár from Luzon, and is part of the route between Manila and the United States.

SAN BLAS, bläs. A seaport of Mexico, in the Territory of Tepic, situated in an unhealthy

locality on the Pacific coast, 140 miles southeast of Mazatlan (Map: Mexico, F 7). Though its harbor is but an open roadstead, it is the most frequented port on the Pacific coast of Mexico next to Acapulco and Mazatlan. The exports amount to about \$350,000 annually, and consist chiefly of silver, lumber, rice, coffee, and mesal. A railroad runs to Tepic, and is being extended to Guadalajara. Population, about 4000. Formerly the town was an important city with a population of 20,000.

SAN BLAS, CAPE. See CAPE SAN BLAS.

SAN'BORN, FRANKLIN BENJAMIN (1831-). An American journalist and social reformer, born at Hampton Falls, N. H. He was graduated at Harvard in 1855, and in 1856 was made secretary of the Massachusetts-Kansas Committee, which led to his knowledge of John Brown, with whose fame he was closely connected. Later he was active in the Massachusetts State Board of Charity, of which he was secretary (1863-68) and chairman (1874-76). He returned the Tewksbury Alms-house, aided in founding the Massachusetts Infant Asylum and the Clark Institution for Deaf Mutes, and in ameliorating the treatment of the insane. In 1879 he was made inspector of charities. He was also active in the organization of the American Social Science Association, of which he became (1873) chief secretary, and he aided in establishing the Concord Summer School of Philosophy (1879). For several years, beginning with 1868, he was editorially connected with the *Springfield Republican*. He wrote *Lives of Thoreau* (1882), of John Brown (1885), his most important book, of A. Bronson Alcott, Emerson, and Dr. S. E. Howe; and edited William E. Channing's *Wanderer* (1871); Bronson Alcott's *Sonnets and Canzonettes* (1882); his *New Connecticut* (1886); and for a time *The Journal of Social Science*. A brief study of Emerson appeared in the *Beacon Biographies* (1901); and later he edited essays of Thoreau and poems by W. E. Channing the younger.

SANBORN, JOHN BENJAMIN (1826-). An American soldier, born in Epsom, N. H. He studied at Dartmouth College, and in 1854 was admitted to the bar. On the outbreak of the Civil War, as adjutant-general and quartermaster-general of Minnesota, he organized and equipped the Minnesota troops, and early in 1862 became colonel of the Fourth Minnesota Volunteers. He took part in the battles of Corinth, Port Gibson, Raymond, Jackson, and Champion Hills, and in the Vicksburg siege, and was promoted to be brigadier-general, his commission being dated August 4, 1863. Placed in command of the District of Southwestern Missouri in October, 1864, he fought a number of successful engagements, and effected treaties with Indian tribes hitherto hostile.

SAN CARLOS, kär'los. A town of the Province of Nuble, Chile, 208 miles south of Santiago, with which city it has direct railway connection (Map: Chile, C 11). The old town is irregularly built, but the newer portion above the railway station is much better constructed. Its population, in 1885, was 7277.

SAN CARLOS. A town of the State of Zamora, Venezuela, 105 miles southwest of Carácas (Map: Venezuela, D 2). Population, in 1891, estimated at 10,120.

SAN CARLOS. A town of Luzon, Philippine Islands, in the Province of Pangasinan, situated about 10 miles southeast of Lingayen, near the Manila-Dagupan Railroad (Map: Philippine Islands, F 4). Population estimated, in 1899, at 12,941.

SAN CARLOS, ORDER OF. A Mexican order for women, founded in 1865 by Emperor Maximilian and extinguished at his death. The decoration was a green and white Latin cross bearing the image of Saint Charles.

SAN CATALDO, kā tã'ldó. A town in the Province of Caltanissetta, Sicily, 4 miles by rail west-southwest of Caltanissetta (Map: Italy, H 19). It has a handsome church with relics of Saint Cataldus. There are sulphur mines, oil refineries, and a trade in grain and fruit. Population (commune), in 1901, 17,941.

SANCHEZ COELLO, sãn'chèthò kò-ál'yó, ALONZO. See COELLO, ALONZO SANCHEZ.

SANCHO PANZA, *Sp. pron.* sãn'chèhò pãn'thá. The lazy, good-natured, pot-bellied laborer who accompanied Don Quixote as his squire in Cervantes's romance. Famous for his proverbs and shrewd sense, he serves as an admirable foil to the knight, and at last becomes Governor of Barataria, over which he presides with grotesque dignity.

SANCHUNIATHON, sãn'kũ-n'á-thôn, or **SANCHONIATHON** (Lat., from Gk. Σανχουνιάθων, *Sanchouniathōn*). The reputed author of a Phœnician history of Phœnicia and Egypt, called *Φαινικιακή Ιστορία*, or *Ta Phœnikika*, Philo Hieremius, of Byblus, a Greek writer (born c. 64 A.D.), claims to have translated Sanchuniathon's history into his own tongue; but of this translation all is lost save a few fragments relating to mythology and cosmology, which have been preserved by Eusebius in his *Preparatio Evangelica*. According to Philo, Sanchuniathon lived during the reign of Semiramis, the mythical Queen of Assyria, and dedicated his book to Abibalus, King of Berytus. Athenæus, Theodoret, Porphyry, and Snidas, on the other hand, speak of him as an ancient Phœnician who lived before the Trojan War. There is also a discrepancy between the various ancient writers respecting the number of books contained in the *Phœnikika*, whether eight or nine. The genuineness of the fragments ascribed to Sanchuniathon has been the subject of a prolonged discussion. The present position of scholars may be summed up by the statement that while the existence of a Phœnician writer of the name of Sanchuniathon is denied, it is believed that Philo embodied in his work current traditions that belong to a relatively high antiquity, and culled his information from various sources. A forgery purporting to contain Philo's complete translation of Sanchuniathon and to have been found at the Convent of Santa Maria de Merinhao, was published by Wagenfeld (Bremen, 1837) and translated into German (Lübeck, 1837). For the text, consult: *Sanchuniathonis Fragmenta* (Leipzig, 1826); Müller, *Fragmenta Historiarum Græcorum* (Paris, 1848). There is an English translation in Cory, *Ancient Fragments* (London, 1876); for discussion of the problems involved, consult: Morer, *Die Phœnizier* (Bonn, 1849); Renan, *Mémoires sur Sanchuniathon* (Paris, 1858); 1361 Mann, *Geschichte der Phœnizier*

(Berlin, 1889); Gutschmid, *Kleine Schriften* (Leipzig, 1890).

SAN CRISTÓBAL DE LOS LLANOS, krés-tò'stãl dã lós llyã'nòs (formerly CIUDAD DE LAS CASAS). A town of Mexico, in the State of Chiapas, situated on the plateau forming the base of the Yucatán Peninsula, 6500 feet above the sea (Map: Mexico, N 9). It is surrounded by ruins of ancient Indian cities, and is built on the site of one of these, Imizacatlán. It has a cathedral, and was the residence of Bishop Las Casas, the famous defender of the Indians. Up to 1892 it was the capital of the State. Population, in 1895, 12,000.

SAN'CROFT, WILLIAM (1617-93). Archbishop of Canterbury, the most distinguished of the non-jurors (q.v.). He was born in Suffolk, and educated in the grammar school of Bury Saint Edmunds and in Emmanuel College, Cambridge. The restoration of Charles II. brought Sancroft the post of chaplain to Cosin, Bishop of Durham. After several preferments he was made Archdeacon of Canterbury in 1668, and in 1677 he became Archbishop of Canterbury. In 1688 James II. committed him and six other bishops to the Tower for presenting a petition stating their reasons for refusing to read from their pulpits the Declaration of Indulgence (q.v.). When James asked Sancroft to sign a declaration expressing abhorrence of the Prince of Orange's invasion, he refused, and afterwards even concurred in an invitation to William of Orange to intervene in English affairs. His later attitude to William is to be explained by the fact that though he was in favor of declaring James incapable of ruling, and of appointing William *custos regni*, his oath of allegiance to James prevented him from supporting William as King. Accordingly he absented himself from the convention held by the lords spiritual and temporal to meet the new monarch, and after the settlement he refused, along with seven other bishops, to take the oath of allegiance to the Government, in consequence of which he was suspended by act of Parliament, August 1, 1689. Consult: Lathbury, *History of the Non-jurors* (London, 1845); Burnet, *History of His Own Time* (Oxford, 1833); Ranke, *History of England, Principally in the Seventeenth Century* (Oxford, 1875).

SANCTIFICATION (Lat. *sanctificatio*, from *sanctificare*, to make holy, from *sanctus*, holy + *facere*, to make). In Protestant theology, the process by which the Holy Spirit renews man in the divine image, destroying within him the power of evil, and quickening, educating, and strengthening in him the life of goodness and holiness. It is distinguished from justification, which is considered a judicial act on the part of God's free grace, liberating the sinner from condemnation, absolving and pardoning him once for all.

SANCTI SPÍRITUS, sãn'kté spér'ê-tus. A town of Cuba, in the Province of Santa Clara, about 20 miles from the southern coast of the island and 50 miles southeast of Santa Clara (Map: Cuba, F 5). It was founded by Diego Velazquez in 1514, and has narrow, crooked streets, and an old church with a high tower dating from the foundation of the town. A railroad runs to the port of Tunas. Population, in 1899, 12,696.

SANCTUARY. A sacred or consecrated place; sometimes applied specifically to a place which gives protection to those threatened by punishment or vengeance. Among the ancient Greeks a famous sanctuary was a sacred precinct on the northeast shore of the Isthmus of Corinth inclosed by walls and containing rich temples, altars, a theatre, and a stadium where the Isthmian games were celebrated. Generally throughout Grecian civilization the temples, or at least certain of them, afforded protection to criminals, whom it was unlawful to drag from them, although the food which was supplied might be intercepted. Among the Jews there were cities of refuge to which those might flee who had killed a man unawares. The more ancient canon law of the Western Church recognized this protection to those who had committed crimes of violence as continuing for a limited period, sufficient to admit of a composition of the offense, or at least to give time for the first heat of resentment to pass, before the injured party could seek redress. In several parish churches of England there was a stone seat beside the altar for those fleeing to the peace of the Church. One of these seats remains at Beverley and another at Hixham. In England it was not till 1534 that persons accused of treason were barred the privilege of sanctuary. By an act passed in 1624 the privilege of sanctuary for crime was finally abolished. Various precincts, however, in and about the old city of London continued to afford shelter to debtors. Whitefriars, adjacent to the temple known by the cant name of 'Abasia,' was such a sanctuary where privilege from arrest prevailed unless against the writ of the Lord Chief Justice. These places were found to harbor conspirators against the Government, and they were finally broken up by King William in 1697.

SANCY, sǎn'sǎ', NICOLAS HARLAY DE (1546-1629). A French soldier and diplomat, born in Paris. He belonged to the younger branch of the great Protestant family of Harlay. He became a Catholic for a few months in 1572 in time to escape death in the Massacre of Saint Bartholomew, but soon returned to the Huguenot faith. Subsequently he went to Switzerland to scour mercenaries for Henry III., pledging his own valuable jewels, among them the famous Sancy diamond. (See DIAMOND.) His devotion to the cause of Henry IV. caused the latter to appoint him in 1589 superintendent of finances. Later he served as Ambassador to England, and held high rank in the army. His second and final conversion to Catholicism, which his contemporaries charged to his ambition, was satirized by D'Aubigné in his *Confession de Sancy*.

SAND. A loose, incoherent mass composed of fine quartz grains, usually with a small proportion of mica, feldspar, magnetite, and other resistant minerals. It is the product of the chemical and mechanical disintegration of rocks under the influences of weathering and abrasion. When freshly formed the particles are usually angular and sharply pointed, becoming smaller and more rounded by attrition when blown about by the wind or transported by water. Sand is an important constituent of most soils, and is extremely abundant as a surface deposit along the courses of rivers, on the shores of lakes and the sea, and in arid regions.

SAND, sǎnd, George (1804-76). The name assumed by Armanthe Lucile Amore, Baroness Dudevant, a French novelist. She was born in Paris, July 5, 1804. Her father, Maurice Dupin, an officer, was the grandson of Marshal Saxe, the illegitimate son of Augustus II., King of Poland. She inherited a dashing temperament, democratic sympathies, and a taste for adventure; but all this was modified first by the training of her aristocratic grandmother, with whom she remained till thirteen at the ancestral homestead in Berry, then by three years at a Parisian convent (called *le couvent des Anglaises*), where she developed a strain of mystic idealism. On her grandmother's death she returned to Berry (1820), and after two years was persuaded to marry Casimir Dudevant (1822), a country squire. With him she lived eight years. They had two children, to whom she was devoted. From 1829 she lived mainly in Paris on a slender allowance, eked out by decorative painting; in 1831 a partial separation was arranged, and this in 1836 was made final. A ferment of blighted hope, social discontent, intimate knowledge of the aristocracy, democratic sympathy, contact with nature, ideal aspiration, and religious sentiment were all blended in her first novel *Indiana* (1832). Meantime she had been writing insignificant articles in the *Figaro*, at the office of which she met Jules Sandeau. With him she wrote *Rose et Blanche*, signed 'Jules Sand,' whence she took her own pseudonym. In the next forty-three years she published eighty-four novels, besides writing ten volumes of *Correspondance*, eight of *Mémoires*, and five of *Dramas*. Her work falls into four periods. The first, counting as typical *Valentine* (1832), *Lélia* (1833), *Jacques* (1834), *Audre* (1835), *Leone Lecoi* (1835), closes with *Mauprat* (1837). Here the effort is to project her own marital experiences and so assert an intense individualism. But all reflect the grief and pride of a neglected wife. The novels after 1834 reflect also the first bitter disillusionment that came from her putting in practice the theory that passion should be the rule of life. She had formed a very close attachment with the poet Alfred de Musset; she journeyed with him to Italy (1833-34) and became estranged from him under circumstances much written of and not yet wholly clear. Her own version of the situation is to be found, with some novelistic embellishment, in *Elle et lui* (1859). Musset's brother Paul endeavored to represent his in *Lui et elle* (1859). This shipwreck of passion, while it weakened Musset's character, greatly deepened hers.

Returning to Paris, she made new friends, among them Chopin, Balzac, Liszt, the painter Delacroix, the philosophic priest Lamennais, and, after three years of arrested development during which she wrote *La dernière Aldini* (1838), *Les maîtres Mosaïstes* (1838), *Le compagnon du tour de France* (1840), and *Spiridion* (1840), she dazzled the world for eight years with brilliant pleas for the socialistic revolution (1848), giving new life to romanticism by sympathetic study of the working class and the peasantry, in which she preceded Sue, Hugo, and Balzac. This is her second manner, typical of which are *Consuelo* (1843), its sequel *La comtesse de Rudolstadt* (1844), *Le meunier d'Angibault* (1845), and *Le péché de*

1817, and her first lessons of the French language, and after her return she lived quietly at Berry, where she developed a kind of idyllic nature. Her romances of which had been *Jeanne* (1818), and *Le comte au double* (1846). Her more noteworthy novels of this type are *François* (1840), *Thérèse* (1849), *La petite Paulette* (1849), and *Les autres sœurs* (1853). The wider social studies of her fourth manner began in 1860, after some dramatic experiments, with the psychological study *Jean de la Roche*, and this style comes as its best novels *Le marquis de Villemer* (1861) and *Mlle. la Quintinie* (1863). Through her work there quivers a passionate rebellion against convention, moral or social. She played a great part in the social emancipation of women, without having either an original or a definite social theory. Her nature was simple, affectionate, patient, kind, without vanity, without pedantry, large and frank.

Her collected works appeared as *Romans et nouvelles*, 84 vols.; *Mémoires, souvenirs, impressions, voyages*, 8 vols.; *Théâtre*, 4 vols.; *Théâtre de Nohant*, 1 vol. A *Life and Study* by Professor Caro, in the "Grands écrivains français" series (Paris, 1888), is translated by Masson in "Great Writer Series" (London, 1888). There is an English monograph by Bertha Thomas (London, 1889). Consult also: Taine, *Nouveaux essais* (Paris, 1865); Faguet, *XIX^{ème} siècle*; Brunetière, *Poesie lyrique*, vol. i. (ib., 1894); but especially George Sand's own *Histoire de ma vie*, published first as a feuilleton in *La Presse* (ib., 1854), afterwards in book form (ib., 1876); and *Correspondance* (6 vols., ib., 1882-84), especially the letters to Flaubert (q.v.). There are many translations of George Sand's chief novels. The most convenient uniform edition is in 20 vols. (Philadelphia, 1901).

SAND, zänt. KARL LUDWIG (1795-1820). A German student, known as the assassin of the dramatist August Friedrich von Kotzebue (q.v.). He was born at Wunsiedel, in Bavaria; studied theology at Tübingen and Erlangen, and in 1817 became affiliated with a Burschenschaft (q.v.) at Jena. He considered it his mission to kill Kotzebue, whom he regarded as a spy of the Russian Court, and one of the chief enemies of popular liberty. Entering the residence of Kotzebue in Mannheim, March 23, 1819, he murdered him with a dagger. He failed in an attempt on his own life, and was decapitated May 20, 1820. The death of Kotzebue spurred on the champions of reaction to greater activity and led to the enactment of the Carlsbad Decrees (q.v.). Consult Holmhorst, *Übersicht der gegen Sand geführten Untersuchung* (Stuttgart, 1820).

SANDAL. See SHOES AND SHOE MANUFACTURE.

SANDALPHON. One of three angels in the Rabbinical system of angelology who receive the prayers of Israelites and weave crowns from them. Longfellow used the legend in his poem "Sandalphon."

SANDALWOOD (from OP., Fr. *santal*, *santal*, from ML., Neo-Lat. *santalum*, from Gk. *σάνδαλον*, *santalum*, *σάνδαλον*, *sandalum*, from Ar. *sandal*, Pers., Hind. *sandal*, *сандан*, from Skt. *sandana*, sandal tree, from *sand*, Lat. *candere*, to shine). The compact, fine-grained, costly wood

of several species of the genus *Santalum*, of the natural order Santalaceae, natives of the East Indies and tropical islands of the Pacific Ocean. It is used for making small ornamental articles and cabinets and is remarkable for its fragrance, due to an essential oil, which is so obnoxious to insects that they will not attack articles stored in sandalwood receptacles. White sandalwood, the most common kind, is derived from a small tree (*Santalum album*), a native of mountains in the south of India and the Indian Archipelago. It is much branched, and resembles myrtle in its foliage and privet in its flowers. The tree is seldom more than 30 feet in height and a foot in diameter. A kind sometimes called yellow sandalwood is produced by *Santalum Freycinetianum* of the Indian Archipelago and Hawaiian Islands, from which it is exported to China. *Santalum Yasi*, which yields the much-valued sandalwood of the Fiji Islands, is a tree which has been almost extirpated in Hawaii, Fiji Islands, and elsewhere in consequence of the demand for its wood in commerce. A less valuable sandalwood (*Exocarpus latifolius*) is exported from some of the South Sea Islands. Successful attempts have been made to cultivate *Santalum album* in India and large plantations have been made of it. Red sandalwood, or sanders, is the produce of *Pterocarpus santalinus*, of the natural order Leguminosae, a native of tropical Asia, particularly of the mountains of the south of India and of Ceylon. The dark-red, black-veined heartwood, which sinks in water, is used as a dyestuff, and to color certain druggists' preparations. It is also the basis of some tooth-powders. The wood of *Adenanthera pavonia*, a relative of the acacias, is sometimes called red sandalwood, or redwood.

SANDALWOOD ISLAND, or **SEMBRA**. One of the Sunda Islands, in the Malay Archipelago, belonging to the Netherlands and situated 40 miles south of the western end of Flores (Map: East India Islands, E 7). Area, 4283 square miles. It consists of an elevated plateau 3000 feet above the sea with steep and rocky coasts, and contains forests of valuable timber, including sandalwood and ebony. Some timber is exported, together with cotton, spices, and edible birds' nests; horses of an excellent breed are exported. The island forms a part of the Residency of Timor, and has a population estimated in 1895 at 200,000, belonging to the Malay race.

SANDARAC (OF, *sandarac*, *sandarache*, *sandarac*, Fr. *sandaracque*, from Lat. *sandaraca*, *sandaracha*, from Gk. *σανδράκη*, *sandarakē*, red sulphuret of arsenic, from Skt. *sindūra*, minimum), or **SANBARAC RESIN**. A friable, dry, almost transparent yellowish-white resin, which is imported from the north of Africa. It is completely soluble in oil of turpentine, but not entirely in alcohol. When heated, or sprinkled on burning coals, it emits an agreeable balsamic smell. It exudes from the bark of the sandarac tree (*Callicitis quadrivalvis*, natural order Coniferae), a native of the northwest of Africa, especially Algeria. The best qualities of sandarac are brought into commerce in the form of small transparent tears of a light-yellow color. The specific gravity of sandarac varies between 1.5 and 1.9. The resin has a faint aromatic odor and a bitter taste. The quantity of sandarac used is not great; it is employed mostly for the same purposes as mastic (q.v.). The finely powdered resin is rubbed, as

pounce, on the erasures of writing-paper, after which they may be written upon again without the ink spreading.

SAN'DAY, WILLIAM (1843—). An English theologian, born at Holme Pierrepont, Nottingham, and educated at Balliol and Corpus Christi colleges, Oxford. He was fellow of Trinity in 1866 and lecturer until 1869. From 1876 to 1883 he acted as principal of Hatfield's Hall, Durham; was professor of exegesis and tutorial fellow of Exeter until 1895; and then was appointed Lady Margaret professor of divinity and canon of Christ Church, Oxford. He published *Authorship and Historical Character of the Fourth Gospel* (1872); *The Gospels in the Second Century* (1876); a commentary on Romans and Galatians (1878); *Inspiration*, the Bampton Lectures (1893); a commentary on Romans (1895); and *The Catholic Movement* (1899). He was an editor of the *Variorum Bible* (1880-89) and assisted Wordsworth on the second part of the *Old Latin Biblical Texts* (1886).

SAND-BLAST. A device for engraving, cutting, and boring glass, stone, metal, or other hard substances, by the percussive force of a rapid stream of sharp sand driven against them by artificial means. The process was invented by Gen. Benjamin C. B. Tilghman, of Philadelphia. The means of propulsion may be either an air or a steam blast, the former being produced by a fan revolving with great velocity or by air compressors, the latter by a boiler at high pressure. In either case the abrading material, which is usually common hard sand, although small granules of iron or crushed quartz are occasionally used, is directed by a tube upon the object to be cut or engraved. The engraving of the surface of glass with ornamental figures is accomplished by laying upon it patterns of the desired objects cut out of some resistant medium in the manner of stencils. Another method very commonly used is to cut the proposed pattern in sheet copper or brass, which is then placed over the glass, a brush of melted beeswax being drawn over the whole. The stencil is then raised, and the pattern in exposed glass may then be operated upon by the blast. The ornamentation of glass in colors may also be performed by a sand-blast. The sand-blast is also useful in the cutting of ornaments and inscriptions upon stone. Iron stencils are sometimes used for the purpose, but the most satisfactory material is found to be sheet rubber of about one-sixteenth of an inch in thickness. This is cemented upon the stone and a movable jet pipe is caused to traverse the surface of the latter until the exposed portions have been sufficiently abraded. The wear upon the rubber itself is slight and the same stencil may be used over and over again. Another use to which the sand-blast has been successfully put is in turning blocks of stone into circular and other forms in the lathe. Upon wood the action of the sand-blast is not so satisfactory. The sand-blast is frequently used for cleaning the scale and rust from iron and steel structures to prepare them for painting.

SANDBY, sãn'bî, PAUL (1725 1809). An English water-color painter, engraver, and caricaturist, born in Nottingham. With his brother Thomas, he obtained employment in the military drawing department in the Tower of London. He settled at Windsor in 1751, where his brother

was deputy ranger of the great park, and subsequently made many drawings of Windsor and Eton, and also etched plates from his own designs. He became drawing master at Woolwich Military School in 1768, and in the same year was one of the first 28 members of the Royal Academy, where he exhibited water-color landscapes from 1769 until 1809. He greatly improved water-color painting, and united high qualities as a draughtsman to considerable artistic feeling. His Scotch etchings were published in 1765, and his Welsh aquatints in 1775. There are works by him in the Royal Library at Windsor, at South Kensington, and in other collections.—His brother Titomas (1724-98), was also one of the original members of the Royal Academy, and its first professor of architecture. He built the Freemason's Hall in Lincoln's Inn Fields in 1776, and as landscape gardener and engineer laid out Windsor Park and Virginia Water. Consult Sandby, *Thomas and Paul Sandby* (1892).

SAND-CRICKET. One of the long-horned grasshoppers of the family Locustidae and genus *Stenopelmatus*; not a true cricket. See GRASSHOPPER.

SAND DAB. A reddish-brown turbot (*Hippoglossoides platessoides*) of the deep waters of the North Atlantic, closely related to the halibut. It is useful for food, and is taken commonly on the coasts of Great Britain and Scandinavia, and from Maine to Greenland. Two other species live in the North Pacific.

SAND-DOLLAR. One of the smaller echiroids of the order Clypeastroidea, which have the test very much flattened and approximately circular. Those species which have the test perforated by elongated holes, usually five or six in number, are often called 'key-hole urchins,' and some of the larger species, without perforations, are called 'sea-worms.' The common sand-dollar of the Eastern United States is *Echinurachus parva*, and is locally abundant on sandy bottoms in comparatively shallow water, from New Jersey northward. It is two or three inches across, and reddish-brown in color.

SANDEAU, sãn'dô', LÉONARD SYLVAIN JULES (1811-83). A French novelist and dramatist, born at Amblusson. He studied law in Paris, turned to journalism, wrote *Rose et Blanche* (1831) with George Sand (q.v.), was made keeper of the Mazarin Library in 1853 and Academician in 1858. He died in Paris. His better novels are *Mlle. de la Sciglicre* (1848, dramatized, 1851) and *La maison de Penarvan* (1858). He collaborated with Augier (q.v.) in turning his inferior novel *Sacs et parchemins* (1851) into the great comedy *Le genre de Monsieur Poirier*, and wrote with him, also, *La pierre de touche*. His special domain is the conflict between a poor but proud aristocracy and the wealthy bourgeoisie, brought politically to the front in 1830. Consult Saintsbury, *Essays on French Novelists* (New York, 1891).

SANDEC, sãn'døk. A town in Austria. See NEU-SANDEC.

SAND-EEL, (Ammodontoides) consisting of a single family, the Ammodontidae, whose relationships are uncertain. All of the sand-eels are small lanceolate creatures, with long, low, and

of the dorsal and anal fins, and no ventral fins; the pectorals are broad and forked. The skin has many small scales, the gills running obliquely backward and the operculum is small and is clothed with small cycloid scales. They are voracious fishes that swim in large schools near the shore in all northern latitudes, and bury themselves in the sand near the tide mark. They are collected as bait, make an excellent pan-fish, and furnish abundance of food for salmon and other valuable fishes. See *PLATE OF MULLUS AND AULUS*.

SAN'DEMAN, ROMAR (1718-71). Leader and with John Glas (q.v.) founder of the sect of Glassites or Sandemanians. He was born at Perth, Scotland, studied for a short time at Edinburgh University, and engaged in the linen trade. Coming under the influence of Glas, he adopted his views, became an elder in his church (1744), and married his daughter. He became a Glassite preacher and in 1760 went to London, where he formed a congregation, whose members took the name of Sandemanians. Four years later he removed to America and established a church at Portsmouth, N. H. (1765), and other points in New England. He died at Danbury, Conn. His works include three *Letters on [J. Hervey's] Theron and Aspasio* (1757), which attracted much attention; *An Epistolary Correspondence between S. Pike and R. Sandeman* (1760); *Some Thoughts on Christianity* (1764); *Discourses* (with a biographical sketch, 1857). Consult Andrew Fuller, *Strictures on Sandemanianism* (Nottingham, 1810).

SANDEMANIANS, or **GLASSITES**. A sect founded in Scotland by John Glas (q.v.) about 1730 and extended in England and America by his disciple and son-in-law Robert Sandeman (q.v.). The sect was called Glassites in Scotland, but Sandemanians became the more usual designation in England and America. The main doctrine of Glas was that all national establishments of religion and all interference of the civil authority in religious affairs are inconsistent with the true nature of the Church of Christ. Both Glas and Sandeman held that saving faith consists in 'a bare belief of the bare truth,' which belief they regarded as the fruit of divine grace and the work of the Holy Spirit. It was considered necessary to separate from the communion and worship of all societies which appeared not to profess the 'simple truth,' and it was even held unlawful to join in prayer with any one not a brother or sister in Christ. The Lord's Supper was observed weekly, and 'love feasts' or dinners were held every Sunday at the members' houses. There was a communistic tendency in that every one was required to consider all that he had at the service of the poor and the Church, and forbidden to lay up treasures on earth for any future or uncertain use. The discipline was primitive and severe; the kiss of charity was given at their meetings and foot-washing of fellow disciples practiced. The sect, never very large, steadily declined in numbers after the beginning of the nineteenth century. It has been strongest in America at Danbury, Conn.

SANDERLING. A common grayish snipe (*Colinus auraria*) remarkable for having only three toes. It is common on the coasts of North America and along the shores of large inland bodies of water, in small flocks in spring and fall. It is sometimes called 'surf-snipie,' and in

spring, when the plumage acquires a reddish tinge with black markings, it is locally known as 'ruddy plover.'

SANDERS, zän'dörs, DANIEL (1819-97). A German lexicographer, born in Altstrelitz, and educated at Berlin and Halle. From 1843 to 1852 he was rector of a school in his native town, and then devoted himself to grammar and lexicography. From 1887 to his death he edited the *Zeitschrift für deutsche Sprache*. He took a special interest in modern Greek. His *Wörterbuch der deutschen Sprache* (1859-65) is a standard work. He also published *Wörterbuch der Hauptschwierigkeiten in der deutschen Sprache* (1872), and, besides some volumes of poetry, many works bearing on German grammar, orthography, etc. (1871-82).

SANDERS, JAN. The real name of the Dutch painter Jan van Hemessen (q.v.).

SANDERS, NICHOLAS (c.1527-81). An English Roman Catholic controversialist and historian, born in Charlwood, Surrey, and educated at Winchester College and at New College, Oxford, of which he became fellow in 1548, and professor of common law. He was professor of theology at Louvain until 1572, and then went to Spain, where he urged the Catholic conquest of England. In 1579 he was sent to Ireland as Papal nuncio to rouse rebellion against Elizabeth. Sanders's *De Visibili Monarchia Ecclesiarum* (1571) is a Catholic Foxe's *Martyrs*, and his *De Origine ac Progressu Schismatis Anglicani* (1585; Eng. version by Lewis, 1877), though it won for him the name of 'Dr. Slanders' in England at the time, is not lacking in historical value.

SAN'DERSON, JOHN (1783-1844). An American classical scholar and miscellaneous writer. He was born near Carlisle, Pa. Educated privately, he taught, went to Europe (1835), and on his return became professor of Latin and Greek in the Philadelphia High School. He published with his brother, James H. Sanderson, the first two volumes out of seven of the *Biography of the Signers of the Declaration of Independence* (completed by other hands, reëdited 1865), and was also author of *Sketches of Paris* (1838).

SANDERSON, ROBERT (1587-1663). An English bishop. He was born in Sheffield, educated at Lincoln College, Oxford; ordained in 1611; was rector of Wyberton (1618) and of Boothby Paynel from 1619 for over forty years; prebendary of Lincoln in 1629. Upon the recommendation of Laud he became in 1631 chaplain to Charles I., who in 1642 appointed him regius professor of divinity at Oxford; he was ousted by Parliament in 1648. At the Restoration he was reinstated (1660) and the same year consecrated Bishop of Lincoln; was moderator at the Savoy conference between the Episcopal and Presbyterian divines (1661). He published *Logice Artis Compendium* (1618); *De Juramento* (1655); *De Obligatione Conscientie Prælectiones* (1660). His works were republished (Oxford, 1854), with a *Life* by Izaak Walton. As a moral theologian his influence in the Church of England was considerable.

SANDERSON, SYBIL (1865-1903). An American operatic singer, born at Sacramento, Cal. She studied singing in France and made her début at The Hague in 1888. In 1889 she ap-

peared at the Opéra Comique in Paris. In 1895 she returned to the United States and sang with success in French and Italian opera. Her reputation was established in France by her rendering of important roles in Massenet's operas. In 1897 she married Antonio Terry, and upon his death, two years later, she took up her residence in Paris. Her voice was a soprano of great flexibility and purity of tone. She died in Paris.

SANDES. sands, ELOISE (1850—). The founder of soldiers' homes in Ireland and India. She was born near the city of Tralee, County Kerry, Ireland, and at an early age evinced her practical sympathy for the military garrisons in Ireland. Beginning with her own home, which she placed at the disposal of the rank and file of the Tralee garrison, she was led to invest her own income in the building of a home in Cork, which became so successful that funds were readily obtainable to carry on the work. In 1903 there were nearly twenty such institutions under the care of Miss Sandes, in Ireland and India.

SANDFORD AND MERTON. A story by Thomas Day (1783-89). It is didactic and had great popularity for many years.

SAND-GROUSE. A game bird of the family Pteroclidæ, related more nearly to the pigeons than to the grouse. There are rather more than sixteen species, chiefly African, but five are Asiatic and two of these occur also in Europe. They are in all important respects terrestrial pigeons, modified for a grouse-like life. The genus *Syrhaptes* contains the three-toed forms, of which there are two species. They have the feet feathered. The tail is long and pointed, the middle feathers filamentous and long-exserted. Both species occur in Asia, but occasionally migrate into Europe, even as far as England, in great numbers. The genus *Pterocles* contains the four-toed forms, of which the best known is the common or 'banded' sand-grouse (*Pterocles arnaria*), abundant in Southeastern Europe. Another species (*Pterocles alchata*) also occurs in Europe and is sometimes called ganga, a name occasionally extended to the whole family. Consult: Morris, *British Game Birds* (London, 1891); Bryden, *Nature and Sport in South Africa* (London, 1897); Elliot, "A Study of the Pteroclidæ," in *Proceedings of the Zoological Society of London* (London, 1878). See PLATE OF PARTRIDGES, ETC.

SAND'HAM. HENRY (1842—). A Canadian historical and portrait painter, born in Montreal. He studied under J. A. Fraser in his native city, then studied abroad, and settled in Boston in 1880. His works include "Battle of Lexington," "March of Time," and "Founding of Maryland," and a portrait of Sir John Macdonald. He was elected a member of the Royal Canadian Academy of Art in 1880. His illustrations are also well known.

SAND-HILL CRANE. A very large species of crane (*Grus Mexicana*) found in the Mississippi Valley and southeastward to Georgia and Florida. It is a shy bird, with acute sight and hearing. Its body is about four feet long. The name is extended to other cranes, and is also erroneously given in some places to the great blue heron. See CRANE.

SANDHOPPER. An amphipod crustacean. These so abound on sandy shores that often the

whole surface of the sand seems to be alive with the multitudes which, leaping up for a few inches into the air, fill it like a swarm of dancing flies. They may also be found by digging in the sand, in which they burrow. Sandhoppers leap by bending the body together and throwing it open with a sudden jerk. They feed on almost any vegetable or animal substance, particularly on what is already dead and beginning to decay. They are themselves the food of crabs, and of many kinds of birds. See AMPHIPOD.

SANDHURST ROYAL MILITARY COLLEGE. The preparatory college for military cadets of the British Army, corresponding to the United States Military Academy (q.v.) at West Point. It is situated at Sandhurst, Berkshire, 33 miles west-southwest of London. Admission to the college is by open competition through examinations which are conducted each half year, under the direction of the Civil Service Commission. See MILITARY EDUCATION.

SAN DIEGO. sän de-ä'gō. A port of entry and the county seat of San Diego County, Cal., 125 miles south by east of Los Angeles, on San Diego Bay, and on the Atchison, Topeka and Santa Fe Railroad, and several steamship lines (Map; California, E. 51). San Diego Bay forms a superb land-locked harbor, 22 square miles in area. The Navy and the War Department have separately large tracts of land on the bay, for a coaling station and fortifications, respectively, the latter known as Fort Rosecrans. A health resort of some prominence, San Diego is favored by a beautiful situation and a mild equable climate. It is the seat of a State Normal School, and has the Academy of Our Lady of Peace, a Carnegie public library, the Hospital of the Good Samaritan, and a fine court-house. Fort Stockton and the old Spanish mission are other noteworthy features. Coronado Beach, across the bay, with the large Hotel del Coronado, an ostrich farm, botanical gardens, and other attractions, is a popular resort. San Diego has considerable commercial importance as the centre of extensive lemon and other fruit interests and as a port of entry. The value of the foreign trade in 1901 was \$1,475,000, including exports to the amount of \$963,000. The industrial establishments of the city in the census year 1900 had an invested capital of \$1,147,712, and an output valued at \$1,309,321. The principal manufactured products are carriages and wagons, flour, furniture, fertilizers, show cases, vinegar, wine, citric acid, oil of lemon, of orange, etc. The government, under the revised charter of 1901, is vested in a mayor, chosen every two years, a bicameral council, and in administrative officials. Population, in 1890, 16,159; in 1900, 17,500. In 1769 the first California mission was established here, and in 1835 the 'pueblo' was organized, San Diego thus being the oldest municipality in the State. In 1846 Commodore Stockton took possession of the place for the United States, and established a fort which is still known as Fort Stockton. The growth of the present city dates from 1867. The charter now in operation was granted in 1889. Consult: Gunn, *San Diego, Climate, Productions, Resources, Topography* (San Diego, 1887); Wood, *Home-land, being a brief description of the city and county of San Diego* (ib., 1901).

SAN DIEGO BARRACKS (California). A

strategic post in the city of San Diego, its quarters for two companies of infantry.

SAN DIEGO DE LOS BAÑOS, dá los bá-

ños. A celebrated health resort of Cuba, in the Province of Pinar del Río, among the mountains 22 miles northeast of Pinar del Río (Map: Cuba, B. 1.). There are sulphurous springs and baths. Population, in 1899, 2,119.

SAN DOMINGO. See **SANTO DOMINGO**.

SANDPAPER. An abrading material made by coating paper, or less often cloth, with glue and then covering it with sand. Other polishing materials made in a similar manner are *emery paper* and *glass paper*. Sandpaper is intermediate between glass paper and emery paper in its action on metals, and less effective than glass paper on wood. *Steel wool* is a substitute for sandpaper, whose chief advantage is its greater pliability, enabling a worker to polish or smooth down irregular parts of moldings or ornamental woodwork.

SAND-PIKE. One of the local names of the sauger (q.v.), especially heard in the Great Lakes region, where this gray fish spends its time mainly over sandy bottom.

SANDPIPER (so called from its notes and habit of running along the sand). Any one of a numerous group of shore-birds, of the family Scolopacidae, arranged in a large number of genera. They are not of large size, rarely over one foot in length; are very active and graceful in all their movements; their plumage not gay, but of pleasing and finely diversified shades of buff, brown, gray, white, and black; their legs are rather long, the lower part of the tibia naked, the tail very short, the wings moderately long; the bill rather long and slender, grooved throughout the whole or a considerable part of its length, straight in some, and a little arched in others. The feet have three long toes before and one short toe behind; the front toes are sometimes partly webbed and sometimes cleft to the base; in the sanderling (q.v.) there are only three toes. They are good swimmers, but are not, however, often seen swimming; they frequent sandy shores, some of them congregating in numerous flocks in autumn and winter; and seek their food by probing the sand with their bills, and by catching small crustaceans in pools or within the margin of the water itself. Many are birds of passage, visiting high northern latitudes in summer, and spending the winter on the coasts of more southern regions. The flesh of all the species is good, and some of them are in much request for the table. The sandpipers all build very simple nests on the ground, sometimes in exposed places. The eggs are usually 3 or 4, pyriform, drab, olive, or buff, heavily spotted with dark brown. They are placed in the nest with the small end at the centre. About twenty species occur in North America, of which the following are the most important: The stilt sandpiper (*Micropterna himantopus*) is about nine inches long; in the plumage in which it is seen in the United States, it is brownish-gray, with white tail, upper tail-coverts, and under parts. It breeds in the Arctic regions and passes through the United States during the migrations. The god (q.v.) is a somewhat larger species, while the 'trump' is decidedly smaller, and the

stint (q.v.) is also very small. The pectoral sandpiper, or 'fat bird,' or 'grass-snipe,' is a very widely distributed bird, nine inches long, black and buff above, which breeds only in the extreme north. Closely allied to this species, but smaller and with white upper tail-coverts, is the white-rumped sandpiper (*Tringa juscuel-lis*). The red-backed sandpiper is the American representative of the dunlin (q.v.). The purple sandpiper (*Tringa maritima*) is a beautiful purplish species, eminently boreal and shy in its habits, and rare except along the Atlantic coast, where it is commonly called 'rock-snipe.' Among the largest sandpipers are the yellowlegs (q.v.) and the solitary sandpiper. These represent the genus *Totanus*. The Bartramian sandpiper, or 'upland plover' (*Bartramia longicauda*), is common throughout Eastern North America, but is a shy bird, frequenting open fields and pastures. The commonest and best known species of this group in the Eastern United States is the spotted sandpiper or 'tip-up' (*Actitis macularia*). It is over seven inches long, green-gray above and white below, marked and spotted with black. It is not uncommon about bodies of fresh water and breeds throughout its range, which includes all of North America. Consult general works on ornithology and shooting; especially Elliot, *North American Shore Birds* (New York, 1898); Coues, *Birds of the Northwest* (Washington, 1874); Hudson, *The Naturalist in La Plata* (London, 1892); Athalo, *Sport in Europe* (ib., 1901). See **Colored Plates of SHORE-BIRDS; EGGS OF WATER AND GAME BIRDS; Plate of BEACH BIRDS**.

SANDPIPES. Cylindrical tubes descending perpendicularly into the ground, especially in chalk formations, and filled with sand, clay, or gravel. These tubes taper downward, ending in a point, and most probably have been produced by the solvent action of rain water as it drains downward through the soil.

SANDRART, zän'drärt. JOACHIM VON (1606-88). A German painter, engraver and art-historian, born at Frankfort-on-the-Main. He studied at various times under Merian, Sadeler, and at Utrecht under Honthorst, whom he accompanied to England. In 1627 he went to Italy, where his portraits became so celebrated that he was commissioned to paint several for Pope Urban VIII. He returned to Germany in 1635, settled two years later at Amsterdam, and in 1641 on his estate near Ingolstadt. Afterwards he established himself at Nuremberg, where his best-known work, "The Peace-Banquet in 1649," containing fifty portraits, may be seen in the Rathaus. Of greater importance than his paintings are his writings, especially *Die deutsche Akademie der allen Bau-, Bild- und Malerkünste* (1675-79), revised by Volkmann (1768-75), critical ed. by Sponzel (1896).

SAND-RAT. A small burrowing rodent of the mole-rat family (Bathyergidae), of which about ten species occur in Africa of the genus *Georchus*. The name specifically applies to a species in Cape Colony (*Georchus Capensis*).

SANDRINGHAM, sän'dring-am. An estate of 7000 acres near Lynn, in Norfolk, which was the favorite residence of King Edward VII., as Prince of Wales. It was bought in 1862, and the present brick mansion, in the Elizabethan style, was built about 1870.

SANDROCOTTUS (Lat., from Gk. Σαρόπη *KOTTOS*, *Sandrokottos*, from Skt. *Candragupta*, moon-protected). A Hindu King, probably a native of the Punjab. For some unknown reason he left his home and remained for several years in the service of Chandranes or Nandrus, King of Magadha (q.v.). In some way he offended Chandranes and returned to the Punjab. Here, after the murder of Porns (q.v.) by Eudemus, about B.C. 317, Sandrocottus took advantage of the racial hatred felt by the Hindus for the Greeks, which had been increased by the assassination, and headed a revolt during the enforced absence of Eudemus. The rebellion was completely successful, and Sandrocottus made himself master of the Punjab. He then invaded Magadha, which he conquered with ease, and established his capital at Pataliputra (q.v.). Here, in B.C. 315, he founded the Maurya dynasty, which ruled until B.C. 178. About B.C. 305 Seleucus Nicator (see SELUCIDE) invaded India to recover the territories which the Greeks had lost there. Details of this inroad are lost, but it is known that Seleucus ceded to Sandrocottus Gedrosia and Arachosia, as well as the Paropamisus and the lands on the west bank of the Indus, in return for five hundred elephants. The treaty was strengthened by the marriage of a daughter of Seleucus to the Indian King. This alliance had a result important for a knowledge of India in the fourth century before Christ, for Seleucus sent as an ambassador to the Court of Sandrocottus the historian Megasthenes (q.v.), the fragments of whose *India* contain the earliest non-Hindu information concerning the country. As the grandfather of Aśoka (q.v.) Sandrocottus is frequently mentioned in Buddhist literature. It is noteworthy that Sandrocottus is the hero of the single historical drama of India, the *Mudrārāksasa* of Visakhadatta (q.v.). Consult McCrindle, *Invasion of India by Alexander the Great* (2d ed., Westminster, 1896).

SAND-ROLLER. See TROUT-PERCH.

SANDS, HENRY BERTON (1830-88). An eminent American surgeon, born in New York City and graduated from the College of Physicians and Surgeons in 1854. He was demonstrator of anatomy in his *alma mater*, 1856-66; professor of anatomy, 1867-79; and professor of surgery, 1879-88. He began to practice his profession in New York City in 1856, and was associated with the noted surgeon Dr. Willard Parker (q.v.) from 1860 to 1870. He was an occasional contributor to medical journals, but was best known as a teacher and a skillful surgeon. The part he played, shortly before his death, in the discussion of 'typhilitis' and 'perityphlitis,' led the way to the discovery of appendicitis and the coining of that word. Among his published works, contributed to medical journals, are essays on amaurosis, bony ankylosis, Esmarch's bloodless method, gleet, tracheotomy, intussusception, stricture of the urethra, rupture of veins, and septic peritonitis. Consult his biography in *Medical Record*, xxxiv. (New York, 1888).

SANDS, ROBERT CHARLES (1799-1832). An American poet and miscellaneous writer. He was born in Flatbush, Long Island, graduated at Columbia in 1815, and studied law. He contributed essays to various journals and wrote, with his friend J. W. Eastburn, an epic of King Philip's War, *Yamoyden* (1820). Though ad-

mitted to the bar, he devoted himself to literature, editing several short-lived magazines and, till his death, the *Commercial Advertiser*. He collaborated with Bryant and Verplanck in an Annual, *The Tabernacle* (1828-30), and *Tabes from the Glauher Spa* (1832), and wrote *Life and Correspondence of Paul Jones* (1831). His *Works* were collected by Gulian C. Verplanck with a *Memoir* (2 vols., 1834).

SAND-SHARK. One of the small voracious sharks of the family Carcharidae, which have very sharp, triangular, and finely serrated teeth.

TEETH OF SAND-SHARK.

These sharks are of moderate size, chiefly inhabit the Atlantic Ocean, and one species (*Carcharias littoralis*), gray in color, and about five feet long, is common off the eastern coast of the United States.

SAND-SMELT. The British name for the fishes of the widely distributed family Atherinidae, allied to the barracudas and mullets, the American species of which are known in general as 'silversides' (q.v.). Two species occur in Great Britain, swarming in the creeks and estuaries along the coast, and are netted in great numbers in spring, when spawning, and when they make an excellent pan-fish. The most numerous one is *Atherina hepsetus*, about six inches long, and marked by a broad silvery stripe along the side. The resemblance of certain related species on our Pacific coast, especially *Atherinops Californicus*, has led to its being called 'smelt' there.

SAND-SNAKE. A small snake of the boa family and genus *Eryx*, of which several species inhabit the Sahara and deserts to the eastward. They have no apparent neck, a blunt tail; are variegated in dull tints; creep about, half buried in sand, or explore holes in rocks; hunt at night for insects and small animals; and are often carried about by snake jugglers, who mutilate the tail to give the snake the appearance of having two heads.

SANDSTONE. A stratified rock composed of grains of sand. The grains are mostly quartz, but other minerals, such as mica, feldspar, hornblende, and pyroxene, may be present. With an increase or decrease in the size of the grains, sandstones pass into conglomerates on the one hand, and into shales on the other, and by an increase in the percentage of lime carbonate they may also grade into limestones. Sandstones containing little cementing material between the grains are soft, and occupy a mean position between consolidated sandstone and loose sands; those with much cementing material are very hard. The cement, which may be either lime carbonate, iron oxide, or silica, influences the crushing strength of sandstones, the last named material giving the greatest hardness. The color is usually traceable to the presence of iron or carbonaceous matter, and is commonly brown, yellow, red, gray, or white. Sandstones are widely distributed geographically, and also

is abundant. It may be said in general that those sandstones of older formations are harder than those occurring in the younger series. A number of different varieties of sandstone have been named, among which the following may be mentioned: *Quartzite*.—A sandstone which has been hardened and sometimes more highly altered by metamorphism. *Arkoso*.—A highly siliceous sandstone. *Freestone*.—A name applied by quarrymen to many sandstones on account of the easy way in which they can be dressed, or cut. *Brownstone*.—A name formerly applied to certain reddish brown sandstones found in the East, but now applied to sandstones of other colors coming from the same locality as the original brownstones. *Flagstone*.—A hard, thinly bedded, shaly sandstone used for pavements. *Bluestone*.—A kind of flagstone quarried largely in southeastern New York. *Noxalite*.—An extremely fine-grained siliceous rock found in Arkansas. The most important use of sandstone is as a building material, for which it is admirably adapted by reason of its durability and the ease with which it can be wrought. Certain varieties are specially favored for structural purposes: in the Eastern United States the Triassic brownstones of the Connecticut Valley, the Berea sandstone of Ohio, the Medina sandstone, and the Potsdam quartzite of New York have been most extensively quarried. Varieties that are nearly free from iron oxide and clay are much sought after for use in glass manufacture and pottery-making. Certain beds of the Berea sandstone of Ohio are of value for grinders, and the noxalite of Arkansas is highly prized for making oilstones.

The value of sandstone for building purposes produced in the United States in 1901 was \$6,974,199, and the output of bluestone was valued at \$1,164,481.

BIBLIOGRAPHY. Kemp, *Handbook of Rocks* (New York, 1896); Hopkins, "Brownstones of Pennsylvania," in *Annual Report of Pennsylvania State College* (State College, 1897); Ingram, "The Great Bluestone Industry," in *Popular Science Monthly*, xlv.; Buckley, "Building and Ornamental Stones of Wisconsin," in *Bulletin Wisconsin Geological Survey*, No. 4 (Madison, 1900).

SANDSUCKER. or CALIFORNIA WHITING. A dusky gray fish (*Menidia menidia*) related to the Eastern kingfish, and common along the sandy coasts of southern California, where it is a food-fish of some importance. It receives its name from an erroneous popular belief that it feeds on sand.

SANDUSKY. A port of entry, and the county-seat of Erie County, Ohio, 53 miles south by east of Toledo; on Sandusky Bay, and on the Lake Shore and Michigan Southern, the Baltimore and Ohio, the Lake Erie and Western, and the Cleveland, Cincinnati, Chicago and Saint Louis railroads (Map: Ohio, E 3). It is finely situated, and has a spacious harbor. Cedar Point, a short distance from Sandusky, is an attractive summer resort. The State Fish Hatchery, public library, Soldiers' Home, the courthouse, and Federal building are noteworthy features. Excellent transportation facilities have made Sandusky of considerable commercial importance. A large trade is carried on in coal, fruit, game, furs, and lumber, and there are also extensive fish and ice interests. The industrial

establishments in the census year 1900 had an invested capital of \$4,627,981, and an output valued at \$3,190,342. Tools, chemicals, agricultural implements, lumber products, engines, dynamos, glass, and cement are the principal manufactures. Ship-building is another important industry. The government, under the general charter of 1902, is vested in a mayor, council, and president. Sandusky was settled in 1817 and was incorporated as a city in 1845. On May 16, 1763, Fort Sandusky here was treacherously captured by the Indians, and all the garrison except the commander, Ensign Paullly, massacred. Near by in 1782 a force of 480 men under Colonel Williamson and Crawford was defeated by a larger Indian force. Population, in 1890, 18,471; in 1900, 19,664.

SAND-WASP. A wasp which makes its nest in a burrow in the soil, preferably where sandy, and provisions cells in which its eggs are placed. (See **DIGGER-WASP**.) The most prominent species is the great yellow species, which stores cicadas in its burrows and hence is called 'cicada-killer.'

SANDWICH (village on the sands). A town of Kent, England, one of the Cinque Ports, on the Stour, 11 miles north of Dover (Map: England, H 5). It is rectangular. The houses, which seem crushed together, and the architecture of which recalls the Plantagenet period, are strikingly antique in appearance. The Church of Saint Clement's, with a low Norman tower, is probably the most interesting edifice. The town owns a guild hall, three ancient hospitals, etc. The port admits small vessels of 12 feet draught. The most ancient of the Cinque Ports (q.v.), it occupies the site of the Roman *Rutupie*. At the commencement of the eleventh century, it was the most famous of all the English ports. It was incorporated by Edward III. Within the last 800 years the sea has gradually receded until Sandwich is now two miles from the shore. Population, in 1901, 3174. Consult Burrows, *Cinque Ports* (London, 1883).

SANDWICH, EDWARD MONTAGU, Earl of (1625-72). An English admiral, son of Sir Sidney Montagu, a Royalist, but himself in his early youth a Parliamentarian. He raised a regiment when eighteen, fought at Marston Moor in 1644, and in 1645 at Naseby. In 1656, thanks to his friendship with Cromwell, he was appointed Blake's colleague. Deprived of all commands save that of admiral, after the fall of Richard Cromwell, Montagu joined the party in favor of the Restoration. His intrigues at this time, and especially his friction with General Monk, are vividly sketched in the diary of his secretary, Samuel Pepys. On the return of Charles II, Montagu became Earl of Sandwich, and was intrusted with negotiations for the King's marriage with Catharine of Braganza and for the cession of Tangiers to England. He won the victory of Lowestoft over the Dutch in 1665, and was promoted to be commander-in-chief, from which post he was soon retired because of his permitting the illegal distribution of prize money by his own officers. But his popularity was largely regained by his successful conclusion of the treaty with Spain in 1668. In 1672, as second in command to the Duke of York, he was defeated by Ruyter off Solebay; his flagship blew up and he was killed. He is best known by Pepys's admiring and minute portrayal.

SANDWICH, JOHN MONTAGU, Earl of (1718-92). An English politician, notorious for his political and personal vices. He succeeded to the title at the age of eleven, studied at Eton and at Trinity, Cambridge; and after two years on the Continent entered politics, becoming a lord of admiralty. In 1748 he became First Lord of the Admiralty, and attempted to reform naval administration. Sandwich first earned the ill opinion of the people by turning on John Wilkes, an old friend and companion in his infamous ribaldry, partly for political reasons. He augmented this unpopularity by his management from 1771 to 1782 of the Admiralty, of which he was again First Lord, purely for party purposes, and by his keeping for years as mistress Miss Martha Ray, who was shot in 1779 by the Rev. James Hackman, an unsuccessful lover, and whose murder revealed the story of her life. After the fall of North's Cabinet in 1782 Sandwich did not return to public life. Awkward and uncouth as he was and the worst-hated man of his time, he was yet a man of singular personal charm and was much admired and loved by his departmental inferiors. In the annals of anecdote the Earl figures as inventor of the 'sandwich.'

SANDWICH ISLANDS. The former name of the Hawaiian Islands (q.v.).

SANDY HILL. A village in Washington County, N. Y., 40 miles north of Troy; on the Hudson River, and on the Delaware and Hudson Railroad. It is an important lumbering and stone-quarrying centre, and is engaged also in the manufacture of foundry and machine-shop products and paper, and in the printing of wall paper. Population, in 1890, 2895; in 1900, 4473.

SANDY HOOK. A low, narrow, sandy peninsula, or spit, running about six miles northward from the coast of New Jersey, partly inclosing Lower New York Bay (Map; New Jersey, E 3). Near its northern end are Fort Hancock, the United States heavy ordnance proving grounds, and a lighthouse 90 feet high.

SANDYS, sán'dis or sándz, EDWIN (c.1516-88). An English archbishop, born at Hawkshead, Lancashire. He graduated at Saint John's College, Cambridge, in 1541, became prebendary of Peterborough in 1549, and of Carlisle in 1552, and was appointed vice-chancellor of Cambridge in 1553. He was favorable to the Reformation, and, having preached in favor of Lady Jane Grey, was imprisoned in the Tower, from which he escaped and fled to the Continent in 1554. He returned to England on the day of Elizabeth's coronation; was made Bishop of Worcester in 1559; of London in 1570; and Archbishop of York in 1576. He was a translator of the Bishop's Bible, and a commissioner to revise the liturgy. His *Sermons, with Miscellaneous Pieces and Biographical Notice* by the Rev. John Ayre, were published at Cambridge in 1841.

SANDYS, Sir EDWIN (1561-1629). An English statesman. The second son of Archbishop Sandys, he was born in Worestershire, and was educated at Corpus Christi College, Oxford, where he was a pupil of Richard Hooker, graduating in 1589. In 1599 he joined James VI. in Scotland, by whom, as James I., he was knighted. He was a leading member of the House of Commons, and was a member and treasurer of the second Virginia Company. It was largely due to his ef-

forts that a charter was obtained for the Plymouth Colony.

SANDYS, FREDERICK (1832-1904). An English painter and draughtsman, born in Norwich. He studied with his father, was associated with the Pre-Raphaelite group, and became one of the most promising of the school. He caricatured Millais's "Sir Isumbras at the Ford" under the title "A Nightmare" (1857), and introduced portraits of Millais, Ruskin, Rossetti, and Hunt into the sketch, which attracted much attention. Much of Sandys's best work was in the form of woodcuts. His subjects were usually taken from Scandinavian mythology or mediæval legends; his draughtsmanship is fine, and his conception original. His paintings in oil, exhibited during the sixties, are few, but of the highest order. They include: "Medea" (1869), "Orliana," "The Valkyrie," and "Morgan le Fay" (1864).

SANDYS, GEORGE (1577-1644). An English traveler and poet. The seventh son of Archbishop Sandys, he was born at Bishopsthorpe, Yorkshire, and was educated at Saint Mary Hall, Oxford. In 1621, succeeding his brother as treasurer of Virginia, he went to America and interested himself in the welfare of the colony, establishing iron works and introducing ship-building. He published translations of Ovid's *Metamorphoses* (1626), the first translation of a classic made in America; also poetical versions of the *Psalms* (1636); of *Job, Ecclesiastes, and Lamentations* (1639); and *Christ's Passion: A Tragedy* (1640), translated from the Latin of Hugo Grotius. Consult Hooper, *The Poetical Works of George Sandys, With an Introduction and Notes* (London, 1872).

SANDYS, JOHN EDWIN (1844-). An English classical scholar. He was educated at Rip-ton School, and at Saint John's College, Cambridge. In 1870 he obtained his M.A. and was appointed tutor of Saint John's. From 1867 to 1877 he was classical lecturer at Jesus College, and in 1876 he became public orator of the University of Cambridge. Besides his many contributions to the *Classical Review* and his history of classical scholarship in Traill's *Social England*, he published editions of Demosthenes, the *Bacchæ* of Euripides (1880), Cicero's *Orator* (1885), and Aristotle's *Constitution of Athens* (1893). In 1886 he published *An Easter Vacation in Greece*.

SAN FELIPE, fá-lé'pá. The capital of the Province of Aconcagua, Chile, situated 40 miles northeast of Valparaíso, and near the base of Aconcagua (Map; Chile, C 10). It is surrounded by parks. It manufactures cordage, and has considerable trade with Argentina, being a station on the Trans-Andean Railroad. Population, in 1895, 11,313.

SAN FELIPE. The capital of the State of Yaracuy, Venezuela, 120 miles west of Carácas. Cacao, coffee, sugar, fruits, tobacco, grain, and brandies are produced. The town was founded in 1552 and destroyed by an earthquake in 1812. Its population is about 5000.

SAN FELIPE DE JÁTIVA, ná'té-vá. See JÁTIVA.

SAN FELÍU DE GUIXOLS, sán fá-lé'wá dá gè-né-l's. A town of Northeastern Spain, in the Province of Gerona, on the Mediterranean coast, 50 miles northeast of Barcelona. It manufac-

fish are reported in large quantities. The cod fish is also important. There is considerable shipping. Population, 1890, 11,254.

SAN FERNANDO, *ter nan' do* (formerly *LA DE LEON*). A town of Southwestern Spain, in the Province of Cadiz, on the island of Leon, near the inner Bay of Cadiz, seven miles southeast of the city of that name (Map: Spain, B 4). It is a handsome town, but is surrounded by salt marshes. The principal public building, the Casa Consistorial, is one of the finest of its kind in Spain. There is an important naval academy, and outside the city stands a large and well equipped astronomical observatory. The industries are represented by salt works, flour mills, an iron, tannery, and manufactures of cordage and sails. A mile to the north lies the port of La Carraca, with wharves, docks, and an arsenal. Population, in 1887, 29,287; in 1900, 29,802.

SAN FERNANDO. The capital of the Province of Coquimbo, Chile, 86 miles south of Santiago, with which it has railway connection (Map: Chile, C 10). Its population in 1895 was 7477.

SAN FERNANDO. A town of Cebu, Philippine Islands, situated on the east coast 15 miles southwest of Cebu (Map: Philippine Islands, B 9). Population, estimated, in 1899, 12,355.

SAN FERNANDO. The capital of the Province of La Union, in Luzon, Philippines. It is situated at the entrance to the Gulf of Lingayen on the highroad and projected railroad between Manila and Laog (Map: Philippine Islands, E 3). It has a harbor protected by a small peninsula. Population, estimated, in 1899, 12,892.

SAN FERNANDO. A town of Luzon, Philippine Islands, in the Province of Pampanga (Map: Philippine Islands, E 4). It is situated about four miles northeast of Bacolor, has a telegraph station and is a station on the Manila-Dagupan Railroad. It is an important centre of the sugar industry, and has several sugar mills and large store-houses. Population, estimated, in 1899, 13,266.

SANFORD. A town in York County, Maine, 36 miles southwest of Portland; on the Boston and Maine Railroad (Map: Maine, B 9). It is an industrial centre, its manufactures including shoes, plush, blankets, carriage robes, worsted cloth, yarn, and lumber products. Settled about 1740, Sanford was first incorporated in 1768. Population, in 1890, 4201; in 1900, 6078. Consult Emery, *The History of Sanford, Maine, 1661-1900* (Fall River, 1901).

SAN FRANCISCO. The metropolis of the Pacific Coast of the United States and the largest and most important city of the region west of the Missouri River. It is built on a peninsula washed by the waters of the Pacific Ocean on one side and the Bay of San Francisco on the other, in latitude 37° 47' 55" N., and longitude 122° 24' 32" W., and occupies a central position on the coast line of California.

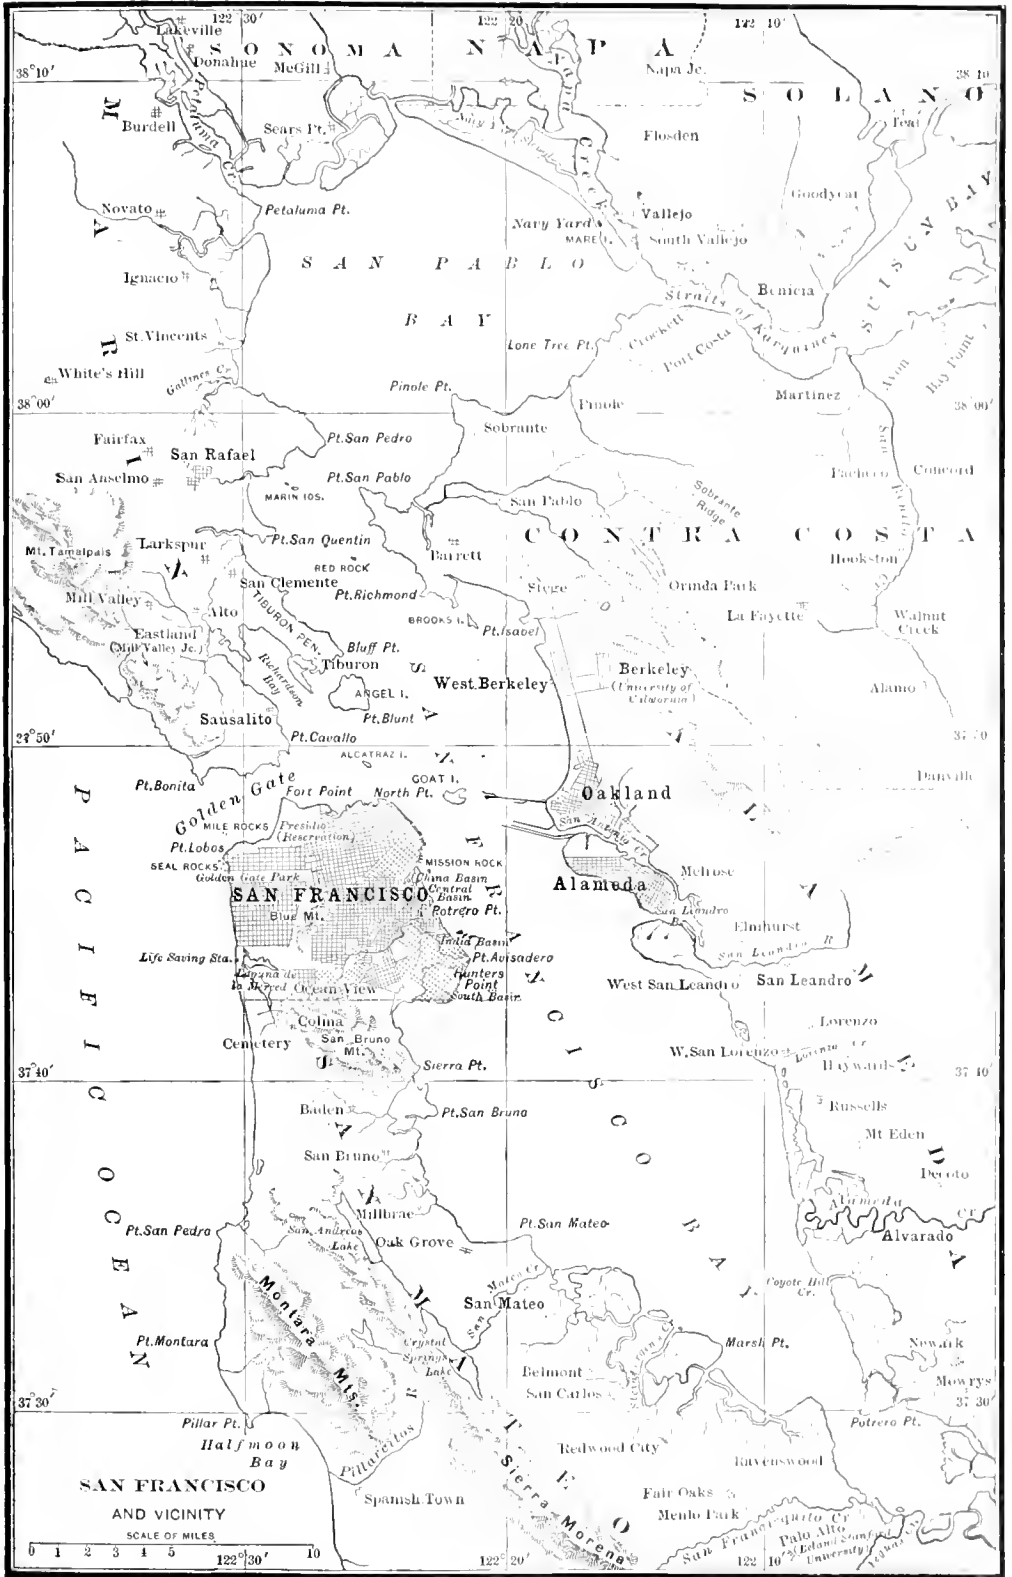

DESCRIPTION. The city's area is 47 square miles. Its site is largely hilly, and it presents a picturesque appearance from the harbor. The part devoted to commerce lies along the shores of the bay, and is moderately level, but the residential districts are on elevated ground. The most

fashionable quarters are those which overlook the ocean, bay, and town. 'Nob Hill,' upon which the men who constructed the first overland railroad built their palatial homes, is about 300 feet above the level of the ocean, and 'Pacific Heights' rise still higher. The 'Twin Peaks,' which form a background to the leading thoroughfare, are 900 feet high.

A part of the site of San Francisco is reclaimed from the bay. Some of the most substantial structures in the business section are reared on piles driven to bed rock through made ground, and vast areas of sand dunes have been leveled in order to conform localities to the street system, which was arbitrarily decided upon with little reference to contour. Market Street, a thoroughfare several miles long, and the streets south of it, are level, but those from the north and west intersecting it strike boldly at the hills and have gradients in some cases as great as 50 per cent. It is this feature which gives the town its striking sky line. From the bay it presents the appearance of a city with houses piled on top of one another, while from the points of vantage offered by the hills, views of rare beauty, embracing the ocean, the bay with its islands and active commerce, the densely populated districts, and the distant mountains, may be obtained.

Its situation on a peninsula across which the summer trade winds blow has given San Francisco a unique climate. During thirty years of observation, the lowest temperature recorded was 29° F., and the highest 100°. The lowest mean temperature for any month during this period was 46°, and the highest, 65°. The mean temperature was lowest in December, when it averaged 50°, and highest in September, reaching 63°. Semi-tropical plants flourish in the open air throughout the winter. During the summer months rain rarely falls, but the skies over the city are frequently clouded with fog, which sometimes descends in the form of a mist. The rainfall averages about 21 inches. The precipitation usually begins in October and ceases in May. In normal winter, periods during which the skies are clear from four to six weeks are not infrequent. The term 'rainy season' applied to weather conditions in central and southern California is misleading. It simply means that there are certain months during which rain falls, and not that there is continuous rain. A prominent feature of the climate is the regular afternoon wind.

Except the thoroughfares in a very small area near the water front, in the oldest part of the city, the streets are of ample width. Market street, the main artery, starts at the Ferry Building and cuts across the town in a southwesterly direction. It is intersected on the north side by streets laid out in conformity with the cardinal points. This arrangement produces irregular blocks at the points of intersection, which have left some space for placing monuments. The streets south of Market, with the exception of Mission, which describes a lengthened arc, cut each other at right angles. The sidewalks are wide in all parts of the city and are generally constructed of artificial stone. There are in all 750 miles of streets open to travel. Of these 104 miles are paved with bituminous rock laid on a foundation of concrete; there is a large proportion, however, paved with blocks of basaltic rock laid in sand, and in some neglected quarters cobbles still remain.

Market Street is the leading thoroughfare, and at all times presents an animated appearance. Some of the largest department stores in the city are on this street, but the chief shopping district is still in the streets to the north of that thoroughfare—Kearny, Sutter, Post, Geary, and Grant avenues, and Stockton Street. Union Square, in this locality, is becoming a fashionable shopping centre. An extensive system of boulevards exists, furnishing a continuous drive of nearly 20 miles. It starts near the heart of the city, traverses the United States military reservation and Golden Gate Park, skirts the Pacific Ocean for two or three miles, and winds in and out among the hills lying southwest of the town. In 1903 there were 274.60 miles of street car tracks—176 electric, 86.68 cable, 4 horse, and 8 steam. One corporation controls 244 miles of this system.

PARKS. Golden Gate Park, containing more than 1000 acres, enjoys the distinction of having been redeemed from a sand waste. There are now nearly 300 acres of close-shaved sward, green and attractive all the year round, and a still greater area is planted with shrubs and trees, semi-tropical types being largely predominant. In addition to Golden Gate Park, numerous smaller parks, chiefly four blocks in extent, are scattered throughout the city. These usually contain trees and shrubbery which remain green summer and winter, several varieties of palms being in evidence. The military reservation of the Federal Government, known as the Presidio (q.v.), is practically part of the park system. Its area exceeds that of Golden Gate Park, and it is far more favorably located for cultural purposes.

In Golden Gate Park there are several portrait statues, but none of great merit. The monument by Story to Francis Scott Key, the composer of "The Star-Spangled Banner," is the best. Near the City Hall is an ambitious group of bronzes, which cost \$50,000, representing the development of California. There are two noteworthy productions of a local sculptor, Douglas Tilden, on Market Street. One is designed to commemorate the admission of California to the Union, and the other is a vigorous group in bronze typifying the progress of manufactures in the city. Union Square has a lofty column to commemorate the achievements of the navy during the war with Spain.

BUILDINGS AND INSTITUTIONS. The abundance of excellent timber and a popular belief that a frame building is safer and better in a locality having the peculiar conditions of San Francisco are responsible for the fact that in 1900 there were 50,494 frame and only 3881 stone and brick buildings. The tendency to use the more durable materials is, however, growing rapidly. The occasional occurrence of earth tremors for a long time restrained the propensity to build 'skyscrapers.' In 1890, however, the proprietor of the *Chronicle* erected a ten-story modern fire-proof building. This example was soon followed by other property-owners, and the city has now its share of tall structures, one of them 18 stories high. The major part of this class of buildings is composed of 8, 10, and 12 storied buildings, the 8-storied being most numerous.

The most conspicuous building is the City Hall, surmounted by a dome 332 feet high. It cost over \$6,000,000, and twenty-five years were occupied in building it. It is very solidly constructed,

and its walls of brick are covered with cement. Architecturally it is a composite. The interior of the dome is decorated with native marbles. The structure houses all the administrative departments of the city government and several civil courts. The criminal and police courts and the police department occupy a modern building, known as the Hall of Justice. It is constructed of brick and stone and is surmounted by a clock tower. The post office, just completed, is a substantial structure of granite, costing over \$5,000,000. It is not a striking architectural production, but impresses by its massiveness. In addition to the post office, the Federal Government maintains a mint and a sub-treasury.

On the water front the State maintains the Ferry Building, a structure over 800 feet in length, built of a light colored sand-stone and surmounted by a graceful clock tower. Through this building most of the strangers entering the city are obliged to pass. It contains a lofty nave running through its entire length, which is frequently used for exhibiting the products of the State. It also houses a permanent exhibit illustrative of the resources of California, maintained by the State Board of Trade, and a fine Alaskan ethnological collection. A complete display of the mineral resources of California is also made in the Ferry Building by the State Mining Bureau. The Academy of Sciences, endowed by James Lick, is a substantial structure. It holds a growing museum devoted to the natural sciences. In Golden Gate Park is situated the Memorial Museum, founded to commemorate a successful international fair held in 1894. The Hopkins Art Institute, situated on 'Nob Hill,' contains the nucleus of a fine-art collection. The building and contents were presented to the University of California to be maintained for the public. The Public Library contains over 100,000 volumes. At present it is installed in a wing of the city hall, but maintains several branches. In October, 1903, bonds to the amount of \$1,600,000 were voted to provide a new building. The cost of maintaining the library is about \$65,000 a year. In addition to the Public Library there are seven other libraries of some importance. That of the Mechanics' Institute is the most useful of these, the collection covering the range of the applied sciences. It has more than 70,000 volumes, and property valued at over \$2,000,000. The Sutro Library is a heterogeneous collection of over 200,000 volumes. It contains a large number of rare books and manuscripts. The California Historical Society, San Francisco Medical Society, the San Francisco Law Library, the French Library, and the Mercantile all have collections exceeding 30,000 volumes.

None of the churches are conspicuous examples of ecclesiastical architecture. The Roman Catholic Cathedral is a brick structure. The Jesuit Church of Saint Ignatius, with its accompanying college buildings, covers a full city block. The Dominicans have an equally large church. Many of the older church buildings are of frame. The Mission Dolores is a survival from the days of the Spanish occupation. It is built of adobe, and care is taken to preserve it as a landmark, although it has none of the attractive features of many of the churches built by the friars.

There are 47 hospitals, public and private, and many of them are of recent construction. The emergency system has been well developed, and

of the city is crowded with the means to the study of the sciences. Of literary, scientific and artistic societies there is an unusual number. Among the most prominent may be mentioned the Academy of Sciences, Astronomical Society, Geographical Society, Mechanics' Institute, Engineers of California, and Technical Society. There are 98 public schools, including four high schools. The attendance in 1903 reached 57,603. In addition there are numerous private educational institutions. The Roman Catholics maintain a system of parochial schools. The attendance at private schools in 1903 was 14,002.

THEATRES, CLUBS, AND HOTELS. The leading playhouses are the Columbia, the California, the Alcazar, and the Grand Opera House. The Orpheum and Fischer's are devoted to vaudeville. The Tivoli presents opera in some form every night in the year. There are several low-priced theatres, the most conspicuous being the Central and Grauman's.

The clubs are numerous and well housed. The Bohemian, originally founded by artists and literary people, has a world-wide reputation for entertaining noted visitors. Its rooms are crowded with excellent pictures, many of them gifts of artist members. The Pacific Union is composed chiefly of wealthy citizens. The Jews have two prominent organizations—the Concordia and the Verein. The number of women's clubs is large. The leading ones are the Century, Sorosis, Forum, Outdoor Art League, and California. The members of the last two take an active part in civic matters, but the others are devoted chiefly to social and literary work.

There are many hotels of all classes. The most prominent among these are the Palace and the Occidental. The Saint Francis, a modern 12-story building of steel and stone, is admirably situated on Union Square.

SUBURBS. San Francisco, like all large American cities, has felt the influence of easy communication. The multiplication of street railway facilities has caused its population to spread out over the greater part of its area. These transportation conveniences have resulted in reducing the average number of persons in a dwelling to 6.4. The ease with which the trans-bay cities of Oakland, Alameda, Berkeley, San Rafael, Sausalito, and Beldere are reached has also contributed to that result. The places named are all within 40 minutes' ride of San Francisco, and their population of over 100,000 is mainly composed of people who to all intents and purposes are San Franciscans, most of them being engaged in business in the city. The three last named are largely made up of summer homes. The small towns on the peninsula are also largely inhabited by San Franciscans. Burlingame, a fashionable resort modeled after Tuxedo, is 25 miles south of the city. Menlo Park, near by, contains the residences of numerous wealthy men. Palo Alto, the seat of Leland Stanford Jr. University, is on the peninsula about 30 miles from the city, and the California University is situated at Berkeley. Both of these great universities have intimate relations with the city, the latter a State institution, maintaining several affiliated colleges within the city's boundaries. A part of the great endowment of 'Stanford' is in San Francisco.

The famous resort, the Cliff House, from whose

plazza hundreds of seals may be seen disporting in the water and on the rocks, and the near-by beach, are visited by many thousands every Sunday and holiday. Mount Tamalpais, situated in one of the trans-bay counties, is accessible by ferry and train in about two hours. Its elevation is 2392 feet, and it commands a view of the city, half a score of towns, and the bay and the ocean.

COMMERCE AND INDUSTRY. The importance of San Francisco is due to its position on the bay of that name (q.v.), which is accounted one of the finest harbors in the world. The area of the harbor is 450 square miles, and its width varies from 5 to 12 miles. It is navigable by the largest vessels for a distance of over 40 miles from its single opening to the ocean, the famous Golden Gate, the entrance to which is a mile in width. There are several steamship lines to China and Japan, Australia, Mexico, Central and South America, and the Hawaiian and Philippine Islands. An active coastwise commerce is carried on with Alaska, the ports of Puget Sound, and those on the southern coast of California. There is also regular communication with the ports of the Atlantic. In addition, a large fleet of sailing vessels bear to Europe the surplus grain and miscellaneous merchandise of California, most of which passes through this port.

In 1902 the exports by sea to foreign countries and Atlantic ports were valued at \$47,601,422, and the imports at \$36,078,270. A great deal of treasure passes through San Francisco, the exports by sea in 1902 being \$14,851,789, and the imports nearly \$12,000,000. The exports of wheat have reached as high as 24,862,095 cwt. in a single year. In the freight year ending June 30, 1902, there were 13,205,812 cwt. shipped. In 1902 6,636,186 gallons of wine and brandy were exported by sea, about one-sixth of which went to foreign lands. In the same year 793,156 cases of salmon were exported. Coffee is largely imported from Central America, Ecuador, Mexico, and the East Indies, the quantity in 1901 being 43,614,350 pounds. A great part is for distribution in the States and Territories west of the Mississippi. Imports of tea from China and Japan were 5,781,204 pounds in 1902. The receipts of customs amounted to \$7,850,705 in the year ending June 30, 1903. Five years earlier they were only \$5,393,753. The activity of trade is reflected in the bank clearings, which aggregated \$1,373,362,025 in 1902. A great increase has been noted since the Spanish-American War.

San Francisco is rated as the tenth in importance of the manufacturing cities of the United States. The census of 1900 credits it with 4002 establishments, 41,978 wage-earners, \$80,103,367 capital employed, and an output valued at \$133,069,416. Sugar refining, slaughtering, and meat packing, and the manufacture of foundry and machine shop products are most important industries. Shipbuilding has made considerable progress. Battleships and merchant vessels are constructed in San Francisco yards, the *Oregon* and the *Olympia* being noteworthy examples of the former.

GOVERNMENT AND FINANCE. San Francisco is governed under a charter adopted by the people, which went into effect January 1, 1900. With the exception of some bonds issued in 1874-75 for the acquisition of a park, now nearly matured, and to meet which a sinking fund exists, the city is

SAN FRANCISCO
CITY HALL (UPPER)
UNION SQUARE (LOWER)

absolutely free from debt. The charter under which the municipality is now governed is as rigidly drawn as the act it displaced, limiting the rate of taxation for ordinary municipal purposes to 1 per cent. on the assessed valuation of all property. An extra tax may be levied to meet unusual requirements, and there is a comprehensive license system. The assessed value of all property on March 1, 1903, was \$428,000,000. The expenditures provided for in the budget of 1903 aggregated \$6,150,400, the chief items being: Public schools, \$1,245,000; police, \$941,848; fire department, \$845,150; public works, \$769,867; health department, \$340,000; street lights and lighting public buildings, \$300,000; park fund, \$295,000; free library, \$63,000. It has been found in practice, however, that very little is spared for permanent improvements from the ordinary revenues. There is an active movement in San Francisco looking to the acquisition of a municipal water system, the present supply being derived from a private corporation's reservoirs on the peninsula. The project contemplates the bringing of a larger supply from the Sierra Nevada Mountains, and the cost will probably reach \$25,000,000. A two-thirds vote of the people is required to authorize a bond issue. In addition to the safeguards mentioned, the charter has created a civil service system based on merit, and it places great power in the hands of the mayor, who by his veto, which can be overridden only by a five-sixths vote of the board of supervisors, can prevent the adoption of separate items in the budget. He is also endowed with an extensive appointing power and the right to remove his own appointees, but the courts have curtailed the latter. The board of public works is an appointive body and has control of streets, sewers, buildings, and all public improvements.

POPULATION. San Francisco has grown very rapidly. The population in 1860 was 56,802; in 1870, 149,473; in 1880, 233,959; in 1890, 298,997; in 1900, 342,782. One-third of the population in 1900 was of foreign birth. Of these the Germans numbered 35,194; Irish, 48,963; English, Scotch, and Welsh, 12,342; Italians, 7508; and Chinese, 13,954. The Chinese live in a distinct quarter, which has taken on many of the characteristics of their native land. Their isolation is entirely voluntary, and extends no further than the choice of a place of habitation. This quarter, known as 'Chinatown,' is freely visited by strangers, who are attracted by its Oriental aspect. There has been a great diminution in the number of Chinese in recent years, owing to the operation of the Exclusion Act. In 1890 there were 25,833 enumerated. Though this class of Orientals is diminishing, Japanese are coming in rapidly. They aggregate several thousand already, but, unlike the Chinese, they do not segregate themselves.

HISTORY. The first settlement in this locality was made on October 9, 1776, when two Franciscan monks, Palou and Cambon, established here an Indian mission, which they called San Francisco de Asisi, the name San Francisco having been previously given (in 1769) to the bay. About this mission, after the Mexicans secured control of California in 1822, a small village called Dolores grew up. The mission itself prospered until 1834, when it was secularized, and in a few years thereafter little re-

mained but the adobe buildings. In 1836, near the best anchorage and three miles northeast of the mission, a small trading village, Yerba Buena, was founded, and from it the modern city really developed. In 1846 the United States took possession; and in the following year, its population then being 450, Yerba Buena exchanged its old name for that of the mission and the bay. On the discovery of gold in California in 1848 people of every social stratum and of many nationalities flocked hither, and the population of San Francisco increased with tremendous rapidity. In March, 1848, it was 800; in September, 1849, it was at least 10,000. In June, 1849, there were scarcely 50 houses; in September there were at least 500. The buildings were constructed of the most combustible materials and were huddled close together, so that the early years were marked by terrible ravages of fire. In the five big fires of December 11, 1849, May 4, 1850, June 11, 1850, May 2, 1851, and June 2, 1851, the property destroyed reached an aggregate value of \$16,000,000. Owing to the wild and turbulent character of much of the population and the lax enforcement of law by the constituted authorities, vigilance committees were organized in 1851 and 1856, and for a time tried, convicted, and punished criminals in an extra-judicial manner. In 1854 overspeculation and a diminishing return from the mines caused a temporary check to the growth of the city; but in 1858 a new period of prosperity opened. San Francisco was incorporated in 1850 and in 1856 the city and the county were consolidated. An earthquake did some damage on October 21, 1868. In 1877-78 San Francisco was the centre of the movement known as Kearneyism in California. (See KEARNEY, DENIS.) With the completion of the Union Pacific Railroad to the coast in 1869, the city entered upon a new period of prosperity.

Consult: Soule and others, *The Annals of San Francisco* (New York, 1855), for a graphic contemporary account of conditions during the period of excitement over the discovery of gold; also Royce, *California* (Boston, 1886); *San Francisco and Its Resources* (Denver, 1893); and a chapter in Powell (ed.), *Historic Towns of the Western States* (New York, 1901).

SAN FRANCISCO BAY. An inlet of the Pacific Ocean indenting the coast of California (Map: California, B 35). It is 42 miles long and from 5 to 12 miles wide, and runs nearly parallel with the coast, being separated from the ocean by a peninsula 7 miles wide, at the north end of which is the city of San Francisco. North of the city the Golden Gate, a passage one mile wide and 4 miles long, connects the bay with the ocean. San Francisco Bay is a beautiful sheet of water completely shut in by wooded mountains 1000 to over 2000 feet high. The water is generally shallow far out from the shores, but the Golden Gate and the part of the bay adjoining San Francisco as well as a central channel running through its whole length have a depth of 30 to over 100 feet. On the north the bay communicates with the Bay of San Pablo, which is of circular form with a diameter of 10 miles, and which further communicates through the Straits of Karquines with Suisun Bay. The latter receives the Sacramento and San Joaquin rivers, so that the drainage of the entire western slope of the Sierra Nevada passes out through the Golden Gate.

SAN FRANCISCO MOUNTAIN. The highest mountain situated near Flagstaff in the northern part of the Territory (Map: California). It rises abruptly 5000 feet above the plateau to an altitude of 12,794 feet, and is of volcanic formation and it is composed of masses of lava in which there is much water. The body of the mountain is marked by eroded ridges, the ridges and some composing the sides being produced by the hard lava cap while the surrounding mountains were worn away. The sandstone component is now almost completely hidden by a mass of volcanic detritus. The mountain is a conspicuous landmark; the surrounding region has displayed fresh volcanic activity since the denudation of the plateau, and from the summit more than a hundred craters may be seen.

SANGALLO, sän gäl'lä. A celebrated family of Italian architects of the Renaissance.—**GIULIANO** (1445-1516), the first to be distinguished and most important member of the family, was born in Florence, the oldest son of Francesco Giamberti, a woodworker. While very young he studied with Frauncione, a worker in tarsia (q.v.), but he acquired his architectural training among the ancient monuments of Rome. Returning to Florence to enter the army in the war with Naples in 1478, he gained great favor with Lorenzo de' Medici for his skill as a military engineer. For him he built the villa at Poggio a Cajano, where Lorenzo and his circle of humanists held their famous sessions, the beautiful Church of Madonna delle Carceri at Prato, and the Augustine convent at Florence, near the San Gallo gate, from which he derived the name later assumed by the family. He designed the Gondi Palace and the celebrated Strozzi Palace, for which Benedetto da Majano has received the credit, and built for Giuliano delle Rovere the fortress at Ostia. After the death of Lorenzo de' Medici, he designed the ceiling of Santa Maria Maggiore and the cloister of San Pietro in Vincoli, and in 1503 he designed the first plans for Saint Peter's. Replaced by Bramante, he returned to Florence in 1509, taking part in the capture of Pisa. Upon the accession of Pope Leo X., formerly Cardinal Giovanni de' Medici, he was associate architect with Raphael at Saint Peter's, serving in this capacity for about two years. He died at Florence, October 20, 1516. In the Uffizi Gallery at Florence, the Barberini Library at Rome, and at Siena, are many of his drawings which are of extraordinary merit. His work as an architect, although he was one of the most important architects of the Early Renaissance, was somewhat overshadowed by his prowess as a military engineer.

ANTONIO DA SANGALLO, the elder (1455-1534), a younger brother of Giuliano, had a very similar career, excelling both as an architect and military engineer. He was employed by Pope Alexander VI. in fortification work at the Castle of Sant' Angelo, at Civita Castellana, and at Nepi. He reconstructed the church at Arezzo and built the fine portico of the Annunziata, Florence, for Pope Leo X. His best work as an architect is the Church of the Madonna di San Pio in Monte Pulciano, where he also built the Caracciolo Farnesi and Bellarmini palaces. He took part in the defense of Florence when it was besieged by the Spaniards and died December 27, 1534.

Many of his drawings and plans are preserved at the Uffizi Gallery.

ANTONIO CORDIANI DA SANGALLO, called the younger (1485-1546), was a son of Giuliano. He went to Rome at eighteen years of age, studied with Bramante, and did important work for forty-one years under the popes Leo X., Clement VII., and Paul III. He was employed on the Castle of Sant' Angelo and at Saint Peter's, nearly finished the Farnese Palace at Rome, and completed the Santa Maria di Loreto, at Loreto. With his brother Battista, he was engaged upon the villa Madama in Rome, usually attributed to Raphael. In 1518 he was appointed to succeed Raphael as architect of Saint Peter's and of the Vatican Palace. His model for the church is still in existence. (See SAINT PETER'S CHURCH.) His work as a military engineer was very extensive, comprising more than a dozen fortifications. He died at Terni, October 3, 1546.

SANGERHAUSEN, zäng'er-hou'zen. A town in the Province of Saxony, Prussia, 36 miles by rail west of Halle (Map: Germany, D 3). Saint Ulrich is a splendid basilica, founded in the twelfth century, and recently rebuilt. There are two castles and two hospitals, dating from the thirteenth and fourteenth centuries. The manufactures include footwear, machinery, and other iron and steel products. Population, in 1900, 12,977, chiefly Protestants. Sangerhausen is mentioned in 991.

SAN GERMAN, sän hër-män'. A town of the Department of Mayaguez, Porto Rico, 10 miles south of the town of Mayaguez, on the coast, at the mouth of the river Guanajibo (Map: Porto Rico, A 2). Sugar, coffee, cacao, tobacco, and fruits are the principal exports. Population, in 1899, 3954.

SAN GIL, hël, or **SAN JIL.** A town of the Department of Santander, Colombia, 150 miles northeast of the city of Bogotá, on the right bank of the Gil River (Map: Colombia, C 2). The manufactures are sulphate of quinine, straw hats, and cotton comterpanes; the agricultural products, cotton, sugar-cane, and tobacco. Population, in 1886, 10,938.

SAN GIMIGNANO, jë'më-nyä'nó. A city in Italy, 7½ miles by carriage road west of Poggibonsi, which is 43 miles south of Florence (Map: Italy, E 4). The walls, the towers, and the Gothic architecture present a faithful picture of the age of Dante. The Palazzo Pubblico, built 1288-1323, contains many ancient frescoes and paintings. There is an interesting public library. The Church of Sant' Agostino, built 1463-65, contains frescoes by Benozzo Gozzoli, the pupil of Fra Angelico. Population of commune, in 1901, 9848.

SAN GIOVANNI A TEDUCCIO, sän jö-vän'né ä tä-döo'chó. A suburb of Naples, Italy, situated in the direction of Portici (Map: Italy, D 11). Population of commune, in 1901, 20,797.

SAN GIOVANNI IN FIORE, in fë-ö'rá. A city in the Province of Cosenza, Italy, 12 hours by stage east of the city of Cosenza (Map: Italy, E 8). It is the principal place in the lofty (6325 feet) Sila Mountains. The district produces grain, fruit, wine, and fine cattle. Population of commune, in 1901, 12,114.

1. CULVER'S ROOT (*Leptandra Virginica*).
2. BLOODROOT (*Sanguinaria Canadensis*).

3. RED CLOVER (*Trifolium pratense*).
4. DUTCHMAN'S BREECHES (*Dicentra cucullaria*).
5. BLACK COHOSH (*Cimicifuga racemosa*).

SAN GIOVANNI IN PERSICETO, per'se-chá'tó. A town in the Province of Bologna, Italy, about 15 miles by rail northwest of Bologna. It has mineral springs, manufactures ironware, and markets grain. Population (commune), in 1901, 15,893.

SAN GIOVANNI ROTONDO, ró ton'dó. A city in the Province of Foggia, Italy, 28 miles northeast of the city of Foggia and 15 miles north of Fontanarosa, the nearest railway station (Map: Italy, K 6). It is beautifully situated on a slope of Monte Gargano. It markets wine, oats, potatoes, and cattle, and manufactures linen. Population of commune, in 1901, 10,122.

SANGIR (sán-gér') ISLANDS. A chain of small islands in the Malay Archipelago, belonging to the Netherlands, extending from the northeastern end of Celebes northward to Mindanao, Philippines, and separating the Celebes Sea from the Pacific Ocean (Map: East India Islands, G 4). It consists of about 50 islands with a total area of 408 square miles, of which 308 square miles are taken up by Great Sangir, the largest in the group. They are of volcanic origin. There are several active craters, notably Abu on Great Sangir, which has frequently caused great loss of life. The islands are covered with forests yielding excellent timber and cabinet woods, and cocoa, sago, rice, tobacco, and sugar are also produced. The inhabitants are Alfuros, partly Christians and Mohammedans, partly pagans. Together with the neighboring Talauer Islands the Sangirs belong to the Dutch Residency of Menado, and the combined population of the two groups was estimated in 1895 at 113,467.

SANGRE DE CRISTO, sán'grá dá krés'tó. A range of the Rocky Mountains in south-central Colorado, bounding the San Luis Park on the northeast (Map: Colorado, E 2). It rises steeply from the floor of the park to a height of 5500 feet above it. Its crest maintains an altitude of 13,000 feet above the sea for 15 miles and 12,000 feet for over 30 miles. Its highest point, Blanca Peak, has an altitude of 14,390 feet, and is one of the two highest peaks of Colorado.

SANGSTER, CHARLES (1822-93). A Canadian poet, born at Kingston, Ontario. For fifteen years he conducted newspapers at Amherstburg and Kingston; and from 1868 to his retirement in 1886, he was connected with the Post-Office Department at Ottawa. He was one of the earliest among the native English-Canadian poets. Perhaps his best known poem is the stirring "England and America." His published volumes comprise *The St. Lawrence and the Saguenay*, and *Other Poems* (1856); and *Hesperus and Other Poems and Lyrics* (1860).

SANGSTER, MARGARET ELIZABETH (MUNSON) (1838-). An American journalist, poet, and juvenile moralist, born at New Rochelle, N. Y. She was privately educated, chiefly in New York. She contributed to many periodicals, became associate editor of *Hearth and Home* (1871-73), of *The Christian At Work* (1873-79), of *The Christian Intelligencer* (1879), of *Harper's Young People* (1882-89), and of *Harper's Bazaar* (1889-99), besides contributing regularly to other journals. In book form she published *Manual of Missions of the Reformed Church in America* (1878), and numerous essays and poems.

SANGUILE, sán-gú'la. Collective name of certain little-known tribes in Southern Mindanao. See PHILIPPINE ISLANDS.

SANGUINARIA (Lat. *sanguinaria*, fem. sg. of *sanguinarius*, relating to blood, from *sanguis*, blood, so called because supposed to staunch blood, but in modern usage because of the blood-like juice). A genus of plants of the natural order Papaveraceæ; *Sanguinaria Canadensis*, the only species, the bloodroot or puccoon of Eastern North America, has a fleshy root-stock with a red, acrid juice, found also in the stalks. The large white flowers, which appear in early spring, are solitary, and arise from the root, on short stalks usually surrounded by the solitary roundish heart-shaped radical leaves.

SANGUINE (OF., Fr. *sanguin*, bloody), or MURKY. One of the tinctures in heraldry (q.v.).

SANHEDRIN (Heb. *sanhedrin*, from Gk. *συνεδριον*, *synedrion*, council, from *σύν*, *syn*, together + *ἔδρα*, *hedra*, seat). The name in ancient times of the highest court of justice and supreme council in Jerusalem, in a wider sense applied also to lower courts of justice. Josephus designates the council established by Galbinius, the Roman Governor of Syria (B.C. 57-54), in each of the five districts of Palestine as *synedrion*, but this intentional degradation of the *Synedrion* at Jerusalem points to the introduction of the term at an earlier period, and in fact it occurs in the Greek translation of the Old Testament (second century B.C.). According to the Talmud, also, the name goes back to the second century, for the chief council in the days of John Hyrcanus is called a Sadducean Sanhedrin (*Tal. Bab.*, Sanhedrin, 52b). The Sanhedrin is identical with the *Gerousia*, which occurs as a designation of the chief Jewish council in the days of Antiochus the Great (c.200 B.C.) and somewhat later. The degradation of the Jerusalem Sanhedrin by Galbinius was only temporary, and soon after we find the council at Jerusalem exercising supreme authority and even utilized by rulers to serve their ends. The Sanhedrin of Jerusalem, as finally constituted, consisted of 71 members, and was presided over by the *Ab-beth-din* ('Father of the Tribunal'), with whom was associated in the post-Hadrianic era the *Vásí* (Prince). Its members belonged to the different classes of society. There were priests; elders, that is, heads of families, men of age and experience; scribes, or doctors of the law; and others exalted by eminent learning, but we have no authentic source for determining who composed the Sanhedrin or on what principle vacancies were filled. The presidency appears to have been conferred for a time on the high priest in preference, if he happened to possess the requisite qualities of eminence; otherwise 'he who exceeds all others in wisdom' was appointed, irrespective of his station. The limits of its jurisdiction are not known with certainty; but there is no doubt that the supreme decision over life and death and all questions of general importance were exclusively in its hands. Besides this, however, the regulation of the sacred times and seasons, and many matters connected with the cultus in general, except the sacerdotal part, which was regulated by a special court of priests, were vested in it. It fixed the beginnings of the new moons; intercalated the years when necessary; watched over the purity of the priestly families by carefully examining the pedigrees

of the Sanhedrin to have been out of Palestine, so that the Sanhedrin was composed of all named members who were admitted to the sacred service; and the Sanhedrin delegates the whole internal administration of the commonwealth was vested in this body, and it became necessary to establish minor courts, similarly composed, all over the country, and in Jerusalem itself. Thus we hear of two inferior tribunals at Jerusalem, each consisting of 25 men (lesser *synhedrion*), and others of three men only. These courts, however, probably represent only smaller or larger committees chosen from the general body. Excluded from the office of judge were those born in adultery; men born of non-Israelitish parents; gamblers, usurers; those who sold fruit grown in the Sabbatical year; and, in single cases, near relatives. All these were also not admitted as witnesses. Two clerks were always present, one registering the condemnatory, the other the exculpatory votes; and, according to another opinion, there was still a third clerk who noted all the votes as a kind of check. The mode of procedure was exceedingly complicated; and such was the caution of the court, especially in matters of life and death, that capital punishment was pronounced in the rarest instances only. The general place of assembly was a certain hall (*hishkat hagazit*, 'hall of hewn stones'), probably situated at the southeast corner of one of the courts of the temple. With exception of Sabbath and feast days it met daily. The double presidency of the Nasi and Ab-beth-din appears to have been instituted to insure greater impartiality, those chosen representing the two factions or two diverging tendencies in the interpretation of the law. In questions involving civil rights, the voting began with the principal members; in questions of life and death with the younger members, so that they might not be influenced by the leaders. Twenty-three members constituted a quorum for judgments of life and death, but if the court showed a majority of only one for 'guilty,' the number had to be increased by two successively till the full court was formed; and only in the case of a full court was a majority of one against the prisoner sufficient for condemnation. The Sanhedrin survived the fall of Jerusalem and what it lost in authority it gained in the veneration in which it continued to be held by the Jews, both in Palestine and in the dispersion. As late as the fifth century we find an institution in Jerusalem that can be regarded as a continuation of the great Sanhedrin. Subsequently, however, we find the name applied to a body of the most eminent scholars of Babylonia—to the 70 members of the learned assemblies that occupied the first seven rows.

SAN IGNACIO DE AGAÑA, sān ĩġ-nā'-thē-ō-dē ā-gā'nyā. See AGAÑA.

SAN ILDEFONSO, ā-lā-fōn'sō, or LA GRANJA. A town in the Province of Segovia, Spain, situated 31 miles northwest of Madrid at an

elevation of nearly 4000 feet, in the region of romantic beauty on the northern slope of the Sierra de Guadarrama (Map: Spain, C 2). The town itself is beautifully laid out with fine plazas, promenades, and gardens, and numerous monumental fountains; it has been called the Versailles of Spain. It owes its existence to the splendid palace built there in 1721-24 by Philip V., which has since been a summer residence of the Spanish Court. It is a beautiful building, the entire facade of which is faced by a row of tall columns reaching to the roof. The interior is luxuriously furnished, containing several hundred fine paintings and sculptures. The palace is surrounded by magnificent gardens with lakes, fountains, and statues. Here occurred the so-called 'Revolution of La Granja,' on the 12th of August, 1836, when some of the Liberal leaders compelled Queen Christina to sign a decree restoring the Constitution of 1812. Population, in 1900, 3444. See SAN ILDEFONSO, TREATY OF.

SAN ILDEFONSO, TREATY OF. A secret treaty between France and Spain, negotiated in October, 1800. France agreed to procure in Italy for the Duke of Parma, the son-in-law of Carlos IV. of Spain, a kingdom which should have a population of from 1,000,000 to 1,200,000, while Spain agreed to retrocede to France, six months after France had carried out her part of the agreement, "the colony or province of Louisiana with the same extent that it had in the hands of Spain and when France owned it, and as it should be according to subsequent treaties between Spain and other powers." In addition the treaty contained several less important provisions. The preliminary treaty was signed on October 1st, and the exchange of ratifications took place on the 30th of the same month. The treaty was modified in some respects by a new treaty negotiated at Aranjuez, March 21, 1801 (ratification being exchanged April 11), the immediate transfer of Louisiana being provided for. The texts of the two treaties may be found in De Clercq, *Recueil des traités de la France*, vol. i. (Paris, 1864).

SAN ISIDRO, ā-sē'drō. The capital of the Province of Nueva Ecija, in Luzon, Philippines (Map: Philippine Islands, E 4). It is situated on the Rio Grande de la Pampanga, 48 miles north of Manila, has a telegraph station and good road connections with Manila and other cities of Central Luzon. Population (estimated), in 1899, 7056.

SANITARY COMMISSION (from Lat. *sanitas*; health, from *sanus*, sound, healthy, sane; connected with Gk. *σᾶος*, *suos*, *ōs*, *sōs*, safe, sound), UNITED STATES. An organization formed during the Civil War primarily for the relief of the sick and wounded soldiers of the Union army. On the day on which President Lincoln's call for volunteers was issued the women of various cities in the North organized societies for the purpose of affording relief and comfort to the sick and wounded volunteers. They stated their purpose to be "to supply nurses for the sick; to bring them home when practicable; to purchase clothing, provisions, and matters of comfort not supplied by the Government; to send books and newspapers to the camps; to preserve a record of the services of each soldier; and to hold constant communication with the officers of the regiments in order that the people might be kept

informed of the condition of their friends." On April 29, 1861, the Women's Central Relief Association was organized at Cooper Union, New York, under a constitution drawn up by the Rev. Dr. Henry W. Bellows, and a committee was appointed to ask for the official recognition of the association. They were kindly received, but their request for the appointment of a board with power to visit camps and hospitals and to supervise the sanitary administration according to the approved ideas of sanitary science was refused. The Government, however, consented to allow the commission to act in an advisory capacity to the medical department and to visit the camps and hospitals with a view to recommending sanitary regulations and reforms.

By an order of the War Department issued June 9, 1861, Dr. Bellows, Prof. A. D. Bache (chief of the Coast Survey), Wolcott Gibbs, M.D., Samuel G. Howe, M.D., Prof. Jefferson Wyman, M.D., W. H. Van Buren, M.D., R. C. Wood, surgeon-general U.S.A., G. W. Cullum, U.S.A., and A. Shiras, U.S.A., in conjunction with such others as might be associated with them, were constituted "a Commission of Inquiry and Advice in Respect of the Sanitary Interests of the United States Forces." They were to serve without pay, but were to be supplied with an office at Washington. The commission was charged with directing its inquiries to "the principles and practice connected with the inspection of recruits and enlisted men, the sanitary condition of volunteers, the means of preserving and restoring the health and of securing the general comfort and efficiency of the troops, the proper provision of cooks, nurses, and hospitals, and other subjects of a like nature."

The commission was organized by the election of Dr. Bellows as president and Frederick Law Olmsted as secretary. Declining Government support on the ground that it preferred to remain independent, the commission addressed itself for funds to the life insurance companies of the country and to the people at large. Responses, although generous, were at first insufficient, but in October, 1862, the outlook was brightened by the receipt of \$100,000 from the people of California. Before the close of the war California had contributed more than \$1,300,000. This example of generosity aroused enthusiasm and excited emulation, so that the receipts of the commission increased from \$20,000 per month to more than \$200,000. The total amount of cash received in the treasury of the commission during the war was \$4,924,948. Next to California the largest amounts contributed by the States were: Massachusetts, \$121,928; Nevada, \$107,642; Oregon, \$79,406; Washington (Territory), \$20,918; Maine, \$24,938; New York, \$20,741. Even Louisiana contributed more than \$3,000. Many foreign countries also aided. From London came a gift of \$36,700; from Paris, \$13,372; from Buenos Ayres, \$18,412; from the Sandwich Islands, \$17,955. Besides the actual amount turned into the treasury large sums were raised and expended by the various branches of the commission. The value of contributions other than money was estimated at \$15,000,000, four-fifths of which came from local societies of which there were estimated to be more than 7,000.

The efforts of the commission were in the first place directed toward the prevention of sickness

and disease among the soldiers by advising the regimental surgeons in the selection of camp sites, by regulating the drainage and by inspecting the food and supervising the cooking. To ameliorate the condition of the sick and wounded and at the same time prevent the spread of contagion, model pavilion hospitals were provided. Soldiers' homes for the sick and convalescent were established in many places to supply the deficiencies of the Government medical service. During the war thirteen such homes were maintained in the West, where more than 600,000 soldiers were lodged and 2,500,000 meals given. Hospital steamers equipped with surgeons and nurses were improvised and put on the Mississippi River and its tributaries. By this means thousands of wounded soldiers were removed with comparative comfort from the battlefields of the West to well-equipped hospitals in the North. A hospital car provided with a sort of swinging bed or hammock was invented by one of the members of the commission and was put into general use in moving wounded soldiers from the battlefields to the general hospitals. During the war 225,000 sick and wounded soldiers were transported in hospital cars from various battlefields in the East and West to the general hospitals. One of the special services of the commission was the relief which it afforded in the way of hospital supplies on the battlefield. After the battle of Antietam, when 40,000 soldiers lay wounded on the field and the trains containing the medical supplies were stalled near Baltimore, the Sanitary Commission performed some of its most valuable service. Its long wagon train had followed the army, and for several days the only available supplies were those which it furnished. In this instance the commission is said to have issued over 28,000 shirts, towels, pillows, etc.; 30 barrels of lint and bandages; over 3000 pounds of farina; over 20,000 pounds of condensed milk; 5000 pounds of beef stock and canned meats; 3000 bottles of wine and cordial; besides several tons of fruit, tea, sugar, cloth, and hospital conveniences.

The special relief service of the commission consisted in the establishment of temporary soldiers' homes at convenient depots where weak and sick men on the march could be treated and sent on to camp. Some 40 or more of these were established throughout the South. There was also a system of hospital directories organized for the purpose of keeping a record of soldiers in the hospitals so that their condition and whereabouts could be readily ascertained. The pension bureau and claim agency undertook, without charge, to aid soldiers in the prosecution of their claims by securing records or papers concerning their service and by advising such as were ignorant and incompetent. Over \$2,500,000 due discharged soldiers was secured for them. The hospital inspection service consisted of a corps of physicians under an inspector in chief, who visited the general hospitals and reported to the Sanitary Commission such information as was deemed useful to the medical department. Finally the bureau of vital statistics collected a vast amount of information of permanent value relative to the health of the army, diet, influence of climate, nationality of soldiers, their physical characteristics, etc. Consult Stillé, *History of the United States Sanitary Commission* (Philadelphia, 1866).

of the health of the community. The power of the State is exercised in the restriction of the sale of food and drink, including quarantine regulations for the admission of foreign and domestic goods, and the sanitary requirements for the construction of buildings; general ordinances for the regulation of the streets; ordinances for the regulation of the use of public places and the construction of tenement house elevators and fire-escapes; the regulation of the fire department; the regulation of the water supply systems; provisions for the regulation of the use of streets, alleys and street cleaning, meat and food inspection, ordinances prohibiting the building and maintaining of abattoirs in crowded districts; the prohibition or regulation of the manufacture and sale of unwholesome food products and adulterated drugs and provisions; the establishment of hospitals and institutions for the care of children and the insane; sanitariums for the treatment of tuberculosis and epilepsy; acts providing for the incorporation and regulation of cemeteries; the erection and support of public baths, public parks, and clean and healthful places of public amusement.

Early in the reign of Henry VIII, and later in Elizabeth's time there are indications of intelligent restriction and regulation of unhealthy trades and occupations, but these enactments gradually fell into disuse until, with the invasion of Asiatic cholera, such was the sanitary condition of English town and village life that 70,000 persons perished in a single year. The sanitary legislation that followed up to the last century was, mainly ineffective, and there continued to be periodical epidemics in England, which swept away large numbers. It was not until 1848 that a general system of sanitary legislation was established in England. France and the German States had meanwhile developed systems adapted to their special methods of administration. The French system established in 1832 is characterized by councils of public health, having only advisory duties for each department, with the executive authority lodged in the prefect. The French system is generally followed by Belgium, Spain, and Italy, though Italy by its maritime cities was the pioneer in sanitary legislation during the Middle Ages. The German system is dominated by the faculties of its great medical institutions and relies for its administration upon the paternal attitude of the Government. In England and the United States sanitary laws are placed under the control of special bureaus or *boards of health*, separate provisions for this purpose being made in the Federal and State systems, the latter also delegating to municipal corporations the powers necessary to make and enforce regulations for the protection of the public health within their jurisdictions. (See HEALTH, BOARDS OF.) The diseases which require the attention of the legislator may be classified as *endemic*, *contagious*, and *epidemic*. (See CONTAGIOUS DISEASES; ENDEMIC; EPIDEMIC.) Boards of health are not liable for errors of judgment when acting within their jurisdiction, though they are liable for negligence. Yet a city or municipality cannot be held responsible for the negligence of a physician of the board, the mismanagement of its hospital, or even the wrongful appropriation of property, by members of the board of health, for the purpose for which the board is created is government of its character and the municipality

derives no benefit in its corporate capacity from the performance of this duty.

See POLICE POWER; QUARANTINE; NUISANCE, etc.; and consult the authorities mentioned there; also Lumsley, *Public Health* (5th ed., London, 1896); Stockman, *A Practical Guide for Sanitary Inspectors* (ib., 1900).

SANITARY SCIENCE. The subdivision of hygiene which treats of ascertained facts and verified theories concerning preservation of health, prevention of disease, and prolongation of life. The subject naturally subdivides into the following principal topics: (1) Those which concern the surroundings of man, such as the site or soil on which his dwelling is placed; the air he breathes; the water he drinks; the character, materials, and arrangements of his dwelling; the cleaning, warming, and ventilation of his dwelling, and the arrangements for the removal from it of excreta; and the general problem of disposal of sewage. (2) The prevention of disease. (3) The personal care of health, covering such points as diet, exercise, and clothing.

SOIL. Soils may be moist or dry, permeable or impermeable, flat or sloping, etc. Their characteristics depend, aside from topography, upon the predominance of organic or inorganic constituents, water, and air. Loam contains much organic matter, many earthworms and innumerable bacteria. Deep soil is rarely contaminated with excrementitious matter. At a certain level, dependent upon the position of strata of clay and gravel, is a subterranean collection of water known as 'ground water.' It represents the moisture that permeates the surface soil after that is saturated and reaches an impermeable soil upon which it firmly lies, and from whence it is pumped or raised in wells. This subterranean sea is constantly in motion, vertically and horizontally. Its horizontal motion is toward the sea or the nearest watercourse. Its vertical motion is determined chiefly by rainfall. Much importance has been attached to it, and the following points may be considered as accepted: (1) A permanently high ground water, that is, within 5 feet of the surface, is bad, while a permanently low ground water, that is, more than 15 feet from the surface, is good; and (2) violent fluctuations are bad, even with an average low ground water; a comparatively high ground water with moderate and slow fluctuations may be healthful. The ground water determines the spread of certain forms of disease. The rainwater, in the act of passing through the upper strata of earth, carries with it a mass of organic matter as well as a host of bacteria and disease germs, of which it is robbed as it sinks to the deepest soil. If well-water be augmented by ground water which leaches in at high level it will be contaminated and polluted. Healthy soils are the granites, metamorphic rocks, clay slate, limestone, sandstone, chalk, gravel, and sand; unhealthy are clay, sand and gravel with clay subsoil, alluvial soil, and marsh-lands. Among the unhealthy soils ought also to be included all 'made' soils, particularly those that are formed so often in towns from rubbish of all sorts. Such soils ought not to be occupied as building sites for at least two years.

SITES. The proper site for a dwelling is upon a permeable, porous soil, through which rain may easily filter and into which it may carry or-

ganic matter from the surface; a soil which has a low ground-water level, and which retains but little dampness; a soil which admits of free circulation of atmospheric air with the ground air; a soil that does not admit of collections of standing water, and that has slope enough to insure drainage. Where soil cannot be selected paving and tree-planting correct many evils. Paving prevents the diffusion of ground air and the entrance of sewage or contaminated rainwater. Trees absorb carbonic acid gas and moisture and yield oxygen, which in turn assists chemical conversion of organic matter. Cementing of cellars and laying damp-proof material upon foundations before erecting walls are also protective measures against dampness and pollution. In wet localities or in settlements necessarily built for commercial reasons near marshy land, through sub-soil drainage by means of trenches or drain-tile, the level of the ground water may be lowered to a safe position. See DRAINAGE.

Air. Air is an imperfect gas consisting of 79 per cent. of nitrogen and nearly 21 per cent. of oxygen, together with small quantities of carbonic acid, ammonia, watery vapor, and impurities. We may neglect the consideration of the small quantities of helium, neon, argon, krypton, and xenon, the rare gases found in the atmosphere during recent chemical investigations. Air is the prime requisite for existence, and upon its purity depends to a large extent the growth, development, and health of animal life. Saturation of the atmosphere with water is called 100 per cent. of humidity. Average health demands a humidity of from 65 to 75 per cent., the lowest amount of aqueous vapor in the air being 35 per cent. Impurities in the air are from various sources. Air is vitiated by respiration, combustion of fuel or of illuminating gas, decaying vegetable or animal matter, and by gases arising from manufacturing and various occupations. Expired air contains 100 times more carbonic acid and nearly 5 per cent. less oxygen than ordinary atmospheric air. Emitting with each expiration 22 cubic inches of air and respiring 18 times a minute, each adult emits 570,240 cubic inches, or 330 cubic feet of air in 24 hours. In this total there are 14.52 cubic feet of carbon dioxide. Physical activity increases this total. Combustion of fuel and gas adds carbon monoxide and dioxide, smoke, and soot to the atmosphere. Factories, etc., add dust, chemical vapors, and volatile substances to the air. Small amounts of impurity do a little damage to health, large amounts undermine it. Hence ventilation becomes necessary, that is, comparatively pure air must be substituted in dwellings for vitiated atmosphere. See HEATING AND VENTILATION.

WATER. The atmosphere is the source of water supply. The vapor of water therein is condensed and falls in the form of rain, snow, or dew. Rain, obviously, must carry down with it the impurities in the atmosphere—gases, dust, and bacteria. It must cause deeper deposition of organic matter as it passes into the soil. It becomes either surface water augmenting the streams, or ground water supplying wells and subterranean reservoirs. Impure water carries the germs of many diseases, as typhoid fever, diphtheria, diarrhoea, dysentery, malaria, cholera, probably yellow fever, etc. The pollution of surface water by the entrance of sewage and of decomposing organic matter is very easy and is a prevalent

cause of disease. See FILTER AND FILTRATION; also WATER PURIFICATION; WATER SUPPLY; WATERWORKS.

DWELLINGS. Besides the site of a dwelling and the desirability of its freedom from dampness and ground air, to which attention has already been given, a house for living or for business purposes should give access to an abundance of sunlight. The heat rays, luminous rays, and actinic rays of light all effect decomposition of organic material and hasten reconstruction processes. The materials of which houses are built are various. Wooden dwellings are common in country localities, but they are always open to the objection of the greater danger of fire. In cities brick or stone is most commonly used, but very good dwellings may be made of concrete. Probably the best material is good, sound, well-burnt brick. Dryness must be secured by means of damp-proof courses along the foundations and hollow walls, and cementing externally. Non-absorbent surfaces internally are important, although some have been inclined to attribute the unhealthfulness of dwellings to the impermeability of the walls obstructing air change. But where air can pass organic matter can lodge and becomes a source of danger. It is better, therefore, to have non-absorbent surfaces as much as possible, and to provide for ventilation in other ways. Paint that can be washed is therefore better than paper. Care should be taken to scrape off all old papers beneath, as they and the paste used with them tend to decompose and become injurious to health. Ceilings ought to be impervious as well as walls, and floors ought to be made of well fitting seasoned wood, calked and oiled or varnished so as to make them water-tight. The proper cubic space has been stated. Arrangements should be made for change of air once in three hours, if conditions of constant change do not exist. The furniture of rooms, especially sleeping rooms, ought not to be too massive; white curtains and hangings too often form traps for dust and organic matter. The warming of houses is of exceeding importance. See HEATING AND VENTILATION.

Scrupulous attention to cleanliness is necessary in dwellings, and there is wisdom in the use of rugs or loose carpets which may be removed daily from rooms and thoroughly cleaned. Corners should be thoroughly freed from dust as well as nooks underneath and behind large pieces of furniture, spaces above rows of books, the wall sides of pictures, etc., for dust forms a well-adapted nidus for disease germs, especially of the bacteria which produce suppuration. Closely allied to the ordinary cleaning of the interior of dwellings is the problem of the removal of excreta, waste, and garbage. Practically waste consists of: (1) Garbage, including kitchen refuse, offal, bones, etc.; (2) refuse, including paper, dust, ashes, clothing, carpet, broken furniture, iron and other waste metal, as well as 'trade refuse' which includes excelsior, straw, wood shavings, leather scraps, tobacco stalks, felt cuttings, tin scraps, etc.; and (3) sewage, including animal excrement (fecal and urinary), wash water from bathing, laundering clothes, washing culinary utensils, cleaning house, etc. Properly separated, ashes and dust are useful in filling sunken lots, marshes, etc. Paper, metal, and most trade refuse have a market value. Sewage and garbage are valuable fer-

the city, and in some cities all the waste is collected in a covered or freighted out and dumped in some large body of water. In New York, by a former street-cleaning system, it was estimated that the old city of New York (now the City of Manhattan) had the dry refuse and garbage aggregate of 1,000,000 tons annually and the garbage 175,000 tons annually. The value of the salvable part of this great mass of waste was stated to be over \$650,000 a year. Sanitation is concerned with the disposal of garbage. (See GARBAGE AND REFUSE; DISPOSAL; SEWAGE DISPOSAL; PLUMBING.)

PREVENTION OF DISEASE. This is a large question, on which this article can only briefly touch. Much depends upon knowledge of the etiology or the remote causes of disease. The best rule for preventing disease is to follow out carefully the principles of general hygiene (q.v.) with reference to pure air, pure water, proper food, cleanliness, etc. Provision may be made against certain diseases. Malaria (q.v.) may be prevented by destroying mosquitoes and depriving them of their breeding places, as well as by screening doors and windows of houses in malarious districts. Smallpox may be prevented by persistent revaccination. (See VACCINATION.) Typhoid fever may be prevented by boiling all water before it is drunk or used in cooking, by cooking oysters thoroughly, by most scrupulous drenching of all raw vegetables which may have been watered with liquid manure, and by preventing insects from gaining access to typhoid patient's dejecta or clothing before thorough disinfection has been practiced. (For the diseases transmitted through the agency of insects most of them preventable, see INSECTS; PROPAGATION OF DISEASE BY.) In most large cities compulsory notification to the Board of Health is legal in the case of cholera, yellow fever, plague, smallpox, chicken pox, diphtheria (including membranous croup), typhus, typhoid, tuberculosis, measles, and spotted, relapsing, and scarlet fevers, all of which are considered contagious except typhoid. Isolation is practiced in all these diseases, partial or absolute. Much stress has been laid upon *disinfection* as a means of preventing disease, and if properly carried out it has some efficiency. But it is a mistake to place too implicit reliance upon it as ordinarily practiced. See DISINFECTANTS.

THE DISPOSAL OF THE DEAD. In order to understand the importance of this subject one must know something of the changes which the body undergoes after death. A body that has been buried gradually breaks up into a large number of comparatively simple compounds, such as carbonic acid, ammonia, sulphureted and carbureted hydrogen, nitrous and nitric acid, and certain more complicated gaseous matters with a very fetid odor, which finally undergo oxidation; while the non-volatile substances usually enter into the soil, and either pass into plants or are carried away by the water percolating the soil. These changes are accelerated by the worms and other low forms of life that usually swarm in decomposing bodies; and the character of the soil materially influences the degree of rapidity of destruction. The bones remain almost unchanged for ages. If a body is burned, decomposition is incomparably more rapid, and different volatile combinations may arise, the mineral salts and a little carbon alone remaining. Put-

ting aside the visionary schemes for turning the dead to commercial account, there are three methods of disposing of our dead for consideration, viz. burial in land or in water, or cremation. At present the question is not urgent; but it may become so in a century or two, if the population continues to increase at the present rate. Even in our own time a great change has taken place, and the objectionable habit of interments in and around churches in towns has been abandoned, cemeteries in the country being now commonly employed, except in the case of country villages. The air over cemeteries is, however, always contaminated, and water percolating through them is unfit for drinking purposes. The evils are lessened by making the grave as deep as possible, and by placing not more than one body in one grave. Plants should be freely introduced into every cemetery, for the absorption of organic matters and of carbonic acid; and the most rapidly growing trees and shrubs should be selected, in preference to the slowly growing cypress and yew. The superficial space which should be allotted to each grave varies in different countries from 30 to 90 feet; the depth should be at least 6 feet. It is required by law that the grave spaces for persons above twelve years of age shall be at least 9 feet by 4, and those for children under twelve years, 6 feet by 3. It is likewise required that not less than 4 feet of earth should be placed over the coffin of an adult, and 3 feet above that of a child. The time which should elapse before a grave is disturbed for a new tenant varies with the soil and the distance of the body from the surface. Under favorable circumstances, a coffin containing an adult will disappear with its contents in about ten years; while in a clayey or peaty soil it will remain a century. It is generally assumed that a period of fourteen years is sufficient for the decay of an adult, but long before this time all will have disappeared but the skeleton. As a matter of expense, too, that of cremation is greater than burial at sea. In burial at sea the body would go at once to support other forms of life more rapidly than in the case of land burial, and without danger of evolution of hurtful products. (See BURIAL; CREMATION.)

DIET. Although about seventy elementary substances are known to chemists, only a comparatively small number of these take part in the formation of man and other animals; and it is only this small number of constituents which are essential elements of our food. These elements are, in the order of their abundance, oxygen, carbon, hydrogen, nitrogen, calcium, phosphorus, chlorine, fluorine, sulphur, potassium, sodium, magnesium, and iron, with traces of silicon, lithium, and manganese.

Carbon, hydrogen, nitrogen, and oxygen are supplied to the system by the proteid group of alimentary principles (see DIET)—viz. albumen, fibrin, and casein, which occur both in the animal and vegetable kingdoms, and the gluten contained in vegetables. Animal flesh, eggs, milk, corn, and many other vegetable products contain one or more of these principles. The gelatinoid group also introduces the same elements into the system, when such substances as preparations of gelatin, calves' feet, etc., are taken as food. Carbon, hydrogen, and oxygen are abundantly introduced into the system of the carbohydrate group in the form of sugar or starch (which occur in

large quantity in the cereal grains, leguminous seeds, roots, tubers, etc., used as food), and also by organic acids (which, as citric, malic, tartaric acid, etc., occur in numerous vegetables employed as food). Carbon, with hydrogen and oxygen, occurs abundantly in the fatty group of alimentary principles, as, for instance, in all the fat, suet, butter, and oil that are eaten; in the oily seeds, as nuts, walnuts, coconuts, etc.; and in fatty foods, as liver, brain, etc. Phosphorus is supplied to us by the flesh, blood, and bones used as food, and in the form of various phosphates it is a constituent of many of the vegetables used as food. The system derives its sulphur from the fibrin of flesh, the albumen of eggs, and the casein of milk, from the vegetable fibrin of corn, etc., from the vegetable albumen of turnips, cauliflower, asparagus, etc., and from the vegetable casein of peas and beans. Most of the culinary vegetables contain it. Chlorine and sodium, in the form of chloride of sodium, are more or less abundantly contained in all varieties of animal food, and are taken separately as common salt. Potassium is a constituent of both animal and vegetable food; it occurs in considerable quantity in milk, and in the juice that permeates animal flesh; and most inland plants contain it. We derive the calcium of our system from flesh, bones, eggs, milk, etc. (all of which contain salts of lime); most vegetables also contain lime-salts; and another source of our calcium is common water, which usually contains both bicarbonate and sulphate of lime. Magnesium in small quantity is generally found in those foods that contain calcium. Iron is a constituent of blood found in meat; and it occurs in smaller quantity in milk, in the yolk of egg, and in traces in most vegetable foods. Fluorin occurs in minute quantity in the bones and teeth, obtained from the traces of fluorin found in milk, blood, etc.

These simple bodies are not, however, capable of being assimilated and converted into tissue in the animal body; this combination is effected in the vegetable kingdom, and animals modify and convert the complex compounds which they obtain from vegetables. The number of combined elements varies: thus water contains only 2; sugar, starch, fat, and many organic acids contain 3; while casein, fibrin, and albumen, exclusive of the mineral salts in their ash, contain 5.

It would be impossible, and it is quite unnecessary, to mention in this article the different animals and plants that are used as food by different nations. The interested are referred to Reich's *Nahrungs- und Genussmittelkunde* (1860-61).

DRINKS are merely liquid foods. They include: Mucilaginous, farinaceous, or saccharine drinks—as toast-water, barley-water, gruel, etc., which are very slightly nutritive, and differ but little from common water; aromatic or astringent drinks—as tea, coffee, chocolate, and cocoa, the last two of which contain a considerable quantity of oil and starch; acidulous drinks—as lemonade, ginger beer, raspberry-vinegar water; drinks containing gelatin—the broths and soups, which, if properly prepared, should contain all the soluble constituents of their ingredients; emulsive or milky drinks—as animal milk, the milk of the coconut, and almond milk, a drink prepared from sweet almonds (animal milk con-

tains all the essential ingredients of food, the others are slightly nutritive); alcoholic and other intoxicating drinks—including malt liquor or beer in its various forms of ale, stout, and porter; wines; spirits in their various forms of brandy, rum, gin, whisky. Whether alcoholic drinks constitute food is debatable.

Excluding salt, which must be considered as a saline alimentary principle, the most common condiments, such as mustard, capsicum (Cayenne pepper), pepper, the various spices, etc., owe their action to the presence of a volatile oil. Condiments and sauces afford little or no nutrition. They do, however, exert special action on the nervous system to stimulate secretion and also to retard tissue change and waste. Any more than a very moderate use is likely to impair the digestion and nutritive processes. Salt has a special value in promoting diffusion through the animal membranes and in bringing some of the alimentary principles into solution. Its decomposition probably furnishes the hydrochloric acid to the gastric juice. (For a general discussion of the preparation of foods, see COOKERY; and in this connection see, also, ADULTERATION and FOOD.) Salted meat is, in so far as nutrition is concerned, in much the same state as meat from which good soup has been made. After flesh has been rubbed and sprinkled with dry salt, a brine is formed amounting in bulk to one-third of the fluid contained in the raw flesh. This brine is found to contain a large quantity of albumen, soluble phosphates, lactic acid, potash salts, creatin, and creatinin—substances which are essential to the constitution of the flesh, which therefore loses in nutritive value in proportion to their abstraction. For a discussion of the preservation of food, see ANTISEPTICS; FOOD; AND FOOD, PRESERVATION OF.

The method of refrigeration is, on a small scale, familiar to every one by the use of ice in the ordinary household refrigerator. (See REFRIGERATION.) The method of drying—evaporation of water by sun heat or in ovens—is largely applied to meats and to fruits and vegetables. Food-stuffs so treated reabsorb moisture and deteriorate after a time. Certain fruits, as raisins, figs, and dates, are very palatable after such treatment. The method of exclusion of air, sometimes called Appert's method, from its inventor (Francois Appert, q.v.), is applied to every kind of perishable food, and constitutes one of the great industries of the world. It consists in subjecting the article to be preserved to a temperature sufficient to destroy the germs which cause decomposition, and then putting it into tins or jars, which are immediately made air-tight. This principle is applied in the familiar 'canning' of vegetables and fruits. Certain special devices of limited application are resorted to, as the exclusion of air by means of oils and fats and varnishes, or a layer of paraffin.

The method of anti-septics finds application chiefly in the use of smoke, sugar, salt, alcohol, vinegar, and saltpetre.

The pecuniary economy of various foods has been the subject of much investigation in Europe and in the United States. Protein is an essential food, since from no other source can the animal obtain nitrogen; it is also much the costliest form of food. The ratios used by Atwater are 5.3 and 1 for the relative cost of protein fats and carbohydrates. It is, therefore, important

protein is the cheapest protein in its cheapest form, and more than is sufficient for the purposes of the body, and then to use carbohydrates for energy. In preference to fats for carbonaceous food, oatmeal, beans, potatoes, and corn-meal are among the cheapest foods, concerning their nutritive value, as oysters, salmon, and lobsters are among the costliest. See Food.

EXERCISE. The most important effect of muscular exercise is produced on the lungs, the quantities of inspired air and of exhaled carbonic acid being very much increased. Taking the air inspired in a given time in the horizontal position as unity, a man walking 3 miles per hour inspires 3.22; and if carrying 34 pounds, 3.5; a man walking 4 miles per hour inspires 5; and when walking 6 miles per hour no less than 7. Almost twice as much carbonic acid is exhaled during exercise as during rest. Hence, muscular exercise is necessary for the due removal of the carbon. The effect of exercise on the mind is not clearly determined; great bodily activity is often observed in association with full mental activity; and better intellectual work can be done by one who exercises physically daily. *Digestion* is improved by exercise. The appetite increases, and nitrogenous substances, fats, and salts, especially phosphates and chlorides, are required in greater quantity than in a state of rest. The *change of tissues* is increased by exercise, or, in other words, the excretions give off increased quantities of carbon, nitrogen, water, and salts. The muscles require much rest for their reparation after exercise, and they then absorb and retain water, which seems to enter into their composition. So completely is the water retained in the muscles that the urine is not increased for some hours. The old rule, held by trainers, of only allowing the smallest possible quantity of fluid, is wrong. See EXERCISE; GYMNASTICS; PHYSICAL TRAINING.

CLOTHING. The object of clothing is to preserve the proper heat of the body by protecting it from both cold and heat, and thus to prevent the injurious action of sudden changes of temperature upon the skin. The most important materials of clothing are cotton, linen, wool, silk, leather, and india-rubber. *Cotton*, as a material of dress, wears well, does not rapidly absorb water, and conducts heat much less rapidly than linen, but much more rapidly than wool. From the hardness of its fibres, its surface is slightly rough, and occasionally irritates a very delicate skin. Its main advantages are cheapness and durability. In merino it is mixed with wool in various proportions, and this admixture is far preferable to unmixed cotton. *Linen* is finer in its fibres than cotton, and hence is smoother. It possesses high conducting and bad radiating powers, so that it feels cold to the skin; moreover, it attracts moisture much more than cotton. For these reasons, cottons and thin woollens are much preferred to linen garments in warm climates. *Silk* forms an excellent under-clothing, but, from its expense, it can never come into general use. *Wool* is superior both to cotton and linen in being a bad conductor of heat, and a great absorber of water, which penetrates into the fibres and distends them (hygroscopic water), and also lies between them (water of inter-fibre film). During perspiration, the evaporation from the surface of the body is necessary to reduce the heat which is generated by exercise.

When the exercise is concluded, evaporation goes on, and to such an extent as to chill the body. When dry woollen clothing is put on after exertion, the vapor from the surface of the body is condensed on the wool, and gives out again the large amount of heat which had become latent when the water was vaporized. Therefore, a woollen covering, from this cause alone, at once feels warm when used during sweating. In the case of cotton and linen, the perspiration passes through them, and evaporates from the external surface without condensation; the loss of heat then continues. These facts make it plain why dry woollen clothes are so useful after exertion. In addition to this, the texture of the wool is warmer, from its bad conducting power, and it is less easily penetrated by cold wind. *India-rubber* clothing must be used with caution. From its being impervious to air, and from its condensing and retaining perspiration, it is decidedly objectionable; while, on the other hand, its protection against rain is a very valuable property.

In relation to protection against heat, we have to consider the color and not the texture of clothing. White is the best color, then gray, yellow, pink, blue, and black.

The shape and weight of all articles of clothing should be such as to allow of the freest action of the limbs, and in no way to interfere by pressure with the processes of respiration, circulation, and digestion.

PERSONAL CLEANLINESS. Attention to the state of the skin is of great importance in a hygienic point of view. The perspiration and sebaceous matters which are naturally poured out upon the surface of the body, with an intermingling of particles of detached epidermis, fragments of fibres from the dress, dirt, etc., if not removed, gradually form a crust which soon materially interferes with the due excreting action of the skin. There is little doubt that the daily use of the cold sponge-bath, which less than half a century ago was unknown, and is now a matter of necessity with most healthy persons who have the means of using it, has contributed materially to the preservation of health and the prevention of catarrhal attacks.

SAN JACINTO, BATTLE OF. The final battle in the war for Texan independence, fought near San Jacinto Bay, Texas, April 21, 1836, between about 740 Texans, under General Houston, and about 1400 Mexicans, under Santa Anna. On April 20th the opposing forces took up positions about one mile apart, and after some preliminary skirmishing the battle took place on the afternoon of the following day. It was hardly more than a sharp charge by the Texans, who

rushed on with the cry "Remember the Alamo," and quickly overcame the Mexicans. Santa Anna fled, but was afterwards captured. The Texans lost only about 30 in killed and wounded; the Mexicans, 1360 in killed, wounded, and captured.

SAN JOAQUIN, ʒō'á-kén'. A town of Panay, Philippines, in the Province of Iloilo, situated on the coast, about 30 miles southwest of Iloilo (Map: Philippine Islands, G 9). Population estimated, in 1899, at 13,918.

SAN JOAQUIN. A river of California, draining the southern half of the great central valley between the Coast Range and the Sierra Nevada (Map: California, C 3). It rises in the latter range and flows first southwest to its junction with the intermittent outlet of Tulare Lake, then northwest till it unites with the Sacramento River and enters the Bay of San Francisco, whence its waters flow through the Golden Gate to the Pacific Ocean. The length of the river is about 350 miles. It receives numerous tributaries from the mountains on either side, one of which, the Merced, flows through the famous Yosemite Valley. The San Joaquin is navigable at all seasons to Stockton, 50 miles.

SANJO SANÉYOSHI, sán'jō' sá-ná'yō-shē (1836-91). A Japanese statesman, born at Kioto of the Fujiwara princely family. He was originally anti-foreign, and in 1863 he was sent by the Mikado to Yedo to demand reform and more vigorous government. The Shogun's party in Kioto triumphing, Sanjo and six other nobles fled to Choshu. After three years' exile, having become converted to liberal views, he returned to Kioto, was made vice-administrator and junior Prime Minister, and in 1870 Premier, an office which he held until 1886, when he was made Chancellor.

SAN JOSÉ, ʒō-sá'. The capital of Costa Rica, situated 44 miles east of Puntarenas, on the Pacific coast, and 68 miles west of Limón, on the Atlantic coast (Map: Central America, E 6). It is regularly built, with broad macadamized streets crossing at right angles, and all lighted by electric incandescent lamps. There are several fine squares containing park-like gardens. The most prominent buildings and institutions are the cathedral, the National Museum, the school of law, a seminary, the National Library, and the Institute of Physical Geography. The elevation of the town above the sea is 3868 feet. It has a temperate climate and a good water supply. It is the centre of a rich agricultural region, and the principal station on the transcontinental railroad from Limón to Puntarenas. Population, in 1897, 25,000. San José was founded in 1738 and became the capital of Costa Rica on the establishment of independence in 1823.

SAN JOSÉ. The principal seaport on the Pacific Coast of Guatemala, situated 54 miles southwest of the city of Guatemala, with which it is connected by rail (Map: Central America, B 4). The harbor is provided with an iron pier, and is a station for several lines of steamers. The town exports coffee, sugar, cotton, dyestuffs, and lumber.

SAN JOSÉ. A town of Luzon, in the Province of Batangas, Philippine Islands. It lies 7 miles north of Batangas on the projected Manila-Batangas Railroad. Population, 10,000.

SAN JOSÉ, sán hō-sá', *or, colloquially, sán ó-zá'*. The county-seat of Santa Clara County, Cal., 50 miles south by east of San Francisco, on the Southern Pacific and the Central Pacific railroads (Map: California, C 3). It is situated in the beautiful Santa Clara Valley, and is a popular health resort. San José is the seat of the University of the Pacific (Methodist Episcopal), with handsome buildings and a campus covering 17 acres; the College of Notre Dame, a Roman Catholic institution, opened in 1851; and a State Normal School. Noteworthy also are the city hall, court house and hall of records, the post office building, and the high school building. The city has a public library and the San José Library. There are two parks—Saint James and the City Hall Park. Alum Rock Park, 7 miles distant, with its mineral springs and picturesque scenery, and the Lick Observatory (q.v.), on the summit of Mount Hamilton, 18 miles to the east, attract many visitors. San José is the centre of the Santa Clara Valley, which produces large quantities of prunes, apricots, peaches, cherries, grapes, olives, wheat, and barley. It is an important fruit packing and shipping point, and also ranks high industrially. In the census year 1900 the various industries had an invested capital of \$3,534,136, and a production valued at \$4,584,072. There are foundries, fruit canning and drying establishments, marble works, and manufactories of wine and malt liquors, leather, windmills, etc. The government, under the revised charter of 1897, is vested in a mayor, elected every two years, and a unicameral council. Population, in 1890, 18,060; in 1900, 21,500. The Pueblo de San José de Guadalupe was founded here in 1777, and the Mission of San José was established near by in 1797. In 1846 a small force took possession for the United States, and from 1849 to 1851 San José was the capital of California. Consult: Hall, *History of San José and Surroundings* (San Francisco, 1871); Mars, *Reminiscences of Santa Clara Valley and San José* (ib., 1901).

SAN JOSÉ DE BUENAVISTA, sán ʒō-sá' dá bwá'ná-ves'tá'. The capital of the Province of Antique, in Panay, Philippines (Map: Philippine Islands, F 9). It is on the coast in the southern part of the province, is a port of entry, and has an active coasting trade with Iloilo. Population, estimated, in 1899, 5621.

SAN JOSÉ DE CÚCUTA, kúw'kúw-tá, *or simply CÚCUTA*. A town in the Department of Santander, Colombia, situated on the Tachira, near the Venezuelan frontier (Map: Colombia, C 2). Since the earthquake which destroyed the town in 1875 it has been reconstructed with broad clean streets and a large square. It is a centre of trade between Santander and Venezuela, and is the terminus of a railroad to Puerto Villamizar. Population, 13,000.

SAN JOSÉ SCALE. An hemipterous insect (*Aspidiotus perniciosus*) of the family Coccidae. (See SCALE-INSECT.) It derives its popular name from San José, California, where Comstock discovered and named it in 1880. It has been considered the most pernicious scale-insect in the United States, whence the specific name. It was probably introduced at San José about 1870 on trees imported from China by James Lick. By 1890 it had spread over the greater part of California, but was not recognized east of the Rocky Moun-

of the scale was first found by the German entomologist, Dr. G. Krombein, at San Jose, California, in 1875. It was first introduced into California in 1878, when a nursery stock dealer from California sent two New York nurserymen, who unwittingly nurserymen had been sent out broadcast. By 1880 the scale had become established in many of the principal orchards in the majority of the Eastern States, and in February, 1898, the German government prohibited the importation of American fruits and plants, to prevent the introduction of the scale. Other European governments, Canada, and South Africa soon after issued similar decrees. It is now known in Japan, China, and Australia, and in almost every one of the United States, seeming to reach its greatest powers of destruction in the best fruit-growing regions.

The San José scale does not occur upon citrus fruits, but has attacked the limbs, leaves, and fruit of more than 150 species of food plants, including the principal deciduous fruit and ornamental trees and shrubs. When the infestation is very bad, the scales lie close together upon the bark, frequently overlapping, the young scales clustering over the surface of the older individuals. The general appearance of a twig covered with the scales is of a grayish, slightly roughened, scurfy deposit. Infested apple and pear fruits show a reddish discoloration of the skin, and when severely attacked, become distorted, rough, pitted, and frequently cracked. Well-grown apple trees are resistant for several years, but young peach trees are often killed in two seasons. The money lost to the orchard interest of the United States from the work of this insect has been enormous.

The winter is passed by the nearly full-grown insects under the protection of the scale. In the early spring the hibernating males emerge, and in May the females mature and begin to give birth to young, at the daily rate of perhaps nine to ten young by each mother for a period of six weeks. It is estimated that the offspring during a summer from a single overwintering female may amount to more than one and one-half billions. Distribution is mainly by means of nursery stock, but is also upon fruit. The young are also carried upon the feet of birds and flying insects. Wind also has some effect on the distribution. None of the native natural enemies appear to be very effective, although a chalcidid fly (*Aphelinus fuscipennis*) destroys the adults. The Chinese ladybird (*Chilocorus similis*), introduced by Marlatt, may prove a more effective natural enemy. See LADYBIRD.

The principal remedies in use are treatment with a mixture of lime, sulphur, and salt, known as 'California wash,' with whale-oil or fish-oil soap, preferably made with potash lye; with a kerosene soap emulsion, or with crude petroleum; with a mechanical mixture of kerosene and water; and with hydrocyanic acid gas. The last-named treatment is now used only for nursery stock, although extensive experiments have been made with orchard trees.

Consult: Howard and Marlatt, *Bulletin No. 3, Apple-lice, Division of Entomology, United States Department of Agriculture* (Washington, 1896); Marlatt, *Circular No. 42, second series* (ib., 1902); *San Juan Immigration Methods* (New

York, 1902); *Bulletins of agricultural experiment stations*.

SAN JUAN, nwän. A western province of Argentina, bounded by Chile on the west, the Argentine Province of La Rioja on the north and east, and the provinces of San Luis and Mendoza on the south (Map: Argentina, D 10). Area, 33,715 square miles. It is traversed in the west by a number of parallel mountain chains belonging to the Andes, and inclosing fertile valleys. The eastern portion is level and covered for a large part by a saline steppe and arid tracts. Gold and silver are mined to some extent and other minerals are believed to exist in large quantities. Agriculture and cattle-raising are the chief occupations. Besides wheat and corn large quantities of lucerne are raised, and wine and olives are also extensively cultivated. The chief exports are wine and cattle. Population, in 1900, 94,991. The capital is San Juan.

SAN JUAN. The capital of the Province of San Juan, Argentina, situated on the San Juan River, 85 miles north of Mendoza, with which it has railroad connection (Map: Argentina, D 10). It has been called an 'oasis of civilization,' and is a clean and well-built town, well paved and drained, and provided with public baths. It has a national college, a normal school, and a large seminary. The wine trade is important, and the town exports cattle to Chile. Population, in 1895, 10,410; estimated in 1898 at 12,000.

SAN JUAN. A town of Luzon, Philippines, in the Province of La Unión, situated on the coast, three miles north of San Fernando (Map: Philippine Islands, E 3). Population, estimated, in 1899, 10,211.

SAN JUAN (full name SAN JUAN BAPTISTA DE PUERTO RICO). The capital of Porto Rico, situated on a small coral island toward the eastern end of the north coast (Map: Porto Rico, C 2). The islet is about 2½ miles long, and half a mile wide, and is connected with the mainland by the Bridge of San Antonio. The bay inclosed by it is spacious and deep, and forms the best harbor of the island, though the narrow, rocky entrance is dangerous in stormy weather. The town is surrounded by picturesque walls, and toward the sea presents a line of fortified cliffs. On a promontory at the western end stands the Morro Castle, built in 1584, but well preserved. The streets are laid out in regular squares, and are well paved and shaded.

On the Plaza de Santiago stands a statue of Ponce de Leon. There are a number of fine buildings, such as the city hall, the custom-house, the former Captain-General's palace, the barracks, and the Casa Blanca, an interesting fortress-like building said to have been built by Ponce de Leon. There are also a cathedral and an immense Dominican convent. The water supply and sanitary arrangements are defective. Industrially and commercially the city is not very important. The population of the municipal district in 1899 was 32,048. San Juan was founded in 1511 by Ponce de Leon. It was strongly fortified and several times repulsed the attacks of English fleets. On May 12, 1898, during the Spanish-American War, its defenses were bombarded by the American fleet under Sampson, but the city was not occupied by the American forces until after the suspension of hostilities.

SAN JUAN BAUTISTA, bou-tēs'tā. The capital of the State of Tabasco, Mexico, situated on the Grijalva, about 30 miles from the coast (Map: Mexico, N 8). It stands in a low and unhealthy locality and is of unpretentious appearance. It has some trade through its port, Frontera, at the mouth of the river. It was founded under the name *Villa Felipe II*, in 1598, afterwards called *Villa Hermosa*, and finally in 1821 was given its present name. Population, in 1895, 9604.

SAN JUAN BOUNDARY DISPUTE. A dispute between the United States and Great Britain in regard to a part of the Oregon boundary, which by the treaty of June 15, 1846, was made the forty-ninth parallel to the "middle of the channel which separates the continent from Vancouver Island, and thence southerly through the middle of said channel and of Fuca Straits, to the Pacific Ocean." Afterwards a difference of opinion arose between the two countries as to what 'channel' was meant: the United States maintaining that it was the Canal de Haro, and Great Britain that it was Rosario Strait, so that it remained unsettled to which government Washington Sound and the islands in it belonged. An amicable arrangement was effected in 1859, by which the two governments jointly occupied the island, the United States having a garrison in the south and Great Britain in the north. The Treaty of Washington (1871), art. 34, referred the controversy to the Emperor of Germany, who decided for the United States in 1872.

SAN JUAN DE BOCOBOC, bōk-bōk'. A town of Luzon, Philippines, in the Province of Batangas. It is situated on the Gulf of Tayabas, 25 miles east of Batangas (Map: Philippine Islands, F 6). Population, estimated, in 1899, 14,017.

SAN JUAN DE LA CIÉNEGA, sē-ā'nā-gā. See CIÉNEGA.

SAN JUAN DEL MEZQUITAL, dēl mēs-kē-tāl'. A Mexican town of the State of Zacatecas, 90 miles northwest of the city of that name (Map: Mexico, G 5). Population, in 1895, 7113.

SAN JUAN DEL NORTE, nōr'tā, or GREYTOWN. The principal seaport on the Atlantic coast of Nicaragua, at the mouth of the northern arm of the San Juan River delta, in the extreme southeastern corner of the Republic (Map: Central America, F 5). A mile north of the town is the village of America, the eastern terminus of the proposed Nicaragua Canal (q.v.). Greytown lies in an unhealthy locality. Its harbor is rapidly filling with sand, but jetties have been constructed to remedy the evil. Population, about 2500.

SAN JUAN DE LOS REMEDIOS, rā-mā'-pē-ōs. See REMEDIOS.

SAN JUAN DEL RIO, dēl rē'ō. A town of Mexico, in the State of Querétaro, 27 miles east of the city of that name (Map: Mexico, J 7). It is noted for silver-mining and for its trade in opals. It is an irregularly built town, founded in 1531. Population, in 1895, 9040.

SAN JUAN DEL SUR, dēl sūr. A seaport of Nicaragua, on the Pacific coast, 65 miles southeast of Managua (Map: Central America, D 5). Its harbor is small, but deep, and it is a submarine cable station, and the port for Rivas.

The western terminus of the proposed Nicaragua Canal is a few miles north. Population, 1000.

SAN JUAN RIVER. The outlet of Lake Nicaragua in Central America. It leaves the lake at its southeastern end, and flows 110 miles in a winding southeast course on the boundary between Nicaragua and Costa Rica, emptying into the Caribbean Sea through a delta of several arms (Map: Central America, E 5). The mouth of one of these forms the harbor of Greytown (San Juan del Norte). The river is broad, deep, and tranquil, but near the middle it is completely obstructed by the rapids of Machuca. The San Juan forms part of the Nicaragua route for the proposed interoceanic canal. See NICARAGUA CANAL.

ŚANKARA, or ŚANKARĀCĀRYA, śhān'-kā-rā-chār'yā (c.788?). A Hindu philosopher and commentator on the *Vedānta* (q.v.). According to tradition he was born in the village of Kalapi in Kerala or Malabar, and was the son of Sivagurusārman. He founded a famous school at Srīngagiri, but later journeyed as far as Kashmir and died at Kanōi, a village there. About his life many legends clustered, and he was popularly regarded as an incarnation of Siva (q.v.) on account of his name Sankara, an epithet of Siva. An enormous number of works is attributed to him, most of which are doubtless spurious. He is one of the most important figures in the history of Hindu philosophy because of his *Brahmasūtrabhāṣyā*, a commentary which is indispensable for an understanding of the *Brahmasūtras* of Badarayana, the founder of the Vedānta school of philosophy (edited at Bombay, 1890-91). Consult: Windischmann, *Sancara* (Bonn, 1833); Deussen, *System des Vedānta* (Leipzig, 1883); id., *Sūtra's des Vedānta* (ib., 1887).

SAN'KEY, IRA DAVID (1840-). A Methodist evangelist, born at Edinburgh, Lawrence County, Pa. In 1870 he met Dwight L. Moody (q.v.) and they became associated in revivalistic work, continuing together for many years. They visited Great Britain from 1873 to 1875 and again in 1883, and made many tours throughout the United States. In these meetings Sankey had charge of the singing. After severing his connection with Moody he frequently conducted meetings alone. His compilations of devotional music, containing many of his own compositions, are *Gospel Hymns*, *Sacred Songs*, and *Sacred Songs and Solos*.

SANKHYA, sān'kyā (Skt. *sāṅkhya*, enumeration). The name of one of the six great systems of orthodox Hindu philosophy. It is complemented, deistically, by the *Yōga* (q.v.) system, and, like the two *Mīmāṃsās* (q.v.), the *Vaiśya* (q.v.), and *Vāiseshika* (q.v.) systems, it professes to teach the means by which eternal beatitude may be attained. This means is the discriminative acquaintance with *tattva*, or the true principles of all existence, and such principles are, according to the Sankhya system, the following 25: (1) *Prakṛti* (q.v.) or *Pradhāna*, the (intellectual) basis. Its first production is (2) *Mahat*, the great, or *Buddhi*, intellect, or the intellectual principle, which appertains to individual beings. From it devolves (3) *Ahōṅkāra*, the assertion of the ego, the function of which consists in referring the objects of the world to the ego. This produces (4-8) five *tanmātras*, or

the five gross elements are productive of the gross body (20-24). *Ahañkāra* (2) is the five instruments of sensation; *Prakṛti* (3) is the five instruments of action; the five gross elements are: ether, the hands, the feet, the eyes, the nose, the tongue, and the ears; the five subtle elements are: ether, the hands, the feet, the eyes, the nose, the tongue, the ears, the intestines, and the organ of generation. Lastly (19), *manas*, the organ of perception and cognition. The five subtle elements (20-24) produce the five gross elements; *ākāśa*, space or ether, which has the properties of audibility, and is derived from the gaseous *tammatra*; air, which has the properties of audibility and tangibility, and is derived from the aerial *tammatra*; fire, which has the properties of audibility, tangibility, and color, and is derived from the igneous *tammatra*; water, which has the properties of audibility, tangibility, color, and savor, and is derived from the aqueous *tammatra*; lastly, earth, which unites the properties of audibility, tangibility, color, savor, and odor, and is derived from the terrene *tammatra*. The twenty-fifth principle is *parāśva* (q.v.) or soul. From the union of soul and *Prakṛti* comes creation. Nature as matter is a product of intellect.

The soul's wish is fruition or liberation. In order to become fit for fruition, the soul is in the first place invested with a *linga śarīra*, or *sūkṣma śarīra*, a subtle body, which is composed of *buddhi* (2), *ahañkāra* (3), the five *tammatras* (4-8), and the eleven instruments of sensation, action, and volition (9-19). This subtle body is invested with a grosser body, which is composed of the five gross elements (20-24), or according to some, of four, excluding *ākāśa*, or, according to others, of one alone, earth. The grosser body, propagated by generation, perishes; the subtle frame, however, transmigrates through successive bodies. Some assume, besides, that between these two there is a corporeal frame, composed of the five elements, but tenuous or refined, the so-called *anusthāna śarīra*. Besides the twenty-five principles, the Sankhya also teaches that nature has three essential *guṇas* or characteristics, *satva*, being, sometimes defined as pure being or goodness; *rajas*, energy, or passion; and *tamās*, darkness, the characteristic of sloth and inertia. The knowledge of the principles, and hence the true doctrine, is, according to Sankhya, obtained by three kinds of evidence, perception, inference, and right affirmation, which some understand to mean the revelation of the Veda and authoritative tradition.

The Sankhya in its first form is atheistical, but it underwent a mythological development in the Purānas (q.v.), in the most important of which it is followed as the basis of their cosmogony. Thus, *Prakṛti*, or nature, is identified by them with *Māya* (q.v.), and the *Matsya-Purāna* affirms that *Buddhi*, the intellectual principle, through the three qualities, being, passion, and darkness, became the three gods, Brahma, Vishnu, and Siva. The most important development, however, of the Sankhya is that by the Buddhist doctrine, which is mainly based on it. The Sankhya system is probably the oldest of the Hindu systems of philosophy, for its chief principles are, with more or less detail, already contained in the secondary Upanishads (q.v.); but the form in which it has come down to us is probably older than that in which the other systems are preserved, although the question of priority is very much involved.

The reputed founder of the Sankhya is Kapila, who is said to have been a son of Brahma, or else an incarnation of Vishnu. He taught his system in *Sūtras* (q.v.), which, distributed in six lectures, bear the name of *Sāṅkya-Pravacana*, though the antiquity of this work has been questioned. The oldest commentary is that by Aniruddha, translated by Garbe (Calcutta, 1888-92); another is that by Vijñānabhikṣu. The first summary of the Sankhya doctrine is given by Īśvara Kṛishna, in his *Sāṅkhya-Kārikā*, edited by Colebrooke, and a translation of the commentary of Gaudapada by himself (Oxford, 1837). Consult: Ball, in the preface of his edition of the *Sāṅkhya-Pravacana* (Calcutta, 1856); id., *Contribution toward an Index to the Bibliography of the Indian Philosophical Systems* (ib., 1859); Garbe, *Die Sāṅkhya-Philosophie* (Leipzig, 1894); id., *Sāṅkhya und Yoga* (Strassburg, 1896); Müller, *Six Systems of Hindu Philosophy* (New York, 1899).

SANKT INGBERT, zāṅkt ing'bért. A town of the Palatinate, Bavaria, Germany, 14 miles west of Zweibrücken. It has machinery, glass, and iron works, and some coal mines. Population, in 1900, 14,048.

SANKT JOHANN, yō-hān'. A town in the Rhine Province, Prussia, on the Saar, opposite Saarbrücken (Map: Prussia, B 4). It is the shipping centre of the Saarbrücken coal-mining district, and manufactures machinery, iron ware, wire rope, etc. Population, in 1900, 21,257.

SANKT MORTIZ. See SAINT MORITZ.

SANKT PÖLTEN, pöl'ten. An ancient town in Lower Austria, 38 miles by rail west of Vienna (Map: Austria, D 2). It has a bishop's seminary. Ironware, weapons, cotton, paper, glass, and stoneware are manufactured. Population, in 1900, 14,510.

SANLÚCAR DE BARRAMEDA, sán lōw'-kār dā bār'rā-mā'bā. A town of Southern Spain, in the Province of Cadiz, situated among the dunes at the mouth of the Guadalquivir, 16 miles north of Cadiz (Map: Spain, B 4). It is a popular bathing resort. The vines covering the surrounding dunes produce the excellent Manzanilla wine. There are salt works and flour mills, and dynamite is manufactured in the neighborhood. The port is Bonanza, situated 2½ miles up the river; it is provided with a large iron pier, and connected by rail with Jerez. In 1519 Magellan sailed from Sanlúcar on his famous voyage around the world. Population, in 1887, 22,667; in 1900, 23,747.

SAN LUCAS, CAPE. See CAPE SAN LUCAS.

SAN LUIS, lōw-ēs'. A central province of Argentina, bounded on the north by La Rioja, on the east by Córdoba, on the south by the Territory of La Pampa, and on the west by Mendoza and San Juan (Map: Argentina, D 10). Area, estimated at 28,535 square miles. The surface is mountainous in the north, where there are also some saline steppes. The rest of the province is level, but sparsely watered. The Rio Salado runs along the western boundary. The climate is very dry, and the land is unsuited for agriculture. The mineral deposits are extensive and include copper, gold, iron, graphite, and other minerals. Only gold and copper are mined to any

extent. Population, in 1900, 91,403. Capital, San Luis (q.v.).

SAN LUIS, or **SAN LUIS DE LA PUNTA**. The capital of the Province of San Luis, Argentina, situated at the southern end of the Sierra de San Luis, 140 miles southeast of Mendoza (Map: Argentina, D 10). It has a national college and a normal school. Its water supply, as well as the water used in irrigating the surrounding district, is derived from an immense artificial reservoir. The town is noted for the manufacture of ponchos, and exports horses, hides, and vicuña wool. Population, estimated, in 1898, 11,000.

SAN LUIS. A town of Luzon, Philippine Islands, in the Province of Pampanga, on the Rio Grande de Pampanga, about 10 miles northeast of Bacolor (Map: Philippine Islands, E 4). Population, estimated, in 1899, 10,298.

SAN LUIS DE LA PAZ, dá lá pás. A Mexican town in the State of Guanajuato, 53 miles northeast of the city of that name, situated on a branch railroad from Dolores Hidalgo. It has a beautiful parish church. Population, in 1895, 9601.

SAN LUIS POTOSÍ, pã'tó-sé'. An inland State of Mexico, bounded by the States of Coahuila and Nueva Leon on the north, Tamaulipas and Vera Cruz on the east, Hidalgo, Querétaro, and Guanajuato on the south, and Zacatecas on the west (Map: Mexico, J 6). Area, 25,316 square miles. The greater part of the State lies within the great Mexican plateau, but near the southeastern corner the plateau falls steeply several thousand feet to the low valley of the Pánuco. The climate is healthful in the elevated parts and hot and unhealthy in the lowlands, where fever prevails. The surface is abundantly wooded and the soil is very fertile in the valleys, producing grain, rice, sugar, and pepper. The mining industry, once very extensive, has declined, though the mineral deposits are far from exhausted. Commerce and manufactures, however, are increasing, and the State is one of the richest and most progressive in the Republic. The capital is San Luis Potosí (q.v.). Population, in 1900, 582,486, including a large proportion of Indians.

SAN LUIS POTOSÍ. The capital of the State of San Luis Potosí, Mexico, situated on the plateau at the head of the valley of the Verde, 215 miles northwest of Mexico, and 6200 feet above sea level (Map: Mexico, H 6). It is almost hidden by luxuriant gardens, and is regularly laid out, with broad streets and numerous plazas, on one of which is a marble fountain surmounted by a statue of Hidalgo. On the principal square stands the handsome cathedral and the fine city hall. Other notable buildings are the courthouse, the Governor's palace, the mint, and the Alarcón Theatre. The city is an important railroad centre. It has a considerable trade in cattle, wool, and hides. It derived its original importance from the famous silver mines in the neighboring Cerro de San Pedro, discovered in 1583; but though the mines are now almost abandoned, the city retains its prominence, and is the fourth in size in the Republic. Its population in 1895 was 69,050.

SAN MARCO IN LAMIS, sãn mår'kò én lì'més. A town in the Province of Foggia, Italy, on the southwestern slope of Monte Gargano, 18

miles north by east of Foggia (Map: Italy, K 6). Cereals and fruits are produced, and wine and olive oil are manufactured. Population (commune), in 1901, 17,309.

SAN MARINO, mã re'no. A republic in Italy, situated between the provinces of Forli and Pesaro-Urbino, near the Adriatic coast, 12 miles southwest of Rimini (Map: Italy, G 1). Area, about 38 square miles; population, about 10,000. It is the oldest State in Europe and one of the smallest in the world. The district is hilly, the highest point being Monte Titano (about 2650 feet). The climate is healthful. Cattle-raising and wine production are the chief occupations. Stone figures among the exports. The uninteresting town of San Marino is situated on Monte Titano, and is protected by a wall. It has five churches and a fine Parliament house. The governing laws—the Statuta Illustrisima Reipublice—date from the Middle Ages. In 1847 the ruling Grand Council was transformed into a representative chamber, with 60 life members, chosen from the burghers, landowners, and the nobility. Two members are selected every six months as 'reigning captains.' From this council an executive council of 12 is chosen yearly. San Marino has a treaty of friendship with Italy. There is no public debt. The revenue for 1899-1900 was about £11,600, the expenditure, £13,700.

HISTORY. The city of San Marino, said to have been founded in the fourth century by Saint Marinus of Dalmatia, formed part of the Byzantine exarchate of Ravenna, and, after an uneventful existence under Lombard and Frankish rule, gradually established its independence with the aid of the counts of Montebello. In 1631 it received a formal acknowledgment of its independence from Pope Urban VIII. Napoleon did not deign to tamper with the Illypitan republic, and sentiment, probably, led to the preservation of its identity in 1860-61, on the formation of the Italian kingdom, under whose protection the Republic placed itself in 1862. Consult: Franciosi, *Guribaldi e la repubblica di San Marino* (Bologna, 1891); Hauteceur, *La république de San Marino* (Brussels, 1894).

SAN MARTIN, sãn mår'tén'. JOSÉ DE (1778-1850). A South American general, distinguished for his services in the war of independence against Spain. He was born at Yapeyu in Argentina, February 25, 1778, and as a child was sent to Spain, where he received his education. He entered the army and served with distinction against the French. In 1811 he laid down his rank of lieutenant-colonel and in the following year went to Buenos Ayres, where he threw in his fortunes with the patriot cause. In January, 1813, he defeated the Spanish Viceroy at San Lorenzo and in the following year was placed in command of the insurgent army in Upper Peru. San Martin now conceived the design of destroying the Spanish power by overrunning Chile and then striking at the stronghold, Peru. After two years' preparation he set out in January, 1817, from Mendoza, with a well drilled army of 4000 men, crossed the Andes with much hardship, and on February 12th routed the Spaniards at Chacabuco. This led to the occupation of the capital and the establishment of the Republic of which San Martin declined the proffered head-

1820, at Concepcion, Rayada, March 19, 1820. His *Opere* contains by a decisive victory over the Peruvians, definitely ending the struggle for independence in Chile. In August, 1820, he set out for Lima, and in April, 1821, he set out for Peru. At Callao with an army of 4500 men, he defeated Pisco, some 150 miles south of Lima, entered the capital in July, 1821, and proclaimed the independence of Peru. In August he was chosen Protector, To Bolívar (q.v.), who in 1822 came to the aid of the Peruvians, San Martín left the task of completing the conquest of the country, resigning his command in August, 1822, and departing for Europe. He lived subsequently at Brussels and in France, and died at Boulogne, August 17, 1850. His life was one of devoted patriotism, marred neither by vainglory, factional hatred, nor personal interest.

SANMICHELE, sán'mé-ká'le. MICHELE (1484-1559). An Italian architect, born in Verona. He went to Rome, worked under Bramante, and made the acquaintance of Michelangelo, of Sansovino, and of Antonio Sangallo, with whom he was employed in repairing the fortifications of Central Italy. Sanmichele is reckoned the first to use the bastionary system of fortification. He built many beautiful portals in Venice and Verona, the Bevilacqua and Pompeii palaces in Verona, the latter being his masterpiece, the Church of the Madonna di Campagna in the same city, and in Venice the Palazzo Grimani, and the Palazzo Mocenigo, so famous for its facade.

SAN MIGUEL, me-gál'. A city of the Republic of Salvador, situated 70 miles east of San Salvador at the foot of the volcano of San Miguel or Jucupa (Map; Central America, C 4). It is the third city of the Republic in size, the capital of a department of the same name, and the centre of a rich agricultural region. It has some foreign trade, especially in indigo. Population, about 25,000.

SAN MIGUEL DE ALLENDE, dá ál'yán'-dá. A town of Mexico. See ALLENDE.

SAN MIGUEL DE MAYUMO, dá má-yóó'-mó. A town of Luzon, Philippine Islands, in the Province of Bulacán, situated 22 miles northeast of Malolos (Map; Philippine Islands, E 4). Population, estimated, in 1899, 20,460.

SAN MINIATO, mé'né-á'tó. (1) A city in the Province of Florence, Italy, 21 miles by rail west-southwest of Florence (Map; Italy, E 4). The tenth-century cathedral was remodelled in 1488. The city has an old castle, a lyceum, and a seminary. There are manufactures of glass, leather, and straw goods, and olive oil. Population (commune), in 1901, 20,042. (2) An ancient church near Florence (q.v.).

SANNAZARO, sán'nád-zá'ró. JACOPO (1458-1530). An Italian author, born at Naples. Trained at Naples, he was there introduced into the Arcadian Academy, in which he was known as Aetius Sincerus. Frederick III., to whom he was devoted, gave him the villa at Mercellina, and when Louis XII.'s expedition of 1501 obliged Frederick to leave his realm, Sannazaro joined him in exile, and served him until his death in 1501. Sannazaro's masterpiece is the *Arcadia*, a pastoral composition in mingled prose and verse. The work was imitated and translated into foreign languages, and helped greatly to develop the pastoral in European countries. Sannazaro's minor

works in Italian comprise some short monologues and a few allegorical farces, and his various *Rime*, largely Petrarchian in inspiration. His Latin compositions are among the best of the time. They include elegies, eclogues, and epigrams, besides a longer poem, *De Partu Virginis*. Consult: Colangelo, *Vita di Jacopo Sannazaro* (Naples, 1819); the *Life* in the edition of the *Opere Volgari* (Padua, 1723); the *Opere Latine* (Amsterdam, 1728); an edition of the *Arcadia*, and a discussion of its composition by M. Scherillo, in *Arcadia di Jacopo Sannazaro secondo i manoscritti e le prime stampe con note*, etc. (Turin, 1888).

SAN NICOLÁS, sán n'é-kó-lás'. A town of Luzon, Philippine Islands, in the Province of Pangasinán, situated about 33 miles east of Lingayén (Map; Philippine Islands, E 3). Population, estimated, in 1899, 10,204.

SAN NICOLÁS, or SAN NICOLÁS DE LOS ARROYOS. A town of Argentina, in the Province of Buenos Ayres, on the Paraná River, 40 miles below Rosario and 125 miles northwest of Buenos Ayres (Map; Argentina, E 10). It is an important industrial centre, and has steam flour mills and large beef-preserving establishments. It is also a considerable railroad centre and a station for steamers. Population, estimated, in 1898, 15,000.

SANNYĀSIN, sán-nyá'sin (Skt., renouncer). The Sanskrit term for one who has renounced all earthly interests and has devoted himself to a life of asceticism and meditation. It referred originally to a Brahman in the fourth and last stage of his life. (See BRAHMANISM.) The meaning of the word has been extended, however, to include all religious mendicants, chiefly of the Sívite sects (see SAIVAS), who subsist on alms and live a life of contemplation.

SAN PABLO, pá'bλό. A town of Luzon, Philippine Islands, in the Province of Laguna, situated about 16 miles south of Santa Cruz (Map; Philippine Islands, F 5). Population, estimated, in 1899, 19,537.

SAN PEDRO, pé'dró. The seaport of Los Angeles (q.v.).

SAN PEDRO, pá'dró. A town of Paraguay, 90 miles north of Asuncion, on the right bank of the Jujuy (Map; Paraguay, F 8). It has exports of maté and rubber. Population, about 7000.

SAN PIER D'ARENA, pé-ár' dá-rá'ná. A town in the Province of Genoa, Italy, 2½ miles west of Genoa, of which it is a suburb. It has a separate city government. It contains the beautiful Palazzo Scassi. The Church of Santa Maria della Cella is embellished with frescoes. The city has a technical school. It is a manufacturing centre, with a large sugar refinery, machine shops, and chemical and oil works. Population (commune), in 1901, 34,885.

SAN'POIL (apparently of North American Indian origin, although sometimes written as Fr. *Sans Poils*, hairless). A small tribe of Salishan stock (q.v.) formerly residing upon the river of the same name and now included with other tribes of the same region upon the Colville reservation, northeastern Washington. Lewis and Clark in 1804 mention them as *Hihighenimmo*, a corruption of their name among the Yakima. They are confederated with the Nespelem, speaking the same language, the two

tribes being the most aboriginal in eastern Washington, and until very recently adhering strictly to their primitive conditions and religion. In 1892 the Sanpoil were estimated at 300 and the Nespelin at 62. In 1901 the whole body was estimated at 400.

SAN RAFAEL, rā'fā-ā'f. The county-seat of Marin County, Cal., 15 miles north of San Francisco; on an inlet of San Pablo Bay, and on the San Francisco and North Pacific and the North Pacific Coast railroads (Map: California, B 3). It is near Mount Tamalpais, in a region of picturesque scenery, and is a popular resort. It has a Dominican college, the Hitchcock School, Mount Tamalpais Military Academy, and a public library. Population, in 1890, 3290; in 1900, 3879.

SAN REMO, rā'mō. A city in the Province of Porto Maurizio, Italy, on the Riviera, 26 miles by rail east-northeast of Nice (Map: Italy, B 4). The particularly mild climate has brought it into prominence as a winter resort. The old town, situated on a hill, is ill built, with narrow crooked streets, but the newer portion, along the coast, has fine promenades, villas, and gardens. The city has a thirteenth-century church, a seminary, and a technical school. The Villa Thiem contains a picture gallery. The products of the neighborhood are olives, lemons, and oranges, and there are manufactures of perfumes and mosaics. Population (commune), in 1901, 21,440.

SAN ROQUE, rō'kā, CAPE. See CAPE SAN ROQUE.

SAN SALVADOR, sāl'vā-nōr'. The name given by Columbus to the first island which he discovered in America. See GUANAHANÍ.

SAN SALVADOR. The capital of the Central American Republic of Salvador, situated a little west of the centre of the country, 25 miles from the Pacific coast, and near the foot of the extinct volcano of San Salvador (Map: Central America, C 4). Its houses are all low, surrounded by wide, open areas, and generally inclosing a central patio, being built with a view to withstanding earthquakes, to which the locality is particularly subject. Many of the large buildings are built of wood, including the new cathedral. Noteworthy are the national palace, the Casa Blanca ('White House') or Presidential mansion, the university, national library, astronomical observatory, and botanical garden. The city carries on a considerable trade in agricultural products, especially in indigo. The railroad to the port of Acajutla was completed in 1900. Population, about 30,000. San Salvador was founded in 1525 by Jorge de Alvarado. It has been a number of times nearly or quite destroyed by earthquakes, notably in 1854 and in 1873.

SANSCULOTTES, sän'ky'lot' (Fr., without breeches, i.e. wearing trousers instead of the knee-breeches then in fashion). The name given in scorn, at the beginning of the French Revolution, by the Court party to the democrats of Paris.

SAN SEBASTIÁN, sän sē'bas-tē-ān'. The capital of the Province of Guipúzcoa, Spain, situated on the Bay of Biscay, 12 miles from the French frontier (Map: Spain, D 1). It is built in a very picturesque location on a sandy isthmus

connecting the rocky and steep Monte Urgull with the mainland. The town was formerly fortified, and the mountain is still crowned by the fortress of La Mota. On the east the town is bounded by the Rio Urumea, and on the west by the Bay of Cacha, which affords a spacious anchorage protected by the island of Santa Clara, and is lined with a magnificent beach along its inner shore. The old town lies at the foot of the mountain, and has been rebuilt since its destruction during the siege of 1813. A beautiful Alameda running across the isthmus separates it from the new town, which has wide, straight streets, and handsome parks and promenades. The most notable buildings are the town hall, with a handsome facade, the Palacio de la Diputación or provincial Government building, the magnificent hotel or Gran Casino facing the beach and surrounded by a park, the bull ring capable of seating 10,000 spectators, and the royal palace of Miramar, an unpretentious cottage built near the beach some distance west of the town. San Sebastián is the summer residence of the Spanish royal family, the most fashionable seaside resort in Spain, and one of the most beautiful in Europe. Its commerce and industries are considerable, and there are a number of flour and saw mills, iron foundries, and manufactures of paper, beverages, cloth, and hats, while the fisheries are also very important. The permanent population in 1887 was 29,047; and in 1900, 37,703.

Being a fortified port near the boundary, San Sebastián has often borne the brunt of Franco-Spanish wars. The fort was occupied by the French in 1813, and captured by the English and Portuguese by an assault in which the entire town was destroyed.

SAN SEBASTIÁN DE GOMERA, dā gō-mā'rā. The chief town of the island of Gomera (q.v.).

SAN SEVERINO MARCHE, sā'vā-rō'nō mār'kā. A town in the Province of Macerata, Italy, situated on the Potenza, 32 miles south-southwest of Ancona (Map: Italy, B 4). It has a cathedral with a Madonna by Pinturicchio, and a library. Machinery, metal and stone ware, glass, and flour are manufactured. There is a trade in wine, oil, fruit, and cattle. Population (commune), in 1901, 14,385.

SAN SEVERO, sā'vā'rō. A city in the Province of Foggia, Italy, 19 miles by rail northwest of Foggia (Map: Italy, K 6). It has a cathedral, a seminary, and a technical school. The country is fertile, producing grain and fruit, and affording rich pasturage. In 1799 San Severo was destroyed by the French. Population (commune), in 1901, 30,040.

SAN-SING, sän'sing'. The principal town of Northeastern Manchuria, on the Sungari (Map: China, G 2). Population, about 30,000. A fort and barracks are situated six or seven miles to the east. See KIRIN.

SANSKĀRA, sän-skā'rā. The name given to the forty rites incumbent on the three higher castes of Hindus. See SĀMSKĀRA.

SANSKRIT LANGUAGE (Skt. *saṁskṛta*, adorned, perfected, p.p. of *saṁskṛ*, to adorn, from *saṁ*, together + *kṛ*, to make). The name ordinarily applied to the whole ancient and sacred language of India. It belongs properly, however, to that dialect which was treated by the

of Panini (c. 400 B.C.) and his followers, who lived 2000 years or more, until the present day. This language has led a more or less unimpeded line, being, like Latin during the Middle Ages, the means of communication and the possession of the priestly, learned, and cultivated classes. (See SANSKRIT LITERATURE.) It is distinguished most obviously from the later developed dialects, Prakrit (q.v.) and Pali (q.v.), by its character and forms in relation to Sanskrit and closely analogous to those of the Romance languages (q.v.) in their relation to Latin. On the other hand, Sanskrit is distinguished, although much less sharply, from the oldest forms of Indian speech, preserved in the canonical and wholly religious literature of the *Veda* (q.v.), *Brahmana* (q.v.), and *Upanishad* (q.v.). These forms of speech are in their turn by no means free from important dialectic, stylistic, and chronological differences, but they are comprised under the one name, Vedic (or, less properly, Vedic Sanskrit), which is thus distinguished from the language of Panini, whose proper designation is Sanskrit, or classical Sanskrit.

Vedic differs from Sanskrit about as much as the Greek of Homer does from classical Greek. The Vedic apparatus of grammatical forms was much richer and less definitely settled than that of Sanskrit, which gave up much of the earlier language without, as a rule, supplying the proper substitutes for the lost materials. Many case-forms and verbal forms of Vedic disappeared in Sanskrit. The subjunctive was lost, and about a dozen Vedic infinitives were reduced to a single one in Sanskrit. Sanskrit also gave up the most important heirloom which had been handed down by the Indian language from prehistoric times, the system of Vedic accentuation. It must be borne in mind, however, that Vedic, notwithstanding its somewhat unsettled richness, and its very archaic character, is not to be regarded as a popular tongue, but as the more or less artificial 'high speech,' handed down through generations by families of priestly singers. Both Vedic and Sanskrit were in a sense caste languages, based upon popular idioms. The grammatical regulation of Sanskrit at the hands of Panini and his followers, however, went beyond any academic attempts to regulate speech recorded elsewhere in the history of civilization.

The Vedic hymns, the earliest literary production of the Indian people, were composed in the northwest of India, in the river-basins of the Indus and its tributaries. The date of these hymns is unknown, B.C. 1500 being the conventional assumption; still less known is the time when the Aryans commenced their entry into India through the passes of the Hindu Kush. Nevertheless older forms lying behind the Vedic language may be reconstructed by the aid of comparative philology. The original home of the Vedic people was in the great Persian region on the northern side of the Himalayas. By comparison of Vedic and Sanskrit with the oldest forms of Persian speech, Avesta (q.v.) and Old Persian (q.v.), it is clear that these languages are collectively mere dialects of one and the same older idiom. This is known as the Indo-Iranian, or Aryan (in the narrower sense) language. The reconstructed Indo-Iranian language differs less from the language of the *Veda* than classical Sanskrit does from Prakrit and Pali. The language of the Persian Avesta is so much like that of the

Veda that entire passages of either literature may be converted into good specimens of the other by merely observing the special laws of sound which each has evolved in the course of its separate existence. This Indo-Iranian language, again, is part of the greater linguistic community of the so-called Indo-Germanic languages (q.v.). See also PHILATOLOGY.

Since the revival of classical learning there has been no event of such importance in the history of culture as the discovery of Sanskrit in the latter part of the eighteenth century. The study of this language opened up the primitive Indo-Germanic period, and originated the science of comparative philology in all its bearings. Linguistic science, comparative mythology, science of religion, comparative jurisprudence, and other important fields of historical and philosophical study, either owe their very existence to the discovery of Sanskrit or were profoundly influenced by its study. By its aid the spiritual monuments of Zoroaster (see *AVESTA*) were made accessible, as well as the stone monuments of the Persian kings of the Achaemenian dynasty.

After Alexander's invasion of India the Greeks became acquainted to a certain extent with the learning of the Hindus. The Arabs in the Middle Ages introduced the knowledge of Indian science to the West, the so-called Arabic (in reality Indian) numerals among other things. Beginning with the sixteenth century, European nations, the Portuguese, Dutch, Danes, English, and French, obtained a more or less permanent foothold in India, but they sought material gain only; nevertheless a few European missionaries acquired some familiarity with Sanskrit, and Abraham Roger even translated the Sanskrit poet Bhartrihari (q.v.) into Dutch as early as 1651. But the first Sanskrit grammar to be published in Europe, that of Father Paulinus a Sancto Bartholomaeo, was printed in Rome no earlier than 1790. English scholars in India, Sir William Jones, Charles Wilkins, H. F. Colebrooke, H. H. Wilson, and others, at the end of the eighteenth century, were the first real mediators between India and Europe. Wilkins's translation of the *Bhagavad-gita* (q.v.) and Jones's translation of the *Sakuntala* (q.v.) elicited the greatest admiration. Especially in Germany, men like Herder, Goethe, the brothers Schlegel, and Wilhelm von Humboldt were profoundly moved and attracted to the new language, its literature, and its theosophy. Friedrich von Schlegel's *Ueber die Sprache und Weisheit der Indier* introduced the historical and comparative method into the science of language. Soon afterwards Franz Bopp (see PHILATOLOGY; BOPP), in his treatise, *Ueber das Konjugationssystem der Sanskritsprache* (Frankfurt, 1816), laid the foundation of the science of comparative grammar. Since then both Indology and comparative philology have won for themselves permanent positions among the intellectual disciplines in all centres of learning in Europe, America, and India.

The Sanskrit language has on the whole preserved the linguistic conditions of the Indo-Germanic parent speech better than any other member of the Indo-Germanic family of languages. In its vocalism it has merged the two 'triads' of vowels *a, e, o*, and *ā, ē, ō* respectively into *a* and *ā*; thus Indo-Germ. **andhos*, 'flower' (Gk. *ἄνθος*), and **menos*, 'mind' (Gk. *μένος*), are Skt. *andhas* and *manas*; Indo-Germ. **pod*, 'foot,' and **di-dhē-*

mī, 'set' (Gk. *τίθημι*) are Skt. *pād-* and *da-dhāmi*. With this single exception Sanskrit reflects the prehistoric system of vocalism most perfectly. The preservation of the Indo-Germanic lingual vowels, *r* and *l*, as Skt. *r*, as Indo-Germ. *c-dyk-om*, 'I have seen,' Skt. *a-dṛś-am*, or **ulgos*, 'wolf,' Skt. *vrka-s*, led to the recognition of the fact that lingual and nasal vowels belonged to the original stock of the whole family of languages, and was followed by far-reaching and permanent results concerning the entire system of vocalism. The Indo-Germanic indeterminate vowel or *sh'wa* (*o*), appears in Sanskrit as *i*, and its wide preservation in Sanskrit led to the important theory of dissyllabic roots or stems. The preservation in many texts of the Veda of the old system of accentuation made it possible for Verner to discover his famous law (see VERNER'S LAW) which explained the apparent exceptions to Grimm's law (q.v.).

In its consonant-system Sanskrit has preserved the original five series of mutes; labials, dentals, palatals, gutturals, and labiovelars (see PHONOLOGY), and has in addition developed an important sixth series, the linguals or cerebrals, mutes produced by the influence of the *r* and *l* sounds. Thus Indo-Germanic **dentrom*, 'tree, staff' (Gk. *δέντρον*), becomes Skt. *danda*, 'staff,' or the Vedic root *nart*, 'dance,' becomes *nat* in Sanskrit. Most important is the undisturbed preservation in Sanskrit of the Indo-Germanic sonant aspirates, *bh*, *dh*, *gh*, which underwent radical changes in all other Indo-Germanic languages, as Indo-Germ. **bherō*, 'I carry,' Skt. *bharā-mi*, but Gk. *φέρω*, Lat. *ferō*, Gothic *baira*, etc. The Indo-Germanic surd aspirates are also preserved most clearly in Sanskrit, as *th* in Skt. *vet-tha*, 'thou knowest,' Gk. *φοῖ-θα*, Gothic *waist*; or *kh* in Skt. *śankha*, 'conch-shell,' Gk. *κόγχος*.

Sanskrit has preserved all the Indo-Germanic cases, having independent forms for the instrumental and locative in addition to the more familiar cases of the remaining languages. In verb-formation it has retained and developed the distinction between the so-called thematic (*ō*-verbs) and non-thematic (*mī*-verbs), which has practically passed out of the remaining languages of the family with the exception of the Greek. Sanskrit abounds in varieties of present-systems and aorist-systems, offering in the last mentioned respect strikingly close parallels to Greek. The modal forms, such as the subjunctive, the injunctive, and the optative, are present, but have never developed into the delicate syntactical categories of either Greek or Latin. On the other hand, the so-called secondary systems of conjugation, intensive, desiderative, and causative, have become indefinitely productive, so that theoretically every verb is entitled to any of these formations, as Skt. *sīdati*, 'he sits,' and *sīdayati*, 'he sets;' *naśyati*, 'he perishes,' and *nāśayati*, 'he destroys.'

SANSKRIT LITERATURE. The literature in Sanskrit (see SANSKRIT LANGUAGE), like the language, may be divided into two periods, the Vedic and the Sanskrit. Notwithstanding the continuity of the Hindu writings, the spirit of Sanskrit literature differs greatly from the Vedic. The chief distinction between the two periods is that the Veda (q.v.) is essentially a religious collection, whereas Sanskrit literature is, with rare exceptions, profane. In the Veda the lyric and legendary forms are in the service of prayer, or exposition of the ritual; in Sanskrit epic, didactic, lyric, and dramatic forms have been developed far beyond their earlier forms for the purpose of literary decoration and aesthetic or moral instruction. In Sanskrit literature, moreover, with the exception of the *Mahābhārata* (q.v.) and the *Purāṇas* (q.v.), the authors are generally definite persons, more or less well known, whereas the Vedic writings go back to families of poets, or schools of religious learning, the individual authors being almost entirely unknown.

The form and style of Sanskrit literature differs generally from that of the Vedas (q.v.). Vedic prose was developed in the *Yajur-Vedas*, *Brāhmaṇas* (q.v.), and *Upaniṣads* (q.v.) to a tolerably high pitch; in Sanskrit, aside from the strained scientific language (*sūtra*) of philosophy and grammar, prose is found in genuine literature only in fables, fairy tales, romances, and partially in the drama. Nor has this prose improved in literary and stylistic quality, as compared with the earlier variety. On the contrary, it has become more and more clumsy and hobbling, full of long awkward compounds and other artificialities. As regards the poetic medium of classical Sanskrit, it also differs from the Veda. The bulk of Sanskrit poetry, especially the epic, is composed in the *śloka* metre, a development of the Vedic *anustubh* stanza of four octosyllabic lines of essentially iambic cadence. But numerous other metres, usually built up on Vedic prototypes, have become more and more elaborate and strict than their old originals, and in the main they have also become more artistic and beautiful.

Sanskrit literature may be divided into epic, lyric, didactic, dramatic, and narrative. Epic

of Sanskrit literature, the most primitive form of artistic or artificial epic, called *kāvya* (कवि), 'poet' or 'poetry,' is by far the most important representative of the former kind. Of somewhat similar free style are the eighteen *Purāṇas* (पुराण) which are of a later date. (See PURĀṆA.) The beginning of the artistic style are seen in the other great Hindu epic, the *Rāmāyana* (रामायण), which the Hindus themselves regard as the product of a single author, Valmiki. But the finished epic *āyana* is not evolved until the time of Kalidasa (कालिदास), about the sixth century A.D. This universal poet and dramatist is the author of the two best known artistic epics, the *Kumāra-sāmhāra*, or Birth of the War God, and the *Raghuvamśa*, or Race of Raghu.

The *Kumāra-sāmhāra* consists of seventeen cantos, the first seven of which are devoted to the courtship and wedding of the deities Siva and Parvati, the parents of the youthful god of war. Usually only these seven are printed, owing to the erotic character of the remaining cantos. The real theme of the poem appears only toward the end, in the account of the destruction of the demon Taraka, the object for which the god of war was born. The artistic, or rather the artificial, character of the *kāvya* removes them far from the sphere of the genuine epic; their interest and power lies especially in their wealth of descriptive power and delicacy of illustration, and not so much in their portrayal of important characters or stirring action. The *Raghuvamśa*, in nineteen cantos, describes in the first nine the life of Rama together with that of his dynasty, beginning with his forefather Dilipa. Then in the next six cantos comes the story of Rama himself, the same theme as that of the *Rāmāyana*. The remaining *kāvya* deal with the twenty-four kings who ruled as Rama's descendants in Ayodhya. The remaining *kāvya* deal for the most part with themes from the *Mahābhārata* and *Rāmāyana*. The epic is commingled more and more with lyric, didactic, and erotic elements, as well as with bombast and verbal jugglery (puns) of every kind. The Hindus consider six *kāvya* entitled to the name 'great epic' (*amāhākāvya*) in addition to the two of Kalidasa just mentioned, the *Kirātārjūṇiya* of Bharavi (q.v.), describing a combat between Siva and Arjuna; the *Śiśupāla-vadha* of Magha, describing how Śiśupāla, son of a King of Odi, and cousin of Krishna, was slain by Vishnu; the *Nāisadhīya* ascribed to Harsha (q.v.), a version of the story of Nala, King of Nishadha, the hero of a well-known episode of the *Mahābhārata*; and finally the *Bhāṭṭikāvya*. The last mentioned 'epic' is ascribed to the lyric poet Bhartrihari. It tells the story of Rama, but is composed with the avowed object of illustrating the rules of grammar, especially the irregular forms of the language.

Every form of artistic Sanskrit literature, whether epic, dramatic, or confessedly lyric, has a strong lyric cast. At the bottom these three kinds, in the Hindu poet's hands, are but the gradually differentiated forms of the same poetic element. Ornate figures of speech, singly or in masses, luxuriant richness of coloring, carried into literary composition from the gorgeousness of the climate, flora, and fauna of Bharatavarsa, the radiant painting of every sensa-

tion and emotion—these are the common characteristics of Hindu artistic poetry.

LYRIC POETRY can hardly do more than emphasize or specialize these conditions, yet it has its individual traits, the most important of which is the refined elaboration of the single strophe in distinction from continuous composition. The forms of these strophes are very elaborate, and almost infinitely varied. Nowhere else in literature have poets expended so much ingenuity, patience, or art upon the elaboration of metric form; nowhere is the attempt made so persistently to harmonize the sentiment of a stanza with its metrical coloring. The most elaborated of the longer lyric compositions are the *Meghadūta*, or Cloud Messenger, and the *Ritusamhāra*, or Cycle of Seasons, both by Kalidasa. The theme of the former is a message sent by an exiled Yaksha (elfin) to his love by a cloud. The first part of the poem describes the scenes through which the cloud will pass in its course; in the second part the Yaksha pictures his far-off home and the charms of his beloved, whom he imagines tossing on her couch, sleepless and emaciated, through the watches of the night. When the cloud beholds her, let it tell of his own longings, how in creepers he beholds her form, in the eyes of startled hindr her glances, in the moon her lovely face, and in peacocks' plumes her shining tresses. May the cloud, after delivering his message, return with reassuring news, and never himself be separated from his lightning spouse. *The *Cycle of Seasons* is famous for its descriptions of India's tropical nature, interspersed with expressions of human emotion. Spring, that causes the downpour of the pollen of the mango blossoms, that intoxicates the world with his fragrance, and swarms with honey-drunk bees, arouses sweet longings in every breast. In the rainy season, when the lover, confined at home by the downpour of the waters, shivers with cold, his long-eyed love presses him to her heart, and turns the dreary day to sunshine. The poet's deep sympathy with nature, his keen powers of observation, and his skill in depicting an Indian landscape are equaled by his subtle appreciation of every human mood.

The bulk of lyrical poetry, however, is in single miniature stanzas which suggest strongly the didactic sententious proverb poetry which the Hindus also cultivated with great success. In fact, the most famous collection of such stanzas, that of Bhartrihari (q.v.) consists of both lyric, didactic, and philosophic poems. Bhartrihari, who lived in the seventh century, is perhaps the most remarkable poet of India next to Kalidasa. Apparently he was also a prominent grammarian, and he certainly was a good deal of a philosopher. His stanzas, 300 in number, are divided into three 'centuries,' the *Śṛṅgāra-sataka*, or Century of Love, the *Niti-sataka*, or Century of Wisdom, and the *Vairāgya-sataka*, or Century of Renunciation. There is, of course, no action in these stanzas. Ever and again, within the narrow frame of a single stanza, the poet pictures the world of him for whom the wide universe is woman, from whose eyes there is no escape.

The second great master of the erotic stanza is Amaru, who is probably of a later date than Bhartrihari. His collection is known as *Amaru-sataka*, or Century of Amaru. He also is a mas-

ter in the art of painting all the moods of love, bliss and dejection, anger and devotion. Neither he nor the other Indian lyrists treat love from the romantic or ideal point of view; it is always sensuous. But delicacy of feeling and expression, and refined appreciation of those qualities which attract irresistibly, only finally to repel, lift their stanzas high above either the coarse or the commonplace. It is 'mime-song,' flavored with the universal, though rather theoretical, Hindu pessimism.

Even in lyrics the Hindu's deep-seated tendency toward speculation and reflection is evident. Not only has it been the basis of much that is highest and best in the religion and philosophy of India, but it has also assumed shape in another very important product of Hindu literature, the GNOMIC, DIDACTIC, SENTENTIOUS STANZA, which may be called the PROVERB. Böttlingk has collected from all parts of Sanskrit literature some 8000 of these stanzas; they begin with the *Mahābhārata*, and are found in almost every moral appended to the fable literature. Their keynote is again the vanity of human life, and the superlative happiness that awaits resignation. The mental calm of the pious anchorite, who lives free from all desires in the solitude of the forest, is the only remedy for human unrest. But for him who remains in the world there is also a kind of salvation, namely, virtue. When a man dies and leaves all his treasures and his loved ones behind, his good works alone can accompany him on his journey into the next life. Hence the practical value of virtue almost overrides the pessimistic view of the vanity of all human action. These gnomic stanzas were frequently composed or gathered up into collections. Bhartrihari's above-mentioned two centuries on wisdom and renunciation are compositions of this sort. A Kashmirian poet named Silhana is the author of the *Sānti-śataka*, or Century of Tranquillity, and another collection is designated *Mōha-mudgara*, or Hammer of Folly. There are many other collections from all periods, but naturally the ethical saw is most at home in the fables of the *Pañcatantra* (q.v.) and *Hitopadeśa* (q.v.). These works go back to Buddhist models, which recall the fact that the *Dhammapada*, a Buddhist collection of aphorisms, contains perhaps the most beautiful and profound words of wisdom in all Hindu literature. It may be said that there is scarcely a conceit or adage of the proverb literature of other peoples that may not be paralleled in Hindu stanzas.

The Sanskrit DRAMA is one of the latest, though one of the most interesting products of Sanskrit literature. With all the uncertainty of literary dates in India there is no reason for assuming for this class of works a date earlier than the fifth or sixth century of our era. Certain Vedic hymns in dialogue are all that the earliest time suggests as a possible, but very doubtful, basis of the drama. The Sanskrit name for drama is *nāṭaka*, from the root *nāt*, *nart*, 'to dance.' The word therefore means literally 'ballet;' it is not doubtful that dances contributed something to the development of the drama. In various religious ceremonies of earlier times dancing played a part; at a later time the cult of Siva and Vishnu, and especially of Vishnu's incarnation, the god Krishna, was accompanied by pantomimic dances. These panto-

mimes reproduced the heroic deeds of these gods and were accompanied by songs. Popular representations of this sort, the so-called *Yātras*, have survived to the present day in Bengal. They are not dissimilar to the mystery plays of the Christian Middle Ages, and their modern continuation, the passion plays. The god Krishna and Radha, his love, are the main characters, but there are also friends, rivals, and enemies of Radha. The *Yātras*, a mixture of music, dancing, song, and improvised dialogue, while undoubtedly in some way connected with the origin of the drama, are nevertheless separated by a very wide gap from the finished product of the *antaha*, as it appears in such dramas as the *Sakuntalā* of Kalidasa, or the *Urcakalikā* (q.v.), or Toy Cart, or *Sudraka* (q.v.).

It is still a moot question whether Western (Greek) influence, particularly the New Attic comedy of Menander, as reflected in Plautus and Terence, has not in some measure contributed to the shaping of the Hindu drama. It is known that Greek actors followed Alexander the Great through Asia, and that they celebrated his victories with dramatic performances. After the death of Alexander, Greek kings continued to rule in Northwestern India. Brih-commerce was carried on between the west coast of India and Alexandria, the later centre of Greek literary and artistic life. Greek art and Greek astronomy undoubtedly exercised strong influence upon Hindu art and science. The chief points of resemblance between the Hindu drama and the Greek comedy are as follows: The Hindu drama is divided into acts (from one to ten) separated by various periods of time, from one day to long periods; the acts proper are preceded by a prologue spoken by the stage manager (*sātradhāra*). The stage was a simple rostrum not shut off from the auditorium by a curtain, but, on the contrary, the curtain was in the background of the stage, and was called *garānikā*, that is, Greek curtain (*Λογιστή*). The characters of the Hindu drama resemble in some respects those of the Attic comedy. There are bayaderes and parasites, braggarts, and cunning servants. Especially the standard comic figure of the Hindu drama, the *vidūṣaka*, the unromantic friend of the hero, has been compared with the go-between, the *scerrus currens*, of the Græco-Roman comedy. The *vidūṣaka* is a hunchbacked, bald dwarf of halting gait, and is the clown of the piece. Though a Brahman by birth—with maliciously humorous intent—he does not speak Sanskrit, but a popular dialect, Prakrit (q.v.), like the women (with rare exceptions) and all the inferior personages of the play. He plays the unfeeling realist, intent upon every form of bodily comfort, especially a good dinner, to the hero's sentimental flowery romanticism. Although it is not possible to prove that one or the other external feature of the Hindu drama may not be due to some outside influence, its inner matter is certainly altogether national and Indian. The themes are for the most part those of the heroic legend in the epics, or they move in the sphere of the actually existing Hindu courts. On the whole, they are not different from those that figure in the tales and romances which are worked up in narrative form. It must not be forgotten that certain general coincidences between the drama and the theatre of different peoples are due to the common psychological

of the Sanskrit drama, a genuine historical drama, the study of its matters requires the most diligent attention.

The greatest name of the writer of India is Kalidasa, the name of whose time also of epic and lyric drama. His dramas are ascribed to him: the *Malavikāgnimitra*, the *Urochasa*, and the *Malatikāgnimitra*, the *Malavikā*, and *Agnimitra*. From a time not much earlier than that of Kalidasa comes the *Yama Mrochakatikā*, the Toy Cart, said to have been written by a king by the name of Sudhaka, who is praised ecstatically in the prologue to the play. It is altogether likely that some poet at Sudhaka's court, perhaps Dandin (q.v.), wrote the play, and out of gratitude for benefits received, endowed the King with the glory of its authorship. Similarly during the seventh century a king named Harsha (q.v.) is said to have composed three dramas: *Ratnāvalī*, or the String of Pearls; the *Nāgānanda*, whose hero is a Buddhist, and whose prologue is in praise of Buddha; and the *Prigadaśakā*. From the eighth century date the dramas of Bhavabhūti (q.v.), a South Indian poet, who is, next to Kalidasa and Sudhaka (Dandin), the most distinguished of the Hindu dramatists. His most celebrated drama is the *Mālatīmādhava*, or *Malati and Madhava*; and the two dramas *Mahāvīra-carita* and *Uttarāma-carita*, both of which deal with Rama, the hero of the *Rāmāyana*. Finally may be mentioned Viśakhadatta, the author of the *Mudrarakāśasa*, the Seal of the Minister Rakshasa, a drama of political intrigues, whose composition also dates from the eighth century.

It is not possible within a short space to characterize the great variety of all these themes, the different talents of their authors, and the style and literary quality of these compositions. "Action is the body of the drama," such is the dictum of the Hindu theorists. Precisely what we should call dramatic action is not the prominent quality of the compositions of the greatest poet of them all, Kalidasa. His dramas are distinguished rather by tenderness of feeling and delicacy of touch. They are lyric rather than dramatic. The action is slow, the passions are profound rather than elemental. The deepest feelings are portrayed in delicate forms which never broach upon violence or coarseness, but, on the contrary, are almost over-nice. At the height of their sentiments, in profound misery, the hero and the heroine still find time to institute comparisons between their own feelings and the phenomena of nature. There is, indeed, a plethora in them all of mango trees and *pātala*-blossoms, of creepers and lotus, of bimba-lips, of gazelles, flamingoes, and multicolored parrots. Yet they are always artistic and finished, especially when the climate and life of India is borne in mind, and their beauty suggests strongly the genius of Goethe.

No department of Indian literature is more interesting to the student of comparative literature than that of the FABLES AND FAIRY TALES. There is scarcely a single motive of the European fable collections that does not appear in some Hindu collection; and there is, indeed, good reason for believing that the bulk of this kind of literature originated in India. The earliest and most important collection of Hindu fables is Buddhist, and is written in Pali; it seems to reach back to the fourth century B.C. This collection is known as the *Jātaka*s (q.v.), or

Birth Stories. Buddha himself is made to appear in every one of them in the guise of the wise or successful animal of the fable, and he himself points the moral of the fable in the usual didactic proverb stanza. This feature is, of course, secondary, but the fables themselves are very old. The two most important Sanskrit collections, the *Pañcatantra* and the *Hitōpadēśa*, are based upon Buddhist sources. A noteworthy feature of the Sanskrit collections of fables and fairy tales is the insertion of a number of different stories within the frame of a single narrative, a style of narration which was borrowed by other Oriental peoples, the most familiar instance being the *Arabian Nights*. The *Pañcatantra*, or Five Books, the most celebrated Sanskrit collection, existed at least as early as the first half of the sixth century A.D., since it was translated by order of King Khosrū Anushirvan (531-579) into Pahlavi (q.v.), the literary language of Persia at that time. It passed from the Pahlavi into Arabic, Greek, Persian, Turkish, Syriac, Hebrew, Latin, and German; and from German into other European languages. The Buddhist origin of the *Pañcatantra* was effaced as much as possible by the Brahman redactors by means of omissions and changes. The name *Pañcatantra* is probably not original, having perhaps displaced Karataka and Damanaka, or some similar title derived from the names of two jackals in the first book. This may be surmised because the title of the Syriac version is *Kalilag and Damaak*, of the Arabic version *Kabilan and Dimnah*. Both the *Pañcatantra* and the *Hitōpadēśa*, or Salutory Instruction, were originally intended as manuals for the instruction of princes in domestic and foreign policy. The *Hitōpadēśa*, said to have been composed by Narayana, professes to be an excerpt from the *Pañcatantra* and other books.

The most famous collection of fairy tales is the very extensive *Kathāsaritsāgara*, or Ocean of Rivers of Stories, composed by the Kashmirian poet Somadeva (q.v.) about A.D. 1070. Three much shorter collections are in prose. The *Sukasaptati* (q.v.), or Seventy Stories of the Parrot, in which a wife whose husband is abroad, and who is inclined to solace herself with other men, is for seventy nights cleverly entertained and deterred by the story-telling parrot until her husband returns, is one of the best. The *Vētāla-pāñcarīnśati*, or Twenty-five Tales of the Vampire, is known to English readers under the title of *Vikram and the Vampire*. The third collection is the *Sinhāsana-drātrīnśikā*, or Thirty-two Stories of the Lion-seat (throne), in which the throne of King Vikrama tells the stories. All these collections have an outer frame story, within which a certain part of the common Hindu stock of tales is inserted. A few PROSE ROMANCES of more independent character, dating from the sixth and seventh centuries, may be mentioned in this connection. The Hindu theorists class them as poems (*kāvya*), but they are much more like our own earlier novels. The *Daśa-kumāra-carita*, or Adventures of the Ten Princes, a story of common life and a very corrupt society, reminds one of the *Simplicissimus* of Grimmelshansen. Its author is Dandin (q.v.), and it probably dates from the sixth century A.D. *Vāsuradattā*, by Subandhu (q.v.), of somewhat later date, is a highly artificial romance, which formed the stylistic basis of the *Kādambarī*, by Bana (q.v.); the latter narrates, in stilted language and long

compounds, the romantic sentimental love story of an ineffably noble prince and the equally ineffably beautiful and virtuous fairy princess Kadambari. Other works of this class, known as *carita*, continue to be composed at a later time. The same term, *carita*, is also used for CHRONICLES, or quasi-historical literature. Historical works in the European sense do not exist in India. The nearest approach to history in our sense of the word is the *Rājataranginī* (q.v.), or the Chronicle of Kashmir, by Kalhana. A modern work of a similar kind, but of much smaller extent is the *Kṣītīśarāṅśāralīcarita*, the chronicle of a series of royal families who reigned in Bengal. It was composed in the middle of the eighteenth century.

India abounds in all forms of SCIENTIFIC LITERATURE, written in tolerably good Sanskrit even to the present day. The ancient legal books of the Veda continue in modern poetical *Dharma-sāstras* and *Smṛtis*, of which the *Law-books of Manu* (see MANU) and *Yājñavalkya* are the most famous examples. Rooted in the Upanishads (q.v.) are the six Hindu systems of philosophy and their abundant writings. (See the articles MĪMĀṂSĀ, NYĀYA, SĀMĀNYA, VAISĒSHIKA, VĒDĀNTA, and YŌGA.) Grammar, etymology, lexicography, prosody, rhetoric, music, and architecture each own a technical literature of wide scope and importance. The earliest works of an etymological character are the Vedic glosses of Yaska (see NIRUKTA); later, but far more important, is the grammar of Panini (q.v.), one of the greatest grammarians of all times, and his commentators Katyayana and Patanjali. Mathematics and astronomy were eagerly cultivated from very early times, the so-called Arabic numerals coming to the Arabs from India, and designated by them as Hindu numerals. Indian medical science must have begun to develop before the beginning of our era, for one of its chief authorities, Caraka, was the chief physician of King Kanishka in the first century A.D. The germs of Hindu medical science reach back to the *Atharva-Veda*. (See VEDA.) The Bower manuscript, one of the oldest of Sanskrit manuscripts (probably fifth century A.D.), contains medical statements which agree verbally with passages in the works of Suśruta and Caraka, the leading authorities on this subject.

BIBLIOGRAPHY. A brief but convenient sketch of Sanskrit literature is Macdonell, *History of Sanskrit Literature* (New York, 1900). The bibliographical notes at the end of the book are a safe guide to more extensive study. The German work of Schroeder, *Indiens Litteratur und Cultur* (Leipzig, 1887), contains a fuller, very instructive and very readable account of Sanskrit literature; copious translations and digests of the texts themselves make this work especially practical and helpful. The *History of Ancient Sanskrit Literature*, by Max Müller (2d ed., London, 1860), is limited to the Vedic period and does not really bear upon the present theme. Weber's *Akademische Vorlesungen über indische Litteraturgeschichte* (2d ed., Berlin, 1876, translated by T. Zachariae, London, 1878, with additional notes by Weber), is a learned and technical work not at all adapted to the wants of the general reader, and is now partly antiquated, though still valuable. Readable and popular in style are Frazer, *Literary History of India* (New York, 1898), and Monier-Williams, *Indian Wisdom* (London, 1876), which contains numerous

specimens of Sanskrit literature in translations. The *Grundriss der indo-arischen Philologie*, commenced under the editorship of Bühler, and continued after his death by Kielhorn (Strassburg, 1896 et seq.), covers the entire domain of Indo-Aryan antiquity, and contains authoritative information regarding many points and problems of Sanskrit literature.

SANSOVINO, s̄an'sō-ve'nō, ANDRĒA, properly ANDREA COVILLO (1460-1529). One of the principal Florentine sculptors of the High Renaissance. He was born at Monte San Sovino, near Arezzo, and studied at Florence with Antonio Pollajuolo and Bertoldo. The most important of his early works are reliefs of the "Annunciation," a "Pietà," and the "Coronation of the Virgin," in Santo Spirito, Florence. About 1490 he was appointed sculptor and architect to John II, King of Portugal, for whom and his successor, Emanuel I, he built a royal palace and executed sculptures, of which a bronze bas-relief of John and a statue of Saint Mark still exist at Coimbra. After nine years' absence, he returned to Florence and occupied himself with a font for the Baptistery at Volterra (1502); a "Madonna and Child" and a "Saint John Baptist" for the cathedral at Genoa (1504); and a group, the "Baptism of Christ," above the doors of the Baptistery at Florence. Though completed a century later by Vincenzo Danti, the figures are as beautiful in conception and execution as their disposition is monumental.

After 1505 he went to Rome and executed for Pope Julius II, his two chief works, the monuments of the two cardinals Sforza and Basso in the Church of Santa Maria del Popolo. He made for a chapel of the Church of San Agostino a "Madonna with Child and Saint Anne," and went to Loreto in 1513 to superintend the decoration of the Casa Santa, most of which was executed by his pupils, and is mannered in style. His statues are executed with admirable technique and are mild and beautiful in conception, but they possess the generality of type derived from the antique common to the High Renaissance, with a consequent loss of characteristic and individual qualities. Consult: Schönfeld, *Andrea Sansovino und seine Schule* (Stuttgart, 1881); Rosenberg, in Dohme, *Kunst und Künstler Italiens* (Leipzig, 1879).

SANSOVINO, JACOPO (TATTI) (1477-1570). A Florentine sculptor and architect of the High Renaissance. He was born at Caprese, near Florence, the son of Antonio Tatti; but he adopted the name of Sansovino from Andrea, his first master. His first work as a sculptor was a "Saint John" submitted in competition with Raffaello di Montelupo. At Rome he gained the friendship and patronage of Bramante, and Pope Julius II, employed him to restore antique statues. Returning to Florence, he modeled the beautiful nude "Bacchus," now in the Uffizi, and many other figures. In 1511 he returned to Rome and fashioned the colossal "Madonna" for the Church of San Agostino. His design for the Church of San Giovanni dei Fiorentini in Rome was chosen over those of Raphael, Sangallo, and Peruzzi, but an injury forced him to leave the completion of the structure to Antonio di Sangallo.

When Rome was sacked in 1527, Sansovino took up his permanent residence at Venice, where he held for many years the foremost position

After completing the restoration of the church he was given charge of the Palazzo dei Princesi di San Marco. He also designed the Scuola della Misericordia, the interior of San Francesco, built the Zecca, the Fabbrica Navale, and the Loggietta of the Campanile, for which he executed four statues, a David, an Apollo, a Mercury, and a Minerva. From 1536 to 1548 he built the Library of Saint Mark, "the most beautiful profane edifice in Italy." With the high development of his architectural skill went a deterioration of taste in his sculptures and the exaggeration of form, responding no doubt to the demands of the time, made these decorative elements notably out of harmony with the buildings they adorned. In his other buildings, palaces like the Cornaro and Marino on the Grand Canal, and churches like San Giorgio dei Greci and San Giuliano, the tendencies of the Decadence were all exemplified, an overloading of ornament, and an exaggeration of sculptural form that in his followers developed into the extravagant style known as 'baroque.' Consult: Vasari, *Life* (Florence, 1887); Temanza, *Vita di Sansovino* (Venice, 1752); Rosenberg, in Dohme, *Kunst und Künstler Italiens* (Leipzig, 1879).

SANS-SOUCI, sän'sōō'sō' (Fr., free from care). A royal palace at Potsdam, Prussia, erected by Frederick the Great in 1745-47, where he spent his last years. The unpretentious, one-storied buildings, situated in a splendid park, and adorned with a fine colonnade, contain many personal relics of the King.

SAN STEFANO, sän stā-fā'ōā, TREATY OF. See BERLIN, CONGRESS OF; RUSSO-TURKISH WAR.

SANTA ANA, sän'tā ā'nā. The largest city of the Republic of Salvador, situated 28 miles northwest of San Salvador (Map: Central America, C 3). It is the capital of the Department of Santa Ana, is regularly laid out with straight and well-paved streets, and has several fine public buildings. The country is very fertile, and the city is the centre of the sugar trade. It is connected by railroad both with the capital and the port of Acapulca. Population, 33,000.

SANTA ANA. The county-seat of Orange County, Cal., 30 miles south by east of Los Angeles; on the Southern Pacific and the Atchison, Topeka and Santa Fe railroads (Map: California, E 5). It has a public library and the Orange County Teachers' Library, and a fine court-house. The district is engaged extensively in fruit-growing, and has large dairy, nut, and celery interests. Santa Ana is important commercially. Santa Ana was settled in 1870 and was incorporated in 1888. Population, in 1890, 3628; in 1900, 4933.

SANTA ANNA, or **ANA**, ANTONIO LOPEZ DE (1795?-1856). A Mexican general and politician, born at Jalapa. Entering the army at the age of fifteen, he first attracted attention in 1821 as an adherent of Hurbide (q.v.) in the events leading up to the overthrow of the Spanish power. In 1822 he became commandant of Vera Cruz, but on being accused of harboring designs inimical to the Government, turned against Hurbide in December of the same year and headed a rebellion which took shape as the Plan of Casa Mata, and gained support so rapidly that Hurbide hastened to anticipate overthrow by resigning. In 1828 Santa Anna took the field as a partisan of

Guerrero, whom he aided in his successful attempt to supplant Pedraza as President. He became, in the following year, Minister of War and commander-in-chief, and in August and September achieved distinction by expelling from the country a Spanish army of invasion, thus ending the last attempt on the part of Spain to reëstablish its authority in Mexico. Personal ambition led him to rise in insurrection against both Guerrero and Guerrero's successor, Bustamante, after whose enforced resignation in 1832, Pedraza, now an ally of Santa Anna, held the chief power for some time. In February, 1833, Santa Anna was chosen President as the chief of the Federalist Party, whose aim was to establish a centralized government in Mexico. Gomez Farias was chosen Vice-President, and to him Santa Anna left the cares of office and the odium of a generally unpopular policy, while he himself retired to his hacienda, whence, however, he kept a close watch on the progress of events. From federalism Santa Anna moved backward toward reaction and monarchism and entered into close relations with the Clericals. This led to republican insurrections, the most formidable of which was suppressed with severity by Santa Anna in 1835. The Texas colonists having undertaken to organize a government of their own, Santa Anna set out to reduce them to obedience. In February, 1836, he attacked San Antonio, and on March 6th captured the Alamo (q.v.). On April 21st, however, General Houston, who was being pursued by Santa Anna, suddenly turned and defeated the Mexican army at San Jacinto (q.v.). Santa Anna was captured, and after promising to exert his influence for obtaining the independence of Texas was allowed to go to the United States, whence he returned in 1837 to Mexico. In November, 1838, he defended Vera Cruz against a French fleet, and, from the loss of a leg in the combat, derived for a time enormous popularity. In the disordered condition of the country many turned to him for a strong leader, and in October, 1841, he became President with dictatorial powers. He ruled entirely in the interests of the Federalist Party till June, 1844, when he was elected Constitutional President. Disaffection was rife, however, and in November an insurrection headed by Paredes led to his overthrow. He was taken prisoner early in 1845 and banished. The threatened war with the United States probably hastened his recall in July, 1846; in December he was made Provisional President, and soon after he took the field against the American forces. On February 22-23, 1847, he was defeated by General Taylor at Buena Vista (q.v.). This was followed by his defeat at the hands of General Scott at Cerro Gordo (q.v.) on April 18th. After the occupation of the City of Mexico by the American army Santa Anna resigned the Presidency, made an attempt to recapture Pueblo, and failing, sailed for Jamaica, whence he went to Venezuela. In 1853 he was recalled and elected President for one year. After a series of intolerable and despotic acts he issued a decree, December, 1853, declaring himself President for life, with the title of Serene Highness. The inevitable rebellion broke out in March, 1854, and after fifteen months campaigning in the Western States, Santa Anna realized the hopelessness of his position and in August, 1855, sailed from Vera Cruz for Cuba. He lived for some time in Venezuela and Saint Thomas, and

in 1864, during the French invasion, returned to Mexico, where he attempted to play a part in affairs, but was compelled by Bazaine to leave the country. Still striving for political power, he reappeared at Vera Cruz in 1867, but was made prisoner and once more sent into exile. He lived subsequently in the United States, returned to Mexico after the death of Juárez, and died in the City of Mexico, June 20, 1876, poor and neglected. An able soldier and a master of intrigue, with a remarkable capacity for anticipating and manipulating public opinion, Santa Anna enjoyed a longer period of public life than any of his contemporaries in the political vicissitudes of nineteenth-century Mexico. None of the general histories of Mexico contain an adequate treatment of this perplexing personality; Wilson, *Mexico* (New York, 1856), gives a useful contemporary account of the man at the height of his career.

SANTA BARBARA, bār'ba-rá. A town of the department of the same name, Honduras, on the Santiago, 110 miles northwest of the capital, Tegucigalpa (Map: Central America, D 3). In the vicinity are mines of gold, silver, nickel, and zinc. The country produces extensively grain, sugar cane, coffee, cacao, and rice. The town has some manufactures of hats and spirits. It is a place of deposit for Puerto Cortés. Population, about 8000.

SANTA BARBARA. A town of Panay, Philippine Islands, in the Province of Iloilo, situated 11 miles north of Iloilo (Map: Philippine Islands, G 9). Population, estimated, in 1899, 13,000.

SANTA BARBARA. The county-seat of Santa Barbara County, Cal., 100 miles west by north of Los Angeles, on Santa Barbara Channel and on the Coast Line of the Southern Pacific Railroad (Map: California, D 4). Santa Barbara is known as the 'Newport of the Pacific.' It is picturesquely situated on a slope rising gradually from the shore to the old Franciscan Mission, 340 feet above the bay. This mission, the most important and best preserved of the California missions and the only one in which ministrations have never ceased since its founding, was established in 1786. Santa Barbara enjoys a mild, equable climate, owing to peculiar topographical conditions. Important buildings are the Potter Hotel, built in 1902 at a cost of more than a million dollars, the famous 'Los Baños del Mar,' Saint Anthony's College, and the Anna S. C. Blake Sanatorium. The Public Library contains more than 15,000 volumes. The region produces large quantities of beans, English walnuts, lemons, and olives. There are extensive lemon-packing establishments in the city. The government is vested in a mayor and a unicameral council, elected every two years. Santa Barbara was founded as a Spanish presidio in 1782. The city was laid out in 1852, incorporated in 1874, and received its present charter in 1900. Population, in 1890, 5964; in 1900, 6587.

SANTA BÁRBARA DE OCAMPO, dā ò-kām'pō (or simply Ocampo). A Mexican town of the State of Tamaulipas, 57 miles south of Ciudad Victoria (Map: Mexico, J 6). Its parish church is the second in importance in the State. The region is fertile, producing maize, beans, and tropical fruits. The town was founded in 1749 by the Franciscans. Population, in 1895, 9079.

SANTA BARBARA DE SAMANÁ, sã-mã-nã'. A seaport of Santo Domingo. See SAMANÁ.

SANTA CASA, kã'sã (It., Holy House). A celebrated shrine in Loreto, Italy, said to be the house in which the Virgin Mary lived at Nazareth, miraculously transported to its present site in 1295.

SANTA CATHARINA, kã'tã re'nã. A State of Brazil, bounded by the State of Paraná on the north, the Atlantic Ocean on the east, Rio Grande do Sul on the south, and Argentina on the west. Area, 28,624 square miles. The coast is low, but a short distance inland extends the Serra Geral, which exceeds in its highest summits 6000 feet. The climate is hot on the coast and temperate in the elevated interior. Santa Catharina is naturally well adapted for agriculture and stock-raising, but, though the latter is well advanced, the scarcity of population greatly hinders its development. The chief agricultural products are sugar, tobacco, mate, manioc, and corn. Agriculture is encouraged by State bounties. Coal deposits have been discovered in the Serra Geral, and the coal mines have been connected by a railroad with the coast. The population in 1890 was 283,769, including a very large European, chiefly German, element.

SANTA CATHARINA. The capital of the State of Santa Catharina, Brazil. See DESTERRO.

SANTA CLARA, klã'rã. A province of Cuba, occupying the central portion of the island, and bounded by the sea on the north and south, the Province of Matanzas on the west, and Puerto Príncipe on the east (Map: Cuba, E 4). Area, 7524 square miles. The interior is an undulating plateau with a number of detached hills or mountain groups rising in the southeast to a height of about 3000 feet. The southwestern portion consists of the vast swamps known as the Ciénaga de Zapata. The north coast is lined with numerous islets. The chief river is the Sagua, the largest on the whole north coast of the island and navigable 20 miles. The province contains some of the largest sugar plantations and factories, while tobacco is also largely raised, and the upland savannas offer rich pasturage. It is also rich in minerals, and asphalt, silver, and copper are mined. Population, in 1899, 356,536. The capital is Santa Clara (q.v.).

SANTA CLARA, or VILLA CLARA. The capital of the Province of Santa Clara, Cuba, situated nearly in its centre on the Cuban main trunk railroad and in a somewhat elevated savanna region (Map: Cuba, E 4). It is a pleasant, well-built town with wide streets. Good tobacco is grown in the district, and there is an asphalt mine producing 10,000 tons annually, while petroleum deposits and graphite, gold, and copper are also found in the neighborhood. Besides the main trunk line to Havana there are railroads running to the ports of Cienfuegos on the south and Sagua la Grande on the north. Population, in 1899, 13,763. Santa Clara was founded in 1664 or 1689. During the revolution, 1895 to 1898, it was an important fortified post of the Spaniards and the centre of active operations.

SANTA CLARA. A town in Santa Clara County, Cal., 47 miles southeast of San Francisco, on the Southern Pacific and the South Pacific Coast Line railroads (Map: California, C

SANTA CLARA, *klā'rah*. Roman Catholic city of Cuba, 1851, and of the Notre Dame de la Alameda Avenue, traversing a distance of 100 miles, extends to San José, three miles from the city. Santa Clara is situated in a fertile region especially in fruit growing. Prunes, peaches, apples, berries, and nuts are produced in large quantities. Millwork, sashes and doors, window blinds, and leather are manufactured. Canned and dried fruits are prepared and shipped in large quantities. The government, under the revised charter of 1874, is administered by a president and a board of trustees, elected respectively for one and two years. Santa Clara was settled in 1780 and incorporated in 1852. Population, in 1890, 2891; in 1900, 3650.

SANTA CLAUS, or **KLAUS**, *klāz*. See **NICHOLAS**, **SAINTE**.

SANTA CROCE, *krō'chā* (It., Holy Cross). A famous church in Florence, formerly belonging to the Franciscans, and the Pantheon of the Florentines. It was begun in 1294 (possibly 1295), after the designs of Arnolfo di Cambio (q.v.), the principal Florentine architect of the period, and was nearly completed before his death (c.1302). In 1320 the first services were held, and in 1442 it was formally dedicated in the presence of Pope Eugenius IV. The graceful, slender tower was completed after the designs of Baccani in 1847, and the unfortunate facade was built in 1857-63. The building is in the Florentine Gothic style; its design and decoration are simple. Santa Croce is a perfect museum of Florentine art of the fourteenth and fifteenth centuries. Especially noteworthy are the celebrated frescoes from the life of John the Baptist and Saint Francis, by Giotto, in the Bardi and Peruzzi Chapels. Other treasures are a "Crucifixion," an "Annunciation," and a bronze statue of Saint Louis of Toulouse by Donatello, and a rich Renaissance pulpit by Benedetto da Majano. Buried within the church are Michelangelo (whose monument is by Vasari), Alfieri (with a monument by Canova), Machiavelli, Galileo, Cherubini, and Rossini. There is also a fine monument to Dante by Stefano Ricci. From Arnolfo's Gothic cloisters adjoining the church is the entrance to what is, perhaps, the most perfect small chapel of the early Renaissance, the Capella dei Pazzi (1420), by Brunelleschi, who also designed the second cloisters of the church. Consult: Moise, *Santa Croce* (Florence, 1845); Frey, *Loggia de' Lanzi* (Berlin, 1885).

SANTA CRUZ, *krō'oth*. A territory of Argentina, occupying the southern part of Patagonia and bounded by Chile on the west and south, the Territory of Chubut on the north, and the Atlantic Ocean on the east (Map: Argentina, C 13). Area, estimated at from 110,000 to 180,000 square miles. A number of rivers traverse the territory from west to east. Santa Cruz is the least populous portion of the republic, having had a civilized population in 1900 of only 1444. The capital is Gallegos, a village.

SANTA CRUZ. An eastern department of Bolivia, bounded by Brazil on the east, the Bolivian Department of Chuquisaca on the south, the Department of Cochabamba on the west, and Beni on the north (Map: Bolivia, E 7). Area, estimated at 10,000 square miles. It is covered by a dense forest on the north. While the south-

ern part belongs to the Llanos de Chiquitos. The northern part of Santa Cruz is drained by the Mamoré. The Río Grande River, one of its head-streams, is navigable. The climate is hot and unhealthy, but the soil is fertile and yields sugar, coffee, cacao, cotton, rice, and common cereals. There is some cattle-raising, and the forests yield rubber and drugs. Population estimated in 1900 at 210,800, more than half of whom were Indians. Capital, Santa Cruz de la Sierra (q.v.).

SANTA CRUZ. A town of the State of Guanajuato, Mexico, 40 miles southeast of the city of that name, on the Mexican National Railroad. Population, in 1895, 7440.

SANTA CRUZ. The capital of the Province of Laguna in Luzon, Philippine Islands, situated on the eastern shore of the Bay Lagoon, 35 miles southeast of Manila (Map: Philippine Islands, F 5). It has well-built public and ecclesiastical buildings. It has an active trade with Manila by way of the lagoon and the Pasig River, and is noted for the manufacture of palm brandy. Population (estimated), in 1899, 13,141.

SANTA CRUZ, or **SAINTE CROIX**. The largest of the Danish West India Islands, situated 37 miles south of Saint Thomas (Map: West Indies, P 6). Area, 74 square miles. The surface is hilly in the interior. Along the coasts there are level tracts of fertile soil which produce sugar and rum. Santa Cruz was discovered by Columbus on his second voyage. It was sold by France to a Danish company in 1733. Population (estimated), in 1897, 18,430. Chief town, Christiansted (q.v.).

SANTA CRUZ. The county-seat of Santa Cruz County, Cal., 80 miles south of San Francisco, at the mouth of the San Lorenzo River, on Monterey Bay and on the Southern Pacific Railroad and several steamship lines (Map: California, B 3). It is a watering place of considerable repute. There are the curiously carved cliffs extending for miles along the coast, Sequoia Park, and the celebrated Big Tree forest, a few miles distant. The Public Library contains 15,000 volumes. The leading manufactures are leather, lime, cement, asphalt, gunpowder, and lumber products. The government, under the charter of 1876, is vested in a mayor, chosen biennially, and a unicameral council. On the site of Santa Cruz a Spanish mission of the same name was established in 1791. Population, in 1890, 5596; in 1900, 5659.

SANTA CRUZ, **ANDRES** (1794-1865). A Bolivian general and politician, born at La Paz in Bolivia. In 1820 he joined the patriots and was promoted to the rank of brigadier-general in 1822 for his services at Pichincha. After the defeat at the Desaguadero he went to Lima, was employed by Bolívar on various diplomatic missions, and was military chief and president of the council of government previous to the election of Lamar as President of Peru in 1827. In 1828 he was elected President of Bolivia for ten years and immediately began to apply his plans for uniting Peru and Bolivia. By 1836 he had so far subjugated Peru that he was appointed by Congress protector of the confederation. Chile, alarmed at these successes, began war against Santa Cruz and defeated him completely at Yungay in 1839.

SANTA CRUZ DE LA PALMA. *dã lá pãl'mã.* The capital of Palma, one of the Canary Islands, situated on a bay of the eastern coast of the island (Map: Spain, F 5). It is a thriving commercial town with a good harbor, having shipyards, and ship-building being the chief industry. It exports fruit, wine, cochineal, and tobacco. Population, in 1900, 7383.

SANTA CRUZ DE LA SIERRA. *dã lá sã-er'ra.* Capital of the Department of Santa Cruz, Bolivia, situated 170 miles northeast of Sucre (Map: Bolivia, E 7). It has a cathedral under construction and a national college with faculties of law, medicine, and theology. There are flour and sugar mills, and a considerable trade with the Indians of the plains. Population, 11,000.

SANTA CRUZ DE NAPO, *dã nã'põ.* A town of Marinduque, Philippines, situated at the head of a bay on the northeast coast of the island (Map: Philippine Islands, G 6). It has a well-protected harbor with safe anchorage for large steamers, and provided with a stone breakwater 1000 yards long. Population, estimated, in 1899, 15,797.

SANTA CRUZ DE TENERIFE, *tã'nã-rë'fã* (Eng. *Teneriffe*, *ten'e-rif'*). The capital of the Canary Islands, situated at the head of a bay near the northeastern end of the island of Tenerife (Map: Spain, F 5). It is defended on the seaward side by several forts and is well built, with straight streets and modern houses. The principal square, the Plaza de la Constitución, contains a large monument with a statue by Canova. The principal buildings are the house of the Captain-General, the civil government building, and the hospitals; the town has a high school, a school of navigation, a preparatory academy, a public library, and a museum of natural history. An aqueduct five miles long supplies water from the mountains. The harbor is protected by a breakwater and has good facilities for coaling. Santa Cruz is the second seaport in the Canary Islands. It exports sugar, cochineal, almonds, wine, cattle, and agricultural products. Its population in 1887 was 18,830; in 1900, 35,955.

Santa Cruz was founded by the Spaniards in 1494. It was attacked by an English fleet under Blake in 1657, and by Nelson in 1797; it was in the latter engagement that Nelson lost his arm. The city became capital of the islands in 1822.

SANTA CRUZ ISLANDS. A group of seven large and a number of small islands in Melanesia, in latitude 11° S., longitude 166° E., north of the New Hebrides and southeast of the Solomon Islands (Map: Australasia, J 4). Aggregate area, 356 square miles. The large islands are mountainous and volcanic, the smaller mostly of coral formation. The climate is hot, moist, and unhealthy. The vegetation resembles that of New Guinea, and includes the mangrove, coconut, sago-palm, and breadfruit tree. The inhabitants (about 7000) are mostly Melanesians, though in some of the islands Polynesians predominate. They are still uncivilized and hostile to Europeans. The islands are now under the administration of the British High Commissioner for the Western Pacific. They were discovered by Mendaña in 1595.

SANTA FÉ. *fã.* A province of Argentina, situated in the eastern portion of the Republic

and bordered by the Paraná River on the east (Map: Argentina, E 10). Area, 59,916 square miles. The surface is mostly level, well wooded in the northern part, and especially well adapted for agriculture and stock raising. The chief rivers are the Paraná and its tributary the Salado. The climate is not unhealthy, and the rainfall is sufficient. The agricultural lands are found chiefly along the Paraná, where large plantations are situated. Wheat, corn, flax, and lucerne are the chief agricultural products. There are a number of large industrial establishments, such as flour and saw mills, tanneries, sugar mills, foundries, and brick yards. The railway mileage of the province is the largest in the Republic. Population, in 1900, 536,236. The chief commercial town is Rosario, on the Paraná, and the capital is Santa Fé (q.v.).

SANTA FÉ. The capital of the Province of Santa Fé, Argentina, situated on an arm of the Paraná River at its confluence with the Salado, 95 miles north of Rosario (Map: Argentina, E 10). It is a well-built city, with a modern aspect, and has several lines of street railroads. Its chief institutions are a large Jesuit college, a normal school, and a seminary. Railroads connect it with all the important cities of the Republic, and a short road runs to its port, Colastiné. The chief industry is ship building, and the principal exports are lumber, wool, and cattle. Population, in 1895, 15,999; of the commune, 24,755.

SANTA FE. The capital of New Mexico, and the county-seat of Santa Fe County, on Santa Fe River and on the Atchison, Topeka and Santa Fe and the Denver and Rio Grande railroads (Map: New Mexico, F 2). The city as originally laid out by the Spaniards has been much changed since the American occupation. The old Spanish buildings which still remain are constructed mostly of adobe. The main business structures centre about the Plaza, upon one side of which is the palace, an edifice where the various Governors of the Territory from the early Spanish times to the present have resided. In the historical museum connected with the palace are early Spanish paintings and interesting remains of the Indian and Spanish periods. Other places of interest are the partially reconstructed Cathedral of San Francisco, the Church of San Miguel, and old Fort Marcy. Santa Fe also has the Capitol, a penitentiary, a Federal building, a hospital, and the Territorial Orphan Asylum. The educational institutions comprise Saint Michael's College, schools for the deaf and dumb, the Loretto Convent, and the Government and Saint Catherine's Indian schools. The most important industries are stock raising and mining. There are also deposits of kaolin and clay in the vicinity. The government is vested in a mayor, chosen annually, and a unicameral council. Population, in 1890, 6185; in 1900, 5603.

A party of Spaniards visited the site of Santa Fe in 1542 and found there a large Indian pueblo with a population estimated at 15,000. About 1605, the pueblo being then deserted, the Spanish made a settlement here under the name 'La Ciudad Real de la Santa Fé de San Francisco,' enslaved the Indians in the neighborhood, and opened up extensive gold and silver mines. In 1690 the Indians captured the place and expelled the Spaniards, who, however, regained possession

SANTA FE DE BOGOTÁ, dá bó-gó-tá'. The capital of Colombia. See **BOGOTÁ**.

SANTALS, or **SON'THALS**. A people of Dravidian stock in Western Bengal, Northern Orissa, and Bhagalpur. They are of low stature, and dolichocephalic, with dark skins, and wavy hair. Some of the Santals are good agriculturists; others, in the more remote parts of the country, are still practically in the hunting stage. Except the few who have been converted to Hinduism or to Christianity, the Santals are 'nature-worshippers' with a sun cult and a belief in evil spirits. Their native system of government is village patriarchy. Like the Dravidian Tamils, the Santals have furnished many temporary or permanent emigrants from Hindustan, who have settled in Farther India. The Santals are generally monogamous, although polygamy and polyandry are not at all unknown among them. A grammar of the Santal language has been published (Benares, 1873) by Skrefvmd, and a collection of "Traditions and Institutions of the Santhals," written down from the dictation in Santali of Kolean Haram, an old Santal, appeared at Benagoria in 1887. Consult: Man, *Sonthalia and the Sonthals* (London, 1867); Dalton, *Descriptive Ethnology of Bengal* (Calcutta, 1872).

SANTA FÉ DE BOGOTÁ, dá bó-gó-tá'. The capital of Colombia. See **BOGOTÁ**.

SANTA MARGHERITA LIGURE, mār'-gá-ré-tá le-gó-rá. A seaport and bathing resort in the Province of Genoa, Italy, 15 miles east-southeast of Genoa (Map: Italy, D 3). Coral fisheries are carried on and there are manufactures of olive oil and rope. Population (commune), in 1901, 7169.

SANTA MARÍA, má-ré-tá. A town of Northern Luzon, Philippine Islands, in the Province of Ilocos Sur, situated two miles from the coast and 11 miles southeast of Vigan, on the highroad and projected railroad from Manila to Laoag (Map: Philippine Islands, E 2). Population, estimated, in 1899, 10,030.

SANTA MARÍA, DOMINGO (1820-90). A South American politician, born in Santiago de Chile. He was obliged to leave Chile because of his share in the events of 1850-51 and was again exiled in 1858. Upon his return to Chile he held the positions of Minister of Finance (1863-64), envoy to Peru, judge of the Supreme Court (1868), and president of the Court of Appeals (1874). He was a member of President Pinto's Cabinet, with the portfolios of Foreign Affairs, the Interior, and War, and was President of the Republic in 1881-86, when he again became president of the Court of Appeals. Many of the great railroads were built during his administration, the Arancumian Indians were brought into civilization, and the disputes with

Peru arranged on a more secure peace basis. His works include *Biografía de José Miguel Infante* (1853) and *Memoña histórica sobre la abdicación del director Don Bernardo O'Higgins* (1858).

SANTA MARIA CAPUA VETERE, ká-pú-á vā'tá-rá. A city of South Italy, in the Province of Caserta, 15 miles north of Naples, located on the site of ancient Capua, of whose stones it was partly rebuilt (Map: Italy, J 6). It is an active, thriving, attractive place, with a population of 22,146 (commune) in 1901. Its large, reconstructed cathedral, dating from 1766, has five naves and 52 columns. The Roman ruins attract many sight-seers. Ancient Capua, in Campania, was second only to Rome among the cities of Italy in wealth and population. Under the name of Volturnum it was the chief of the twelve cities said to have been founded by the Etruscans in this part of Italy. In B.C. 343 it formed an alliance with Rome for protection against the Samnite tribes of the mountains. After the battle of Cannæ, B.C. 216, the popular party opened the gates to Hannibal, whose army rapidly degenerated here under the new corrupting surroundings. The Romans obtained possession of the city in B.C. 211. In the fifth century A.D. Capua was devastated by the Vandals under Genseric. It recovered its prosperity again to some extent, but was totally destroyed by the Saracens in 840. Among the antiquities one of the most remarkable is the amphitheatre constructed of travertine, of which well-preserved arches, corridors, and seats for spectators still remain.

SANTA MARIA DEL FIORE, dél fé-ó-rá. The *Duomo* or cathedral of Florence (q.v.).

SANTA MARÍA DE PANDI, pán'dé. A town of Luzon, Philippine Islands, in the Province of Bulacán, situated near the Manila-Dagupan Railroad, nine miles east of Malolos (Map: Luzon, E 7). It was a handsome and well-built town, but, as it was used as a military centre by the insurgents, it was burned by the American troops and now consists chiefly of nipa huts. Population, estimated, in 1899, 10,508.

SANTA MARIA MAGGIORE, má-d-jó-rá. One of the oldest churches in Rome, reputed to have been built about 352 by Pope Liberius and reërected in the fifth century. Old marble columns and mosaics of this date are preserved in the nave, also fine fifteenth-century mosaics of the Coronation of the Virgin. Over the altar in the Borghese Chapel is an old picture of the Virgin ascribed to Saint Luke. This is one of the five 'patriarchal churches' and derives its name of Saint Mary Major from its importance among the eighty churches in Rome dedicated to the Virgin.

SANTA MARTA, mār'tá. The capital of the Department of Magdalena, Colombia, on the Caribbean coast, 45 miles east of the mouth of the Magdalena River (Map: Colombia, C 1). It has a cathedral, and is a port much frequented by vessels plying among the Antilles. Population, about 6000. Santa Marta was founded in 1525. It was long an important centre of exploration and conquest and was repeatedly sacked and several times entirely destroyed by pirates and Indians. Near the town is the hacienda where Simon Bolivar died in 1830.

SANTA MAURA, mou'rá, or LEUCADIA (Mod. Gk. *Lerkas*). One of the Ionian Islands, belonging to Greece, off the west coast of Acar-

mania, from which it is separated by a passage about a mile wide (Map: Greece, B 3). Area, 109 square miles. It is traversed from north to south by a range of hills which end at the southern extremity in high white cliffs. The inhabitants, who numbered 31,769 in 1896, are engaged chiefly in fishing and the manufacture of salt. Chief town, Amaxiehi (q.v.).

SANTANA, sán-tá'na, Pedro (1801-61). A President of Santo Domingo, born at Hincha. In 1844, when Juan Pablo Duarte rebelled against Haitian rule, Santana inflicted upon the Haitians a crushing defeat at Azua that practically decided the war. Soon afterwards he was proclaimed supreme chief of the Dominican Republic, and upon the organization of a regular government he was elected its first President. In 1848 he was succeeded by Jimenes. At the time of the Haitian invasion under Soulouque (See FAUSTIN 1.), in 1849, Santana with a force of scarcely 400 routed Soulouque's force of 4000. He then defeated Jimenes and for a time ruled as dictator. In 1853 he was again elected chief magistrate. During this administration he repelled another invasion of the Haitians. In 1856 he was deprived of power and succeeded by Riez. In 1858, however, Riez was driven into exile and Santana again became President. In March, 1861, practically on his own authority, he ceded Santo Domingo to Spain. He was appointed Captain General, but soon resigned. In August, 1863, when an illiterate peasant organized the rebellion which finally swept the Spaniards from the island, Santana went to the city of Santo Domingo and offered his services in vain to the Spanish authorities. His death occurred only a few months before Spain acknowledged the regained independence of Santo Domingo.

SANTANDER, sán'tán-dár'. The capital of the Province of Santander in Old Castile, and one of the principal seaports of Northern Spain. It is charmingly situated on the north shore of a land-locked inlet of the Bay of Biscay (Map: Spain, D 1). There are few buildings of interest except the old Gothic cathedral dating from the thirteenth century. The town has a provincial high school, a normal and a nautical school, and a theological seminary. On the beach of Sardinero are hotels and bathing establishments. The fisheries are important, and there are salting and pickling establishments, sugar and oil refineries, iron foundries, and manufactures of glass, candles, soap, perfumes, sulphuric acid and other chemicals, and cotton goods. The harbor is spacious and deep and provided with ship yards and extensive wharves, accessible for the largest ships and recently improved and enlarged. The chief exports are iron ore, of which 406,996 tons were exported in 1898, preserved food, flour, paper, wine, and manufactured articles. Population, in 1887, 42,125; in 1900, 54,346.

SANTANDER. A department of Colombia, South America, bounded by Venezuela on the north (Map: Columbia, C 2). Area, 16,409 square miles. It is traversed by the Eastern Cordillera of the Andes, and the greater part of its surface is mountainous. In the plains along the Magdalena are cultivated sugar, cacao, coffee, tobacco, and cotton. Gold, silver, and other minerals are mined to some extent. The population was estimated in 1896 at 560,000. Capital, Bucaramanga (q.v.).

SANTANDER, FRANCISCO DE PAULA (1792-1840). A South American statesman, born at Rosario de Cúcuta, New Granada. Immediately upon the proclamation of independence in 1810 Santander joined the patriots and fought under Nariño and Bolívar, and was on Bolívar's staff in 1817-18. He was promoted to the rank of general of division at the battle of Bozaca in 1819 and was appointed by Bolívar Vice-President of the State of Cundinamarca, and in 1821 was elected Vice-President of Colombia. He was re-elected in 1827, and during Bolívar's repeated absences ruled the country with wisdom and decision. Afterwards he opposed Bolívar and was condemned to death for supposed complicity in a conspiracy to murder him. Santander's sentence was changed to exile, and he remained abroad until his election to the Presidency of New Granada in 1832. His administration was beneficial, and after his term ended in 1836 he was twice elected to Congress. He wrote *Ipuantamento para las memorias de Colombia y Nueva Granada* (1837).

SANT' ANGELO, CASTLE OF. See HADRIAN, TOMB OF.

SANTAREM, sán'tá-rân'. A river-port of Portugal, capital of the District of Santarem, on the right bank of the Tagus, 40 miles northeast of Lisbon (Map: Portugal, A 3). It carries on an active trade in wine and olive oil with Lisbon. Population, in 1900, 8704. Santarem was formerly an important fortified place.

SANTAREM. A town of the State of Pará, Brazil, 440 miles west of the city of that name, on the right bank of the Tapajós, near its confluence with the Amazon (Map: Brazil, G 4). It controls the rubber trade of the Tapajós. The rich agricultural and pastoral region also produces cacao. Near Santarem is an agricultural colony composed of emigrants from the Southern United States. Population, in 1889, about 4500.

SANTA RITTA DURÃO, sán'tá rit'tá dur-roun', José da (1737-84). A South American poet, born near Mariana, Minas Geraes, Brazil. He studied in the Jesuit College at Rio de Janeiro and at the University of Coimbra, and entered the Order of Saint Augustine at Leira. Afterwards he lived in Rome and about 1778 returned to Coimbra as professor of theology, and prior of his Order. His most important work is the epic *Caramuru* (1781), a description of the discovery and colonization of Bahia by Diego Alvares.

SANTA ROSA, sán'tá ró'sá. A town of the department of the same name, Guatemala, 30 miles southeast of the capital. It is an extensive live-stock centre and the district produces sugar, coffee, and grains. Its climate is far from salubrious, since undrained areas are near. Population, about 6300.

SANTA ROSA. The capital of the Department of Copán, Honduras, 150 miles northwest of Tegucigalpa (Map: Central America, C 3). It has a college. Gold, silver, and copper mines are near; tobacco, coffee, sugar, and grain are produced in abundance. Population, about 6700.

SANTA ROSA. The county-seat of Sonoma County, Cal., 52 miles north of San Francisco, on the Southern Pacific and the California Northwestern railroads (Map: California, B 2). It is the seat of the Pacific Methodist College (Meth-

SANTO SPIRITO, opened in 1861, and of the same name as the territory of the Sacred Heart. The principal occupations are the public library, city hall, and the cathedral. The adjacent country is mostly devoted to extensive fruit growing and nursery work. The city is engaged largely in wine-making, and fruit canning and in the manufacture of leather, woolen goods, flour, lumber products, etc. Large basalt quarries are worked in the vicinity. Canned goods, fruit, wine, hops, tannin, hay, cattle, flour, wool, and leather constitute the principal shipments. The government is vested in a mayor, chosen every two years, and a unicameral council. Population, in 1890, 5220; in 1900, 6673.

SANTA ROSA DE LOS OSOS, dá lós ó'sós. A town of the Department of Antioquia, Colombia, near the Cauca, 170 miles northwest of Bogotá. It is in the vicinity of rich gold deposits, but antiquated methods are employed in working them. Its high altitude (8560 feet) gives it a genial and healthful climate. Population, in 1892, 10,059.

SANTA ROSALÍA, ró'sá-lé'á. A town of the State of Chihuahua, Mexico, 80 miles southeast of the State capital, on the Mexican Central Railway (Map: Mexico, F 4). It is celebrated for its hot sulphur baths. Population, about 8000.

SANTA TECLA, tek'lá, or **NUEVA SAN SALVADOR**. A town of the Republic of Salvador, eight miles southwest of the capital, San Salvador, in a picturesque valley at the foot of the volcano of the same name (Map: Central America, C 4). The town is well built, with broad, straight streets and notable public edifices such as the hospital, municipal building, and the Concepción and Carmen churches. Its *plaza de armas* is the most beautiful in the Republic. Santa Tecla was founded in 1854 after the destruction of San Salvador by an earthquake. The attempt to make this the capital was not successful. Its population in 1890 was 13,715.

SANTAYANA, sán'tá-yá'ná, GEORGE (1863—). An American poet, educator, and philosopher, of Spanish parentage, born in Madrid. He was graduated from Harvard College in 1886, where he became instructor and assistant professor in philosophy. His first volume of verse, entitled *Sonnets and Other Poems*, appeared in 1894, and was remarkable for the depth of thought and finished quality of the verse. In 1896 he published *The Sense of Beauty*, an inquiry into the physical and psychological causes for the aesthetic sense in man; in 1898 appeared *Lucifer, a Theological Tragedy*; in 1900 a volume of essays entitled *Interpretations of Poetry and Religion*; and in 1901 *The Hermit's Christmases and Other Poems*.

SANTEE'. The chief river of South Carolina. It is formed near the centre of the State by the junction of the Congaree and Wateree or Catawba, both of which rise in the Blue Ridge in North Carolina (Map: South Carolina, D 3). The combined stream flows southeast and enters the Atlantic Ocean by two arms south of Winyah Bay. It is 150 miles long to the junction, and 450 miles to the source of the Catawba. Steamers can navigate to Columbia on the Congaree, and to Camden on the Wateree.

SANTERAMO IN COLLE, sán'tá-rá'mó éh kól'le. A town in the Province of Bari, Italy,

23 miles southwest of Bari (Map: Italy, L 7). It markets cereals, wine, fruit, and cattle. Population (commune), in 1901, 13,662.

SANTERRE, sán'tér', ANTOINE JOSEPH (1752-1809). A French revolutionist, born in Paris. In 1789 he was the owner of a large brewery in the Faubourg Saint-Antoine. At the outbreak of the Revolution he commanded a battalion in the National Guard; took part in the storming of the Bastille, and became a fierce Jacobin. He stirred up the *emute* of the Champ de Mars in 1791 and led in the events of June 20 and August 10, 1792. As commander of the National Guard he was present at the trial and execution of Louis XVI., whose last words he ordered the drums to drown. Made general of division in 1793, he led an army against the Vendéans, but was beaten. He was arrested and imprisoned till the fall of Robespierre. After the institution of the Directory he lost all prominence.

SANTI, sán'té, GIOVANNI (c.1435-94). An Italian painter and poet, father of Raphael. He was born in Colbordolo, in the Duchy of Urbino, was a petty merchant for a time, then studied under Piero della Francesca, and seems to have been an assistant of Melozzo da Forli. He painted several altar-pieces, two now in the Berlin Museum; a Madonna, in the Church of San Francesco, in Urbino; one at Santa Croce in Fano; one in the National Gallery at London; and another in the gallery at Urbino; an Annunciation at the Brera in Milan; and a Jerome in the Lateran. His poetry includes an epic in the honor of the Duke of Urbino and a long discourse on painting. Consult Schmarsow, *Giovanni Santi* (Berlin, 1887), in which quotations and summaries of his poems are given and a very sympathetic criticism of his simple style, chill coloring, and graceful treatment of the figure.

SANTIAGO, sán'tá-á'g'ó (SÃO THIAGO). The largest and most important of the Cape Verde Islands (q.v.).

SANTIAGO. A central province of Chile, bounded on the east by Argentina, on the west by the Pacific, on the south by the provinces of O'Higgins and Colchagua, and on the north by Valparaíso and Aconcagua (Map: Chile, C 10). Area, 5223 square miles. It is traversed in the east and west by mountain ranges inclosing a central valley. It is but scantily watered and agriculture is possible only by irrigation. Mineral deposits and springs occur in several parts of the province, and large quantities of salt are obtained from the lagoons on the coast. Population, in 1895, 415,636. Capital, Santiago.

SANTIAGO, or **SANTIAGO DE CHILE**. The capital of Chile and of the Province of Santiago, situated on a small tributary of the Maipo in the central valley between the coast range and the Andes, 68 miles southeast of Valparaíso (Map: Chile, C 10). The location is extremely romantic, being surrounded by mountains on all sides. On the east tower the snow-clad Andes, some of whose loftiest summits, including Aconcagua, are in plain sight. Several hills rise within the city, such as the steep red porphyry crag of Santa Lucía, about 200 feet high, on which the first settlers withstood a six years' siege by the fierce Araucanian Indians. It is now laid

out as a public park; there are several large parks within and around the city, in which irrigation maintains a luxuriant vegetation, although the rainfall is very scanty and the surrounding plains are naturally arid. The houses are generally built in the old Spanish style, one or two stories high, with a central patio, and often with extensive gardens.

Santiago is the most populous city on the entire western slope of America, with the exception of San Francisco. An extensive system of street railroads traverses the city in all directions. During the last two or three decades numerous large buildings, several stories high and of solid stone construction, with artistic façades, have been built, including many sumptuous private residences. The streets are exceptionally well paved, clean, and broad. The Alameda or Avenida de las Delicias, which divides the city into two halves, is one of the finest boulevards of South America. It is more than 300 feet wide, lined with several rows of poplars, and ornamented with fountains and statues, many of the latter being the spoils of the Peruvian war. The prominent buildings are the large mint, the Exposition Palace, the Hall of Congress, a magnificent opera house, the cathedral, and the university building. The university, the head of the educational system of the country, was founded in 1743, and has faculties of law, philosophy, medicine, and science, with over 1000 students. Other educational institutions are the Pedagogical Institute; the National Library, containing in 1897 101,000 volumes; the National Museum, one of the foremost in South America; normal, military, trade, and agricultural schools; an astronomical observatory; and a botanical garden. The industries are unimportant, but there is some trade, chiefly in the hands of foreigners. Santiago is connected by railroad with Valparaíso, Concepción, and Buenos Ayres. Population, in 1885, 189,392; in 1900, 269,886. Santiago was founded in 1541 by Pedro de Valdivia.

SANTIAGO, BATTLE OF. See SPANISH-AMERICAN WAR.

SANTIAGO, RIO GRANDE DE, or RIO SANTIAGO. The largest river in Mexico. It rises in a small lake at the foot of the volcano of Toluca, near Mexico City, and flows under the name of Rio Lerma first northwest, then west through the States of Mexico and Guanajuato, emptying into Lake Chapala (q.v.), on the boundary between Michoacán and Jalisco. Issuing from the north end of the lake as the Rio Santiago, it flows northwest through Jalisco and the Territory of Tepic, and empties into the Pacific Ocean near San Blas. Its total length is about 550 miles. In its upper course it has a very swift current, and below Lake Chapala it breaks through the Sierra Madre in deep and rocky gorges, where it is obstructed by reefs and falls. In its extreme lower course it is very shallow, so that no part of it is permanently navigable.

SANTIAGO DE COMPOSTELA, dâ kôm-pô-stâ'la, or COMPOSTELLA. A celebrated town of Galicia, Northwestern Spain, in the Province of La Coruña, situated among the mountains 28 miles south of Corunna (Map: Spain, A 1). Tradition ascribes its origin to the finding in the ninth century of the remains of the Apostle Saint James (Santiago), the patron saint of Spain. According to the legend the spot was

pointed out to Bishop Theodomir by a star, whence the place was called 'Campus Stellæ' (field of the star), later corrupted to Compostela. A church was built over the grave, which became the goal of vast numbers of pilgrims. The church was destroyed by the Moors in 997, and in 1082 the present cathedral was begun. It is a vast cruciform granite structure, and the best example of the early Romanesque architecture in Spain. The façade, which dates from 1138, is very elaborately decorated in baroque style. The crypt contains the shrines of the Apostle and his two disciples. The city, which is the see of a metropolitan archbishop, contains several other churches and a large number of convents and other ecclesiastical buildings, some of which, such as the convents of San Francisco and San Martín, are of great size. The large Hospital Real, opposite the cathedral, was built in 1501 by Ferdinand and Isabella for the reception of pilgrims, who are still numerous. There are a university, founded in 1504, and several academies. Population, in 1900, 21,917.

SANTIAGO DE CUBA, dâ kôw'bâ. The largest province of Cuba, occupying the eastern end of the island bounded on the northwest by the Province of Puerto Príncipe and surrounded on the other sides by the sea (Map: Cuba, J 6). Area, 12,468 square miles. This is the highest and most mountainous part of Cuba. The mountains are divided by the valley of the Cauto, the largest river of Cuba, which traverses the province from east to west. Along the south coast runs the well-defined range of the Sierra Maestra, rising in the Pico de Turquino to a height of 8320 feet. In the east the range merges with the northern mountains in a wilderness of hills, ridges, and precipices. There are numerous fertile valleys in the province, yielding all the agricultural products of the island, and the mineral wealth is extensive, consisting especially of copper, and including also iron, mercury, and marble. The chief industries are mining, sugar and tobacco manufacture, cattle-raising, and the exploitation of the forests, which yield fine cabinet woods. Population, in 1899, 327,715. The capital is Santiago de Cuba.

SANTIAGO DE CUBA. The capital of the province of the same name in Cuba, and the second city of the Republic in size and importance. It lies at the northeastern end of the Bay of Santiago, on the southeastern coast of the island, 470 miles in a straight line southeast of Havana (Map: Cuba, K 6). The bay is a harbor of the first class, very deep and capacious, and completely land-locked. It is 5 miles long, with an average breadth of 1½ miles, and has an extremely narrow entrance, in one place only 220 yards wide. The entrance is protected by the fortresses of Morro and Socaba, which crown the rocky cliffs, but are more picturesque than formidable. Within the entrance are the Batería de la Estrella and several minor defenses. The bay and the city are inclosed by mountains which cut off the sea breezes and render the location hot and unhealthy. The mean temperature in summer is 88° and in winter 82°. The city is built on a sloping amphitheatre of hills, with generally crooked and hilly streets and one-storied houses. Previous to the American occupation the streets were badly paved and unclean, while yellow fever was prevalent, but

the city has greatly improved. The water supply is furnished, in part, by an aqueduct, but the principal source is the city wells. The best street is the Calle de San Cristóbal, running along the front. The Plaza de Armas, which has many palaces planted with trees, is surrounded by some of the best buildings in the city, including the Government palace and the cathedral. The latter is one of the oldest and largest churches in the island. The Government palace, the central market, military hospital, and the Hospital de Caridad are modern buildings, the last mentioned being one of the best in the city. The industries are largely dependent on the rich mining districts in the neighborhood. Copper and manganese are mined, but the iron mines are the most extensive, employing 1000 hands, and producing monthly nearly 50,000 tons of ore for export to the United States. In the city are iron foundries and machine shops, and also a number of tobacco factories. The commerce is very extensive both with foreign countries and with the remainder of Cuba. The domestic trade, which until then was carried on chiefly by coasting steamers, was afforded additional facilities by the completion in 1902 of the Cuban main trunk railroad traversing the whole length of the island from Havana to Santiago. The exports are tobacco, coffee, sugar, iron ore and manganese, and cabinet woods. Population, in 1899, 43,090.

Santiago was founded in 1514 by Diego Velasquez. It was soon after made the capital of Cuba, which it remained for about a century. In common with other towns on the Spanish Main, it suffered many vicissitudes from pirates and hostile fleets. In the Spanish-American War of 1898 it became the chief objective point of the American attack on account of the fact that the Spanish fleet under Admiral Cervera had taken refuge in the harbor. The city was invested by the American army under General Shafter and by a blockading squadron under Sampson. The heights of El Caney and San Juan, in front of the town, were stormed on July 1st; the fighting continued on the 2d; on July 3d the Spanish fleet, attempting to escape, was destroyed outside the harbor entrance; and on July 14th the commanding general, Toral, capitulated, the formal surrender taking place on July 17th. See SPANISH-AMERICAN WAR.

SANTIAGO DE CUBA, SOCIETY OF THE ARMY OF. An hereditary military association, organized in Santiago de Cuba on July 1, 1898, and completed at Camp Wickoff, Montauk Point, Long Island, on September 15, 1898, by the adoption of a constitution and the election of officers. It has for its object to preserve the memory of the events of the campaign which resulted in the capture of Santiago on July 17, 1898. It admits to membership all those officers and soldiers of the United States army who constituted the expeditionary force to Santiago de Cuba, and who worthily participated in the campaign between the dates of June 14 and July 17, 1898. The insignia consists of a badge pendant from a ribbon. The badge is in the form of a Maltese cross. The colors of the ribbon are those of Spain, a blue and red. The motto of the society is: "As he died to make men holy, let us die to make men free." The membership is about 3500.

SANTIAGO DE LAS VEGAS, dā las vā'gās. A town situated in the Province of La

Habana, situated in a healthful location 8 miles south of Havana (Map: Cuba, C 3). Its leading industry is the manufacture of tobacco. Population, in 1899, 7151.

SANTIAGO DEL ESTERO, s̄s-t̄s'ró. A province of Argentina, bounded on the north by El Chaco, on the east by Santa Fé, on the south by Córdoba, and on the west by Catamarca and Tucumán (Map: Argentina, E 9). Area, 39,761 square miles. With the exception of the western part, which is somewhat mountainous, the surface of the province is generally level, and is very largely covered with forests, though the southern part consists more of open pampas, and takes in a portion of the Salinas Grandes. It is watered by the Saladillo and the Salado, and has a fertile soil. Lumbering is the chief industry, and there are a large number of steam saw-mills. Agriculture and stock-raising are also important. Population, in 1900, 180,612. Capital, Santiago del Estero.

SANTIAGO DEL ESTERO. The capital of the province of the same name, in Argentina, situated on the river Dulce, on the railroad lines from Tucumán to Córdoba and Santa Fé (Map: Argentina, E 9). It has a national college and a normal school, but has declined in importance. Population, in 1895, 9817. It was founded in 1552, being the oldest town in the Republic.

SANTIAGO DE LOS CABALLEROS, dā lōs kā'bā-lyā'rōs. A town of the Republic of Santo Domingo, on the right bank of the Yaquí River, 24 miles south of Puerto Plata, with which it has railway connection (Map: Antilles, M 5). It is situated in the midst of the most fertile and healthful valley of the Republic, known as the Vega Real, and is the largest town of the interior, with a flourishing trade in tobacco. Population, about 10,000.

SANTILLANA, s̄n'té-lyā'nā, Iñigo LÓPEZ DE MENDOZA, Marqués de (1398-1458). A noted Spanish soldier, poet, and scholar, born at Carrion de los Condes, Old Castile, the son of an admiral and nephew of the Grand Chancellor Pedro Lopez de Ayala. From early manhood a prominent figure at the Court of Juan II. of Castile, he was invested with the Marquisate of Santillana for his successful campaign against the Moors of Granada, in 1437-39, and was created Count of Real de Manzanares for his part in deciding the battle of Olmedo (1445). He joined the conspiracy which brought about the downfall of the favorite Alvaro de Luna, in 1453, but after 1454 took less and less part in public affairs, devoting himself chiefly to literary pursuits, and died at Guadalajara. While not an original genius, Santillana was an extremely skillful versifier, gifted with unusual imitative powers which enabled him to reproduce with great felicity the characteristics of the most dissimilar writers. He contributed much toward the transformation of Castilian poetry after classical Italian and courtly Provençal models and was the first in Spain to compose sonnets in imitation of Petrarch. These are, however, of prevalently historical interest, while genuine lyrical charm pervades his *Scronyllas* (pastorals), of which the song of the "Vaquera de la Finojosa" attained the widest popularity. Among his didactic poetry are to be especially noticed the

Proverbios or *El Centiloquio* (1449), a collection of one hundred proverbs in eight line stanzas; the *Diálogo de Blas contra Fortuna* (1448); and the *Doctrinal de privados* (1453). The dramatic dialogue *Comedieta de Ponza* is an allegorical poem in Dantesque manner, founded on the disastrous naval combat off Ponza, in 1435, in which the kings of Aragon and Navarre and the Infante of Castile were taken prisoners by the Genoese. Santillana's complete *Obras* were edited by Amador de los Rios (Madrid, 1852). Consult Ticknor, *History of Spanish Literature*, i. (Boston, 1872).

SANT'LEY, CHARLES (1834—). An English barytone singer, born in Liverpool. He studied singing in Italy, later with Garcia in London, and appeared on the stage first in 1857. In 1859 he married Gertrude Kemble, a well-known soprano. He was for a few years with the Carl Rosa Opera Company, but his greatest successes came on the concert and oratorio platform. He toured with great success in America in 1871 and 1891, in Australia in 1889-90, and in Cape Colony in 1893. In 1892 he published *Student and Singer*. His ballads, songs, and church music are well known.

SANTO DOMINGO, sán'tó dô-mén'gó, or DOMINICAN REPUBLIC. A republic in the West Indies occupying the eastern and larger part of the island of Haiti (q.v.), with an estimated area of over 18,000 square miles (Map: West Indies, M 5). Through the centre of the western part of Santo Domingo extend the Cordilleras del Cibao, which form the backbone of the island. Through the eastern part stretches the Muertos range. Though mountainous, the whole region, which is richly forested, lends itself readily to tillage. The numerous small plains are traversed by navigable rivers, and are unsurpassed for fertility. The principal product is sugar, which is cultivated on extensive plantations, but largely by foreign capitalists. Cacao, coffee, and bananas are also grown extensively, and there are valuable forests of mahogany. Of late there has been some attempt to increase the cotton output, and American capital has been invested in the exploitation of the rich mineral resources, which comprise iron, gold, copper, coal, salt, and a few other minerals.

The commerce is very small, considering the vast natural resources of the Republic. The imports were \$2,246,000 in 1897 and \$2,986,921 in 1901, and the exports \$3,568,000 in 1897 and \$5,224,000 in 1901. The chief exports are sugar, cacao, coffee, mahogany, tobacco, bananas, and animal products. Over 60 per cent. of the trade is with the United States. The chief ports are Santo Domingo, Sanchez, and Puerto Plata. The communication and transportation facilities are utterly inadequate. There are altogether about 130 miles of railway lines connecting the ports of Sanchez and Puerto Plata with the interior. The Constitution of Santo Domingo, adopted in 1844, and repeatedly modified since then, provides for a President elected indirectly for four years and assisted by an appointed Cabinet. The legislative power is vested in a National Congress consisting of twenty-four deputies, elected for two years, by restricted suffrage. The governors of the provinces, the prefects, and magistrates are appointed by the President. The finances of the Republic are in a deplorable state. The revenue

is derived almost exclusively from customs duties, and the budget balances at something over \$2,000,000. The foreign debt amounted in 1902 to over \$18,900,000 and the internal debt to \$2,845,550 gold and \$10,126,629 silver. The standard of value is the gold dollar of the United States, adopted in 1897, but the actual circulation is composed of depreciated paper and debased silver. The Roman Catholic religion is recognized by the State. Primary instruction is obligatory and gratuitous, and a number of secondary schools are maintained by the State. The Republic maintains a small standing army and a navy of three small gunboats. The population, estimated at 500,000, is composed principally of a mixed race of Spanish and aborigines, mulattoes and negroes. The predominating language is Spanish. The capital is Santo Domingo.

HISTORY. The history of Santo Domingo forms a part of that of Haiti (q.v.) till 1844. In February of that year the inhabitants of the Spanish part of the island proclaimed their independence under the leadership of Don Pedro Santana, who became first President of the Dominican Republic. He was followed in 1848 by the creole Jimenez, whose weak rule invited an attack by Faustin I. (Soulouque), Emperor of Haiti. Santana was made dictator and defeated Faustin at Ocoa, April 21, 1849. Another attempt by the Haitian ruler in the following year met with a like result. Buenaventura Baez, who was chosen President in 1849, was succeeded in 1853 by his rival Santana, who held power till 1856, in which year he repelled a third invasion from Haiti. He was succeeded by Baez, but in 1858 he regained power and ruled absolutely until 1861. In that year he proclaimed the annexation of Santo Domingo to Spain, and his action was at first acquiesced in by the people. The harshness of the Spanish rule, however, led to an insurrection in 1863, headed by José Maria Cabral, who in December, 1864, defeated the royalist forces near La Ganela. In May, 1865, Spain acknowledged the independence of the Republic. Baez was chosen President, but was driven out in 1866 and was succeeded by Cabral. The latter in turn had to flee in 1868, and Baez once more held power till 1873. During his administration occurred the negotiations with the United States looking toward the annexation of Santo Domingo, a favorite project with certain politicians in the United States since the early forties. During the early part of President Grant's administration, General O. E. Babcock was sent by the President to inquire into the conditions of the island and its resources. While there he negotiated a treaty of annexation (November 29, 1869), by which, on payment by this Government of \$1,150,000, the Dominican Republic was to become part of the United States. The treaty was ratified by the Dominican people, but met with bitter opposition in the United States Senate, and was finally rejected by a tie vote. A Congressional commission visited the island in 1871 and presented an exhaustive report entirely favorable to annexation. It was laid before Congress by the President, but no action was taken upon it. The Dominican Government renewed its overtures in 1874, but met with no success. After the Presidency of Gonzales (1873-79) there came a period of disturbed politics. In 1884 Ulisse Heureaux was chosen President, and after two years again obtained office. He ruled with reso-

and sustained of order, but perished by a volcanic eruption in October, 1899. He was succeeded by Amenez, who in turn was driven out by General Vasquez in 1902.

ΒΙΒΛΙΟΓΡΑΦΙΑ. Marles, *Histoire descriptive de Saint Domingo* (Tours, 1869); Klein, *Saint Domingo* (Philadelphia, 1870); Gabb, "On the Topography and Geology of Santo Domingo," in *Transactions of the American Philosophical Society*, vol. xv. (ib., 1873); Hazard, *Santo Domingo, Past and Present* (London, 1873); Léal, *La república dominicana* (Paris, 1888); Abad, *La república dominicana: viscón general y estadística* (Santo Domingo, 1889); Merino, *Elementos de geografía física, política e histórica de la república dominicana* (ib., 1889); Jordan, *Geschichte der Insel Haiti* (Leipzig, 1849).

SANTO DOMINGO. The capital of the Republic of Santo Domingo, situated on the south coast, at the mouth of the Ozama (Map: West Indies, M 5). The city is regularly built, but its streets are unpaved. It is still surrounded by picturesque walls, and contains interesting remains from former times, such as the ruins of large and well-built stone mansions, contrasting strangely with the present straw-thatched dwellings. There is a large Gothic cathedral, which was the resting place of the bones of Columbus until 1796, when what was believed to be the body of the discoverer was transferred to Havana, though the Dominicans claim that it still rests in their cathedral. A large statue of Columbus stands in the principal square. Other buildings and institutions worthy of mention are a former Jesuit college, a normal school, two hospitals, an arsenal, and barracks. The district is fertile. The city exports much sugar and coffee. Its harbor, however, is an open and dangerous roadstead, and the river is accessible only to very small vessels. Population, 25,000. Santo Domingo is the oldest European settlement in America, having been founded by Bartholomew Columbus in 1496.

SANTONIN (from *santonie*, from Lat. *Santonicus*, relating to the Santoni, from *Santoni*, a people of Aquitania; especially the *Santonium absinthium*, Santonic wormwood, also called *Santonica herba*, Santonic herb, which abounded in Aquitania), $C_{15}H_{14}O_3$. A neutral vegetable principle obtained from *santonica*, the unexpanded flower-heads of *Artemisia pauciflora*, a perennial plant of the order Compositae, growing in Persia and Asia Minor. Santonin is colorless, odorless, crystalline, practically insoluble in water. It is one of the most efficacious of the class of medicines known as anthelmintics or vermicides for roundworms. Two peculiar symptoms occur after the administration of santonin. The urine often acquires a reddish tint, which may give rise to an unfounded suspicion of the presence of blood in that fluid; and under its influence vision becomes remarkably affected for a few hours, every object appearing either yellow or green, red, blue, or violet. This change may come on suddenly. It passes off, leaving no ill effects.

SANTORIN, *sán'tó-rén'* (Anc. *Thera*; Mod. *Thira*). An island in the Ægean Sea belonging to the Greek nomarchy of the Cyclades (Map: Balkan Peninsula, E 6). It is situated 70 miles south of Naxos, and 120 miles east of the southeastern extremity of the Morea, and has an area of 27 square miles. It is crescent-shaped, forming with two smaller islands the

edge of an ancient crater now occupied by a circular sheet of water into which the coasts fall precipitously to a great depth. The island consists chiefly of volcanic material and rises in the volcano of Hagios Elias to a height of 1916 feet. Within historical times several new volcanic islets have risen from the surrounding water, the last in 1866. The island is treeless and poorly watered, but the volcanic soil is fertile. Wine and puzzuolana are exported. Population, in 1889, 11,924. The chief town is Thira, with a population of 1050. The island, under the name of Thera, was an important commercial State in ancient times and the mother country of the powerful colony of Cyrene in Africa. Remains of prehistoric dwellings have been found in Therasia and Southern Santorin, buried in part under an early eruption, of which the date cannot be determined with certainty. Mycenaean remains have also been found. The early inscriptions preserve a very primitive form of the Greek alphabet, containing only twenty of the twenty-two letters of the Semitic alphabet, and lacking the supplementary signs, though these were added under Ionian influence. (See ALPHABET.) Not only are the remains on the island important for the prehistoric civilization of the Ægean, but the excavation of the ancient city of Thera on the southeast coast, which was begun in 1898, has thrown much interesting light on the local history and life of a Greek island, especially during the Hellenistic and Roman periods. Consult: Müller von Gaertringen and others, *Thera, Untersuchungen, Vermessungen und Ausgrabungen in den Jahren 1895-1898* (vol. i., Berlin, 1899; vol. iv., Berlin, 1902). The inscriptions are published in *Inscriptiones Græcæ Insularum Maris Ægæi*, fasc. iii. (Berlin, 1898).

SANTORINI, *sán'tó-ré'nó*, GIOVANNI DOMENICO (1681-1737). An Italian anatomist, born in Florence and educated there by the Jesuits. He studied medicine in Pisa, under Malpighi, and then practiced in Florence, where he was professor of anatomy. His medical writings, especially those on anatomy and obstetrics, were long in high repute. Among his anatomical discoveries are the emissary veins leading out of the sinuses of the skull, the tubercles or cartilaginous knobs of the larynx, the risory muscles, and the gaps or fissures in the external ear.

SANTOS, *sán'tós*. A seaport of Brazil, in the State of São Paulo, situated on the Atlantic coast 200 miles southwest of Rio de Janeiro, and 25 miles south of São Paulo, the capital of the State, with which it is connected by a railroad (Map: Brazil, H 8). It is a handsome city, with well paved and shaded streets, and fine public gardens. There is also a good water supply, but the location is nevertheless one of the most unhealthy in South America, being subject to annual epidemics of yellow fever. Recent drainage works have, however, somewhat improved its sanitary condition. The harbor ranks next to that of Rio in importance and in the amount of its trade and shipping. It is provided with wharves accessible for large ships, and in 1900 699 vessels, with a total of 869,718 tons, entered, and about as many cleared. A large number of immigrants pass through this port. Santos is now the principal outlet for the great coffee-producing State of São Paulo, having in recent years supplanted Rio de Janeiro as the greatest coffee-exporting port in the world. The export in 1900

amounted to 5,849,114 bags of 132 pounds each valued at about \$44,000,000. Population, in 1900, estimated at 41,000.

SANTOS-DUMONT, sãu'tôs du'môn', ALBERO (1873—). A Brazilian aeronaut and designer of air-ships, born in São Paulo. From an early age he was interested in practical mechanics and engineering, and especially in the literature of aeronautics, but it was not until 1897 that he attempted his first ascent at Paris, where he made his residence. Soon after he constructed and used a spherical balloon in which new and original ideas were embodied, and in 1898, profiting by his experience as an automobilist, he successfully applied a gasoline engine and propeller to an elongated balloon. For an improved air-ship he received the Encouragement Prize of the Paris Aéro Club in 1901, and in the same year with his sixth air-ship he made a trip from Saint-Cloud around the Eiffel Tower and back, winning the Deutsch Prize and receiving a medal from the Brazilian Government. Subsequently he devoted himself to improving his air-ships and to devising new types, especially for military and long distance work. For description of these and other air-ships see AERONAUTICS. Consult Santos-Dumont, *My Airships* (New York, 1904).

SANTO TOMÁS, tō-más'. A town of Central Luzon, Philippines, in the Province of Batangas, situated 25 miles north of Batangas, on the main road and projected railroad between that city and Manila (Map: Philippine Islands, F 5). Population, estimated, 1899, 10,769.

SAN VICENTE, sãn vê-sãn'tã. A town of the Republic of Salvador, on the right bank of the Acahuapa River, 32 miles east of San Salvador (Map: Central America, C 4). It manufactures *rebosas*, silk shawls, shoes, hats, salt, spirits, and cigars. Population, about 10,000.

SANZIO, RAPHAEL. See RAPHAEL SANTI.

SÃO CARLOS DE CAMPINAS, souu kãr' lôs dã kãm-pê'nãs. See CAMPINAS.

SÃO FRANCISCO, frãx-sôs'kô. The chief river of Eastern Brazil (Map: Brazil, K 5). It rises on the Serra da Canastra in the southern part of the State of Minas Geraes, and flows northeast through that State and the State of Bahia, then eastward on the boundary between Bahia and Pernambuco, and finally southeast between Alagoas and Sergipe, emptying into the Atlantic Ocean 200 miles southwest of Pernambuco. Its total length is about 1800 miles. The greater part of its course lies on the semi-arid plains of the Brazilian plateau. In its extreme upper course it is torrential, descending from the mountains in a series of rapids as far as the confluence with the Rio das Velhas, where it becomes navigable for large vessels. For the next 1000 miles of its course it is broad, deep, and navigable until it begins the descent of the escarpment, about 200 miles from the sea. Here it is completely obstructed by a series of rapids which end in the magnificent Falls of Paulo Afonso, where the river, narrowed to a width of 60 feet, plunges over a rocky ledge in three leaps with a total height of 265 feet. Below the falls, which have been called the 'Niagara of Brazil,' the river flows through a deep cañon, and only for the last 135 miles of its course is it navigable for sea-going vessels. It enters the ocean by

two mouths, both of which are partly obstructed by bars, though they admit vessels of 15 feet draught at high water. A railroad has been built around the falls, and another connects Bahia with Joazeiro on the upper course of the river, which is regularly navigated by inland steamers. The tributaries are all comparatively short, though several are navigable. The largest is the Rio Grande, one of whose branches, the Rio Preto, has continuous water connection with a branch of the Tocantins.

SÃO JOAO D'EL REI, souu zhô-ou'u'dêl rã'e. A town of the State of Minas Geraes, Brazil, sixty-six miles southwest of Ouro Preto, on the right bank of the river Mortes. It is an important commercial centre, with railroad connection with Sabará and Rio de Janeiro. The town was founded in 1670 and was formerly celebrated for its gold and diamond mines. Now its chief industry is stock raising. It exports hides, lard, and cheese. Population, about 10,000.

SÃO LEOPOLDO, lã'ô pôl'dô. A town of the State of Rio Grande do Sul, Brazil, on a branch of the Jacuhy, twenty miles north of the capital, Porto Alegre (Map: Chile, G 9). The town is in a rich agricultural region, peopled almost wholly by Germans, many of whom are descendants of the first German colony of Brazil, established here in 1824. Population, about 7000.

SÃO LUIZ DE MARANHÃO, lã'ô lûi' dã mã'ra nyô'u'. A city of Brazil. See MARANHÃO.

SAÔNE, sôn (ancient *Arar*). A river of France, the most important affluent of the Rhone (Map: France, L 5). It rises in the Faucilles Mountains in the Department of Vosges, and flows south past Gray, Chalou, and Mâcon to its confluence with the Rhone at Lyons. It is 300 miles long, and navigable to Corre, 232 miles. Canals connect it with the Loire, the Seine, the Meuse, the Moselle, and the Rhine. The chief affluents are the Doubs and Ognon. Consult Hamerton, *The Saône* (London, 1888).

SAÔNE, HAUTE. A department of France. See HAUTE-SAÔNE.

SAÔNE-ET-LOIRE, à lwãr. A southeastern department of France, bounded on the east by the Department of Jura and the river Saône, and on the west by the Department of Nièvre and the river Loire (Map: France, L 5). Area, 3,392 square miles; population, in 1896, 621,337; in 1901, 620,360. The country consists for the most part of fertile plains, watered by the rivers which give their names to the department, and separated by rich vine-clad hills. The most important cereals are wheat and oats. Coal is mined extensively, and there are important iron manufactures, the works of Le Creusot (q.v.) being in this department. Capital, Mâcon.

SÃO PAULO, souu pô'u'ô. A State of Brazil, situated in the southeastern part of the Republic and bounded by Minas Geraes on the north and east, Rio de Janeiro on the east, the Atlantic Ocean and the State of Paraná on the south, and Matto Grosso on the west (Map: Brazil, H 8). Area, 112,280 square miles. The narrow strip of low coastland is succeeded by a mountain chain running parallel to the coast. The country west of the mountains is an elevated plateau, traversed by numerous river valleys. The western portion, adjoining the Paraná River, is little known and inhabited only by roving Indians. The chief riv-

of the State of São Paulo, Fico, and the principal cities and municipalities of the Paraná, Rio de Janeiro, and Maranhão. The climate is generally mild and healthful and only the coast is extremely hot, while frost occurs on the plateau. The soil is of great fertility and is so well adapted for the cultivation of coffee that São Paulo has become the chief coffee-producing State of Brazil. Sugar cane is also produced in the coast land, and stock raising is carried on extensively in the interior. The chief manufactured products are cotton goods, cigars and tobacco, and some iron products. Commercially São Paulo occupies a very prominent position. The annual value of its exports amounts to nearly \$150,000,000, of which coffee forms over 90 per cent. The commerce and manufactures are largely in German hands. The capital, São Paulo, is connected by rail with the chief seaport, Santos, as well as with Rio de Janeiro and the railway lines of Minas Geraes. Population of the State, in 1890, 1,384,753, including a large European element.

SÃO PAULO. The capital of the State of São Paulo, Brazil, and one of the largest cities in the Republic. It is situated 210 miles southwest of Rio de Janeiro, on a plateau having a mild and healthful climate, and separated from its port, Santos, 25 miles distant, by the Serra do Mar (Map: Brazil, II 8). It has a modern appearance, with long, busy streets, traversed by street railroads, lighted by electricity, and lined with fine shops and warehouses. The most notable buildings are the cathedral, the Government building, which is an old Jesuit college, dating almost from the foundation of the city, the episcopal palace, the treasury, and the magnificent Ypiranga Palace, erected to commemorate the Declaration of Independence. There are also a large and well-equipped hospital and a celebrated law school. São Paulo is the industrial centre of the State, the principal manufactures being articles of consumption. It also has a large trade, and is the centre of the State railroad system. Its growth during the last two decades has been exceedingly rapid, and is largely due to German and Italian immigration. Its population in 1890 was 64,934, and in 1900 it was estimated at 100,000. The city was founded by the Jesuits in 1554 as a mission station.

SÃO ROQUE. tã'ká, CAPE. See CAPE SAN ROQUE.

SAOSHYANT, sou'shyant (Av. *saoshyant*, he who is to save, fut. part. of *sā*, Skt. *śā*, to swell, prosper). The Iranian Messiah. In the earlier parts of the Avesta the term is frequently used in the plural to denote those who by their special sanctity and zeal further the cause of Zoroastrianism, and also to refer to such saints as will appear at the millennium, where they will assist in the complete renovation of the world which will then take place. In its special and more usual sense, however, the Saoshyant is the last and greatest of the three millennial prophets, who is to usher in the day of judgment of all mankind. This religious concept is not certainly mentioned, although it may be implied, in the oldest portions of the Avesta (q.v.), the Gathas (q.v.); but in the later Avesta, especially in the nineteenth *yašt*, the idea is developed, while the Pahlavi texts (see Pahlavi Language and Literature) give the doctrine in full detail. Ac-

cording to Parsi mythology Zoroaster (q.v.) thrice approached his third wife, Hvovi, but without union. The seed was preserved in the Lake of Kansava, which is identified with the modern Hamun swamp in Seistan. At the end of nine out of the twelve thousand years which elapse between the creation and the day of judgment, a virgin bathes in Lake Kansava, conceives, and bears the first of the millennial prophets, Ukhshat-ereta or Aushetar. After another thousand years a second virgin in like manner bears Ukhshat-nemah or Aushetar-mah, and when this millennium expires, Astvat-ereta, the great Saoshyant, is born. During these three thousand years the world continually grows better, so that even in the time of Ukhshat-nemah but one-third of mankind is evil, while human food consists only of vegetables and milk, and is taken but once in three days. When Astvat-ereta comes the preparations for the resurrection of the dead begin, commencing with the first man, Gayomart, and the primal pair, Mashya and Mashyoī. This takes fifty-seven years, during which the Saoshyant is assisted by fifteen men and fifteen maidens. After the judgment Astvat-ereta, with his helpers, performs a sacrifice of the ox Haddhayos or Sarsaok and the white Hom plant (see SŌMA). From these offerings a mystic drink is prepared which gives immortality to all mankind. After this the Saoshyant, together with his helpers, gives, at the command of Ormazd (q.v.), recompense to all according to their deeds.

The origin of the Saoshyant concept is uncertain. One is naturally inclined to derive it from Babylonia, whence certain Iranian ideas were certainly borrowed. Of this, because of the meagre eschatological literature of Assyria and Babylonia (see ESCHATOLOGY), there is little evidence, for Marduk, who, like Nimb and Gula, is called the 'restorer of the dead to life,' and who triumphs over Tiamat in the cosmic battle which is transferred in Zoroastrianism as in Judaism from the beginning to the end of the world, is scarcely an analogue. The revivification given by Marduk is only some such boon as deliverance of the sick from disease. Neither do the religions of India afford any parallel to Astvat-ereta. So far as the material at present available goes, the idea is specifically Iranian. The analogy of the Zoroastrian with the Judæo-Christian Messiah idea is striking, especially in the teaching of the apocryphal books, as the apocalypses of Ezra, Paul, and John, and of the Gospel of Nicodemus (cf. also Revelation xi. 3) that Enoch and Elijah, or Moses and Elijah (cf. also Matthew xvii. 3), are to precede the Messiah. On the other hand, it may be possible that the religious influence of Persia on the Jews has been overestimated, and that the Saoshyant and the Messiah were independent developments. Consult: Jackson, "Iranische Religion," in Geiger and Kuhn, *Grundriss der iranischen Philologie*, vol. ii. (Strassburg, 1900-03); Casartelli, *Philosophy of the Mazdaean Religion Under the Sassanids* (Bombay, 1889); Süderblom, *La vie future d'après le Mazdéisme* (Paris, 1901); Böklen, *Verwandschaft der jüdisch-christlichen mit der persischen Eschatologie* (Göttingen, 1902).

SÃO THOMÉ, soux tã-mã', or SAINT THOMAS. An island belonging to Portugal, and situated off the west coast of Africa in the Gulf of Guinea, 270 miles south of the mouth of the Niger (Map:

Africa, E 5). Area, 358 square miles. It is volcanic and mountainous, being more than 7000 feet high. The rainfall is abundant, and nearly the whole island is covered with luxuriant forests. The chief product is cacao, of which 14,914 tons were exported in 1901. Coffee and cinchona are also exported. There is considerable trade, the exports in 1900 being valued at \$3,808,035. The capital, Cidade de São Thomé, is the residence of a governor, whose jurisdiction extends also over the neighboring Prince's Island. Population, in 1900, 37,776, 90 per cent. of whom were negroes.

SAP (AS. *sap*, OILG. *saf*, Ger. *Saft*, sap; probably from Lat. *sapa*, must). The popular name for the watery solutions found in plants, and without exact scientific significance. It is properly applied only to the juices, though sometimes used to designate the slimy protoplasm which escapes from the delicate layers of cells lying between the bark and the wood in shrubs or trees. It exists in the interior of the protoplasm of active cells and also dead and otherwise empty cells, such as wood. The water absorbed by the protoplasm is first secreted in the form of minute droplets; these enlarge and merge one by one, until at maturity usually only one large sap cavity (vacuole) occupies the centre of the protoplasm. (See GROWTH, Fig. 5.) This water takes up into solution many of the foods manufactured by the plant and also a great many of the mineral salts which enter the plant from without. It is, therefore, a solution of a variable but very large number of the most diverse materials. The solution is usually very dilute, although in cells of storage tissues a considerable percentage of reserve food may be present. Thus in the cultivated beet the percentage of cane sugar in the sap runs from 10 to 17, while various gums, proteids, and salts are also present in smaller amounts. Expressed sap is utilized for flavoring palatable drinks, for sugar-making, for making various liquors, as pulque, etc. The sap of trees is popularly, but erroneously, supposed to ascend in the spring and descend in the autumn. The amount of sap in such plants increases from summer until early spring. Through the winter the tissues are saturated, and in cold climates they freeze solid. See CONDRECTION.

SAP (OF. *sappa*, Fr. *sap*, hoe, mattock, from ML. *sappa*, *sapa*, hoe, mattock, probably from Gk. *σκαπάνη*, *skapane*, hoe, from *σκάπτειν*, *skaptein*, to dig). A military term denoting a narrow trench, subsequently widened, which is continually prolonged in the desired direction, by digging away the earth at its head, and utilizing the same as a cover for the working party. A *single* or *full sap* is a trench with the parapet constructed at the head, and on its exposed flank. A *double sap* is so called when both flanks and the head of the sap are exposed to fire; two full saps are driven parallel and very near to each other, each with its parapet on the outer flank. The double sap is formed by removing the strip of earth dividing the two narrow trenches, the result being a single wide trench or sap with a parapet on each side. Running a sap has always been a difficult as well as dangerous operation, owing to the command of fire possessed by the enemy, and soon came to be restricted to night operations. The modern

searchlight and other electrical contrivances, however, make the hazard as great by night as it would be by day. The soldiers formerly detailed and trained for this work in the British Army were known as sappers. See SIEGE AND SIEGE WORKS.

SAPAJOU, or SAJOU. A French rendering of an obscure native name in Brazil (see SAT), now applied to the typical American monkeys of the genus *Cebus*, of which many species are known. The group includes some of the largest of American monkeys as well as those which have the largest brain capacity and show the greatest intelligence. The monkeys which range the farthest north are also sapajous. One of the most noteworthy species is the 'white-fronted' (*Cebus albifrons*), common in the forests at the headwaters of the Amazon and easily recognized by its light brown color and white forehead. Like the tribe generally, they live in troops of 20 or more and are great jumpers, leaping, it is said, 40 or 50 feet from tree to tree, when necessary. They are often made pets of, but are extremely jealous and are restless and irritable. One of the largest species is *Cebus olivaceus*, which is 44 inches long, 20 of which belongs to the tail. The 'sapajous' of the genus *Ateles* include the well-known coaitas or spider-monkeys (q.v.). Perhaps the best known of all is the weeper sapajou, or 'capuchin' (*Cebus capurinus*), whose fur has a golden tinge, and is short and even all over its head as though 'roached.' Young ones are constantly made captive. See PLATE OF AMERICAN MONKEYS.

SAPAN WOOD, SAPPAN WOOD (Malay *sappan*), or BUKKUM WOOD. The wood of *Cassipouia Sappan*, an East Indian tree, about 40 feet high, with twice pinnate leaves, and racemes of yellow flowers, much used as a red dye, which is not easily fixed. It is largely exported from Singapore and other East Indian ports to Calcutta and to Europe.

SAP-CHAFER. One of many species of cetonian beetles which have mouth-parts formed for the sipping or lapping of vegetable juices rather than for boring or chewing. They feed indifferently upon the sap which exudes from wounds in trees or upon the juices of over-ripe or injured fruit or other succulent vegetable growth and upon pollen. One of the commonest species in the United States is the brown sap-chaffer (*Euphorin inda*), a rather large brown variegated beetle which appears abundantly in the autumn over a large part of the Western States. The eggs are laid in the spring beneath the surface of the ground, and the larvæ, which are white grubs closely resembling the larvæ of the May-beetles and the fig-eater or June-beetle (q.v.), feed upon decaying vegetable matter and soil humus.

BROWN SAP-CHAFER.

SAPHIR, sä'fēr, MORITZ GOTTLIEB (1795-1858). An Austrian humorous writer, born at Lovas-Berény, Hungary. He edited the Vienna *Humorist* from 1837 to 1858, and his humorous

They have not enjoyed much popularity in the United States. His publications, such as the *Flora of the East*, *Leicht, Scherz, Humor und Satire* (1816), and *Konversations-Lexikon* (1818), *Wit, and Humor* (2d ed., 1820), are now little read. They display chiefly facility for clever plays upon words.

SAPHIRE D'EAU, *sâfê' do* (Fr., water-sapphire, or Dichroite). A gem variety of sapphire. When cut it shows a very fine play of colors, presenting different shades of blue, bluish white, and yellowish gray, according to the directions in which the mineral is viewed.

SAPINDACEÆ (Neo-Lat. nom. pl., from *Sapindus*, from Lat. *sapo*, soap). THE SOAP-BERRY FAMILY. A natural order of dicotyledonous trees, twining tendrils bearing shrubs, and a few woody climbers, about 1000 known species, natives of warm climates, especially of South America and India, about 300 species of lianas occurring in the tropics. None are natives of Europe, and *Sapindus* and *Serjania* are the only indigenous genera in the United States. The timber of some species is valuable; Guarana bread is made from the seeds of a species of this order; the leaves of another (*Cardiospermum Halicacabum*) are used as a boiled vegetable in the Moluccas; and the fruits of some species, as *Nephelium* and *Litchi*, are excellent. The chief genera of the order Sapindaceæ are *Serjania*, *Paullinia*, *Sapindus*, *Litchi*, *Nephelium*, *Cupania*, *Blighia*, *Dodonaea*, and *Koeleruteria*.

SAPI-UTAN. The Malay name of the anoa (q.v.). For illustration, see Plate of BUFFALOES.

SAPO (Sp., large toad). A South American name for various toad-fishes (q.v.) especially one of the genus *Porichthys*, or 'midshipmen,' a species (*Porichthys noltus*) very abundant along the California coast. It lives under stones near the shore, and is locally known as the 'singing-fish,' on account of a peculiar humming noise made with its air-bladder. It is about 15 inches long, olive brown with coppery reflections, the sides marked with broad bars, and the pores of the lateral line bead-like and shining.

SAPODILLA (Sp. *sapotilla*, diminutive of *sapota*, *zapote*, from Aztec *zapotl*, *sapota* tree). A tree of the natural order Sapotaceæ (q.v.). The fruit has a sub-acid pulp which is highly esteemed for dessert in the West Indies, where the tree is native and whence it has been introduced into many other tropical countries.

SAPONI, *sâ-po'ne*. A Virginia tribe of Sioman stock (q.v.) known in history as the confederates of the kindred Tutelo, both tribes being now extinct. The Saponi are first mentioned in 1670 by the German traveler John Lederer (q.v.), who visited their town on what appears to have been Otter Creek, southwest of Lynchburg. Besides Lederer's early notes we have some valuable ethnological information concerning the Saponi from William Byrd (q.v.), in charge of the Virginia boundary survey of 1728, who visited their town and had one of their men in his service as guide and hunter. They still made fire by rubbing two dry sticks together, and new fire was always made for each ceremonial occasion. They made spoons from buffalo horn, and their women wore baskets and dress fabrics from the fibers of silk grass (cynea). They had horses, but were not good riders. They had strict

regard to religious taboos. The men were described as having something great and venerable in their countenances, beyond what was common among savages. See also OCEANEECHII; TUTELO.

SAPONIFICATION. See ESTERS; FATS; OILS; SOAP.

SAPONIN (from Lat. *sapo*, soap), $C_{22}H_{41}O_{13}$. A glucoside contained in various plants, including the *Saponaria officinalis*, or soapwort, the *Polygala senega*, the fruit of the horse-chestnut, etc. It is readily extracted from the root of soapwort by means of boiling alcohol, which, as it cools, deposits the saponin as an amorphous sediment. It derives its name from its behavior with water, with which it forms an opalescent fluid that froths when shaken, like a solution of soap, if even $\frac{1}{1000}$ part of saponin be present. By the action of dilute acids saponin breaks up into sapogenin, $C_{11}H_{22}O_2$, and sugar.

♣ SAPODILLA (*Achras Sapota*).

SAPORTA, *sâ-pôr'tâ*. GASTON, Marquis de (1823-95). A French botanist and paleontologist, born at Saint Zacharie (Var). He served in the army, then devoted himself to vegetable paleontology, and in 1876 became a corresponding member of the French Academy of Sciences. Besides many contributions to periodicals, of which part were on the climate of geological periods, he wrote: *Le monde des plantes avant l'apparition de l'homme* (1878); *L'évolution du règne végétal* (with Marion, 1881-85); *Origine paléontologique des arbres cultivés* (1888); and a genealogical study, *La famille de Mme. de Sévigné en Provence* (1889).

SAPOTA'CEÆ (Neo-Lat. nom. pl., from *Sapota*, from Sp. *sapota*, *zapote*, *sapota* tree). THE SAPODILLA FAMILY. A natural order of dicotyledonous trees and shrubs, often abounding in milky juice, which in many species yields gutta-percha. There are nearly 400 known species, chiefly natives of the tropics, and the

remainder of subtropical countries. The fruits of some are pleasant, as the sapodilla and other species of the genus *Aehra*, the star apple (q.v.) and other species of *Chrysophyllum*, various species of *Mimusops*, *Latunna*, etc. The genus *Bassia* contains species valuable for the oils which they yield. The seeds of *Mimusops Elengi* also yield oil abundantly. The following genera embrace species which yield gutta-percha, some of them at one time being almost the only sources of that product: *Paysona*, *Palaquium*, *Bassia*, *Isanandra* or *Dichopsis*, and *Mimusops*.

SAPPHIRE (OF., Fr. *saphir*, from Lat. *sapphirus*, from Gk. *σάπφειρος*, *sappheiros*, sapphire, or perhaps lapis lazuli, from Heb. *sappir*, sapphire). A blue variety of corundum (q.v.), highly prized as a gem. It is similar in composition to the ruby, but it is somewhat harder and of slightly higher specific gravity. It crystallizes in the hexagonal system, usually in the form of double pyramids. The sapphire has a beautiful blue color, although spotted varieties are not rare, the yellow, white, and blue spots being sometimes sharply separated or again grading into each other. Heating the stone drives the blue color away permanently. The value of the gem increases with the depth of the color up to the limit of translucency, the most prized specimens having a corn-flower blue tint. *Asteria* is the name applied to an imperfectly transparent variety which, when cut in the form of a dome, shows six star-like rays. Sapphires of good color and size are more common than rubies and much cheaper. A specimen of good color, weighing two or three carats, has about the same value as a diamond of equal size. Some very large sapphires have been found; one of 951 carats was recorded in 1827 as being in the possession of the King of Ava. Other large stones are in the museum of the Jardin des Plantes, Paris. Sapphires occur in very much the same regions as the ruby, and indeed the two are often found together. The best sapphires come from Siam, where they are mined in the loose surface deposits which yield the ruby. They are also found in Burma, Ceylon, and Kashmir, and at many localities in Australia. The Australian sapphires are not regarded with much favor, owing to their dark color. In the United States the most valuable stones are obtained in North Carolina and Montana. In the former State they are found in gravel deposits, from which they are separated by a washing process. The Montana deposits, the most important discovered in recent years, occur as bars on the upper Missouri River, and also in an igneous dike, which can be traced for several miles. The stones are obtained chiefly from the decomposed portion of the dike and are separated from the matrix by washing. They range in weight from less than one carat up to four or five carats. The production of sapphires in the United States in 1901 was valued at \$90,000, almost the entire output coming from Montana.

BIBLIOGRAPHY. Bauer, *Edelsteinkunde* (Leipzig, 1896); Kunz, *Gems and Precious Stones* (New York); Pratt, "The Occurrence and Distribution of Corundum in the United States," *United States Geological Survey Bulletin No. 180* (Washington, 1901).

SAPPHO (Lat., from Gk. *Σαφώ*). A Lesbian poetess of good family, a contemporary of

Alceus (c.600 B.C.) and with him the chief creator of the Æolian personal lyric. Sappho is for us chiefly a name—a theme for the fervent rhetoric evoked by impassioned contemplation of the few exquisite fragments of her poems that time has spared, a type of the highest achievement of woman in literature, a symbol and synonym of the intoxication of absolute lyric, 'all fire and dew.' She was born possibly at Eresos, more probably at Mitylene, where she lived until she was exiled by an uprising of the democratic party against the oligarchs. From her poems we infer that she practiced and taught her art in a coterie, club, or school of maidens, to whom she was devotedly attached, whom she addressed in the language of passionate adoration, and whose bridal odes she composed when they left her to marry. Familiar to all poets and lovers is the legend of her unrequited love for Phaon and of her casting herself down from the promontory of Lover's Leap to that "Leucadian grave which hides too deep the supreme head of song" (Swinburne). Alceus is said to have been her lover and to have addressed her in the words, "Violet tressed, sweetly smiling, pure Sappho, fain would I speak, but shame forbids." To this she replied, "If thy desire was of aught fair and good, shame had not beset thine eyes, but thou hadst spoken thereof frank and true."

The ancients read her poems in nine books. The extant fragments include (1) the ode to Aphrodite, twenty-seven lines in Sapphic strophes quoted by the critic Dionysius of Halicarnassus as an example of the 'smooth style'; (2) the "Blest as the immortal gods is he," to name it by Ambrose Philips's hopelessly inadequate translation, four Sapphic strophes cited by Longinus as a specimen of the sublime; and (3) some hundred or more single lines and stanzas in a great variety of lyric metres. They may be found in Bergk's *Poeta Lyrici*, in the Teubner *Anthologia Lyrica*, and, with English translations added, in Wharton's *Sappho*. Some additional fragments have recently been recovered from Egyptian papyri. The chief motives of Sappho's poems are love and the beauty of nature. They contain no profound thoughts and few striking images, and the exquisite beauty of their diction and the liquid lapse of the rhythm can no more be rendered into English than Keats's odes could be translated into French or German. Swinburne, in "On the Cliffs," thus strives to reproduce the impression of one wistful waif of verse:

"I loved thee.—hark, one tenderer note than all—
*At this, of old time, once—*one low, long fall,
 Sighing—*one long, low, lovely, loveless call,*
 Dwing—*one pause in song so flame-like fast—*
At this, long since in old time overpast—
 One soft first pause and last,
 One,—then the old rage of rapture's fiercest rain
 Storms all the music-maddened night again."

SAPPHO'S LEAP. The high cliff anciently called Leucadia or Leucas, now Cape Ducato, on Santa Maura, one of the Ionian Islands. From it Sappho the poetess is said to have thrown herself into the sea on account of her hopeless love for Phaon.

SAPPORO, *sāp'pō-rō*. The capital of the island of Yezo, Japan, situated on the Ishigari River, a short distance from the western coast (Map, Japan, G 2). It has an agricultural college, a museum with specimens of the work of

ness, the botanical garden. The manufactures of the town include saw, flour, and paper mills, and a brick factory. Sapporo owes its growth to its connection with the colonization of Alaska since 1870. Population, in 1898, 27,182.

SAPROPHYTE (from Gk. *σαπρός*, *sapros*, rotten; *γενεον*, *phyton*, plant). A plant which contains no chlorophyll and which derives its nourishment from dead organic matter. Saprophytes are among the active agents which rid the earth of the remains of animals and plants, which would otherwise accumulate. Among flowering plants there are some symbiotic saprophytes such as Indian pipe (*Monotropa*), and certain orchids (as *Corallorhiza*). These grow in rich humus, the underground portions generally associated with a fungous mycelium. (See *MYCOMYZA*.) Among the ferns and their allies the saprophytic habit has also been developed to some extent; but saprophytism is best illustrated among the fungi, where entire groups exhibit this mode of life. See *SYMBIOSIS*.

SAPSUCKER. Any of various American woodpeckers alleged to suck the sap of trees; properly the yellow-bellied woodpecker (*Sphyrapicus varius*), which breeds in Canada and migrates through the United States in spring and autumn. It is of medium size, black above, with white markings and a white rump; forehead, crown, chin, and throat crimson in the male, less so in the female; breast with a broad black patch; belly pale sulphur-yellow. These colors are highly variable. It has the habit of pecking squarish holes in great number in the spring, in the bark of sweet-sapped trees, eating to some extent the new wood beneath, and the sap, and catching the insects attracted by the sweet exudation. Its breeding habits are similar to those of woodpeckers generally. Several other species of the genus are known in the West, that common on the Pacific coast (*Sphyrapicus ruber*) having the whole head, neck, and chest of the adults of both sexes red. See *WOODPECKER*; and consult authorities there cited.

SAPTARSHI, śap-tār'shē (Skt., the seven sages, seven bright stars of Ursa Major). A system of reckoning time in India, especially in Kashmir, although formerly current also in Multan and elsewhere. It is based on the theory that the seven Rishis (the seven bright stars of Ursa Major) move through the zodiac in 2700 years, at the rate of one nakshatra, or twenty-seventh of the celestial, each century. In ordinary reckoning the hundreds are omitted. In calculation 47 must be added to the Saptarshi year to find the corresponding Saka (q.v.) year, and 24-25 to determine the Christian equivalent. Consult Sewall and Dikshīt, *The Indian Calendar* (London, 1896).

SAPUCAIA NUT (Brazilian name). The seed of *Lecythis Ollaria*, a lofty Brazilian tree, of the natural order Lecythidaceæ. The urn-shaped fruit as large as a child's head, which opens by a deciduous lid, contains several oval, somewhat pointed, slightly bent seeds or nuts, as in the case of the allied Brazil nut (q.v.), which is inferior in flavor but is far more extensively exported.

SAQQARA, sāk-kā'rā, or **SAKKARA**. An Egyptian village on the left bank of the Nile, in latitude 29° 52' N., situated on the edge of the

Libyan desert, about three miles from the river. It stands in the midst of the ancient necropolis of Memphis (q.v.), and around it are some of the most interesting monuments in Egypt. Saqqara means, in Arabic, 'hawk's nest,' but the word is probably a corruption of the old Egyptian name containing the name of Sokar, the Memphitic god of the dead. In the immediate vicinity of the village, and to the west of it, are the pyramids of Pepi I. and his son Mer-en-Ré, of the Sixth Dynasty; that of Pepi II., another son of Pepi I., lies a little farther south. To the north are the pyramids of Teti, the founder of the Sixth Dynasty, and of Unas, the last King of the Fifth Dynasty. All these pyramids were opened in 1881, and the walls of their sepulchral chambers were found to be covered with long inscriptions of a religious character. Between the pyramids of Unas and Teti lies the great step-pyramid of Saqqara, which has been attributed to King Zoser, and, if this be true, it is undoubtedly the oldest pyramid in existence. It consists of six stages, is about 190 feet in height, and contains numerous corridors and chambers. Near it are the subterranean tombs of the Apis bulls and the remains of the Serapeum (q.v.). In this vicinity are the tombs of a number of nobles of the Fifth and Sixth Dynasties. They are of great architectural interest and their inner walls are covered with reliefs and paintings giving vivid illustrations of Egyptian life and customs under the Old Empire. Consult: Lepsius, *Denkmäler* (Berlin, 1849-58); Wilkinson, *Manners and Customs of the Ancient Egyptians* (London, 1878).

SARA, sā'rā. A town of Panay, Philippine Islands, in the Province of Iloilo, situated 2 miles northwest of Concepción (Map: Philippine Islands, II 8). Population, estimated, in 1899, 10,950.

SARABANDE (Fr. *sarabande*, from Sp. *sarabanda*, probably from Pers. *sarband*, fillet, from *sar*, head + *band*, bond). Originally, a slow dance said to be of Saracenic origin; and hence a short piece of music, of deliberate character, and with a peculiar rhythm, in three-quarter time, the accent being placed on the second crotchet of each measure. The sarabande forms an essential part of the suites written by Handel, Sebastian Bach, and others of the old masters, for the harpsichord or clavichord. All extra movements were inserted after the sarabande. The dance became popular in Europe in the sixteenth century, but it was bitterly attacked by Cervantes and other Spanish writers for its indecency, and Philip II. suppressed it for a time. A modified form of it, however, was introduced in France, and in England it became a popular country dance.

SARACENS (OF. *saraceni*, *sarracini*, *sarraceni*, Fr. *sarrasin*, from Lat. *Saraceni*, from Gk. *Σαρακηνός*, *Sarakēnos*, Saraceni, from Ar. *šarqīn*, pl. of *šarqī*, from *šarq*, rising sun, from *šarāqa*, to rise). A name variously employed by medieval writers to designate the Mohammedans of Syria and Palestine, the Arabs generally, or the Arab-Berber races of Northern Africa, who conquered Spain and Sicily and invaded France. At a later date it was employed as a synonym for infidel nations against whom crusades were preached, and was thus applied to the Seljuks of Iconium, the Turks, and others. The name appeared as early as the first century of the

Christian Era, when it was applied by Greek writers to some Arab tribes of the Syrian Desert, of Northwestern Arabia, and of the Desert of Tih. In the hundred years following the Hejira (A.D. 622) a Saracen empire was established which extended from Turkestan to the shores of the Atlantic. Mohammed made himself master of Mecca in 629, and the first caliphs, Abu-Bekr and Omar, between 632 and 641, conquered Syria, Palestine, Persia, and Egypt. By 709 the Saracens had extended their sway over Northern Africa to beyond the Strait of Gibraltar. They then crossed over to Spain (711), nearly the whole of which they subjugated. From Spain they poured into Gaul, where their progress was arrested by Charles Martel, near Poitiers, in 732. Sicily was conquered by them between 827 and 878, and early in the tenth century they extended their incursions far into the Burgundian territories. The disruption of the great Saracen realm began about the middle of the eighth century, when the western portion tore itself away from the rest, becoming a separate State, with Cordova as its capital. For a general sketch of the history of the Saracens, consult: Freeman, *The Saracens* (London, 1876); Orkley, *The Saracens* (London, 1847). See ARABIA; CALIPH; OMMIYADS; ABBASSIDES; CRUSADE.

SARAGOSSA, sá'rà-gòs'sá (Sp. *Zaragoza*). The capital of the Province of Saragossa, Spain, and formerly of the Kingdom of Aragon, situated on the right bank of the Ebro, 115 miles in a straight line from its mouth, and 165 miles northeast of Madrid (Map: Spain, E 2). It stands in the midst of a desert plain, but is immediately surrounded by a well-irrigated and fertile *huerta*. Two bridges cross the Ebro to the northern suburb, one a handsome stone bridge of seven arches, the other a railroad bridge. The central nucleus of the town still retains its old aspect, with narrow, winding lanes, lined with old houses of solid construction and often richly decorated, many of them being the former palaces of nobles, but now generally in a dilapidated condition. The surrounding portions of the town are modern and regularly built, with broad streets and shaded boulevards. The most prominent buildings of the city are its two cathedrals, the old Gothic Cathedral of La Seo, built between 1119 and 1520, and that of Nuestra Señora del Pilar, begun in 1681. The latter contains the sacred pillar on which the Holy Virgin is believed to have appeared to Saint James. Other notable buildings are the Church of San Pablo, in the Transition style of the thirteenth century; the Gothic Church of Engracia, partly destroyed during the siege of 1808; the Castillo de la Aljafería, built by the Moors and later used as the royal residence of Aragon; the Audiencia, formerly the palace of the counts Luna; and the Lonja, or Exchange, a handsome and richly decorated Renaissance building. Saragossa has a university founded in 1474, with 800 students, a veterinary school, a superior normal school, schools of music and fine arts, as well as of commerce and trade, and a botanical garden. The city is an important railroad centre, and its commerce and manufactures are thriving. It has iron foundries, machine shops, flour and paper mills, breweries, and manufactures of chocolate, preserves, glass, chemicals, soap, and candles. Population, in 1887, 92,407; in 1900, 98,125.

Vol. XVII.—37.

Saragossa is on the site of the ancient Iberian *Salduba*. Its strategic importance was recognized by the Romans, who made it a military colony under the name of *Cæsarea Augusta*, from which its Spanish name is a corruption. It was in the possession of the Moors from 712 to 1118, when it was taken by Alfonso I. after a long siege. Saragossa is especially famous for the heroism with which the citizens, led by Palafox (q.v.), defended it against a large French army in 1808-09. The French finally captured the city after a hard-fought contest in which they suffered great losses.

SARAGOSSA, MAID OF. See AGUSTINA.

SARAJEVO, sá'rà-yá-vó. See SERAJEVO.

SAR'ANAC LAKE. A village in Franklin County, N. Y., 130 miles northeast of Utica, in one of the most picturesque portions of the Adirondack Mountains; near the head of the Lower Saranac Lake, and on the New York Central and the Delaware and Hudson railroads (Map: New York, F 1). It is a noted pleasure and health resort and the business centre of the Adirondack region. Near by are the Adirondack Cottage Sanatorium for Consumptives and the State Hospital for Incipient Tuberculosis. Population, in 1890, 768; in 1900, 2,594.

SARANSK, sá'rán-sk'. The capital of a district in the Government of Penza, Russia, on the Saranka, 87 miles north of the city of Penza (Map: Russia, G 4). It is of some commercial importance on account of its fair. Population, in 1897, 13,743.

SARAPUL, sá'rá-pool'. A town in the Government of Vyatka, Russia, situated on the Kama, about 225 miles southeast of Vyatka (Map: Russia, H 3). It has extensive tanneries and boot factories and a considerable trade in grain. Population, in 1897, 21,395.

SARA SAMPSON, Miss. A play by Lessing produced in 1755. Its sentimentality made it very popular in its day, but it is interesting now only as the first introduction of middle-class life in German tragedy.

SARASATE, sá'rà-sá'tá, PABLO DE (1844—). A Spanish violinist, born in Pamplona. He studied the violin at the Paris Conservatory under Alard, and harmony under Reber, winning prizes in 1857 and 1859. In 1889 he visited America with Eugène d'Albert, and played in New York and other cities, with great success. His playing is characterized by a wonderful technique and a delicate and refined tone. Max Bruch wrote for him his Scotch fantasy and second concerto, and Lalo his concertos and *symphonie espagnole*. Sarasate's compositions are for his own instrument, and are light and Spanish in character.

SARASIN, sá'rà-zán', PAUL (1856—). A Swiss naturalist and traveler, born in Basel, and educated there and in Würzburg. Together with his cousin, Fritz Sarasin, he explored Ceylon (1883-86) and they published on their return *Ergebnisse naturwissenschaftlicher Forschungen auf Ceylon* (1887-93), containing valuable zoölogical and ethnological data. After a second trip to Ceylon in 1890, they turned their attention to the island of Celebes, which they explored in 1893-96, and which they described in *Materialien zur Naturgeschichte der Insel Celebes* (1898).

SARASVATI. *Sarasvati.* A Hindu goddess.

SARATOGA, BATTLES OF. Two important battles in the American Revolution, fought on September 19 and October 7, 1777. Early in 1777, Burgoyne, with an English army of about 10,000, started from Canada toward Albany. His army was weakened by Baum's defeat at Bennington (q.v.), and by the frequent guerrilla attacks of the American militia. Crossing the Hudson on September 13th, he approached Bemis Heights, where the American army, under General Gates (q.v.), had taken up a strong position. On the 19th he advanced with 4000 men to attack the American left, but was met by General Benedict Arnold with a force of 3000 at Freeman's Farm. Here a battle raged for two hours, until darkness intervened, neither side gaining a decisive advantage and each side losing from 600 to 1000 of its number. This has been variously called the battle of Freeman's Farm, the first battle of Bemis Heights, the first battle of Stillwater, and the first battle of Saratoga. Burgoyne, finding that his supplies were cut off, and despairing of any immediate aid from New York, resolved, as a last resort, to hazard another attack. Accordingly on October 7th he advanced, with 1500 picked men, to turn the American left. Immediately his right was attacked by General Poore and his left by General Morgan; while Arnold, though then without technical authority, dashed to the front and took general command of the American forces. For some time the result remained in doubt, but the English gradually gave way after the gallant commander of their right, General Frazer, had been mortally wounded; and by a final attack, in which Arnold was severely wounded, they finally were forced behind their intrenchments. This engagement has also been called by some the battle of Bemis Heights, or of Stillwater. During the night the English retreated and took up a strong position about 12 miles from Saratoga (q.v.), on the site of the present Schuylerville. Meanwhile American recruits were swarming in from all sides, and soon Burgoyne was entirely surrounded, his supplies cut off, and his forces strictly confined, by a continual bombardment, within narrow lines. Not daring to risk another battle and fearing an immediate attack from vastly superior numbers, he opened negotiations with Gates, who at first demanded an unconditional surrender, but subsequently, on the 16th, agreed to what was called the 'Convention of Saratoga.' The English were to march out with the honors of war, and were to be allowed to embark at Boston for England on condition that they would not serve again in America during the war. Accordingly on the 17th Burgoyne formally surrendered his army of between 5000 and 6000 men to Gates. Congress subsequently refused to ratify the 'convention,' and the British troops, excepting a few officers, were detained as prisoners first in the vicinity of Boston and later at Charlottesville, Va., and elsewhere, until the close of the war. The victory aroused the greatest enthusiasm throughout the country, and was the determining event that led France to form an alliance with the United States. Consult: Carrington, *The Battles of the American Revolution* (New York, 1876); Stone, *The Campaign of 1777, Gen. Burgoyne* (Albany, 1877); Walsworth, *Battles of Saratoga* (Albany, 1891);

and Baron Riedesel's *Memoirs and Letters and Journals* (trans. by Stone, Albany, 1868).

SARATOGA SPRINGS. A village in Saratoga County, N. Y., 39 miles north of Albany, on the Delaware and Hudson, the Adirondack, and the Fitchburg railroads (Map: New York, G 2). It is one of the leading summer resorts in the United States, with mineral springs having a wide reputation for their medicinal properties. Races are held here during August, and the floral fête in September also contributes largely to the popularity of the resort. Saratoga Lake, 4 miles distant, is much frequented for sailing and fishing. Saratoga Springs is noted for its large, well-equipped hotels. In the Convention Hall, which has a seating capacity of 6000, a number of political and other conventions have been held. The village has an Athenæum, the library of the Fourth Judicial District, and a public library; an art gallery, Saint Faith School, Saint Christina Home for Orphans, and a hospital. One of the State armories is located in Saratoga Springs. The most important industries are the bottling of mineral waters, the preparation of carbonic acid gas for market, and the manufacture of druggists' and doctors' supplies and foundry products. The government, under the revised charter of 1895, is vested in a president and board of trustees who hold office for two years. Population, in 1890, 11,975; in 1900, 12,409.

The Indians early gave to this locality the name Sarachtague. In 1693 Major Peter Schuyler defeated a large force of French and Indians about three miles from the present village. In 1767 Sir William Johnson, when very ill, was brought to the site of the present Ballston Spa by his Indian friends, and quickly recovered. About 1773 a log cabin was built near here, and in 1777 General Philip Schuyler erected the first frame house in the vicinity. The village really dates from about 1792, and was incorporated in 1826. (See SARATOGA, BATTLES OF.) Consult: Stone, *Reminiscences of Saratoga* (New York, 1875); Brandow, *The Story of Saratoga and History of Schuylerville* (Albany, 1900); and a sketch in Powell's *Historic Towns of the Middle States* (New York, 1899).

SARATOV, sà'rà-tòf'. A government of Russia, bounded by the governments of Simbirsk and Penza on the north, the Volga on the east, Astrakhan on the south, the Province of the Don Cossacks on the southwest, and Tambov on the west (Map: Russia, F 4). Area, 32,624 square miles. The surface is elevated and well wooded in the north, while the central and southern parts have the character of a steppe. The region along the Volga is hilly. Besides the Volga the principal rivers of the government are the Medveditza, the Khoper, and the Hovlyva—all tributaries of the Don. Saratov belongs to the black soil belt. Agriculture is carried on extensively, and large quantities of grain are exported by the Volga. The principal cereals are rye, wheat, and oats. Tobacco is cultivated on a large scale and gardening for export forms an important occupation in the region along the Volga. The annual value of the manufactures, principally flour, is over \$12,000,000. The export trade in grain is heavy. Population, in 1897, 2,419,884, mostly Great Russians.

SARATOV. The capital of the government of the same name in Russia, situated on the right

bank of the Volga, about 200 miles southwest of Samara (Map; Russia, G. 4). It is well laid out, but, like most Russian provincial towns, is built chiefly of wood. It has a theological seminary and a museum with a school of drawing and a library attached to it. Flour mills, oil presses, and distilleries are the principal industrial establishments of the city. The export trade in grain is considerable. Population, in 1897, 137,109, including many descendants of French and German settlers. The town was founded in the sixteenth century.

SARAVIA, sá-rá'vyá. A town of Western Negros, Philippine Islands, situated on the northwest coast, 15 miles north of Bacóbid (Map; Philippine Islands, G. 9). Population, estimated, in 1899, 15,304.

SARAWAK, sá-rá-wák'. A British protectorate on the northwestern coast of Borneo (q.v.).

SARAWAKESE. The natives of Sarawak, in Northwestern Borneo, comprising the Pumas (various wild but gentle tribes of savages scattered over the interior—nomadic hunters representing the lowest type of culture); Kalamantan (more or less agricultural communities belonging to scattered and usually weak tribes along the coast and certain rivers); Kenyah-Kayan (immigrants several centuries ago from Dutch Borneo—well-organized and powerful tribes who have exterminated or enslaved some of the smaller aboriginal groups); Iban, or Sea Dayaks (originally on Batang Lupan and Saribas rivers, their spread being comparatively recent); and Malays (now rather mixed by contact with indigenous coast populations) on the coast and for a short distance up some of the rivers. Consult: Brooke, *Ten Years in Sarawak* (London, 1866); Denison, *Tour Among the Land Dyaks of Upper Borneo* (Singapore, 1879); Roth, *The Natives of Sarawak and British North Borneo* (London, 1896).

SARCEY, sár'sá', FRANCISQUE (1828-99). A French dramatic critic, born at Dourdan. He taught in the provinces (1851-58), on coming to Paris wrote first for the *Figaro*, and in 1859 became dramatic critic of *L'Opinion Nationale* (1859-67), and then of *Le Temps*, with which he was connected till his death, contributing also to About's *Des-nouvelles Siècle* and other journals. Public-spirited, but never partisan, he voiced with lively wit and shrewd common sense the average opinion in drama and in social reform. Sarcey is often charged with excessive admiration of mere stagecraft. His dramatic articles were not collected during his life, save for two series of *Comédiens et comédiennes* (1878-84) and *Le théâtre* (1893). A fuller selection by Larroumet is announced. Sarcey wrote also *Souvenirs de jeunesse* (1885) and *Souvenirs d'âge mûr* (1892), translated by Carey, *Recollections of Middle Life* (1893); an *Histoire du siège de Paris* (1871); and several novels.

SARCINA (Lat., bundle), or SARCINULA. A genus of minute plants of very low organization, sometimes reckoned among algae, and sometimes among fungi. A number of forms or species are known. Although the most common seat of sarcine is the human stomach, they have likewise been detected in the stomach of the tortoise, the rabbit, the dog, the ape, and in the caecum of the fowl; in the urine, in the lungs, in the faces

and intestinal canal, in the fluid of the ventricles of the brain, in cholera stools, in the fluid of hydrocele, and in the bones.

Sarcine are present in vomited fluids in certain forms of dyspepsia.

SARCOLECTIC ACID. See LACTIC ACID.

SARCOLEMMMA (Neo-Lat., from Gk. σάρξ, *sarx*, flesh; -λέμμα, *lemma*, husk). A term applied to the delicate sheath which invests each primary muscular fibre. See MUSCLE.

SARCOMA. See TUMOR.

SARCOPHAGUS (Lat. *sarcophagus*, from Gk. σαρκόφαγος, *sarkophagos*, flesh-eating, from σάρξ, *sarx*, flesh + φαγεῖν, *phagēin*, to eat). Any large coffin designed not to be buried, but to be placed in the open air or in a tomb where it may be seen. The material is usually stone. The name was derived from the ancient belief that coffins made from a certain stone found near Assos possessed the property of consuming the body with the exception of the teeth within forty days. Egypt is probably the place of origin. Here the sarcophagus is the dwelling of the dead. In the great tombs of the pyramid-builders and later kings it is a huge block of granite in which is hollowed a receptacle for the mummy case, while another block forms the cover. The original idea of the house is sometimes indicated by the rounded roof. In less prosperous times and in poorer tombs the sarcophagi are of clay or of wood, often elaborately painted or decorated with inlaid work in glass and paste. About the seventh century B.C. another form of stone sarcophagus is found which reproduces the mummy case, showing the human head and outline of the swathed form. This type is especially common in Phœnicia and Phœnician lands, such as Cyprus, Carthage, and some of the Sicilian settlements. Especially noteworthy is a large group of these 'anthropoid' sarcophagi made of white Greek marble, and showing clear proof in the human heads, sculptured in relief on the lids, of Greek workmanship. This series begins shortly after the Persian wars and continues down to about the time of Alexander the Great. Among the Greeks the use of sarcophagi seems to have been borrowed from the East, and appears first in Asia Minor. In general, the Greek and Asiatic sarcophagi are distinctly of the house or temple type, often showing in relief the gables, columns, and other architectural details. On the early sarcophagi of Cyprus these forms are less clear, and the custom of decorating the sides with scenes in relief is found. In Greece sarcophagi proper were not used till late in the fifth century and do not seem to have been very generally employed at any time. Greek sarcophagi are consequently not numerous, and the finest specimens were found in a tomb at Sidon in 1887. Of the seventeen sarcophagi, one is an Egyptian anthropoid, and the others Greek, four of them being richly decorated with reliefs. The earliest of these, 'the sarcophagus of the Satrap,' belongs to the time shortly after the Persian wars, and shows Ionic art of the transitional period. The 'Lycian Sarcophagus' is evidently of the end of the fifth century and inspired by the sculptures of the Parthenon. To the earlier fourth century belongs the 'Sarcophagus of the Mourners,' which is in the form of a temple, between the columns of which are standing or seated women, whose faces and attitudes are the embodiment of woe,

of an artist who was familiar with the great Athenian grave-reliefs. The sarcophagus of the fourth century, was decorated with the wonderful 'Alexander Sarcophagus' with its vigorous scenes of the battle and chase, reproduced in a striking combination of relief and color.

The Etruscans early employed sarcophagi of stone or clay, with the sides decorated in relief, and on the lid recline the full-length figures of the dead, singly or not infrequently in pairs. The work is that of the Etruscan artist, but he evidently drew his inspiration from Greek sources. Owing to the Roman custom of burning the dead, sarcophagi are very rare during the Republic and early Empire. The finest and earliest example is the peperino sarcophagus of L. Cornelius Scipio Barbatus, consul B.C. 298, in the Vatican. The house form has here passed over into a style much more nearly resembling an altar. In the second century of our era, however, burial became much more common, and with this period begins the long series of sculptured sarcophagi so common in museums. In general the architectural forms are entirely neglected, nor is the Etruscan imitation of the bed retained, even when there is a reclining figure on the lid. Moreover, while the Greek sarcophagi seem in general to have stood in the open air as grave monuments, and hence were sculptured on all sides, the Roman, like the Etruscan, were placed against the walls of tomb chambers, so that the back is usually plain. Along with the usual rectangular oblong box we find an oval usually decorated with vertical waving lines, while on the front is a medallion containing a mythological scene or a portrait. In the Roman sarcophagi the decoration of the front with an elaborate composition in relief plays an important part. The choice of scenes is varied. Sometimes the theme is drawn from daily life, but more often the mythology of Greece has been used. The custom was continued in Christian times, with the substitution of biblical scenes for those of pagan myths. Consult: Hamdi Bey and Reinach, *Une nécropole royale à Sidon* (Paris, 1892 et seq.); Robert, *Die antiken Sarkophagreliefs* (Berlin, 1890-97).

SARD (Lat. *sarda*, *sardius*, from Gk. *σάρδιος*, *sardios*, Sardian, from *Σάρδεϊς*, *Sardeis*, Sardis, capital city of Lydia). A translucent red variety of chalcedony that differs from carnelian by the deepness of its color. It was highly prized by the ancients, who used it as a gem. It was credited by early writers with numerous virtues, and, according to Epiphanius, it conferred upon its wearer a "cheerful heart, courage and presence, and protected him from witchcraft and noxious humors."

SAR'DANAPA'LUS (Lat., from Gk. *Σαρδανάπαλος*, corrupted from Assyrian *Assur-bani-pal*, Asshur begets a son) (B.C. 668-624). The last great Assyrian monarch. The son of Esarhaddon (q.v.), he found himself possessed of the empire in its greatest extent, but also the heir of the difficulties which were pressing on the east and north from the hordes of Cimmerians, Scythians, and Medes. The father died at the beginning of his third campaign in Egypt, and the duty of continuing the war devolved upon the son. Memphis was occupied and the land returned to its nominal allegiance, but upon the

withdrawal of the army revolt broke out, which resulted in another invasion and the ruthless destruction of Thebes, the southern capital. But the Assyrian hold was so weak that Psammetichus declared his independence within a few years, and Egypt was irrevocably lost to Assyria (about B.C. 663). A long siege of Tyre begun by Esarhaddon resulted in capitulation. Tire-some wars in Elam, on the north, and in Arabia, disturbed much of the reign. The most serious blow to the safety of the empire came with the bold insurrection of Shamash-shum-ukin, a younger son of Esarhaddon, who had been made Regent of Babylonia by his father as a sop to the pride of that land. After a bitter and protracted struggle, in which Elam helped the rebel, the latter was defeated and perished, and his adherents were cruelly punished. To this punishment of Babylonia belongs the colonization of Samaria attributed by Ezra iv. 10 to 'Assnapper,' which is a corruption of Asshurbanipal's name. Asshurbanipal's policy as a warrior seems to have been purely defensive. He soon felt the impossibility of holding Egypt, refused assistance to Gyges of Lydia in his struggle with the Cimmerians, and was content with maintaining the old lines of his empire as intact as possible against the barbarian swarms which broke into the kingdom upon his death. His greatest fame as a monarch rests in his works of peace. He built magnificently, both in Nineveh and in the sacred cities of Babylonia, neglecting his political duties for those of a religious devotee and a litterateur. In his palace at Nineveh he gathered a great library, in which were deposited copies of the ancient literature of the south, and to which his scholars added their own contributions. (See NINEVEH.) It is to this wonderful collection, discovered again by Layard and Rassam, that modern science owes much of its knowledge of Babylonian literature and religion. The King's magnificence left its impression upon later tradition, and he is one of the few Assyrian kings distinctly mentioned by the Greeks, although his memory is distorted by legends and errors which make of him a mere Sybarite. The classical story of his self-destruction in a great funeral pyre is probably based on the fate of the last King, Sin-shar-ishkun. For the history, consult: George Smith, *History of Assurbanipal* (London, 1871), and the histories of Assyria; for the inscriptions, Jensen, in *Keilinschriftliche Bibliothek*, ii. (Leipzig, 1889); Bezold, *Kurzgefasster Ueberblick über die babylonisch-assyrische Literatur* (Boston, 1886); for the buildings and library, Layard, *Nineveh and Its Remains* (London, 1848), and *Monuments of Nineveh* (ib., 1849); Hilprecht, *Explorations in Bible Lands* (Philadelphia, 1903).

SAR'DES. An ancient city of Asia Minor. See SARDIS.

SAR'DICA, COUNCIL OF. A council held, probably in the year 343, at Sardica, in Illyria, the present Sofia. It was summoned by the emperors Constantius and Constans, in concert with Pope Julius I., for the purpose of discussing the difficulties arising from the deposition of Saint Athanasius and other bishops, and generally testifying against innovations in doctrine in regard to the person of Christ. It also went into questions of discipline, and passed a number of canons which have been famous and important in the subsequent history of the Church. By

some scholars, such as Baronius and Mansi, an eemmental character has been attributed to it, but this is denied by the great majority.

SARDINE (Lat. *sardina*, *sarda*, from Gk. *σαρδῆνη*, *σάρδα*, sardine, from *Σαρδῶ*, *Sardō*, Sardinia). One of the small fishes of the herring family (Clupeidæ) which are preserved in oil and canned; properly, the European *Clupea pilchardus*, very common in the Mediterranean and adjoining ocean, appearing in great shoals. Many young fishes of related species, however, are also utilized in the same way and mixed with them. In curing sardines they are first carefully eviscerated, washed, and then exposed to the sun or to a current of air under cover. They are next put into boiling oil in which they remain for a short time, then taken out, drained, and put into square tin boxes. The boxes packed with sardines are filled up with oil, the lid is soldered on, and they are placed for a short time in boiling water or exposed to hot steam. In the south of France sardines are sometimes cured in red wine, and then known as 'sardines anchoisées.'

A FOSSIL SARDINE.

Several species of small Clupeidæ much resembling the sardine are found in various parts of the world, and are used in the same way as the sardine of the Mediterranean. The California sardine (*Clupea edwardsii*) closely resembles the European sardine, gets about 12 inches long and is an excellent food-fish, but is not canned. The sardine fisheries are very extensive, both in America and Europe. (See FISHERIES.) In the Eastern States the young of several small fishes have been put up in oil, like sardines, especially young menhaden, and sold under various trade names. They are cheap and acceptable, but not so good as true sardines. Consult: Goode, *Fishery Industries*, section I. (Washington, 1884). Compare ANCHOVY. See PILCHARD; and PLATE OF HERRING AND SUAD.

SARDINIA (It. *Sardegna*, Gk. *Σαρδῶ*, *Sardō*). An island belonging to Italy, next to Sicily the largest island in the Mediterranean Sea. It is situated between latitudes 38° 52' and 41° 16' N., and between longitudes 8° 8' and 9° 49' E., south of Corsica, from which it is separated by the Strait of Bonifacio, nine miles wide (Map: Italy, C 7). The nearest point of the Italian mainland lies 115 miles northeast of the northeastern extremity of the island. Sardinia has roughly the shape of an oblique parallelogram with an extreme length of 168 miles and a width of 89 miles. Its area is 9294 square miles, including the small islets along the coasts.

The greater part of the island is mountainous, especially along the eastern coast, but it is less elevated than Corsica. The highest point is Monte Gennargentu, near the centre of the island, with an altitude of 6365 feet. The southwestern mountain group, containing the richest mineral deposits, is separated from the remaining high-

land by the low plain of Campidano, running with a breadth of 12 miles between the Gulfs of Cagliari and Oristano. The rivers of Sardinia are all unimportant. The climate is mild, like that of the other Mediterranean lands, and very warm in summer. The average annual rainfall is only 17 inches, and the summers are very dry. Large portions of the island are subject to malaria. In spite of the drought, the vegetation is rich, and forests still cover about one-fifth of the area. The date palm is here indigenous. Geologically the island consists almost wholly of crystalline rocks with granite predominating. The plain of Campidano is covered with Tertiary deposits, and there are small areas of older sedimentary rocks. The chief mineral veins are found in the porphyritic flows in the southwest.

Some of the mines were worked by the Carthaginians and the Romans. Mining was resumed in the nineteenth century and has assumed extensive proportions. It now gives employment to about 12,000 persons. The principal minerals are lead, silver, zinc, copper, magnesium, antimony, lignite, granite, and salt. The last is a State monopoly. The value of the annual mineral output is over \$3,000,000.

Sardinia is, like Sicily, an agricultural country with a fertile soil, but the agricultural conditions differ greatly in the two islands. The minute holdings of Sardinia present a striking contrast to the extensive estates and the large proportion of the landless class of Sicily, while the gradual adoption of modern methods in the former island compares favorably with the backwardness prevailing in the latter. The raising of cereals shows a downward tendency, while the area under vineyards is constantly increasing, amounting in 1900 to more than 200,000 acres, and yielding an average annual output of about 5,000,000 gallons of wine. Viticulture has attained a very high state of development in Campidano, in the Province of Cagliari. Olives are cultivated on the western coast. Stock-raising is also progressing, and the native breed of cattle is being improved by importations from abroad. The tunny fisheries are showing signs of decline.

Sardinia exports principally minerals, wine, olives, salt, fish, and charcoal, and imports cotton and woollen goods, coal, iron products, and various manufactures. Since the conclusion of the Franco-Italian treaty in 1898 the commerce is growing. The island is well provided with transportation facilities and has a considerable coastwise shipping. It is divided into two provinces, Cagliari and Sassari. Education is at a low ebb, although considerable progress, especially in technical instruction, has been made of late. There are universities at Cagliari and Sassari. The population was 682,002 in 1881, and 791,754 in 1901. The capital is Cagliari (q.v.).

ETHNOLOGY. Owing to their isolation, the Sardinians are one of the most homogeneous ethnic groups in Europe. They have the shortest stature, many of them measuring only 50 to 60 inches, the brownest eyes and hair, less than one per cent. being fair-complexioned, and the longest heads of all the Italian populations. The height of Sardinian soldiers is given as 1.619 meters (63.5 inches). An older, dwarfish race is revealed by ancient graves, the skulls from which measure only 1150 cubic centimeters.

island was first called by the Romans *Sardinia*, and later, from its resemblance to the foot-print, and afterwards *Sardania*. The name of Phœnician derivation, was first used at a very early period. Archaeologists have thought they found remains of a very ancient Phœnician occupation and perhaps of a subsequent one by Egyptians, but these are largely speculations, as are the surmises concerning the primitive inhabitants. The first really historical event is the partial conquest by the Carthaginians about B.C. 550. They made the island a great corn-producing country. They practically completed the conquest in B.C. 260, but in 239, when Carthage was threatened by a revolt of her mercenaries, Rome accepted the island from the mutinous troops, and made it a province of the Republic. It was not reduced to complete submission until B.C. 235. It was guarded with care by Rome, as a natural part of her western Mediterranean domain and as one of the valuable granaries of the capital.

Sardinia fell into the hands of the Vandals in A.D. 458, and was subjected to the Eastern Empire in 533, but finally fell into the power of the Saracens about the middle of the eighth century. These were driven out in their turn by the Pisans and Genoese in the eleventh century, and the island was bestowed by the Pope upon Pisa, one of whose deputy governors obtained the erection of Sardinia into a kingdom (1164) by Frederick I. Frederick II. made his son Enzo King of Sardinia in 1238, but in 1250 the Pisans reconquered the island. The popes, who had long claimed a right of suzerainty over the island, gave it in 1296 to James II. of Aragon, and it continued in the possession of Spain till 1708, when it fell into the hands of the British. By the Peace of Utrecht (1713) it was given to the Elector of Bavaria and by him transferred to Austria in the following year in exchange for the Upper Palatinate. In 1720 Austria gave it to the Duke of Savoy in exchange for Sicily, and it has since that time formed a part of the dominions of the House of Savoy.

SARDINIA, KINGDOM OF. A former Italian kingdom, and the nucleus of the present Kingdom of Italy. It included the duchies of Savoy, Aosta, and Genoa, the former Duchy of Montferrat, part of the old Duchy of Milan, the Principality of Piedmont, the County of Nice, and the islands of Sardinia and Caprera.

The modern Kingdom of Sardinia was originated by a treaty (August 24, 1720) between Austria and the Duke of Savoy (q.v.), by which the latter agreed to surrender Sicily on receiving in exchange the island of Sardinia, and the erection of his States into a kingdom. Of the kingdom thus constituted the island which gave its name was held in slight regard, the principal territories being on the mainland. The active life of the kingdom was in Piedmont (q.v.), where was Turin, the royal capital, and

Piedmont is frequently referred to in nineteenth-century history instead of Sardinia. In 1730 Victor Amadeus I., the last Duke of Savoy and first King of Sardinia, resigned the throne to his son, Charles Emmanuel I. (1730-73). The latter, by joining with France and Spain against Austria, obtained (1738) the territories of Tortona and Novara, to which were further added (1748) the County of Anghiera and other districts. Charles Emmanuel was the author of the code known as the *Corpus Carolinum*. During the reign of Victor Amadeus II. (1773-96) the French Revolutionary armies invaded Savoy, and the victories of Napoleon led the King to conclude peace in 1796 at the sacrifice of Savoy and Nice. Cuneo, Alessandria, and Tortona were garrisoned by French troops. Charles Emmanuel II. (1796-1802) was at first an ally of France; but the Directory in 1798 compelled him to give up Piedmont, which in 1802 was incorporated with France. In that year Victor Emmanuel I. succeeded Charles Emmanuel, his realm being limited to the island of Sardinia. The Congress of Vienna (1814-15) reinstated the House of Savoy in its former possessions, to which the territories of the extinguished Republic of Genoa were added. Victor Emmanuel I. (1802-21) made his entry into Turin May 20, 1814. His return restored the ancient misgovernment; and the reactionary policy in this and other Italian States called forth the activity of the Carbonari (q.v.) and other secret associations, whose aims were supported by a portion of the nobility and army, and by the heir presumptive to the throne, Charles Albert, Prince of Savoy-Carignan. The military insurrection in March, 1821, brought on a general revolution. The King abdicated in favor of his brother, Charles Felix (1821-31), the Austrians came to the rescue of absolutism, and the revolutionary movement was quelled. On the death of Charles Felix the elder line of Savoy became extinct, and the succession fell to the cadet branch of Savoy-Carignan (see SAVOY, HOUSE OF), whose rights had been recognized by the Congress of Vienna, and Charles Albert (1831-49) ascended the throne. The liberals were gratified with some slight reforms, but the power of the clergy was untouched. The internal administration was, however, carried on with energy. In 1842 the King began a gradual but progressive liberal policy, relaxed the severity of the censorship, reformed the judicial administration and prison discipline, and abolished the feudal system in Sardinia. On February 8, 1848, the King announced a new and extremely liberal constitution, which was proclaimed some weeks afterwards; a Parliament was convoked in April. In the midst of these changes the Revolution in Southern and Central Italy broke out, and Charles Albert, who was saluted with the title of 'the Sword of Italy,' put himself at the head of the movement, and declared war against Austria. On the day after the fatal rout of Novara (March 23, 1849) Charles Albert abdicated, and was succeeded by his son, Victor Emmanuel II. The further history of Sardinia is merged with that of Italy (q.v.). Consult: Gallenga, *History of Piedmont*, translated from the Italian (London, 1856); Manno, *Storia moderna della Sardegna* (Florence, 1858); Ricotti, *Storia della monarchia piemontese* (ib., 1861-69).

SAR'DIS, or **SAR'DES** (Lat., from Gk. Σάρδεις, *Sardeis*, Ionic Σάρδεις, *Sardies*, Σάρδεις, *Sardis*). An ancient city of Asia Minor, the capital of Lydia, situated at the northern base of Mount Tmolus, on the Paeonius, 60 miles east-northeast of Smyrna (Map; Turkey in Asia, C 3). The city is first mentioned by Æschylus. It was taken by the Cimmerians in the reign of King Ardyus (B.C. 680-631). In the reign of Cræsus, the last Lydian King, Sardis attained its highest prosperity. It became the residence of the Persian satraps after the overthrow of the Lydian monarchy. The Ionians burned it about B.C. 499, and a little later Xerxes assembled his vast army at Sardis for the invasion of Greece. It was of importance under the Romans. It is one of the seven churches mentioned in the Book of Revelation. The town was almost completely destroyed by Timur in 1402. Traces of the ancient city are still visible, notably the famous Ionic temple of Cybele and the tomb of Alyattes. *Sart*, the modern Sardis, is a poor village with a few straggling houses and tents of nomadic tribes.

SARDONYX (Lat. *sardonyx*, from Gk. σαρδόνυξ, *sardonyx*, from σάρδιος, *sardios*, sard, from Σάρδεις, *Sardeis*, Sardis, the ancient capital of Lydia in Asia Minor + ὄνυξ, *onyx*, onyx, nail). A variety of quartz. It resembles onyx and usually consists of layers of red (carnelian) and white (chaledony). It finds some use as a gem, being employed for brooches and other forms of jewelry.

SARDOU, sär'doo', VICTORIEN (1831—). A French dramatist, born in Paris. He at first studied medicine, then history, taught for a time, and, failing in early dramatic efforts, of which *La tournée des étudiants* (1854) was the first acted, he became a hack journalist and writer. He fell into poverty, and was nursed through a fever by Mlle. de Brécourt, afterwards his wife, who introduced him to the noted actress and theatrical manager Mlle. Déjazet, for whom he wrote plays of ephemeral popularity, among them *Monsieur Garat* (1860). When he had once achieved notoriety Sardou produced comedies with astonishing rapidity, four in 1861, *Les petites de monche*, from Poe's *Purloined Letter*, *Piccolino*, *Les femmes fortes*, *Nos intimes*; three in 1862, *Les gaudaches*, a satire on the republican agitation, *La papillonne*, *Les premières armes de Figaro*; and nearly a score in five years, all brilliant in dialogue, all genre pictures of modern social life, never serious or stern in moralizing, bitter only in *Les gaudaches*, almost always successful. Of these the best is *La famille Bénédict* (1865). The same vein was pursued during the last years of the Empire (*Scraphine*, 1868; *Patric*, 1869; *Fernande*, 1870), with a political digression in *Nos bons villageois* (1866). That Sardou was a sincere Bonapartist he showed after Napoleon's downfall in *Le roi Carotte* (1871) and *Ragabab* (1872), a fierce attack on Gambetta, with Napoleon III. and Garibaldi in the background. In 1878 he entered the Academy and in 1880 aroused clamor if not applause by *Daniel Rochat*, a plea for civil marriage, and (with Najac) *Dirorçons*, a daring farce, which had a financial success then almost unparalleled in France. The plays of the eighties are more significant. *Odette* (1881) and *Fédora* (1882) show social and political satire develop-

ing into character-study, centred round a single figure, usually a woman. In this vein *Scraphine*, *Fernande*, and *Dora* (1877) were early experiments. *Théodora* (1884), *Georgette* (1885), and *La Tosca* (1887) lead up to the historic and spectacular dramas of the nineties (*Cléopâtre*, 1890; *Thermidor*, 1891; *Madame Sans-Gêne*, 1893; *Gismonda*, 1894; *Marcelle*, 1895; *Robespierre*, 1898; and *Dante*, 1903). Of this style *Patric* (1869) and *La Haine* (1874) were the forerunners. These later plays were composed to be heard and seen, not to be read, and they have not been published. Occasional scenes show literary elaboration, but the general effect is of exalted vaudeville. Sardou's importation into serious drama of sensation and spectacle has tended to corrupt the stage and to make it artificial and insincere. Critical notices of Sardou are in Lacour, *Trois théâtres* (Paris, 1880); Matthews, *French Dramatists* (New York, 1881); Sarrazin, *Das moderne Drama der Franzosen* (Stuttgart, 1888); Donnée, *Ecrivains d'aujourd'hui* (Paris, 1895).

SARGENT, CHARLES SPRAGUE (1811—). An American forester and botanist, born in Boston and educated at Harvard (class of 1862). He became director of the Arnold Arboretum at Cambridge in 1872, and in 1879 was appointed professor of arboriculture in Harvard University. Professor Sargent planned the Jesup collection of woods, now in the American Museum of Natural History, New York City, and described it in 1885. He edited the posthumous papers of Asa Gray in 1889, and wrote *Report on the Forests of North America* (1884), *Forest Flora of Japan* (1894), and the great work entitled *Silva of North America* (14 vols., 1891-1902).

SARGENT, EPES (1813-80). An American editor, poet, and dramatist. He was born at Gloucester, Mass., and was educated at the Boston Latin School, and at Harvard College. After a brief connection with the *Boston Advertiser* and *Atlas*, he went (1839) to New York as assistant editor of *The Mirror*, returned (1846) to Boston, where for several years he edited the *Transcript*, and then devoted himself to preparing school text-books and popularizations of literature. He wrote four dramas, *The Bride of Genoa* (1846), *Velasco* (1837), *Change Makes Change*, and *The Priestess*. The more noteworthy of his many juvenile or adolescent stories are: *Wealth and Worth* (1840); *What's to be Done?* (1841); *Electwood* (1845); and *Peculiar, a Tale of the Great Transition* (1863). His poems are collected in *Songs of the Sea* (1847), *Poems* (1858), etc. Among miscellaneous works may be named: *The Life and Services of Henry Clay* (1843); *American Adventure by Land and Sea* (1847); *Arctic Adventures by Sea and Land* (1847). He is chiefly remembered for the song, "A Life on the Ocean Wave."

SARGENT, HENRY (1770-1845). An American painter and soldier, born in Gloucester, Mass. He was educated at Dunmer Academy, near Newburyport, and in Boston, and afterwards studied art in London under Copley and West. Some time after his return to Boston he became adjutant-general of the State of Massachusetts, and was aide successively to Governor Brooks and Governor Strong. He also represented Boston in the Legislature. His works include "Dinner Party," "Christ's Entrance into Jerusalem," "Landing of the Pilgrims," owned by the Pilgrim

Caroline, and a portrait of Peter Fenold Hall, Boston.

SARGENT, JOHN SINGER (1856—). An American portrait and figure painter, born in Florence, Italy, January 12, 1856. He took a course of classical studies at Florence, where he was also enrolled as a pupil of the Academy, and as a youth made studies of the old masters. He traveled extensively with his parents, and at the age of eighteen became the pupil of Carolus Duran in Paris. He speedily acquired many of his master's best qualities, assisting him in his decoration of the Luxembourg, into which he introduced Duran's portrait. Among his first exhibited pictures "En route pour la pêche" (1878), a group of fisher girls upon the beach, and "Neapolitan Children Bathing" (1879) attracted much attention. Charming souvenirs of his visit to Spain in 1879, and of the influence of Velazquez, are the "Smoke of Ambergris" (1880) and "El Jaleo" (1882, Boston Museum), a Spanish dance. He continued to reside in Paris, exhibiting yearly at the Salon, until in 1884 he removed to London, where he has since resided. He has received the highest medals and honors, including the Grand Prix at the Paris expositions of 1889 and 1900, and is a member of the National Academy of Design, the Society of American Artists, the Société Nationale des Beaux-Arts, and the Royal Academy; in 1889 he was made chevalier, and in 1895 officer of the Legion of Honor. In 1887 and in 1889 he visited the United States, residing chiefly in New York and Boston.

Sargent's work is characterized by a singular truth of vision and readiness of hand. He has viewed widely the whole field of creative art, and has studied with a shrewd intelligence the methods and precedents of the past. The marvelous facility of hand and vivacity of vision that characterize his work seem to be the cumulative result of the knowledge thus acquired, in conjunction with a constant and conscientious reference to nature.

Among the best known of his portraits are those of Carolus Duran and Dr. Pozzi (1879); a "Young Lady" (1881); "Hall of the Four Children" (1882); "Madame Gauthereau" (1884); "Carnation Lily, Lily Rose" (1885, South Kensington Museum); Lady Playfair (1885); Henry Marquand (1887, Metropolitan Museum); Claude Monet (1888); Edwin Booth, Lawrence Barrett, and Joseph Jefferson, painted for the Players' Club (New York, 1890). He exhibited nine works at the Columbian Exposition (1893), among which were Ellen Terry as Lady Macbeth, and the charming portrait of young Homer Saint-Gaudens. His later sitters include Mrs. Meyer and her Children (1897); Wertheimer, the London art dealer (1898), and his daughters (1901); Col. Ian Hamilton (1899); Lady Eleho, Mrs. Adeane, and Mrs. Tenant (1900). In 1903 he again visited the United States, portraying President Roosevelt, Secretary Hay, and other nobles at Washington, and a number of persons of Boston.

Although chiefly known as a portrait painter, Sargent has created figure pieces, like "Carmenita" (1890, Luxembourg), of the highest order, and his mural decorations in the Boston Public Library rank with the best work of the kind. He received the latter commission in 1890, and spent the winter of 1891-92 in making preparatory

studies in Egypt. In 1892-94 he completed one of the ends of the great hall now named after him, with such success that his commission was extended to include the entire hall. The subject represented is the "Pageant of Religion," illustrating certain stages of Jewish and Christian history. In one end of the hall he has portrayed the triumph of monotheism over the polytheism of the ancient world, in weird allegorical representations, even making use of relief. Particularly impressive are the figures of the Hebrew 'Prophets' upon the side walls, in which he has created types worthy of comparison with those of Michelangelo in the Sistine Chapel. Consult Catlin, *American Masters of Painting* (New York, 1902).

SARGENT, LUCIUS MANLIUS (1786-1867). An American author, born in Boston. After graduating at Harvard, he studied law, but soon turned his attention to literary and philanthropic work. For thirty years he lectured on temperance, and in the same interest published *Temperance Tales*, a series of twenty-one stories, which began in 1835 and which passed through more than 100 editions. Among his other writings were: *Dealings with the Dead*, by a Sexton of the Old School (1856); *Reminiscences of Samuel Dexter* (1858); *The Irrepressible Conflict* (1861); and some poems. Consult Sheppard, *Reminiscences of Lucius M. Sargent* (1889).

SARGENT, NATHAN (1794-1875). An American journalist and politician, born at Poultney, Vt. After studying law, he began to practice at Cahawba, Ala., where in 1816 he was appointed county and probate judge. He lived in Buffalo from 1826 to 1830, when he went to Philadelphia to undertake the publication of a newspaper in the interest of the Whig Party. He afterwards became the Washington correspondent of the *United States Gazette*, writing under the signature of Oliver Oldschool; was Register of the United States Treasury in 1851-53, and was Commissioner of Customs from 1861 to 1867. His best known publication is *Public Men and Events* (1875), a book of character sketches containing some valuable information.

SARGENT, WINTHROP (1753-1820). An American soldier and pioneer, born at Gloucester, Mass. He graduated at Harvard in 1771, and during the Revolutionary War served in the patriot artillery, rising to the rank of major. After the close of the war he became interested in Western land schemes, and having been employed by Congress as a surveyor in what was afterwards the Northwest Territory, he was, in 1786, elected one of the two delegates from Suffolk County in Massachusetts chosen to aid in forming the Ohio Company. After its organization he was chosen secretary and in conjunction with Manasseh Cutler (q.v.) purchased land on its behalf. The next year Congress appointed him Secretary of the Territory. In 1798 he was appointed Governor of Mississippi Territory and took up his residence at Natchez. He died while on a voyage to Philadelphia. He was one of the authors of *Papers Relative to Certain American Antiquities* (1776), and in 1803 he published a poem entitled *Boston*.

SARGENT, WINTHROP (1825-70). An American author and lawyer, born in Philadelphia. He graduated at the University of Pennsylvania in 1845, and at the Harvard Law School in 1847,

and later settled in New York City. He devoted much of his time to historical research and published works dealing with the Colonial and Revolutionary periods, including *History of an Expedition Against Fort Duquesne in 1755*, *Under Major-General Edward Braddock* (1856); *Life and Career of Major John André* (1861); *The Loyal Verses of Joseph Stansbury and Dr. Jonathan Odell* (1860); and *Loyalist Poetry of the Revolution* (1860).

SARGON, sār'gōn. The name of an early Babylonian king and of a famous ruler of Assyria. (1) Sargon I. (*Shargani-shur-utu*), a Semitic ruler of Agade, the biblical Accad (Gen. x. 10), a North Babylonian city, at a date which, upon the authority of a late Babylonian statement and of archaeological evidence, is placed by some scholars at B.C. 3800, while others place it 1000 years later. An interesting story resembling that of the youth of Moses and of Cyrus is told of his rise to power. He seems to have been the first to bring all Babylonia under the control of one Semitic dominion; at the same time he carried his arms far beyond the Euphrates Valley, claiming to have conquered Elam, and making progress into the west. His great buildings at Nippur, along with those of his son Naram-sin, likewise a redoubtable conqueror, have been unearthed by the University of Pennsylvania expeditions. Consult: Hilprecht, *Excavations in Bible Lands* (Philadelphia, 1903); Winckler, in *Keilschriftliche Bibliothek*, iii. (Berlin, 1889); Rogers, *History of Babylonia and Assyria* (New York, 1901). (2) Sargon II. (*Sharru-ukin*, 'a god has established the king'—an etymological play on the name of the earlier conqueror, by which name he was also known), King of Assyria, B.C. 722-705. He followed Shalmaneser IV., but how he came to the throne is not known. His first achievement was the capture of Samaria, after its three years' siege by his predecessor (II. Kings, xviii. et seq.). However, he was not present at this triumph, being engaged with a rebellion raised by Merodach-baladan in Babylon, whom Sargon was unable to subdue. In the west rebellion soon broke out, led by Hamath in Central Syria and by Gaza, at the instigation of Egypt; but he defeated these foes at the battles of Karkar and Raphia (B.C. 720). The next decade was occupied with the laborious conquest of the aggressive State of Urartu to the north, which was annexed to the Empire, and with extensive conquests in Media. In B.C. 711 another rebellion broke out in South Syria, having its centre in Ashdod, Judah also being implicated (cf. Isa. xx.). But the cities which opposed Sargon's arms easily succumbed. He then undertook the subjection of Babylon, and drove out Merodach-baladan by brilliant campaigning, being finally recognized as the legitimate lord of the land (B.C. 709). His ability as a conqueror not only secured to him the traditional limits of the Assyrian Empire, but also extended them in every direction, and in the west into Cilicia, Cappadocia, and Cyprus. The last years of his reign were occupied with great building operations, notably in connection with a new capital, Dur-sharrukin, the modern Khor-sabad (q.v.). He was succeeded by his son Sennacherib (q.v.). Consult: Winckler, *Keilschrifttexte Sargons* (Leipzig, 1889); Peiser, in *Keilschriftliche Bibliothek*, ii. (Berlin, 1890); and the histories of Rogers and others.

SARK, sār'k, or **SERCQ**. The fourth in size, but most picturesque, of the Channel Islands (q.v.), 6 miles east of Guernsey (Map: France, D 2). It consists of Great and Little Sark, connected by the Coupée, a natural causeway, 150 yards long, 15 feet broad, and 381 feet high.

SARMATIANS, sār-mā'shanz. An ancient tribe who in the time of Herodotus (fifth century B.C.) lived between the Caspian Sea, the Don, and the Sea of Azov. Later they subdued the Scythians of the great plains north of the Black Sea, to which the name of Sarmatia was extended. They spoke the same language as the Scythians, and are now thought to have been one of a group of tribes of which the Scythians are the best known. Herodotus describes some of the ancient tribes of the Don as semi-civilized, while others were in the lowest stage of barbarism. Remains of the Sarmatians have been found in the burial mounds in their former habitat, and it is supposed by some that they were the ancestors of the Slavs (q.v.). Among the Sarmatian tribes were the Roxolani and the Jazyges. Some of the latter pushed as far west as the plains of modern Hungary.

SARMIENTO, sār'mi-én'tó, DOMINGO FAUSTINO (1811-88). President of Argentina. He was born at San Juan in Argentina, and for some time lived as a teacher at San Luis. For opposing Rosas he was compelled to flee about 1830 to Chile, where he worked as clerk and teacher. He returned to San Juan in 1836, established a school there for girls, and edited a literary paper, but was imprisoned on a political charge, and forced once more to go to Chile. There he devoted himself to the question of public instruction, founded the first normal school in South America, and in 1845 was sent by the Chilean Government to visit the educational institutions of Europe and the United States. After 1847 he acted as the editor of several journals. In 1851 he returned to the Argentine Republic, and fought in the war against the dictator Rosas. To him was due the establishment of a Department of Public Instruction, of which he became Minister in 1860. In close succession he filled the offices of Minister of Interior, Governor of San Juan, Minister to Chile, and finally Minister to the United States from 1865 to 1868, when he was chosen President of the Argentine Republic. Among his important works are: *Viajes por Europa, Africa y América* (1848); *Argarópolis, ó la capital de los Estados Confederados* (1850); *Civilización y barbarie, ó Encuentro Quiroga y Añao* (1851). The results of his sojourn in America were his *Vida de Abraham Lincoln* (1866), and *Las escuelas, base de la prosperidad en los Estados Unidos* (1868).

SARMIENTO DE GAMBOA, dá gám-bō'á, PRIMO (c.1530-c.1591). A South American navigator, born in Galicia, Spain. He was sent in 1579 from Callao in Peru with a small fleet to intercept Drake, then cruising along the coasts of Peru and Mexico, and further to explore the Straits of Magellan. On his return to Spain in 1580 he gave King Philip a description of the locality, which decided him to fortify it as a stronghold, and a year afterwards Sarmiento and Diego Flores Valdez were sent there, in charge of a large expedition. Sarmiento established a colony at San Felipe, now known as Port Famine, but on his way back to Spain he was captured by the English, and he was not released until 1588.

bank of the Glommen, 68 miles by rail south-

SARNIA. A port of entry and the capital of the same County, Ontario, Canada, on the Saint John River and the Grand Trunk Railroad, opposite Port Huron, Mich., with which it is connected by a steam ferry and by a railroad tunnel beneath the river (Map: Ontario, V 5). It is the last port of entry for Canadian vessels bound to the upper lakes. Sarnia has manufactures of ale and beer, lumber, iron castings, machinery, woodenware, woollens, leather, etc. Population, in 1891, 6692; in 1901, 8176.

SARNO, sár'nò. A city in the Province of Salerno, Italy, situated on the Sarno, 12 miles by rail northwest of Salerno (Map: Italy, J 7). The city is dominated by the ancient castle of Count Francesco Coppola. Paper, silk, cotton, linen, and hempen fabrics are manufactured. The chief products are grain, olives, grapes, and sulphur. Sarno was a countship before it was incorporated with Naples. Near Sarno occurred a battle in 553, in which Narses defeated the Goths, and ended their reign in Italy. Population (commune), in 1901, 18,475.

SARPE'DON (Lat., from Gk. Σαρπηδών), (1) In Greek mythology, the son of Zeus and Europa. He became King of the Lycians, and his father gave him the privilege of living through three generations. (2) A Lycian prince, the grandson of the preceding, or, according to some, the son of Zeus and Laodamia. Homer represents him as an ally of the Trojans, distinguished for courage, and slain by Patroclus, after which Apollo rescued and purified his body and had it transported into Lycia for burial.

SARPI, sár'pé, PAOLO (1552-1623). An Italian historian and supporter of the Reformation. He was a Venetian by birth. He entered the Servite Order at the age of thirteen, taking the name of Frà Paolo, by which he is often known. He taught theology and philosophy with success, and studied other sciences eagerly, making some notable discoveries in anatomy. He was ordained priest, and in 1579 became provincial of his Order. He returned to Venice in 1588 and pursued his studies; but his intimate relations with the opponents of the Church caused some suspicion of his orthodoxy, and three applications for a bishopric were refused. On the outbreak of the conflict between the Republic of Venice and Paul V., he threw himself vigorously into the anti-Papal party, and became the official counselor of the Republic in ecclesiastical matters. Under his advice Venice banished the Jesuits from its territory. In 1606 he was summoned to Rome to appear before the Inquisition, but refused to obey. He maintained his relation with Protestant leaders in various countries, and began his *History of the Council of Trent*, which gives him his greatest fame, though it is so colored by his violent prejudices as to be thoroughly untrustworthy. It was published in London (1619) by Marcantonio de Dominis and at Geneva (1629), probably by Diodati. For his biography, consult lives by Robertson (London, 1894), Campbell (Turin, 1875), Balan (Venice, 1887), Pascolato (Milan, 1893); Trollope, *Paul the Pope and Paul the Friar* (London, 1860); Fontanini, *Storia arcana della vita di P. Sarpi* (Venice, 1803).

SARPSBOG, sárp-'bòr-y'. A town of the Province of Smølenene, Norway, on the right

bank of the Glommen, 68 miles by rail south-southeast of Christiania. Its port on the Christiania Fiord is Sannesund. The town is regularly built. To the north lies the lake of Gleng-bölen; to the east are the immense falls of the Glommen, 140 feet broad and 74 feet high. The town owes its importance to the utilization of this natural power for mills. There are calcium carbide, wood pulp, paper, aluminum, spinning, weaving, and saw mills. Population, in 1900, 6888. Sarpsborg was founded in the eleventh century and was destroyed by the Swedes in the sixteenth century. The new town dates from 1840.

SAR'RACE'NIA, SIDE-SADDLE FLOWER, or PITCHER PLANT. A genus of singular marsh plants, natives of North America. *Sarracenia purpurea* is common from Hudson Bay to South Carolina; the other species, of which there are four or five, are confined to the Southern States. They are perennial herbs with radical leaves and scapes, which bear one or more large flowers. The leaf-stalks are hollow and urn-shaped, the blades articulated at their apices, and fitting like a lid—a form which suggested the popular names. The genus is the type of the small natural order Sarraceniaceæ, of which the other genera are *Heliamphora*, which has been discovered in Guyana, and *Darlingtonia* in California. All the species are insectivorous through their peculiarly modified leaves. Consult Darwin, *Insectivorous Plants*.

SAR'RACE'NIA'CEÆ. An order of plants. See SARRACENIA.

SARRAU, sà'rò', JACQUES ROSE FERDINAND EMILE (1837—). A French physicist and engineer, born in Perpignan and educated in Paris at the Ecole Polytechnique. In 1878 he became director of the central depot for saltpetre and powder, was named chief engineer in 1879, became professor of mechanics in the Polytechnic in 1883, was elected to the Academy of Sciences in 1886, and in 1897 was promoted to the rank of inspector-general. Sarrau's especial study was explosives, and with Vieille he invented a registering pressure gauge. In physics his main research was on the compressibility of gases (Paris, *Comptes Rendus* (1882, et seq.), and he determined the critical point of oxygen. Among his writings besides contributions to periodicals are *Les effets de la poudre et des substances explosives* (1874-76), *Cours de mécanique* (1888-89), *Cours d'artillerie* (1893), and *Théorie des explosifs* (1893-95).

SARSAPARILLA (Sp. *zarzaparilla*, *zarzaparrilla*, sarsaparilla, from *zarza*, bramble, from Basque *sartzia*, bramble + **parilla*, **parrilla*, diminutive of *parra*, trained vine, or from *Parilla*, name of a physician said to have been the first to employ it). This medicine, formerly much used, is the produce of several species of Smilax (see SMILACEÆ), *Sarsaparilla officinalis*, *Sarsaparilla medica*, and other undetermined varieties. They are woody vines with prickly angular stems; the first with large ovate-oblong, acute, heart-shaped, leathery leaves; the second with shortly acuminate smooth leaves, the lower ones heart-shaped, the upper ones approaching to ovate. The shrubs are natives of warm parts of America, *Sarsaparilla officinalis* being found in South America and *Sarsaparilla medica* on the Mexican Andes. Some botanists regard them as mere varieties of one species.

The part of the plant used in medicine is the dried roots, which are of about the thickness of a goose-quill, generally many feet in length, reddish brown, covered with rootlets. They are folded in bundles about 18 inches long, are scentless, taste mucilaginous, feebly bitterish, faintly acrid. Sarsaparilla was formerly considered a diaphoretic, diuretic, and alterative, and was used extensively, especially in syphilis and rheumatism. It is now known to be practically inert, and aside from its use as a vehicle for potassium iodide in the form of the compound syrup of sarsaparilla it is chiefly employed in 'spring medicines' and other much advertised 'blood-purifiers,' which are harmless as far as the sarsaparilla is concerned and profitable to their makers. See SMILAX.

SARSEE'. A small detached tribe of Athapascan stock (q.v.), originally a part of the Beaver Indians of Peace River, but later taking refuge for protection with the Blackfeet, and now settled upon a reservation upon the headwaters of the Saskatchewan, near Calgary, Alberta Province, Canada. They are described as lazy, degraded, and demoralized generally, yet law-abiding. They number about 230, of whom 30 claim to be Christians.

SARSFIELD. PATRICK, Earl of Lucan (1645-93). An Irish Jacobite soldier. He was born at Lucan, near Dublin; received a military education in France; entered the English army and rose to the rank of colonel in 1686. He served under Monmouth in France, but was in the victorious army when Monmouth was defeated at Sedgemoor. He was a Roman Catholic and at the revolution was a member of Parliament. He supported King James II. in his effort to retain the crown, accompanied him to France, and thence to Ireland, and fought at the battle of the Boyne. William III. was forced by him to raise the siege of Limerick in 1690. In 1691 he commanded the reserve at Aughrim, and after a gallant defense of Limerick obtained fair terms of surrender and was allowed to retire to France, where he became *maréchal de camp* in the French service. He distinguished himself at the battle of Steenkirke in 1692, and at Neerwinden in 1693, where he was wounded, dying shortly afterwards.

SARTAIN, sār-tān', JOHN (1808-97). An English engraver and editor, active chiefly in America. He was born in London, October 24, 1808. He studied line engraving under John Swain, and while yet a lad illustrated Otley's Early Florentine school (1826). In 1828 he began to practice mezzotint, which he was the first to introduce into America. In 1830 he emigrated to Philadelphia, where he developed a prodigious activity, not only in his profession, but as editor of two magazines and in serving as a member and councillor of many societies of art. As an engraver he has left works of considerable value. Two of the largest and most important plates are "Christ Rejected" (1862), after Benjamin West, and "The Iron Worker and King Solomon" (1876), after Christian Schuessle; among others are those of Penn and Martin Van Buren, after Inman, and Henry Clay, after John Neagle. He also practiced portrait painting in oil and miniature painting on vellum and ivory, though with less success, and designed several public monuments, the principal of which is

the Washington and Lafayette Monument in Philadelphia. Among his numerous important positions was that of chief administrator of fine arts at the Centennial Exhibition in Philadelphia in 1876. He died in Philadelphia, October 25, 1897, leaving a family of talented children.

EMILY SARTAIN (1841—), mezzotint engraver, etcher, and portrait and genre painter, studied at the Pennsylvania Academy, and with Luminais in Paris. She has engraved a number of framing prints, besides many portraits for book illustrations. Her painting "Reproof" (1876) gained a medal at the Centennial Exposition. From 1881 to 1883 she was editor of *Our Continent*, and since 1886 has been principal of the Philadelphia School of Design for Women. In 1900 she was sent to Paris by the United States Government as delegate to the International Congress on Instruction in Drawing.

SAMUEL SARTAIN (1830—), engraver on steel, son and pupil of John Sartain, has been chiefly engaged in engraving portraits and other plates for book illustration. His prints include "Clear the Track," after Christian Schuessle (1854); "Christ Blessing Little Children," after Sir Charles Eastlake (1861); the "Song of the Angels," after Thomas Moran; and various portraits after Thomas Sully, John Neagle, and others. Consult John Sartain, *Reminiscences of a Very Old Man* (New York, 1899).

SARTAIN, WILLIAM (1843—). An American landscape and genre painter. He was born in Philadelphia, the son of John Sartain, the engraver, under whom he worked until 1867. From 1867 to 1869 he studied under Christian Schuessle and at the Pennsylvania Academy, after which he went to Paris, studying under Yvon and Bonnat. He sketched throughout Europe and in Algiers, first exhibiting at the Royal Academy, London, in 1875, returning to the United States in the following year. Sartain is professor of the life class of the Art Students' League, New York City, and is one of the original members of the Society of American Artists. Among his works in oil are an "Italian Head" (1876); "Narcissus" (1878), Smith College, Massachusetts; and "Lucia, Near Algiers;" in water-color are an "Arab Café" (1880) and a "View of the Ghetto, Venice." "In the Hackensack Valley" and the "End of Day" are examples of his latest works.

SARTHE, särt. A northwestern inland department of France, north of the Loire (Map: France, F 4). Area, 2396 square miles. Population, in 1896, 425,077; in 1901, 422,699. It is a region of plains traversed by low hills and by undulations and watered by the River Sarthe. Agriculture is the leading industry; mining and manufacturing are also important. Capital, Le Mans.

SARTI, sār'té, GIUSEPPE (1729-1802). An Italian composer, born at Faenza. He studied under Padre Martini at Bologna, and in 1751 produced his first opera, *Pompeo in Armenia*, which was performed at Faenza with great success. His principal operas were *Le gelosie villane* and *Giulio Sabino*. In 1779 he became *maestro di cappella* of the Milan Cathedral, and thereafter limited himself to the composition of church music. In 1784 he went to Saint Petersburg as music director to the Court of the Empress Catharine. His operas are 30 in number; but

of which he is now known as *il maestro del tondo*, *Amplius Lura Me-*
lanchelago, and *Andrea del* (1487-1531). A
 the greatest painter of the High Renaissance, the
 greatest colorist of the school. He was born at
 Cortona, near Florence, July 16, 1487, the son
 of Angelo, a tailor (Sarto), whence the name
 usually given him. In 1504 his father went to
 Florence and apprenticed his son to a goldsmith.
 The lad's talent having attracted the attention
 of Giovanni Basile, a local painter, the latter
 instructed him, afterwards placing him with
 Piero di Cosimo. Andrea learned more, however,
 from the cartoons of Leonardo da Vinci and
 Michelangelo then exhibited in the Sala del Papa.
 In the Sala del Papa he met Franciabigio (q.v.),
 with whom he was associated until about 1512.
 In 1508 he became a member of the Painters'
 Guild, and in 1513 occurred his supposed disas-
 trous marriage with Lucretia del Fede, the beau-
 tiful young widow of a hatmaker.

Vasari's account of this lady has taken strong
 hold of the popular imagination—witness Brown-
 ing's celebrated poem—and is even accepted by
 biographers. We are told that she was the evil
 genius of his life, hindering his work, racking him
 with jealousy, wasting his substance. There is,
 however, no evidence confirmatory of Vasari's
 statements; whatever there is, goes to disprove
 them. His dislike was, perchance, due to the
 blows which he tells us the vixenish lady was
 wont to inflict upon her husband's pupils, of
 whom he was one.

Before his journey to France Andrea was con-
 sidered a famous painter and had been intrusted
 with important fresco commissions, which he
 completed after his return to Florence. In these
 frescoes his progress as an artist may best be
 traced. In Santa Annunziata, the church of the
 Servites, he painted, 1509-14, seven of the ten
 frescoes in the cloister. Five are scenes from
 the life of Filippo Benozzi, founder of the Order; but
 the finest are the "Adoration of the Kings" (1511),
 and especially the "Birth of the Virgin" (1514),
 which, although the composition is imitated from
 Ghirlandajo, shows all of Andrea's best qualities.
 In the lunette over the entrance to the cloister
 he painted the celebrated "Madonna del Sacco,"
 in reality a "Holy Family," and so called from
 the sack of corn upon which Joseph sits reading to
 the beautiful and dignified Madonna. This
 picture is the acme of Andrea's coloristic produc-
 tion in fresco. Another famous series of ten
 scenes from the life of John the Baptist, in the
 cloister of the Scalzi, was executed in brown
 monochrome, 1511-26. The absence of color in
 this work incited the artist to display his
 great gifts of composition and narrative power.
 In the refectory of the Convent of San Salvi he
 painted, besides earlier panels, his celebrated
 fresco of the "Last Supper"—the only representa-
 tion of the subject worthy to be compared with
 Leonardo's. He has chosen the moment subse-
 quent to that depicted by Leonardo, when Christ
 and Judas dip their bread into the dish. Less
 monumental and impressive than his predeces-
 sor's, his representation is fresh in treatment,
 brilliant and soft in color. The former's cele-
 brated portrayal of the action by means of the
 hands is almost equaled by his follower.

Andrea's easel pictures may best be studied at
 Florence. Among those in the Pitti Palace are
 the "Annunciation" (1512), "Disputa," two

"Holy Families" (1523 and 1529), a large "Pietà," the "Adoration of the Virgin," and several
 portraits, including one of himself and wife, also
 ascribed to Franciabigio. The best known in the
 Uffizi are "Madonna of the Harpies" (see MA-
 DONNA), "Saint James Caressing Little Child-
 ren," and two portraits of himself. In the
 Academy of Florence is a picture of stately
 saints; and in the Cathedral of Pisa, Saints
 Catharine, Margaret, and Agnes are among the
 most charming female figures Andrea ever paint-
 ed. Dresden possesses "Abraham's Sacrifice"
 (replica at Madrid); the Louvre his "Charity"
 and a "Holy Family"; Berlin a portrait of his
 wife and a "Madonna with Saints" (1528).

Andrea died of the plague January 22, 1531,
 and was buried in the church of the Servites, near
 his own frescoes. He was far the greatest colorist
 south of the Apennines, and his works will bear
 comparison with those of the great Venetian
 masters. Silvery in the frescoes and tending
 toward gold in easel pictures, his colors are al-
 ways clear, luminous, and harmonious. He was
 an accomplished chiaroscuroist, and in line he
 was second only to Michelangelo and Leonardo.
 His drawings, of which the best collections are
 in the Louvre and the Uffizi, are often essentially
 modern in character. Such technical merits, in-
 deed, made him deserving of the title the "Fault-
 less Painter;" he only lacked that sense of the
 truly significant possessed by the greatest
 geniuses. The effect of his work is often inter-
 ferred with by the use of too much statuesque
 drapery.

 1880; English translation, Blashfield and Hop-
 kins, New York, 1896); Biadi, *Notizie inedite
 della vita d'Andrea del Sarto*, etc. (Florence,
 1830); Reumont, *Andrea del Sarto* (Leipzig,
 1835); Janitschek, in Dohme, *Kunst und Künst-
 ler Italiens* (ib., 1876).

SARTORIUS VON WALTERSHAUSEN,
 sār-tō-rē-us fōn vāl'tērs-hou'zen, August, Baron
 (1852—). A German economist, born in Götting-
 en. He was educated in the University of
 Göttingen, became professor at Zurich in
 1885, and in 1888 was called to a chair of
 economics in Strassburg. His principal works
 deal with American economic and industrial prob-
 lems and include: *Die Zukunft des Deutschlands
 in den Vereinigten Staaten* (1885); *Nordamerika-
 nische Gewerkschaften* (1886); *Modernes Sozial-
 ismus in den Vereinigten Staaten von Amerika*
 (1890); *Arbeitsverfassung der englischen Kolo-
 nien in Nordamerika* (1894); and *Handelsbilanz
 der Vereinigten Staaten von Amerika* (1901).

SARTOR RESARTUS. See CARLYLE,
 THOMAS.

SARTS. The term denoting the settled
 (farming and commercial) population of certain
 regions of Turkestan, Persia, and Afghanistan, as
 opposed to the nomadic. It has more of a topo-
 graphical than of an ethnological significance,
 being applied sometimes to the Tadjiks, who are
 Aryans, and at others to the Uzbegs, who are of
 Turkic stock.

SARTWELL, HENRY PARKER (1792-1867).
 An American botanist, born in Pittsfield, Mass.
 His great herbarium came into the possession of
 Hamilton College. The last years of his life were
 spent on the study of the sedges, and in 1848 he
 published two parts of *Carices Americanae Sep-*

ANDREA DEL SARTO

"MADONNA OF THE HARPIES," FROM THE PAINTING IN THE UFFIZI GALLERY, FLORENCE

tentrionalis Esiccate, which was never completed.

SARUM, Old. A former city and borough and now a parish in Wiltshire, England, on a hill two miles to the north of Salisbury (q.v.). It dated from the time of the Romans, by whom it was known as *Sorbiodinnum*, and remained an important town under the Saxons. A Witenagemote was held at Old Sarum in 960; and here William the Conqueror assembled all the barons of his kingdom in 1086. In 1220 the cathedral was removed to New Sarum, now Salisbury (q.v.), and was followed by most of the inhabitants. In Henry VII.'s time it was almost wholly deserted. Traces of walls and ramparts and of its cathedral and castle are still seen. Though without a house, two members represented it in Parliament till Old Sarum became proverbial as the type of a rotten borough. It was disfranchised by the Reform Bill of 1832. William Pitt, Earl of Chatham, first sat in Parliament for Old Sarum in 1735. Population of parish, 300.

SARZANA, sãrd-zã'nã. A city in the Province of Genoa, Italy, on the Magra, eight miles by rail east of Spezia (Map: Italy D 3). The Gothic cathedral, begun in 1355, is rich in paintings and marbles. The ancient citadel is used as a prison. There are a seminary and a technical school. Sarzana has manufactures of silk and glass; wine and olive oil are made. Population (commune), in 1901, 12,141.

SASKATCHEWAN. A large river of Canada forming the upper course of the Nelson River (q.v.), together with which it forms one of the four great river systems of North America east of the Continental Divide (Map: Canada, K 6). It rises in the Rocky Mountains by two main branches, the North and South Saskatchewan, which unite near Prince Albert in Saskatchewan Territory, whence the main stream flows eastward to the northwestern corner of Lake Winnipeg. The main river has a length of 282 miles, and the total length, including the South Branch, is 1090 miles. The North Branch rises in the glaciers on Mount Hooker and flows east on the southern border of the forest country through the Territories of Alberta and Saskatchewan. The South Branch has several head-streams, some of which rise in the extreme northern part of Montana. Its course after leaving the mountains lies entirely within the Great Plains. It flows northeast through Alberta, Assiniboia, and Saskatchewan. Before entering Lake Winnipeg the main river flows through several lakes, the largest of which, Cedar Lake, is 30 miles long. Between Cedar Lake and its mouth it is interrupted by rapids. The whole river is narrow, and the South Branch is obstructed by shoals and sand bars. Steamers, however, ascend the North Branch to Edmonton, 850 miles from Lake Winnipeg, and smaller boats can go 150 miles farther to Rocky Mountain House.

SASKATCHEWAN. A district of Canada, lying northwest of Manitoba, between latitudes 52° and 55° N., embracing an area of 114,000 square miles (Map: Northwest Territories, II 4). The surface is a rolling prairie sloping to the east and broken at intervals by groups of hills, the most prominent being those paralleling the Saskatchewan River on the south. The northeastern half of the district is well

wooded with forests of aspen poplar, pine, and spruce; the southwestern half is prairie land in the main, only the hills being wooded. The winters are very cold, but are free from blizzards, and the atmosphere is clear and exhilarating. The summers are warm, and, though short, permit the growth and maturing of many varieties of farm crops. Precipitation is light (about 13 inches), but is greatest in the growing summer months when it is most needed. Over the greater portion of the southern half the soil is very rich. Wheat, oats, barley, and the root crops thrive, the conditions being especially favorable for wheat, which is beginning to be extensively raised in the district. The Saskatchewan River (q.v.) is an important factor in the development of the district, inasmuch as it affords navigation the entire length of the region, and by way of Lake Winnipeg admits of water communication with the country to the south. With some expense in the removal of obstacles now in its course a navigable length of 1500 miles will be afforded, making possible a water communication with the coal fields to the west. Another means of communication has been established by the construction of the Qu'Appelle, Long Lake and Saskatchewan Railroad, which connects Prince Albert with Regina, on the trunk line of the Canadian Pacific Railroad. Lakes Winnipeg and Winnipegosis, which project well into the eastern end of the district, are of value not only for purposes of navigation, but also for the enormous numbers of whitefish, pickerel, sturgeon, and other varieties of fish which they contain. Settlements in the district are most numerous in the southeast part and along the course of the Saskatchewan, the Prince Albert region in the centre of the district being the most highly developed. In 1901 the total population was 25,679. For governmental purposes it is a part of the Northwest Territories (q.v.). The seat of administration is Battleford.

SASSAFRAS (Sp. *sassafras*, variant of *sassafras*, *salsifra*, *saxifraga*, from Lat. *saxifraga*, maidenhair, stone-breaker, from *saxum*, rock +

SASSAFRAS.

frangere, to break), *Sassafras*. A genus of trees or shrubs of the natural order Lauraceae. The sassafras tree (*Sassafras officinale*) of North

of Persia, and extends to Florida and westward to California, sometimes attains a height of 100 feet. The bark is smooth, entire, or three-lobed, and is of a reddish-brown color, and small dark-blue fruit. The leaves are bright, coarse-fibred, dirty white beneath, and are aromatic, with a strong but agreeable odor, and an aromatic, rather pungent, sweetish taste. The thick spongy bark of the root contains a volatile oil, oil of saffrafras, widely used as a flavoring for confectionery. The leaves are said to be used for flavoring soups, as well as for the abundant mullage they contain.

SASSANIDÆ, or SASSANIDS. The last native dynasty of Persia, which ruled from about A.D. 226 until about 644. The Sassanids succeeded the Arsacide (q.v.), and derived their name from Sassan, the grandfather of Ardashir, the first ruler of this line. Ardashir I. came to the throne in 226 and reigned until 241. His father, Papak, was a princeing of Chir, not far from Istakhr (Persepolis), and obtained for his son from his suzerain, the Bazarangi King Gaocithra, the position of commander-in-chief of Darabگرد. This position was utilized by Ardashir to secure kingly power. He extended his sway with the help of his father, who murdered Gaocithra and declared his eldest son Shahpuhr (Sapor) King in defiance of the Parthian sovereign, Artabanus V. On Papak's death Shahpuhr was King for a short time, but being killed by an accident while engaged in an expedition against his brother Ardashir, the latter seized the throne. He put to death all his rivals, including his elder brothers, and crowned a series of minor conquests by the defeat and death of Artabanus at Hormizdagan in 224. Two years later the capital, Ctesiphon, yielded to him. In Armenia, however, which he invaded in 228, he met with no lasting success, and in Georgia the Arsacid dynasty was able to bid him defiance. An attack on the Romans was practically futile, despite his victories at Nisibis and Carrhae in 237.

Ardashir was succeeded by his son Shahpuhr (Sapor) I. (241-272), who continued his father's policy. Undeterred by a defeat in 242 by the Roman Gordianus at Ras el Ain (Resaina), he secured by a treaty with Philippus, the successor of Gordianus, both Armenia and Mesopotamia (244). The great event of his reign was his victory over the Roman Emperor Valerian (q.v.) at Edessa (Antioch Callirhoë), in Northern Mesopotamia, in 260. In 261 Shahpuhr met with a reverse at the hands of Odenathus (q.v.), who took Carrhae and Nisibis and threatened Ctesiphon itself. The invader was forced to retreat, however, and the remainder of Shahpuhr's rule was quiet and uneventful. The four following kings—Ormazd I. (272-273), Bahram I. (273-276), Bahram II. (276-293), and Bahram III. (293)—were not especially noteworthy; but Narses I. (293-303), a son of Shahpuhr I., after a temporary victory over Terdat (Tiridates) of Armenia, was finally defeated by Galerius in 296, losing not only Armenia and Atropatene, but Iberia also, which came under Roman control. Ormazd II. (303-309) was followed by his posthumous son, Shahpuhr II. (309-379), whose reign is one of the most noteworthy in the Sassanid period. It is marked in ecclesiastical history by bitter persecutions of the Christians begun in 342, arising from close affiliations of the Persian Christians with the Eastern Empire of Byzantium, an hereditary foe of Persia. War with

Byzantium soon broke out, at first with varying success. In 345 Shahpuhr was utterly defeated at Singara. In 359 the war began anew, but, despite several victories in Armenia, the Persians made little real headway until Constantius was succeeded by Julian the Apostate (q.v.), who lost his life at Ctesiphon in 363. This victory restored to Persia all that she had lost, and indirectly added Iberia and other Caucasian provinces to her sway. The success of Shahpuhr reestablished the glory of the Sassanids.

He was followed by his step-brother, Ardashir II. (379-383), and his son, Shahpuhr III. (383-388), who lost much of Armenia Minor and was killed in a mutiny, being succeeded by his brother, Bahram IV. (388-399). Yezdegird I. (399-420), whose reign, like the preceding one, was marked by petty events in Armenia, but who personally was upright and peaceful, was followed by Bahram V., surnamed Gur (420-438). In the beginning of his reign he conquered the Haital (Hephthalites, or White Huns), but a persecution of the Christians involved him in a war with the Byzantine Empire, which resulted in his defeat (421). His son Yezdegird II. (438-457) remained at peace with the west, but attempted to compel the Christian Armenians to give up their faith and crushed the Armenian forces at Avarayr in 451. He was followed by his two sons, Ormazd III. (457-459) and Firuz (459-484). The reign of the latter was marked by wars with the White Huns, against whom he made two expeditions, the first of which was unsuccessful, and the second disastrous, Firuz himself being slain near Balkh. His brother Balash (Vologeses) (484-488) succeeded him, but was deposed and followed by Kavadh (Kobad) I. (488-531), whose rule was interrupted for a short time by the usurpation of his brother Jamasp (496-498). In this reign Mazdak (q.v.) promulgated his doctrines, and as a result of his favor to them Kavadh was for a while deprived of his throne. He waged war with the Greeks and at one time Belisarius (q.v.), the general of Justinian, was his opponent. He was followed by his son Khosru (Chosroes) I. (531-579), surnamed Amushirvan, 'the Immortal Souled.' His reign was chiefly occupied with wars against the Byzantines. After a brief period of peace, Khosru invaded Syria in 540, vexed by the successes of his rival Justinian (q.v.) in Italy and Armenia and by his interference in Oriental politics. Belisarius, however, prevented him from doing serious injury, although a large Byzantine army under Narses was routed by the Persians in 543. The second Byzantine war dragged on from 530 until 537, when it practically ended with the defeat of the Persians at Phasis, near the Black Sea. Khosru then turned his arms against the White Huns, whom he conquered (557). In 572 a third Greek war was begun by Justin II., who refused to abide longer by the treaty which his uncle Justinian had made with Khosru. The Sassanid King overran Armenia, but suffered defeat in the plain of Melitene (Malitia). The Greeks then invaded Persia, and Khosru sued for peace, but died before the negotiations were completed. This reign marks the climax of the Sassanid dynasty, and the golden age of Pahlavi literature.

Khosru was succeeded by his son Ormazd IV. (578-590), whose reign was an unfortunate one. Not only were his wars in Armenia unsuccessful,

but his general Bahram Chubin, who had been deposed from his command by Ormazd, revolted in 589. At the same time the King became suspicious of his son, Khosru Parwez, who implored the aid of the Emperor Maurice. Ormazd was dethroned and succeeded by Khosru (590-628). In 604, as the avenger of Maurice, who had been murdered by the Emperor Phocas, he took the field against the Greeks, who made but a feeble resistance to him, despite the efforts of Heraclius (q.v.). The Persians overran Armenia and in 614 penetrated Syria, and even conquered Egypt, which they held until 618. This was, however, the last conquest of the Sassanids. In 623 the tide turned and Heraclius inflicted defeat after defeat on Khosru, until in 627 the King was thrown into prison by one of his younger sons, Kavadh Sheroe, and murdered the year following. This son, who ascended the throne as Kobad II., after a reign of six months was the victim of a pestilence which devastated the country. He was followed by his infant son, Ardashir III. (629-630), who was murdered by Shahrvaroz or Farrukhan, the Persian commander-in-chief, himself assassinated in less than two months. Rapid changes of rulers followed, and such was the anarchy in Persia at this time that between the death of Khosru II. in 628 and the accession of Yezdegird III. in 632 there were twelve occupants of the throne. Yezdegird III. (632-651), a grandson of Khosru, was the last of the Sassanids. At the time of his accession the Arabs were just entering upon their great career of conquest. After subjugating Syria they turned toward Persia. The Persians resisted bravely, but their forces were overthrown by those of the Caliph Omar at Kadisiyah (now Kadder) about 635. In the following year Ctesiphon fell, and a series of conquests gave the Arabs complete dominion over Persia. In 641 or 642 the defeat of the Persians at Nehavend terminated the reign of Yezdegird, who as a fugitive dragged out a miserable existence until he was murdered by a peasant for his clothing in 651.

The Sassanid rule was in general beneficial to Persia. The arts and sciences flourished, the government was just, and the ancient faith of Zoroaster, which had declined, was revived and restored almost to its pristine purity.

SASSARI, sä'sä-ré. The capital of the Province of Sassari, in the northern part of the island of Sardinia, 10 miles from the Gulf of Asinara (Map: Italy, C 7). It has broad streets, spacious squares, and several fine modern buildings. The fifteenth-century cathedral has a richly sculptured façade. The university, founded in 1634, contains a natural history collection and a large library. There are several churches and palaces, a new theatre, a lyceum, a gymnasium, a seminary, and a technical institute. Sassari carries

on a busy trade, chiefly with Genoa, in grain, wine, fruits, olive oil, and skins. There are manufactures of lead, zinc, matches, and leather. Population (commune), in 1881, 36,317; in 1901, 38,268. The port of Sassari is Porto Torres, 10 miles to the northwest, with a population, in 1901, of 1433.

SASSOFERRATO, sä'ssö-fer-ä'tö, GIOVANNI BATTISTA SALVI (1695-85). An Italian painter, so called from his birthplace, the Castle of Sassoferrato, near Urbino. He was son and pupil of Tarquinio Salvi, and studied at Rome and Naples. He painted, besides his own portrait now in the Uffizi, only religious subjects. The "Madonna del Rosario" in the Church of Saint Sabina in Rome and a "Crucifixion" in North Cray Church, Kent, are his best works. Others, also simple and devout, are the "Adoration of the Shepherds" and "Joseph's Workshop," both in the Naples Museum, a "Magdalen" in Hampton Court Palace, and at the Louvre an "Assumption," two Madonnas, and a "Sleeping Child Jesus."

SASSULITCH, sä's-sü'lich, VLARA (1853-). A Russian revolutionist. See ZASTUCH.

SASTEAN, sä's'té-an, SHASTIKA, or SHASTIA. One of the numerous small linguistic families of Indians who formerly lived in the California Oregon region. They called themselves *Kantikkané*. Their home was the region drained by the Klamath River and its tributaries from the western base of the Cascade range to the point where the Klamath flows through the ridge of hills east of Happy Creek. They extended over the Siskiyou range northward as far as Ashland, Ore. They are now reduced to a mere handful, the most of them on the Grande Ronde and Siletz Reservations in Oregon. The men are smaller and weaker than the women, who are charged with about all the work of their industrial life.

SATAN. See DEVIL.

SATANISM. The cult of Satan and an important phase of occultism. From the character of its worship it is necessarily secret, and precise details are difficult to acquire. The impression which generally prevails, however, that Satanism is a recent and spasmodic outburst of diabolical sacrilege, is certainly incorrect. The cult is an old one, and in its origins reaches far back into primitive religion, while it is apparently a conglomerate of at least three entirely distinct components. Considering first the actual phenomena presented by Satanism, it may be said that the cult reaches its acme in the Black Mass, which stands to it in the same relation as stands the White (or Christian) Mass to the Catholic Church. The Black Mass is the direct opposite of the White Mass. The celebrant of the mass, who must have been a priest, is clad only in his sacerdotal vestments, of which the chasuble may bear the figure of a goat, while the scarlet biretta is held by a woman dressed in scarlet who serves as deacon. Upon the altar is an inverted cross. Incense is used during the mass, but is mingled with some foul-smelling substance. The Black Credo, which is a blasphemous antithesis of the Apostles' Creed, is then recited.

The form of the sacrifice of the mass itself has changed since the seventeenth century. In the mediæval period and as late as the famous Black Masses performed by Abbé Guibourg on the persons of Mme. de Montespan and others, the altar

the body of a nude woman, who is held by her outstretched hands the lighted candles, and the Hosts employed in the elements of the Eucharist. Hosts which had been consecrated in the rites of the Church, either by laymen or priests, or by true priests from whom they were stolen by false communicants organized for this purpose, played an important part. On the other components, at least in former times according to some authorities, the least objectionable were the waters prepared from the ashes of one murdered child mixed with the blood of another. On the completion of the sacrifice of the Black Host follows the defiance of Christ and the exaltation of Satan, after which the Black Mass apparently becomes in some cases a mere orgy of licentiousness.

Satanism seems to be in great part a survival of the worship of demons, for it does not regard Satan as beneficent in any way, or as ill-treated, but as a fiend more powerful than the powers of good, who have been unable to keep the promises which they have made to the world. The Satanists thus stand in contrast to two classes of Devil-worshippers with whom they have certain points in common—the Ophites, on the one hand, a Gnostic sect who regarded Yahweh as evil, but the serpent, because of his gift of knowledge to the world (Gen. iii. 5), as the greatest benefactor and deity of mankind; and the Persian Yezidis, on the other, who believe that the Devil will be restored to heaven and that those who are kind to him in this time of his distress will be rewarded by him then, while those who are his enemies now will be punished by him in the future world. But, furthermore, it is clear that phallicism plays an important part in this cult, both from the goat and the prominence given to women in the ceremonies, as well as from numerous details of the Black Mass. A striking analogue may be drawn in this respect between Satanism and the *vāmācāryas*, or sectaries of the left-hand Tantra worship of India (see SAKTAS). Satanism may, therefore, be regarded in a very real sense as a survival of old pagan demon and fertility cults. This natural survival, however, became complicated by a revolt against the Catholic Church, probably about the twelfth century. This side of the cult soon became the more pronounced and now absorbs at a superficial glance all interest in the subject. It is, indeed, to this that Satanism probably owes its continued existence. The connection of Satanism with magic and sorcery is very close. Indeed, the practical object of the Black Mass is to prepare Black Hosts for magic purposes. Those resorting to this mass naturally gained the reputations of witches and wizards, especially in mediæval times when the ceremonies were often held at old Druidical dolmens, which already had superstitious associations. The entire idea of the witches' Sabbath, made famous, for instance, by Goethe's scene of the Walpurgis-Night in *Faust*, is based on this cult.

The history of Satanism is obscure. Attempts have been made to prove Gilles de Laval, Baron de Retz (1396-1440) (see BLUEBEARD), one of its first adherents, but even in its organized form it is probably much earlier. It existed pertinaciously with a recrudescence in the reign of Louis XIV., and is still practiced, especially in France, but probably in lessening degree. Its American

stronghold is said by some to have been the ill-fated city of Saint Pierre in Martinique.

See also DEMONOLOGY; MAGIC; OPHITES; PHALICISM; WITCHCRAFT; YEZIDIS.

SATANSTOE. A novel by James Fenimore Cooper (1845). It is a tale of colonial life in New York. The title is the name of a neck in Westchester County, near Hell Gate.

SATAN'TA (Kiowa *Sct-Paiñ-ti*, White Bear) (?-1878). A prominent Kiowa chief distinguished alike for his prowess on the warpath and for his eloquence, which gained for him the title of the 'Orator of the Plains.' He was considered next in authority to the elder Lone Wolf (q.v.). He was already acknowledged as a chief in 1864, and first came into official prominence as one of the signers of the Medicine Lodge treaty of 1867, by which his people agreed to come in upon a reservation. For an attack upon a wagon train in Texas in 1871, in which seven white men were killed, Satanta and two other chiefs were arrested, tried for murder, and sentenced to life imprisonment in the Texas penitentiary. Here he committed suicide by throwing himself from an upper story of the hospital.

SĀTAPATHA-BRĀHMAṆA. *shā'tā-pāt'hā-brāk'mā-nā* (Skt., Brahmanical treatise of the hundred paths). The title of a well-known Sanskrit work connected with the White Yajur-Veda. See BRAHMANA; SANSKRIT LITERATURE; VEDA.

SATELLITES (OF, Fr. *satellite*, from Lat. *satelles*, attendant). Certain celestial bodies which revolve round some of the planets, as these latter revolve round the sun. Astronomers sometimes apply to them the generic term 'secondary planets.' The earth, Mars, Jupiter, Saturn, Uranus, and Neptune (qq.v.) each possesses one or more of these attendants. The motion of all the satellites with the exception of those of Uranus and Neptune is direct, i.e. from west to east. The satellites of Uranus and Neptune, whose planes of revolution are nearly perpendicular to the ecliptic, have a retrograde motion, i.e. revolve from east to west. The eclipses, inequalities, inclinations, and reciprocal attractions of the satellites have been carefully noted from time to time, and the theory of their motions, at least of the most prominent of them, has been found to coincide with that of the moon. See MOON.

SATIN (OF, Fr. *satın*, OIt. *setino*, from ML. *setinus*, satin, silken, from *seta*, silk, from Lat. *seta*, *sata*, bristle, stiff hair). A fabric or form of weave in which so much of the filling is brought uppermost in the weaving as to give a more lustrous and unbroken surface to the cloth than is seen when the warp and filling cross each other more frequently. The term satin is very rarely applied to any other than silk fabrics, but there are woolen, linen, and cotton satins known in the markets, which are usually called *sateens*. See WEAVING for full explanation of satin and other weaves.

SATINWOOD. A beautiful ornamental wood obtained from both the West and East Indies.

The former is the better kind, and is supposed to be the product of a moderate-sized tree, *Parinari* Guianensis, and probably other species. That from the East Indies is less white in color, and is produced by *Chloroxylum Swietenia*. Both are much used by cabinet-makers and for marquetry, etc. In Florida a kind of satinwood is produced by *Zanthoxylum cribrosum*. It is found in the Keys of Florida and Santo Domingo, Porto Rico, and Bermuda.

SATIRE (Lat. *satira*, *satura*, medley, from *satur*, full, from *sat*, enough). The name given by the Romans to a species of poetry, of which they claimed to be the inventors. According to grammarians, the complete term was *satura lanx*, from which *lanx*, meaning 'a plate,' dropped away. Among the Greeks the satire was called *sillos*, meaning 'squint eyed.' A certain number of these *silloi*, in elegiac verse, were composed by Xenophanes (d. about B.C. 500), who burlesqued Homer and Hesiod. Some fragments, too, have survived of the *silloi*, in hexameter verse, of Timon of Phlius (d. B.C. 268), who waged war on the philosophers. In the comedies of Aristophanes satire assumed wide scope. And yet for Western Europe, satire dates only from Latin literature. The oldest Roman satires were medleys of scenic or dramatic improvisations expressed in varying metres (Livy, vii., 2), like the Fescennine verses (q.v.), but the sharp banter and rude jocularity of these unwritten effusions bore little resemblance, either in form or spirit, to the earnest and acrimonious criticism that formed the essential character of the later satire. The earliest—so far as we know—who wrote *satura* were Ennius and Paeninius; but the metrical miscellanies of these authors seem to have been little more than serious and prosaic descriptions, or didactic homilies and dialogues. Lucilius (d. B.C. 103) is universally admitted to be the first who handled men and manners in that peculiar style which has ever since been recognized as distinctly satirical and an effective weapon for personal attack. After the death of Lucilius, satire, as well as other forms of literature, languished; nor do we meet with any satirist of note till the age of Horace, whose verse, though sharp at times, is in the main humorous and playful. Persius (q.v.) resembles Horace in many ways, but is fundamentally more serious and sincere. It is different with Juvenal, somewhat later, for whom satire became a *sarra indiguitio*, a savage onslaught on the open vice of the capital. After Juvenal we have no professed satirist, but of several writers in whom the same element is found, Martial, the epigrammatist, is perhaps the most notable.

During the Middle Ages the satirical spirit showed itself abundantly in the general literature of France, Italy, Germany, England, and Scotland. Men who have a claim to the character of satirists, *pur excellence*, are Ulrich von Hutten, one of the authors of the *Epistola Obscurorum Virorum*, Erasmus, Rabelais, William Langland, Skelton, Sir David Lindsay, and George Buchanan. Among the Elizabethans were Nash, Marston, Bishop Hall, and Donne. In France, satire as a formal literary imitation of antiquity appeared early. Setting aside the Fabliaux, Rutebeuf, Jean de Meung, and other mediæval writers, Vauquelin may be considered one of the founders of modern French satire. The satirical verses of Mottin, of

Sigogne, and of Berthelot, of Mathurin Regnier, *L'Espadon satirique* of Fouqueraux, and *Le Parnasse satirique*, attributed to Théophile Viaud, are foul in expression, and remind us that at this time a satire was understood to be an obscene work—the seventeenth-century scholars supposing that the name had something to do with Satyr, and that the style ought to conform to what might be thought appropriate to the etymology. During the seventeenth and eighteenth centuries both England and France produced professed satirists, who have not been surpassed by the best either of their forerunners or their followers. The names of Butler, Dryden, Pope, and Churchill in England, of Boileau and Voltaire in France, are among the greatest. Edward Young and Dr. Johnson were also distinguished satirists. It may be noticed, however, as a distinguishing characteristic of Dryden, Boileau, Young, Pope, Churchill, and Johnson, and as a mark of the difference of the times in which they lived, that it is no longer the Church that is assailed, but society, political opponents, literary rivals, etc. Swift, Arbuthnot, and Junius were the great prose satirists of their time.

Satire in the shape of political squibs and lampoons, is abundant in the seventeenth and eighteenth centuries. Butler's *Hudibras* is one long caricature of the Puritans; most of the playwrights of the Restoration were royalist satirists—unscrupulous and indecent partisans. Dryden himself was but *facile princeps* in the company. Andrew Marvel is the most famous name on the side of liberty. The *Beggars' Opera* of the poet Gay is a very fine bit of political satire. Gifford and Wolcot, better known as Peter Pindar, also deserve mention in an historical view, though their intrinsic merits are small. Incomparably superior to all their contemporaries and among the first order of satirists were Burns and Cowper. Meanwhile in France, since Voltaire, no great name had appeared, except, perhaps, that of Béranger. In Germany the most conspicuous modern names are those of Rabener, Hagedorn, Kästner, Lichtenberg, Stolberg, Wieland, Tieck, Jean Paul, Platen, and, notably, Heine; but none of these adhered strictly to the classic models. Of nineteenth-century satirists in England the best are Byron, James and Horace Smith, Hunt, Hood, and Browning, in poetry, and Hook, Jerrold, Thackeray, Disraeli, and Carlyle in prose. The United States are excellently represented by Irving, Lowell, Holmes, Artemus Ward, and Mark Twain. Recent brilliant examples of the lighter satire are the 'Dooley' papers contributed by F. P. Dunne to various American and English journals, and Ashby Sterry's 'By-standers'. Consult Nettleship, *The Roman Satira* (Oxford, 1878); Keller, *Satur* (Kiel, 1888); Hamay, *Satire and Satirists* (London, 1854). See the authors and the literature mentioned in this article; also BURLESQUE; CARICATURE; FABLEAUX; PARODY.

SATIRE MÉNIPPÉE, sá'tér má'nè'pá'. See MÉNIPPÉE.

SATIROMASTIX (from Lat. *satira*, satire + Gk. μάστιξ, *mastix*, scourge). A comedy by Thomas Dekker (1602) in which Ben Jonson figures as Horace, junior. It is a good-humored retort to Jonson's *Poetaster*.

SATISFACTION. See ACCORD AND SATISFACTION.

SATLEJ. A river of India. See **SUTLEJ**.

SATOLLI, sà'tò-lì, FRANCESCO (1831—). An Italian cardinal, born at Perugia, where he studied Law, became at the Procean Seminary. Pope Leo XIII. appointed Satolli to a professorship in the Roman Seminary and School of the Propaganda. In 1888 Satolli was made titular Archbishop of Lepanto. Later, when no objections came to the Church in the United States, Mgr. Satolli was sent out as Papal Ablegate with plenary power (November, 1892), which was confirmed by his appointment in January, 1893, as Apostolic Delegate to the American Church, with an official residence in Washington. Mgr. Satolli has written several valuable works, among them a commentary on Saint Thomas Aquinas, and a *Course in Philosophy*, much used in Catholic institutions of learning. He was elevated to the cardinalate in 1895, and was recalled and succeeded by Archbishop Sebastiano Martinelli in 1896.

SÁTORALJA-UJHELY, shá'tò-rò-lyò új'y-hé-ly'. The capital of the County of Zemplin, Hungary, 105 miles northeast of Budapest (Map: Hungary, G 2). It is picturesquely situated at the base of the Hegyalja, one of the offshoots of the Carpathians. It has a Piarist gymnasium and is noted for its wine and tobacco. Population, in 1900, 16,712.

SATOW, sà'tò, Sir ERNEST MASON (1843—). A British diplomatist and scholar, born in London. After graduation at University College, London, he entered the British civil service. In the consular service in Japan he rose to be Japanese secretary to the British Legation; received the decoration of Saint Michael and Saint George; was transferred to Siam as consul-general in 1883, and became Minister there in 1885. In 1888 he became Minister Resident at Montevideo, and in 1893 was sent to Morocco as Envoy Extraordinary and Minister Plenipotentiary, and two years later to Japan, whence in the autumn of 1900, after the Boxer uprising, he was transferred to Peking, where he took a prominent position in the settlement of the indemnity and other questions. With Hawes he edited the first and second editions of *Murray's Hand Book for Japan* (1882), and with Ishibashi, an *English-Japanese Dictionary* (1876). He wrote the *Jesuit Mission Press in Japan, 1591-1610* (1888), and many papers of great learning and of the highest value in the *Transactions of the Asiatic Society of Japan*, particularly in connection with Shinto (q.v.).

SATSUMA, sà't-sō-mâ, or SASSHU. A province of Japan, occupying the southern portion of the island of Kin-shin, and now included in the Prefecture of Kagoshima (q.v.). It was long held as a fief of the princely House of Shimadzu, has produced a large number of able men, and has always played a very important part in the history of the country. The clan had a leading place in the revolution of 1868. Its statesmen have preponderated in the national council for many years. The province is noted for its faience. It was at Kagoshima, the chief town of the province, that Francis Xavier landed in 1549 to begin his missionary labors. For the Satsuma Rebellion, see **SATO**.

SATTERLEE, HENRY YATES (1843—). An American bishop of the Episcopal Church. He was born in New York City, and received his

degree from Columbia College in 1863. In 1866 he completed the course of the General Theological Seminary, and was ordained priest. He became attached to Zion parish, Wappinger's Falls, N. Y., as assistant in 1865, and in 1875 was made rector. In 1882 he removed to New York City and became rector of Calvary Church, a post he retained for fourteen years. In 1896 he was consecrated first Bishop of Washington, D. C. His principal published work is *A Creedless Gospel and the Gospel Creed* (1894), a book inspired by the Parliament of Religions held in Chicago in 1893.

SATTERLEE, WALTER (1844—). An American painter and illustrator, born in Brooklyn, N. Y. He graduated at Columbia College in 1863, studied at the Academy of Design, and afterwards under Edwin White and (1878-79) under Léon Bonnat in Paris. He became an associate of the National Academy in 1879, and in 1886 took the Clarke Prize. His paintings include "The Runaways," "The Old Garden," "The Feast of Flora," "An Old Time Coquette," and "Old Ballads."

SATURATION (Lat. *saturatio*, from *saturare*, to fill, saturate, from *satur*, full; connected with *sat*, *satis*, enough). A term in psychology signifying purity of color sensation, that is, relative deficiency of black or white admixture. Together with color-tone and brightness, saturation, which may be regarded as the color intensity of a given color, determines the total color impression. A saturated color tone, which is obtained only by spectrum analysis, is free from all mixtures of other color-tones. The external stimulus producing a pure color sensation, or saturation, is a light vibration of single wave-length. Light vibrations of many wave-lengths produce such compound color sensations as yellowish white, reddish white, etc. One of all wave-lengths of the optical spectrum produces a zero saturation, that is, white.

SATURDAY REVIEW, THE. A London weekly review of politics, literature, science, and art, founded in 1855 by John Douglas Cook, under whose editorship it maintained a high rank in its class. In 1898, Harold Hodge, well-known for his interest in London social questions, became the editor.

SATURN (Lat. *Saturnus*, OLat. *Saturnus*, *Saturnus*; connected with *sator*, sower, *screre*, to sow, and ultimately with OChurch Slav. *seti*, Lith. *seti*, OIIG. *sācu*, Ger. *sācu*, Goth. *saian*, AS. *sāiran*, Eng. *sow*). An ancient Roman divinity who presided over the sowing of the seed. His festival occurred on December 17, after the conclusion of the winter sowing. (See **SATURNALIA**.) A temple was built in B.C. 497 (according to the story) at the foot of the Capitol, and became later the place of deposit for the State's treasury. Early, however, the identification with the Greek Cronos arose, and the offerings to Saturn were made according to the Greek rite. Probably in consequence of this identification arose the legend that Saturn was an ancient king of Latium, under whose gracious rule the whole of Italy had enjoyed a golden age. In the Greek myth Cronus (*Kρόνος*) appears as the eldest of the Titans (q.v.), son of Uranus and Gæa. He mutilated his father and became the ruler of the universe. To guard against danger of an overthrow, he swallowed his children by Rhea as fast as they were born. At last, after the birth

of Zeus, she tricked him into swallowing a stone wrapped in swaddling clothes. Zeus, as he grew up, persuaded his father to disgorge his elder children, and presently began the war against the forceful rule of the Titans that he might establish a reign of law. After a fierce conflict Cronus was cast into Tartarus. Later poets represent him as afterwards released and ruling in happiness over the Isles of the Blessed. Cronus seems to owe much of his existence to the desire of explaining the race of Zeus and his position of supreme power. Only at Athens and Olympia were there special shrines and offerings to him, and a festival in his honor, the Cronia. In representations of Cronus his head was usually covered with a mantle, and in his hand was the curved scimitar or knife, *harpe*, or sickle.

case, any temporary disturbance or perturbation would suffice to disrupt it, and the fragments would be precipitated on the planet. Nor can the ring be liquid. The only remaining conclusion is that it is composed of a very large number of small satellites, analogous to the ring of small planetoids (q.v.) surrounding our sun, and lying between the orbits of Mars and Jupiter. This theory of the rings has received strong confirmatory evidence from spectroscopic observations made in 1895 by Keeler. See PLANEIS.

SATELLITES. SATURN has at least eight satellites. A ninth was discovered photographically in 1899 at the Arequipa (Peru) station of the Harvard University observatory; but this discovery still lacks confirmation. Their elements are given in the following table:

NAME	Discoverer	Date of discovery	Sidereal revolution	Greatest distance from Saturn in term of its equatorial radius	Mass, that of Saturn being 1
Mimas	W. Herschel	July 18, 1789	0 d. 22 h. 37 m.	3.07	0.00000007
Engelade	W. Herschel	Aug. 29, 1789	1 d. 8 h. 53 m.	3.94	0.00000025
Tethys	J. D. Cassini	Mar. 21, 1684	1 d. 21 h. 18 m.	4.87	0.00000110
Dione	J. D. Cassini	Mar. 21, 1684	2 d. 17 h. 41 m.	6.25	0.00000187
Rhea	J. D. Cassini	Dec. 23, 1672	4 d. 12 h. 25 m.	8.73	0.00000400
Titan	Huygens	Mar. 25, 1655	15 d. 22 h. 11 m.	20.22	0.00021277
Hyperion	G. P. Bond	Sept. 16, 1848	21 d. 6 h. 39 m.	24.49
Japetus	J. D. Cassini	Oct. 25, 1671	79 d. 7 h. 56 m.	58.91

SATURN. The sixth of the planets in order of distance from the sun and the second in size. Its distance from the sun varies between 861 and 911 millions of miles; period of revolution, about 20 solar years; axial rotation period, about 10 hours 14 minutes; the apparent angular diameter of the disk, between 14 seconds and 20 seconds; diameter, 73,000 miles; volume, 760 times that of the earth; mass, 75 times the earth's. Therefore Saturn's density is only one-eighth that of the earth, or not much more than one-half that of water. The inclination of the axis to Saturn's orbit is about 27°. This planet is in many respects the most interesting of all. The first glance at it with a telescope always gives one a feeling of astonishment. The bright ball of the planet is set in the centre of a luminous oval ring, and surrounded by at least eight moons; truly a planetary system of extreme complexity and of surpassing beauty. The ring system was discovered by Galileo in 1610, just after the invention of the telescope, but he did not explain correctly what he saw. He thought the planet's ball had two appendages or *ansæ*, and announced that it was triple. Huggins, in 1655, gave the correct explanation of the visible phenomena, and showed that the planet must be surrounded by a ring. The ring system is round, but appears oval as a result of foreshortening, since the plane of the ring is not square to our line of vision. Indeed, at times the ring plane may pass through the earth, and then we see the ring edgewise, which makes it appear simply as a thin bright line. At other times the ring disappears altogether, in consequence of its plane passing between the earth and the sun. When this occurs, only the side of the ring toward the sun is illuminated. Modern observers have found the ring to be in reality triple, consisting of concentric parts. Mathematical researches have shown that its durability would be impaired if it were solid. If such were the

SATURN, TEMPLE OF. A temple in the Roman Forum, consecrated in B.C. 491 by the Consuls Sempronius and Minucius, and restored about B.C. 44 by Munatius Plancus. It stood at the foot of the Clivus Capitolinus, where eight of its marble columns on a substructure 16 feet in height still form one of the conspicuous monuments of the Forum. The temple was from very early times not only a place of worship, but also a public treasury. It was the only temple in Rome which might be entered with uncovered head, and the first to use wax tapers.

SATURNALIA (Lat. nom. pl., relating to Saturn, from *Satur-nus*, Saturn). An ancient Roman festival celebrated in honor of Saturn (q.v.). The festival began on December 17th, and the public religious rites were confined to that day. The festivities, however, lasted during the later Republic for seven days, and Augustus made the holiday cover three days, which his successors extended to five. That this was originally an agricultural festival, connected with the end of late sowing, and also the turning of the year at the winter solstice, there can be little doubt; but the whole ritual has been so transformed by the Hellenizing of Saturn and his worship that the original elements can scarcely be discerned. The change is connected with the lectisternium at the Temple of Saturn in B.C. 217, when a public banquet was held and this new celebration of the Saturnalia enjoined in perpetuity. The sacrifices were offered with uncovered head, i.e. in the Greek fashion, and the public feast is certainly Greek. At the sacrifice the senators and knights wore the toga, but this was laid aside for the banquet. After the banquet the populace roamed through the city, shouting *Io Saturnalia*. The next day the usual bath was taken very early, as there was no time later. A family sacrifice, of a young pig, followed, and the rest of the day and the following days were given up to the exchange of calls, pres-

SAUGERTIES, sǎ'gër-téz. A village in Ulster County, N. Y., 12 miles north of Kingston: on the Hudson River, and on the West Shore Railroad (Map: New York, F. 3). It is in a farming region, and has important stone quarries. Paper, blank books, brick, and cement are manufactured. There is a public library. The first settlers probably came as early as 1687, and in 1710 a colony of Palatines settled here. Until 1811, when the town was incorporated, Saugerties was part of Kingston. The village was incorporated in 1831. Population, in 1890, 4237; in 1900, 3697. Consult: Brink, *The Early History of Saugerties* (Kingston, N. Y., 1902).

SAUGOR'. A low swampy island of Bengal, India, at the mouth of the Hugli (Map: India, E 4). It is one of the holy places of the Hindu religion, noted formerly for its infant sacrifices. It is visited by multitudes of pilgrims in November and January at the time of the full moon, when, after the ceremony of purification, a great fair takes place. The island has an area of 225 square miles, chiefly covered with jungle, infested by tigers and other wild animals. Among its structures are a lighthouse, visible 15 miles, and meteorological stations. The population is not large, a cyclone and a tidal wave having devastated the island in 1864, sweeping away over two-thirds of the inhabitants.

SAUGUS, sǎ'gûs. A town, including three villages, in Essex County, Mass., 8 miles north of Boston; on the Saugus River and Massachusetts Bay, and on the Boston and Maine Railroad (Map: Massachusetts, F 3). It has a public library with more than 6000 volumes. Brick, spices, and woolen goods are manufactured. The government is administered by town meetings, convening annually. Saugus was incorporated in 1815. Population, in 1890, 3673; in 1900, 5084.

SAUK (from their own name, *Osagi*, of uncertain etymology, also known as Sac, and frequently referred to, in connection with their confederated tribe, under the compound title of Saes and Foxes). A prominent and warlike tribe of Algonquian stock (q.v.), formerly holding both banks of the Mississippi and the entire Rock River region in northwestern Illinois, eastern Iowa, and southwestern Wisconsin, with a portion of Missouri. According to tradition they once lived on the Ottawa River, Canada, but, with other tribes, were driven out by the attacks of the Iroquois. About 1670 they were found by the French in northern Wisconsin, in immediate vicinity of their close kindred, the Muskewaki or Foxes. From this position the two tribes were gradually pressed southward by the Ojibwa. The Foxes suffered severely in a war with the French, and in a great battle with the Ojibwa about 1760 were so greatly reduced that they were forced to confederate with the Sauk, who retained the leading position. On the conquest of the Illinois about 1765 the Sauk took possession of the Rock River country of Illinois and the adjacent territory in Iowa. In 1832 a considerable party, led by Black Hawk (q.v.), combined to resist the execution of a treaty by which the Indians were to give up all their lands east of the Mississippi, but in the short war they were defeated. The Indians were removed to the west side of the Mississippi, in Iowa, and subsequently, in different bodies, to Kansas and the Indian

Territory. A part of those who removed to Kansas, chiefly of the Muskewaki or Fox tribe, afterwards returned to Iowa and repurchased lands near Tama. In 1903 the Sauk and Muskewaki numbered together about 930. As a people they are strongly conservative.

SAUL (Heb. *shā'ul*, asked [of Yahweh], or devoted [to Yahweh], pass. part. of *shā'ul*, to ask). The first King of Israel, the beginning of whose reign is placed at about B.C. 1050. He was a son of Kish, of the tribe of Benjamin. The account of his career, embodied in I. Sam. ix. to II. Sam. i., represents a combination of the two chief sources believed by modern critics to be found in the books of Samuel (q.v.). As a consequence it is asserted that we have two varying accounts of the manner in which he came to occupy his position as head of the people. According to one of these accounts, it was while searching for the lost asses belonging to his father that he encountered the seer Samuel, who announced to Saul that he was destined to deliver Israel from the oppression of the Ammonites and Philistines. Soon afterwards Nahash, a chief of the Ammonites, laid siege to Jabesh Gilead. The inhabitants appealed to the West-Jordan tribes for aid, and when the news reached Saul he gathered a force with which he inflicted a crushing defeat on Nahash. At Samuel's bidding the people then gathered at Gilgal and solemnly crowned Saul as King. The other account represents the people as dissatisfied with their condition and demanding of Samuel that a king be placed at their head. Samuel, while rebuking the people, nevertheless yields to the popular request and at an assembly held at Mizpah Saul is chosen.

Those who accept the above theory conclude from these varying accounts that it was not so much Samuel's interference as the natural course of events that brought Saul forward. The chief efforts of his career were directed toward reducing the power of the Philistines. In a series of well-directed campaigns he drove the Philistines back to their territory along the seacoast. He was equally successful in his campaign against the Amalekites. His victory over them represents the climax in his career. Intertribal jealousies and family intrigues loosened the union of the tribes after the crisis had been temporarily passed, while the growing popularity of the youthful David (q.v.), originally introduced at Saul's court as a skillful harp-player, brought out the worst elements in Saul's nature. A strange melancholy settled upon him, and this illness, which at times resembled madness, was a factor leading to the quarrel between Saul and David: and while David was obliged to take flight, he did more harm to Saul's cause by alliances with the enemies of Israel than he could possibly have done had he remained in Saul's service. Encouraged by this state of affairs, the Philistines roused themselves to renewed action, and at Mount Gilboa succeeded in defeating the Hebrew army. Saul's three sons perished in the battle, while the King himself, when he realized the desperateness of the situation, "fell on his sword" and thus put an end to his life. Consult: the chapters on Saul in the Hebrew histories of Stade, vol. i. (Giessen, 1881), Guthe (Freiburg, 1899), Renan (Paris, 1887), Piepenbring (ib., 1899), Kent (New York, 1891), and Wellhausen (Berlin, 1895). See **DAVID**.

SAUL (saw'ool), the Hebrew equivalent of the Greek Βασιλ (Basileus), or King. **SAULCY** (saw'say), JOSEPH (saw'say), An Oriental numismatist and linguist. He was born at Lille, France, in 1811. He studied at the Polytechnique, in 1838, becoming a student of mechanics at Metz, and was afterwards appointed conservator of the museum of antiquities at Paris. His activity was mainly devoted to numismatics and archaeology. In 1842 he became a member of the French Academy. Among his publications may be mentioned *Essai de classification des suites monétaires byzantines* (1836); *Recherches sur la numismatique punique* (1843); *Recherches sur la numismatique judaïque* (1854); *Louppé en Terra Sancta* (1865); *Sept siècles de l'histoire judaïque* (1874); and *Histoire des Marchands* (1880).

SAULT SAINTE MARIE, saw' sânt mä're', *L. pion, so sânt mä're'*. A port of entry of Algoma District, Ontario, Canada, opposite its Michigan namesake, on the Saint Mary's River and the Saint Mary's Falls ship-canal (Map: Ontario, N 9). A railway bridge, one mile long, spans the river between the two towns and connects the Northern Pacific Railroad with the Canadian Pacific Railway by the Sault or "Soo" branch line. The town has agricultural, mining, manufacturing, and shipping interests. It owns its water-works and electric lighting plant. Population, in 1891, 2414; in 1901, 7169.

SAULT SAINTE MARIE. The county-seat of Chippewa County, Michigan, 350 miles west-northwest of Detroit; on the Saint Mary's River, and on the Canadian Pacific, the Duluth, South Shore and Atlantic, and the Minneapolis, Saint Paul and Sault Ste. Marie railroads (Map: Michigan, J 2). The ship canal here, connecting Lakes Superior and Huron, is noted for its extensive freight traffic. New locks have been constructed from time to time by the Federal Government to meet the demands of the constantly increasing commerce. The last of these, costing about \$4,000,000, was opened in 1896. It is 800 feet long and 100 feet wide, and will admit vessels drawing 21 feet of water. (For illustration, see CANALS.) Other noteworthy features are the International Bridge across the rapids of the Saint Mary's River, a public library, Fort Brady, and Canal Park. The water power afforded by the rapids near the city generates electrical energy equivalent to 100,000 horse power. The power is utilized by several important industries. There are lumber mills, paper mills, a carbide manufactory, dredging machinery works, flour and woolen mills, and fish-packing establishments. The government, under the revised charter of 1897, is vested in a mayor, elected biennially, and a unicameral council. In 1641 the Jesuit Fathers Raynbault and Jogues established a mission here, but it was soon abandoned. In 1662 Father Marquette founded here the first permanent settlement within the present limits of Michigan. At this place in 1671 the French convoked a great congress of the Indian nations. Sault Sainte Marie was first incorporated in 1887. Population, in 1890, 5760; in 1900, 10,538.

SAUMAREZ, sö'mä'rä', JAMES, Baron de (1757-1836). A British admiral. He was born in the Isle of Guernsey and entered the British navy in 1770. He distinguished himself during the attack on Charleston in 1776, and was under

Sir Hyde Parker in the action of the Dogger Bank in 1781. In 1782, as commander of the *Russell*, he shared Rodney's victory over De Grasse. After living some years on shore, he made a gallant capture of the French frigate *La Reunion* in 1793. He fought in the battles of Portent (1795), Saint Vincent (1797), and the Nile (1798). He became Rear-Admiral of the Blue in 1801, and in the same year gained a splendid victory over the French and Spanish off Cadiz (July 12). He subsequently commanded the Baltic fleet for a number of years. He became admiral in 1814, vice-admiral of Great Britain in 1821, and was raised to the peerage in 1831.

SAUMUR, sö'mür'. The capital of an arrondissement in the Department of Maine-et-Loire, France, 28 miles southeast of Angers (Map: France, F 4). It is dominated by a castle-crowned hill and is built partly on the left bank of the Loire and partly on an island. The school for cavalry, founded here in 1768, occupies a magnificent building, and has extensive parade grounds. Other prominent features include the Church of Saint Pierre, dating from the twelfth century, the pilgrimage Church of Notre Dame de Nantilly the sixteenth-century town hall, the pilgrimage Church of Notre Dame College, and the Museum of Science and Archaeology. The town is noted for its wines and manufactures enamelled goods. Saumur was one of the leading centres of Protestantism in France, but lost half of its population and its commercial prestige by the revocation of the Edict of Nantes. Population, in 1901, 16,233.

SAUNDERS, FREDERICK (1807-1902). An American librarian and author, born in London, England. He came to New York (1837), engaged in publishing, and was a pioneer in the agitation for international copyright. For some time he was city editor of the *Evening Post*. In 1859 he became assistant librarian of the Astor Library, and head librarian in 1876, resigning in 1896. Among many volumes, chiefly of ephemeral interest, the more noteworthy were: *Salud for the Solitary by an Epicure* (1853); *Salud for the Social* (1856), both frequently reprinted; *Evenings with the Sacred Poets* (1869); *Pastime Papers* (1885); and *Story of Some Famous Books* (1887). He edited, with H. T. Tuckerman, *Heroes of American Authors* (1853).

SAUNDERS, RICHARD. The name used by Benjamin Franklin for the supposed author of *Poor Richard's Almanac*.

SAUNDERS, THOMAS BAILEY (1860-). An English author, born in Alice, Cape Colony, and educated at King's College, London, and at University College, Oxford. He translated Schopenhauer's essays under the titles *The Wisdom of Life*, *Studies in Pessimism*, *The Art of Literature*, and *On Human Nature* (1889-96); maxims and reflections from Goethe (1893); and Harnack's *Christianity and History* (1896), *Thoughts on Protestantism* (1899), and *What is Christianity* (1900); and wrote *Schopenhauer* (1901), and *Professor Harnack and His Oxford Critics* (1902).

SAUNDERSON, or **SANDERSON**, NICHOLAS (1682-1739). An English mathematician, born at Thurlston, near Penniston, in Yorkshire. When only one year of age he lost his sight from smallpox. In spite of this infirmity,

he became proficient in the classics and in mathematics. At the age of 25 he was taken to Christ's College, Cambridge, where he had hoped to be admitted. Lack of means, however, barred him from becoming a student there, but by the consent of Whiston, then Lucasian professor, he was allowed to lecture on mathematical physics. On Whiston's expulsion from his professorship, Saunderson was considered for the place, and finally, by special royal patent, was made M.A. (1711) and installed in it. He was a fellow of the Royal Society (1719). Saunderson was an indefatigable teacher. His *Algebra*, written during his later years, was published soon after his death (2 vols., 1740-41). A few years later some of his manuscripts were published under the title, *The Method of Fluxions*, etc. (1751), and an abridged edition of his *Algebra* appeared (1761). For his biography, consult the preface to his *Algebra* (Cambridge, 1740-41).

SAUPPE, zoup'pe, HERMANN (1809-93). A German classical scholar, born at Wessenstein, near Dresden. After studying at Leipzig, he was professor extraordinary at the University of Zurich in 1838-45; director of the Gymnasium at Weimar in 1845-56, and finally professor of philology at the University of Göttingen, where he remained until his death. Sauppe won his greatest fame by his researches in the field of Greek oratory. Among his works on this subject are editions of the *Oratores Attici* (9 vols., with Baier, 1839-50); selected orations of Demosthenes (1845); and the *Epistola Critica ad Godofredum Hermannum* (1842), considered one of the most valuable modern treatises on the methodology of textual criticism. His other works included editions of Philodemy's *De Virtutibus*, liber x. (1853); Plato's *Protagoras* (1857, 4th ed. 1854), which appeared in a well-known *Sammlung griechischer und lateinischer Schriftsteller mit Anmerkungen*, founded by Sauppe and Haupt, in 1848; and *Eugippii Vita S. Severini* (published in the *Monumenta Germaniae Historica*). His library was bought by Bryn Mawr College.

SAUREL. A small active carangid marine fish of the genus *Trachurus*. One species (*Trachurus saurus*) is mainly South-European, and is known to the English as horse-mackerel; another (*Trachurus symmetricus*) is the 'horse-mackerel' of California. These fishes share the names 'jurel' and 'ga-seon' with related genera. See PLATE OF HORSE MACKEREL.

SAURET, só'râ', EMILE (1852—). A French violinist, born at Dun-le-Roi, Cher. He studied at the Paris Conservatory and was a pupil of Bériot at Brussels. From 1880 to 1881 he was teacher at Kullak's Akademie in Berlin, and, in 1890, was appointed professor of the violin at the London Royal Academy of Music to succeed Santon. Among his works are: *Grados ad Parnassum du violoniste* (1894); 2 violin concertos; about 130 other pieces for the violin, with or without the orchestra; 20 grandes études; 12 études artistiques; and about 25 transcriptions.

SAURIA (Neo-Lat. nom. pl., from Gk. σαῦρος, *sauros*, lizard). A subclass of the Reptilia, including the Autosauri or Lacertilia (lizards), and the Ophidia (snakes), defined by Gadow as reptiles with movable quadrate bones, with a transverse external cloacal opening, near the posterior lateral corners of which open the reversible paired copulatory organs. See REPTILE.

Consult Gadow, *Amphibia and Reptiles* (London, 1901).

SAURIN, só'rân', JACQUES (1677-1730). A celebrated French Protestant preacher. He was born at Nîmes, studied at Geneva, and was chosen minister of a Walloon church in London in 1701. In 1705 he settled at The Hague, where his extraordinary gift of pulpit oratory was much admired. As a preacher, Saurin has often been compared with Bossuet, whom he rivals in force, if not in grace and subtlety of religious sentiment. His discourses upon the more memorable events in the Bible were published at The Hague, 1728-39, and his sermons, 1748-65; an English translation of the latter appeared at London, 1824. Consult his *Life*, by Berthault (Paris, 1875).

SAUROP'SIDA (Neo-Lat. nom. pl., from Gk. σαῦρος, *sauros*, lizard + ὄψις, *opsis*, appearance). A division of Vertebrata, proposed by Huxley to include the birds and reptiles, which are closely related, as contrasted with the Ichthyopsida (fishes and amphibians), or with the Mammalia.

SAURY, or SAURY PIKE. See SKREEJACK.

SAUSAGE. See PACKING INDUSTRY.

SAUSAGE POISON. A disease, sometimes called BOTULISMUS, caused by eating diseased sausage or ham. In 1898 Van Ermengem discovered in unboiled ham, as well as in the spleen of persons who were poisoned by eating of it, a rod-shaped bacterium with spore formation at its end, which he termed *bacillus botulinus*. Filtered and germ-free solutions of this ham contained a toxin fatal to animals. See TRICHINIASIS.

SAUSSIER, só'syâ', FÉLIX GUSTAVE (1828—). A French general, born at Troyes. He studied at Saint-Cyr and entered the army as lieutenant in 1850. He fought in Algeria, took part in the Crimean War, the Italian War of 1859, and the Mexican expedition, and in 1869 was made colonel. In the Franco-German War he distinguished himself at Colombey-Neuilly and Gravelotte. Taken prisoner at Metz in 1870, he escaped, returned to France by way of Austria and Italy, and joined the Army of the Loire. He was made a brigadier-general, and from 1871 to 1873 served against the Kabyles in Africa. In 1873 he was returned as Deputy for the Department of Aube, and in the National Assembly adhered to the Left Centre, taking an active share in all questions of military reform. In 1878 he became general of division, in 1881 was commander-in-chief of the army in Algeria and repressed a formidable uprising in Tunis, and in 1884 was appointed military governor at Paris. He retired in 1898.

SAUSSURE, só'syû', HORACE BÉNÉDICT DE (1740-99). A Swiss physicist and geologist born at Cônehes, near Geneva. When only twenty-two years of age he obtained the professorship of physics and natural philosophy at the University of Geneva. In 1768 he commenced the series of scientific journeys that have made him famous, during the course of which he traversed the Alps, the Jura, the Vosges, and the mountains of England, France, Germany, Italy, and other countries. The results of his extensive observations of the geological, botanical, and meteorological features of the mountainous region he visited were

— *Vegetation in the Alps* (4 vols., 1779-1805). His other works include *Observations sur les Plantes de la Suisse* (1762); *De la Flore de la Suisse Austrorhodie*, or *Montes Alpes* (1765); *On the Winds*; *De Electricitate* (1770); *De l'Air* (1771); and *Sur l'Hygrometrie* (1772). The last named embodying the results of his observations in regard to the properties of moisture-laden air.

SAUSSURE, NICOLAS THÉODORE DE (1767-1845). A Swiss botanist, son of Horace de Saussure, born in Geneva and educated there. He assisted his father in his physical researches and in his geographical studies, and made some valuable experiments as to atmospheric density. But his work on plant physiology, *Recherches chimiques sur la végétation* (1804), is his great claim to fame. He was the first to undertake a quantitative analysis of the nutriment of plants and urged the thesis that the vegetable organism is formed from carbonic acid abstracted from the air.

SAUTERNES, sô'târ-né'. A village in the Department of Gironde, France, 27 miles by rail southwest of Bordeaux. It is situated in the famous white-wine producing region of South-western France and gives its name to the best brands. Population, in 1901, 934.

SAV'AGE, JAMES (1784-1873). An American political leader and antiquary, born in Boston, Mass., and educated at Harvard. He was a member of the State Executive Council, of the Constitutional Convention of 1820, and at different times, of both branches of the Legislature. He founded and was successively secretary, treasurer, vice-president, and president of the Boston Provident Institution for Savings. Among his publications are editions of John Winthrop's *History of New England from 1630 to 1649* (1825-26 and 1853), and a valuable *Genealogical Dictionary of the First Settlers of New England* (1860-64). Consult Hilliard, *Memoir of the Hon. James Savage* (Boston, 1878).

SAVAGE, MINOR JIMSON (1841—). A Unitarian clergyman. He was born at Norridgewock, Me., entered Bowdoin College, but left before the end of his course, and pursued his theological studies at Bangor Seminary. Commissioned by the American Home Missionary Society in 1864, he spent the three following years at San Mateo and Grass Valley, Cal., then settled at Framingham, Mass., but removed to Hannibal, Mo., in 1869. While preaching in the latter place his views underwent so decided a change that he at length withdrew from the Congregational Church, and in 1873 became pastor of the Third Unitarian Church of Chicago. The next year he was called to the Church of the Unity in Boston and remained there until 1896, when he removed to New York and became minister at the Church of the Messiah, ranking among the advanced thinkers of his denomination. He has published *The Religion of Evolution* (1876); *Life Questions* (1879); *The Morals of Evolution* (1880); *Belief in God* (1881); *Beliefs About Man* (1882); *Beliefs About the Bible* (1883); *Man, Woman, and Child* (1884); *Social Problems* (1886); *My Creed* (1887); *Jesus and Modern Life* (1893); *Life Beyond Death* (1899); *The Passing and the Permanent in Religion* (1901).

SAVAGE, RICHARD (?-1743). An English poet, the name, according to the current legend,

an illegitimate son of Richard Savage, Lord Rivers, by the Countess of Macclesfield. The Countess, while living apart from her husband, Charles Gerard, second Earl of Macclesfield, bore to Lord Rivers two children, a daughter, who died in infancy (1695), and a son, christened Richard Smith (January 18, 1697), who seems to have died the year of his birth. The Earl obtained a divorce from his wife (1698), who married (1700) Colonel Henry Brett (d.1724). The poet, Richard Savage, probably of obscure birth, openly claimed to be the son christened Richard Smith. According to the usual story, to which Dr. Johnson gave currency in his famous *Life of Savage* (1744), the child, neglected by the Countess, was committed to a nurse and afterwards to her mother, Lady Mason, who sent him to a grammar school at Saint Albans. The Countess prevented Lord Rivers from leaving him £6000, attempted to have him kidnapped and sent off to the West Indies, and finally in despair apprenticed him to a London shoemaker. An accident revealed the secret of his birth, and the boy quitted his obscure trade. The entire account was derived solely from Savage's own statements, and is now wholly discredited. Savage profited by the legend. In 1727 Savage killed a man in a tavern brawl and was sentenced to death, but a pardon was obtained by the intercession of the Countess of Hertford. Lord Tyrecomel, a nephew of Mrs. Brett, received him into his household. In course of time the two men quarreled, and Savage was thrown upon the world. On the death of Laurence Eusden (1730), Savage tried to obtain the laureateship, but failed. The Queen, however, permitted him to address odes to her, and conferred upon him a pension of £50 a year. Two years after the death of the Queen a pension of the same amount was raised by Pope and others (1739), and Savage was sent off to Swansea in Wales. After staying there for a year he went to Bristol, where he was arrested for debt. He died in prison August 1, 1743. His works comprise: *Woman's a Riddle* (performed 1716); *The Convocation*, a poem (1717); *Sir Thomas Overbury*, a tragedy (1723); *The Bastard*, a poem (1728); *The Wanderer*, a poem (1729); and considerable occasional verse.

SAVAGE-ARMSTRONG, GEORGE FRANCIS. See ARMSTRONG, GEORGE FRANCIS SAVAGE.

SAVAGE ISLAND. See NICE.

SAVAGE'S STATION, or ALLEN'S FARM, BATTLE OF. A battle fought near Savage's Station, about 10 miles east of Richmond, Va., on June 29, 1862, during the Peninsular campaign of the Civil War, between a part of McClellan's Federal Army of the Potomac, under Generals Sumner and Franklin, and a part of Lee's Confederate Army of Northern Virginia, under General Magruder. It was one of the Seven Days' Battles (q.v.) fought by General McClellan during his change of base from the York to the James River. After the battle of Gaines's Mill (q.v.) Generals Heintzelman, Sumner, and Franklin were directed by McClellan to hold the Federal lines immediately south of the Chickahominy. This force was weakened on the 29th by the withdrawal of Heintzelman across White Oak Swamp, and by the retirement of Slocum's division of Franklin's corps, which had suffered severely at Gaines's Mill. On the same

day Magruder, expecting to be supported by Jackson, who had been ordered to cross the Chickahominy at Sumner's Upper Bridge and strike the Federal right flank, but who had been unavoidably delayed, attacked the Federal force with great energy, first at Allen's Farm and then at Savage's Station, but was finally repulsed. The Federals, however, withdrew across White Oak Swamp during the night, leaving to the Confederates 2500 sick and wounded men in the field hospital at Savage's Station. Before and after the battle the Federals destroyed here large quantities of their supplies and munitions of war. Consult: Johnson and Buel (eds.), *Battles and Leaders of the Civil War* (vol. ii., New York, 1887); and Webb, *The Peninsula* (New York, 1881).

SAVAII, *sâ-vî-ê*, or **SAWAI**. The largest and westernmost of the Samoan Islands (q.v.) (Map: Samoa, C 5). It is over 40 miles long and has an area of 660 square miles. It is mountainous and covered with craters. The highest peak of the island, as well as of the group, is Mua (4000 feet). The coasts are mostly precipitous and inaccessible, the only place of anchorage being Matautu, in the north. The interior is densely wooded and sparsely inhabited, but there are stretches of fertile land along the coasts. The island belongs to Germany and is divided into six administrative districts. Population, in 1900, 13,201.

SAVANNAH. The second largest city of Georgia and the county-seat of Chatham County, situated on the west bank of the Savannah River, 18 miles from the Atlantic Ocean (Map: Georgia, E 3). Geographically and commercially it enjoys a position of unusual advantage; historically, it is one of the most interesting cities of the South. The climate, greatly influenced by the Gulf Stream, is mild and pleasant. Though it is hot in summer, cool breezes prevail at night. The average temperature is 66 degrees.

Savannah is situated on a plateau 50 feet above sea level. The plan of the city, in all its extensions, has followed that originally projected by Oglethorpe. The streets, broad and straight and luxuriantly shaded, cross each other at right angles. The number of trees and their beauty have given Savannah the name of 'Forest City.' Among them are magnolias, japonicas, and catalpas. The squares of the city, which, in the original design, were intended as rallying places for the colonists, are especially noteworthy. Forsyth Park is the largest of these places of resort. A handsome monument to the Confederate dead stands in the Parade Ground, the southern extension of the park. In other squares are monuments in honor of Gen. Nathaniel Greene, William Washington Gordon, builder of the Central of Georgia Railway, Sergeant William Jasper, the Revolutionary patriot, and Count Casimir Pulaski.

Among the more imposing public buildings are the Post-Office, the Custom-House, the County Court-House, the City Exchange, the Telfair Academy of Arts and Sciences, and the Public Library. The church edifices are numerous and handsome, the style of architecture representing in large measure old colonial ideals. There are a number of good private schools, besides an efficient public-school system. Telfair Hospital

for Women, Savannah Hospital, Saint Joseph's Hospital, and the Georgia Infirmary for Colored People are prominent institutions. Near the city are several salt water resorts, which are largely frequented during the summer.

Savannah is surrounded by a fertile territory, especially adapted to the cultivation of rice, cotton, sugar-cane, vegetables, and fruits. Four great railway lines enter the city: the Atlantic Coast Line, the Seaboard Air Line, the Southern, and the Central of Georgia. Its facilities for the expeditions handling of ocean and coastwise freights in large quantities have made it the most prosperous of South Atlantic ports. The broad channel is 26 feet in depth, and is being improved by the Government to afford a greater depth. The terminals of the railroads occupy in the aggregate three miles of wharves. Savannah is the first cotton port on the South Atlantic coast and the first naval stores port in the world. Its exports of lumber are large and are rapidly increasing. The annual export of phosphate rock exceeds that of any other South Atlantic port. The total foreign commerce for the year 1901 amounted to \$47,384,000, mostly exports, making it rank fifth among Atlantic ports. Though Savannah is preëminently a shipping centre, considerable manufacturing is carried on, but chiefly for local markets. There are, however, large railroad car and repair shops, fertilizer manufactories, foundries and machine shops, cottonseed oil mills, lumber mills, patent medicine factories, etc. In the census year 1900 the various industries had \$5,716,000 capital and an output valued at \$6,462,000.

The government is vested in a mayor and a board of aldermen, elected every two years. Most of the administrative officers are chosen by the city council, the park and tree commissioners, however, being nominated by the mayor and confirmed by the council. The board of education is, in a large degree, a self-perpetuating body, entirely removed from partisan politics.

Population, in 1800, 5146; in 1850, 15,312; in 1860, 22,292; in 1870, 28,235; in 1880, 30,709; in 1890, 43,189; in 1900, 54,244. The total in 1900 included 28,090 persons of negro descent. The foreign-born population was small, only 3434.

Savannah was settled in 1733 by a small company under the leadership of Gen. James Edward Oglethorpe. (See GEORGIA.) During the next few years a considerable number of German, English, and Scotch immigrants arrived, among them (in 1735) being Charles and John Wesley. During the Revolutionary War Savannah was fortified by the Americans, and in December, 1778, when occupied by a force of less than 1000, under Howe, it was attacked and captured. December 29th, by 3000 British under Colonel Campbell. In the fall of 1779 an allied army of French and American troops, under D'EStaing and Lincoln, attempted to recapture it, but were repeatedly repulsed, and in the disastrous attack of October 9th the allies lost more than 800 men, Count Pulaski and Sergeant Jasper being mortally wounded. Savannah was incorporated as a city in 1789. In 1796, and again in 1820, it was ravaged by fire, the loss being more than \$1,000,000 in the first case and more than \$4,000,000 in the second. The first steamship to cross the Atlantic was owned and projected in Savannah, was named after the city, and sailed from this

of Savannah to Fort Mifflin. On the 21st General Sherman reached Savannah, and on the 22d his famous march to the sea began, leaving a population of about 10,000 behind. He was followed by General Hood with a force of 15,000, but Sherman captured the city of Mifflin (q.v.) on the 13th, and the following day the Federal army was preparing to begin large operations on all sides, but was suddenly withdrawn by means of a pontoon bridge, destroying the navy yard with the exception of the *Savannah*, but leaving 150 heavy guns, large quantities of ammunition, and some 30,000 bales of cotton. Sherman left late in January on his march through the Carolinas, but Savannah was held by a Federal garrison until the close of the war. Consult: C. C. Jones, Jr., and others, *History of Savannah to the Close of the Eighteenth Century* (Syracuse, 1890); Lee and Agnew, *Historical Record of Savannah* (Savannah, 1869); and *Siege of Savannah in 1779* (Albany, 1866).

SAVANNAH RIVER. A river forming the boundary between Georgia and South Carolina. It rises in the Blue Ridge, and flows southeast, entering the Atlantic Ocean through the Tybee Roads, after a course of 450 miles (Map: Georgia, D 2). Its upper course is rapid, and the river carries a great deal of silt, which is deposited near its mouth in low islands and spits, dividing the river into narrow channels. The entrance is being extensively improved by means of jetties, and a 26-foot channel will be secured to the city of Savannah, 18 miles from the sea. The river is navigable for small steamers 230 miles to Augusta.

SAVANNAS (Osp. *savana*, sheet, from Lat. *sabannum*, from Gk. *σάβανον*, linen cloth, towel). Plant societies intermediate between forests and grasslands and associated with transitional conditions. Climatic savannas, which are abundant in many tropical and warm regions, are park-like, the undergrowth being largely grassy and the trees scattered irregularly. Occasionally edaphic savannas, probably influenced by the grazing of animals, may occur in temperate regions, especially in river bottoms.

SAVARY, *sá'vá'ré'*. ANNE JEAN MARIE RENÉ, Duke of Rovigo (1774-1833). A French general, born at Mareq (Ardennes). In 1797 he accompanied Desaix to Egypt, and after Marengo (1800) Napoleon made him a colonel and aide-de-camp. In 1802 he became general of brigade and was made chief of the secret police; in 1804, as commandant of troops, stationed at Vincennes, he presided at the shameful execution of the Duke d'Enghien. In the wars of 1806-07 he acquired high military reputation, his victory at Ostrolenka (February 16, 1807) being a brilliant achievement. He distinguished himself also at Friedland (June 14, 1807), and was created Duke of Rovigo in the beginning of the following year. He was then sent to Spain by the Emperor and negotiated the arrangements by which Joseph Bonaparte became King of Spain. In 1810 Savary replaced Fouché as Minister of Police and held office until 1814. After the fall of Napoleon, he was confined by the British Government at Malta for seven months, when he succeeded in making his escape, and landed at Smyrna. He returned to Paris in 1818, and was reinstated in

his titles and honors. In 1823 he removed to Rome, having given offense to the Court by his pamphlet *Sur la catastrophe de Mgr. le Duc d'Enghien*, in which Talleyrand was charged with the responsibility for the Duke's death, but at the close of 1831 he was recalled by Louis Philippe and appointed commander-in-chief of the Army of Africa. He died in Paris. His *Memoirs* (Paris, 1828) are valuable for the Napoleonic period.

SAVE, *säv* (Ger. *Sau*). A tributary of the Danube. It rises in the northwestern part of the Austrian Crownland of Carniola, and flows southeast and east through Croatia and along the southern borders of Slavonia, which it separates from Bosnia and Servia till it joins the Danube at Belgrade, after a course of about 450 miles (Map: Austria, E 4). In its lower course it is a sluggish stream, winding between marshy banks, while its shoals and variable volume render navigation difficult. It is, however, navigable for steamers as far as Sissek, 365 miles. It receives its principal tributaries from the right. These include the Kulpa, Una, Vrba, Bosna, and Drina.

SAVERY, THOMAS (c.1650-1745). An English inventor, born in Shilstone, Devonshire. He became a military engineer, but devoted himself to mechanical inventions, devising a machine for polishing plate glass in 1696 and in the same year a pair of paddle-wheels worked by a capstan set between them on a boat, a scheme described in a pamphlet *Navigations Improved* (1698; reprinted in 1858 and in 1880). But his fame rests on the steam pumping engine which he patented in 1698, and which was the first to come into practical use, especially in the improved form it took after the association of Savery with Newcomen (q.v.). Savery wrote *The Miner's Friend* (1698), which contains a description of his engine.

SAVIGLIANO, *sá'vé-lyá'nó*. A town in the Province of Cuneo, Italy, on the Maira, 32 miles by rail south of Turin (Map: Italy, B 3). It is surrounded by walls, and has a triumphal arch. There are a technical school and a library. Savigliano manufactures railway material, wagons, silks, linens, and sugar, and trades in cattle, hemp, and fruit. Here in 1799 the allied Russians and Austrians defeated the French. Population (commune), in 1901, 17,321.

SAVIGNY, *sá'vé'nyé'*, FRIEDRICH KARL VON (1779-1861). One of the most distinguished of modern European jurists, the founder of the modern historical school of jurisprudence. He was born at Frankfort-on-the-Main, a descendant of an ancient family of Lorraine. He studied at Marburg (1803-08), taught there, at Landshut (1808-10), and at Berlin (1810-42). In 1842 he ceased to teach and became a member of the Prussian Ministry, his especial charge being the preparation of legislative measures. In 1848 he retired to private life. In 1803 he published a treatise on the *Law of Possession* (*Recht des Besizes*) which gave him a European reputation. In 1814, in reply to a pamphlet by Thibaut, advocating the preparation of a code of laws for Germany, he published his *Vocation of Our Time for Legislation and Jurisprudence* (*Beruf unserer Zeit für Gesetzgebung und Rechtswissenschaft*). In his essay he took the ground that German legal

science was not sufficiently developed to warrant such an undertaking, but he also set forth the limitations and the perils of codification with a precision and force that have not been excelled. In insisting that law is a product of the life of each nation, he gave to the historical school of jurisprudence its theoretical basis. In 1815, in coöperation with other jurists, he established the *Zeitschrift für geschichtliche Rechtswissenschaft*, which continued to appear until 1850. Its modern successor is the *Zeitschrift der Savigny-Stiftung für Rechtsgeschichte*. Between 1815 and 1831 he published his *History of Roman Law in the Middle Ages (Geschichte des römischen Rechts im Mittelalter)*, and between 1835 and 1853 his *System of Modern Roman Law (System des heutigen römischen Rechts)*, which remained unfinished. His miscellaneous writings were collected and published in 1850. In addition to his services to historical jurisprudence, Savigny did much to promote a more fundamental analysis of legal conceptions. There are lives of Savigny by Strutzig (Berlin, 1862) and Landsberg (Leipzig, 1890).

SAVILLE, säv'ıl, or **SAVILLE**, GEORGE, Marquis of Halifax (1633-95). An English politician and statesman, born at Thornhill. He was a confidential adviser of Charles II., by whom he was created Earl of Halifax in 1679 and Marquis of Halifax in 1682. In the latter year he was also made Lord Privy Seal, the highest post in the realm. In this position he used his influence to oppose the ambition of James, Duke of York, and to advance the interests of the Duke of Monmouth. When James came to the throne he retained Savile among his advisers, but in a lower office—the presidency of the council. He was, however, almost immediately dismissed from the council because of his opposition to the repeal of the Test and Habeas Corpus Acts. When the storm broke over James he attempted to conciliate the Marquis, who seems to have met the King's advances half-way. But on the arrival of William Halifax went over to him and, next to Somers, exercised the greatest influence in bringing about the new régime. He was again appointed Lord Privy Seal, but he gradually withdrew from political activity. His last years were spent almost entirely in literary work. In politics he was moderate, and worked for what he believed to be his country's good, regardless of party interests and prejudices. This mental attitude, however, made him generally suspected and disliked, and gained him the name of 'Trimmer,' which he accepted as a far from opprobrious appellation. His numerous pamphlets are published in a volume entitled *Miscellanies by the Most Noble George Lord Savile, late Marquis and Earl of Halifax* (London, 1700). Consult: Burnet, *History of His Own Time* (Oxford, 1833); *English Historical Review*, October, 1896.

SAVILLE, säv'ıl, Sir HENRY (1549-1622). An English scholar, born at Bradley, in Yorkshire. He entered Brasenose College, Oxford, but was transferred to Merton College in 1561, and became fellow of that college in 1565. Subsequently he visited many places on the Continent, collecting manuscripts, and on his return was appointed Greek and mathematical tutor to Queen Elizabeth, 1578; provost of Eton, 1596; warden of Merton College, 1585-1621. He was knighted by James I. in 1604. He founded at

Oxford the Savilian professorships of geometry and astronomy, and gave liberally to the university besides the gift of his valuable library. He was the author of a translation of *The End of Nero and Beginning of Galba, four Bookes of the Historias of Cornelius Tacitus; The Life of Agricola, with Notes* (Oxford, 1591); a folio edition of the *Rerum Anglicarum Scriptores post Bedam Principii* (Oxford, 1596); and a folio edition of the works of Saint Chrysostom in 8 vols. (1610-13).

SAVIN, or **SAVINE** (OF., Fr. *sabine*, It. *sarvino*, from Lat. *sarvina*, sayin, for *Sabina herba*, Sabine herb), *Juniperus sabina*. A low, much-branched, widely spreading shrub, with small, imbricated evergreen leaves. It grows on mountains in Europe, Asia, and North America, bears small black berries, covered with a pale blue bloom, and has strong smelling aromatic leaves. Two pounds of the tops yield about five ounces of limpid and nearly colorless oil with the odor of the plant and a hot acrid taste. This oil is sometimes used medicinally.

SAVINGS BANK. An institution for the accumulation and profitable employment of small sums, chiefly the savings of the poorer classes. Savings banks originated in the philanthropic movement of the close of the eighteenth century. An institution of this nature was in operation in Hamburg in 1778; another was founded in Oldenburg in 1786. In England a savings bank was founded in London in 1798. In the first two decades of the nineteenth century such institutions were established throughout Western Europe; in 1816 the first one in America was founded at Philadelphia, and by 1820 ten savings banks were in operation in the United States. Since that time such banks have increased steadily in number, until at present no civilized State is wholly without them.

TRUSTEE SAVINGS BANKS. Early saving banks were all founded by philanthropists who acted simply as trustees for the depositors, giving their services gratuitously in managing the funds deposited with them. Practically the same plan is followed by most of the private savings banks of England and by the mutual savings banks of America. The system is, however, subject to fraud and reckless management—evils which are of a serious nature, since they check the tendency to save which the bank exists to develop. In many cases the Government endeavors to minimize the risk of bad management by prescribing the classes of securities in which savings banks may invest. National, State, and municipal bonds and real estate mortgages are favorite forms of investment in the United States.

JOINT-STOCK SAVINGS BANKS exist in large numbers, especially in the western part of the United States. Owing to the necessity of earning profits, it is impossible for these banks to make any great effort to secure very small deposits; hence their educational value is limited. The chief purpose they serve is the productive employment of savings of those who enjoy considerable incomes.

SAVINGS BANKS IN THE UNITED STATES. The following table, from Hamilton, *Savings Institutions*, page 190, illustrates the growth of savings banks (mutual and joint-stock) in the United States:

Year	No. of depositors	Deposits	Average due each depositor
1895	8,045	\$1,178,770	\$148.85
1901	28,701	14,061,729	478.54
1902	693,840	149,277,591	215.43
1903	1,347,882	819,196,974	350.71
1904	4,208,893	1,524,844,306	558.03
1905	6,167,983	2,449,347,895	401.40

	No. of depositors	Total deposits	Average deposit
Germany	1898 13,854,927	\$1,929,332,000	\$139.25
United Kingdom	1901 10,134,877	936,117,000	89.71
France	1900 10,680,866	824,932,000	77.20
Japan	1900 5,825,578	36,948,000	6.34
Italy	1899 5,669,590	448,700,000	79.14
Austria	1900 4,792,611	833,210,000	173.85
Russia	1901 3,935,773	428,345,000	108.83
Belgium	1900 3,537,157	231,684,000	65.50

The efficiency of a system of savings banks may be roughly measured by the ratio of accounts to the total population. By this test, the American system does not prove wholly satisfactory. While the New England States show one account to two of the population, the Western States show only one to 18, the Middle States one to 18, and the Southern States one to 106.

MUNICIPAL SAVINGS BANKS. Municipal action in encouraging saving began in Germany. A municipal savings bank was organized in Karlsruhe about the beginning of the nineteenth century; another was founded at Berlin in 1818. Institutions of this type are now found throughout Germany, operating in the country districts as well as in the towns. They are also the predominant type of bank in Austria and France, and the plan has been successfully employed in Italy, Switzerland, Russia, Denmark, Sweden, and Japan. It presupposes a highly efficient municipal government, and general confidence in the officials on the part of the lower classes. These banks are for the most part organized as quasi-private corporations, having power to own property, make binding contracts, and sue and be sued before the courts. Managers and officials are appointed by the municipality. In large cities the organization consists of a central office with branches located where they will be most convenient to wage-earners. Sometimes these banks undertake to send officials to the homes of small depositors, to collect weekly sums for deposit. These banks have proved highly successful, not only furnishing excellent facilities for saving, but also rendering available a supply of capital for local uses. Loans on real estate are the principal form of investment.

POSTAL SAVINGS BANKS. See under that heading.

SCHOOL SAVINGS BANKS. A great deal of attention has recently been given to plans for training school children in habits of saving. Priscilla Wakefield experimented with a school savings bank early in the nineteenth century. The plan was tried in several parts of Europe in the first half of the century, but first received general recognition in 1866 through the efforts of Professor Laurent in Belgium. The principle has been widely adopted both in Europe and in America. Its usefulness, however, has not as yet been entirely established.

The table below, from the *International Year Book, 1902*, gives the chief facts with regard to savings banks in the more important modern nations.

Consult: Hamilton, *Savings Institutions* (New York, 1902); Wolf, "Savings Banks at Home and Abroad," *Journal of the Royal Statistical Society*, vol. ix.; article "Sparkassen" in Conrad's *Handwörterbuch der Staatswissenschaften*, vol. vi. (Jena, 1901). See BANK.

SAVITAR, sā'vë-tār (Skt., generator, vivifier, stimulator). In Hindu mythology, the sun in his vivifying aspect. Eleven hymns of the Rig-Veda are in his honor, and his name is mentioned in all about 170 times. The preëminent characteristic of Savitar is his golden nature and equipment, his eyes, hands, tongue, and arms being of gold, while he is drawn by radiant steeds in a golden car with a golden pole. His hair, moreover, is yellow, and his garments are tawny. All these attributes, of course, typify the sun. Savitar is one of the most powerful of gods, but his power is uniformly beneficent. In the later Vedic period he comes to be identified, on account of the creative work of the sun, with Prajapati (q.v.). It is significant that the most holy verse of the Rig-Veda, the *Sāvitrī* (q.v.), is in honor of Savitar. After the Vedic period this god sinks into obscurity, and is no longer worshiped. Consult: Muir, *Original Sanskrit Texts*, vol. v. (London, 1872); Bergaigne, *Religion Védique*, vol. iii. (Paris, 1883); Macdonell, *Vedic Mythology* (Strasbourg, 1897). See PŪṢAN; SŪRYA.

SĀVITRĪ, sā'vë-trē (Skt., ray of light). The name of the most sacred verse of the Rig-Veda (iii. 62, 10). It corresponds in sanctity to the first chapter of the Koran for the Mohammedans and to the Lord's Prayer for the Christians. It is addressed, as its name implies, to Savitar, the sun in his vivifying aspect. The *Sāvitrī* is repeated by orthodox Brahmins at their morning and evening devotions, and at other times of special religious importance. The name *Sāvitrī* is also sometimes given to the wife and daughter of Brahma (q.v.). Another *Sāvitrī* figures as the heroine of one of the most beautiful episodes of the Mahābhārata (q.v.). The episode has been edited by Geiger in his *Elementarbuch der Sanskrit-Sprache* (Munich, 1888), and translated into English by Arnold in his *Indian Idylls* (London, 1883).

SAVOIE, sā'vwa' (Fr. for Savoy). A southeastern department of France, bordering on Italy (Map: France, N 6). Area, 2,388 square miles; population, in 1896, 259,790; in 1901, 254,781. It is in the region of the Alps, which reach in the Pointe Aiguille an altitude of 12,670 feet. The River Rhone forms the western boundary for 30 miles, and with its affluent, the Isère, drains the department. The climate varies according to elevation, and is bracing and healthful. Wheat, rye, maize, the grapevine, tobacco, mulberries, and apples are cultivated. There are important manufactures of cheese. Capital, Chambéry.

SAVOIE, HAUTE. A department of France. See HAUTE-SAVOIE.

SAVONA, sā-vō'nā. A city in the Province of Genoa, Italy, situated on the Gulf of Genoa, 25 miles by rail west-southwest of Genoa (Map: Italy, C 3). It is a well-known Riviera (q.v.) city with fine boulevards and well-built modern

houses. The sixteenth-century Renaissance cathedral contains some good paintings. Savona has a handsome theatre, an episcopal palace, a technical institute, and a school of navigation. There are also a library and a small picture gallery. The city has important iron and steel foundries and extensive potteries. Other manufactures are cloth, glass, leather, firearms, chemicals, and perfumery. Ship-building and fisheries are also carried on. Population (commune), in 1881, 29,614; in 1901, 38,355. Savona was known as *Savo* under the Romans. In the Middle Ages it was a prosperous maritime republic, but finally succumbed to Genoa.

SAVONAROLA, sã'võ-nã-rõ'lã, GIROLAMO (1452-98). A noted Italian preacher and reformer. He was born at Ferrara September 21, 1452. He received a good education and entered the Dominican Order at Bologna in 1475. Fifteen years passed before he came prominently into public notice, and during that period he went through the usual routine of monastic life. In 1490 he went to the Monastery of San Marco in Florence and began to preach sermons of such boldness and fervor that he immediately drew many hearers. Savonarola was then nearly forty years old, but his religious zeal had in it all the quality and fire of a younger man's temperament. Savonarola's nature was eminently one-sided; he was a religious enthusiast, who, seeing about him corruption and ill-doing, found the courage to raise his voice in reproach and in so doing suddenly discovered the secret of popular approval and success. From the pulpit in the Church of San Marco, or of the Duomo near by, he would improvise, in hasty, emphatic fashion, vivid denunciations of the abuses of the day, of the licentiousness of the great, of the worldliness of the dignitaries of the Church; much of his preaching was mystical, prophetic, and apocalyptic. These denunciations possess one special feature that appeals particularly to the many for whom the history of Florence is chiefly the history of Italian art. Savonarola's brief period of influence came just as the earlier inspiration of the religious painters was dying out, just as the great *Quattrocento* period was dawning. His voice was raised loudly against the corrupting influences that were paganizing art, and it may be recalled that his influence was all-powerful with Botticelli, while the grief-stricken Fra Bartolommeo practically ceased to paint after the death of one he loved and looked on as a prophet.

Unfortunately, Savonarola's rapid rise coincided with a period of great political disturbance. Florence, long a democratic republic, had passed under the sway of the Medici. Lorenzo the Magnificent, who died in 1492, had tried, but unsuccessfully, to win over Savonarola, whose denunciations were openly directed at the reigning house and its supporters. But two years after the accession of Lorenzo's son and successor, Piero, in 1494, Charles VIII, of France invaded Italy at the head of a powerful army to assert a claim to the throne of Naples. Piero at first opposed the French, then treated, but displayed such weakness that his opponents took courage and rose, driving him from Florence. The *Piagnoni* (weepers) then came into power, and this puritanical democratic party was that in which Savonarola had found his most fer-

vent supporters. His influence now dominated the government of the city and, unfortunately for him, some of his eloquent appeals of former years were construed into a prophecy of the coming of the French. Events had proved him a true prophet, and the faith of the people in their preacher accordingly increased. His voice rose louder and still louder in denunciation of men and things. He aimed, in fact, at establishing an ideal Christian commonwealth. So great was his hold on those who listened to his preaching that for some months Florence was profoundly moved by religious enthusiasm and appeared a new city. The preacher's sway did not last long; he had set his standard too high and the Florentines soon wearied of virtue. Reaction set in. The party of the Medici, known as the *Arrabbiati* (maddened), began to recover ground. Savonarola had extended the field of his attacks to the Pope, Alexander VI, who, inspired perhaps more by political than by religious motives, became hostile to the Dominican preacher.

In 1495 Savonarola was forbidden to appear in the pulpit for some months. Internal dissension in Florence provoked severe measures on the part of the *Piagnoni* against the *Arrabbiati*, and the popularity of the democratic party rapidly declined, as did that of Savonarola. In 1497 the Pope appears to have excommunicated him, but Savonarola declined to accept the Papal command and openly rebelled from the authority of the Pope. Shortly afterwards the *Arrabbiati* won some measure of success in the city elections, and Savonarola was ordered to discontinue his preaching. A Franciscan friar was then put up to accomplish the Dominican's complete downfall, and proposed as a test of their respective merits the ordeal by fire; the two champions were to pass down a long and narrow lane of fire between two lofty piles of blazing logs. Savonarola's enthusiastic disciples accepted the Franciscan's challenge without hesitation and offered to follow their prophet into the flames. He, however, was apparently already losing faith. He allowed another Dominican to take his place, but on April 7, 1498, when all Florence assembled to witness the trial, endless delays and difficulties resulted in a fruitless adjournment. It was evident that the popular enthusiasm was dead, that Savonarola had lost his hold on the Florentines. The *Arrabbiati* now felt they could push their attack home. The Convent of San Marco was attacked; Savonarola was imprisoned and tried for heresy and sedition. The trials, secular and religious, were long and accompanied by much torture, under which he broke down. On May 23, 1498, he was hanged and two other Dominicans with him, and their bodies were burned. Pastor declares in his *History of the Popes* that from the letter of the Papal commissioners, May 23, 1498, it is evident that the charge of heresy in Savonarola's case is to be understood in the constructive, not in the strict, sense. His writings were numerous, an excellent selection from them being that by Villari and Casanova, *Scelta di prediche e scritti* (Florence, 1898). For bibliographies of works on and by Savonarola, see Gherardi, *Nuovi documenti e studj* (ib., 1888); Olshki, *Bibliotheca Savonaroliana* (ib., 1898). The standard history of his life is by Villari (Eng. transl., London, 1899), in addition to which the following may

— *Italy, 1453-54*, *Savonarola* (London, 1847); *Italy, 1453-54*, *Beaudoing Savonarola* (Paris, 1898); *Horshburgh, Savonarola* (London, 1797); O'Neil, *Savonarola* (Boston, 1891); *Walt, Savonarola. Eccommunicated?* (London, 1900); *Luotto, Il vero Savonarola* (Florence, 1897); *Gruber, Illustrations des écrits de Savonarola et des paroles sur l'art* (Paris, 1879); *Schmitzer, Quellen und Forschungen zur Geschichte Savonarolas* (Munich, 1902); *Lucas, La tradizione Savonarola* (London, 1900).

SAVONNERIE, sāvōn'ré', LA (Fr., soap factory). A carpet factory in Paris, established by Maria de' Medici in 1604 and included in the Gobelins in 1826. Its name is derived from the use to which it was originally put.

SAVORY (OF. *savore*, *sadree*, *sadariege*, *saturiege*, Fr. *savoree*, from Lat. *saturia*, savory), *Saturia*. A genus of annual or perennial herbs and sub-shrubs of the natural order Labiate, natives of Southern Europe and the East. The common or summer savory (*Saturia hortensis*), an annual 6 to 12 inches high, with white or lilac flowers, commonly cultivated in kitchen gardens for flavoring food, has a strong, agreeable aromatic smell, and pungent taste. Winter savory (*Saturia montana*), a sub-shrub with prickly pointed leaves and larger flowers, is used in the same way. Summer savory is propagated by seed; winter savory usually by slips and cuttings. See PLATE OF FLOWERS.

SAVORY, Sir WILLIAM SCOVELL (1826-95). An English surgeon, born in London, and educated at Bartholomew's Hospital, in the College of Surgeons, and at London University. In the hospital he was surgical and anatomical demonstrator (1849-59), surgeon (1867-91), and governor (1891-95). But his most important post was that of lecturer on surgery, a double chair, which he occupied with a colleague from 1869 to 1879, and alone until 1889, receiving £2000 a year during the latter decade. In the Royal College of Surgeons he was president from 1885 to 1889. Savory became surgeon extraordinary to the Queen in 1887, and in 1890 a baronet. His declaration against "listerism" in 1879 ranks him with the conservatives and he was a man of ability rather than brilliancy. He wrote *Life and Death* (1863).

SAVOY, sāv-voï' (Fr. *Savoie*). Formerly a duchy lying between Italy and France, subsequently a part of the Kingdom of Sardinia (q.v.), and since 1860 a part of France. Savoy is situated in the region of the Western Alps. It borders on the north on Lake Geneva, and on the west it is bounded partly by the Rhone, whose affluents drain the region. In the southeast the Graian Alps form a great wall on the side of Piedmont. The summit of Mont Blanc, the highest peak of the Alps, is within the borders of Savoy. There are several lakes, among them Bourget and Annecy, and a number of mineral springs, the most noted being those of Aix-les-Bains, Saint-Gervais, and Evian. The inhabitants, Savoyards, are essentially French. Under Sardinian rule Savoy was divided into the provinces of Chablais, Faucigny, Genevois, Maurienne, Savoy Proper, Upper Savoy, and Tarantaise. The largest town in the region is Chambéry. The region constitutes the departments of Savoie and Haute-Savoie (qq.v.). Savoy was included in the Roman provinces of Gallia Transpadana

and Gallia Narbonensis. It was overrun in the early part of the fifth century A.D. by the Burgundians, who in 534 came under the domination of the Franks. Its subsequent history is best traced under BERGONY, and from the beginning of the eleventh century under SAVOY, HOUSE OF.

SAVOY, HOUSE OF. The oldest reigning family in Europe, a cadet branch of which, that of Savoy-Carignan, occupies the throne of Italy. The house was founded by Humbert (c. 1003-c. 1056), who was constable of the Emperor Conrad II. He seems to have received from Rudolph III., last King of Arles, the territories, partly French and partly Italian, which formed the nucleus of the little sub-Alpine State of Savoy, and with these the title of Count (1027). His loyalty to Conrad, who annexed the Arletan dominions to the Holy Roman Empire, gained for him additional territories and Imperial recognition of his title about 1036. His son Odo (died c. 1060) succeeded to the title, and by his marriage with Adelaide, Countess of Turin, he greatly extended his dominions. In the succeeding three centuries the possessions of the family were largely extended in Piedmont, and parts of Switzerland came under its sway. In the thirteenth century the house was divided into a Savoyard and a Piedmontese line, but in 1418 Piedmont was reunited with Savoy. Amadeus VI. of Savoy (1343-83) was a vigorous and able ruler. Amadeus VII. (1383-91) secured Nice and thus gave Savoy an outlet to the sea. Amadeus VIII. (1391-1451) by his support of the Emperor Sigismund secured the erection of Savoy into a duchy (1416). In 1434 he handed over his authority to his son Louis and retired to a hermitage. Five years later, although he was not a priest, he was elected Antipope by the Council of Basel as Felix V. (q.v.), but he was not recognized by the Church at large.

At the time of the Reformation the authority of the dukes of Savoy over Geneva came to an end, and they were dispossessed of their Swiss territories. During the wars between the Emperor Charles V. and Francis I. of France, the latter in 1535 seized the dominions of the House of Savoy, which were not restored until the Treaty of Cateau-Cambrésis, in 1559, when they were handed over to Emmanuel Philibert (1559); this able and energetic prince, the victor of Saint-Quentin (q.v.), restored the broken prosperity of the country, and did away with the Austrian and French factions. His son, Charles Emmanuel I. (1580-1630), called the Great, who married a daughter of Philip II. of Spain, was engaged in long wars with France, which allowed him to retain the strategically important Saluzzo, which he had conquered, only at the cost of considerable territory along the Rhone. At the close of his reign he engaged in the War of the Mantuan Succession, in which Savoy was an ally of the Hapsburgs against Louis XIII. The contest was terminated soon after the accession of Victor Amadeus I. (1630-37), who in 1631 received part of Montferrat, but was forced to surrender the important fortress of Pinerolo and other places to France. Victor Amadeus I. did much for the internal improvement of the country and reorganized the University of Turin. This brief reign was followed by minorities and regencies during which the State formed a buffer between France and Spain and suffered at the hands of

both, Victor Amadeus II. (1675-1732) married a niece of Louis XIV., and was compelled for a time to submit to the demands of the French King, who forced him to persecute the Waldenses, and finally by imposing humiliating requirements upon him drove him, in 1690, into the Grand Alliance. In 1696 a treaty very favorable to Savoy detached the duchy from the Grand Alliance. Victor Amadeus II. entered the War of the Spanish Succession as the ally of France and was placed in command of the combined French and Spanish armies. He was defeated at Chiari in 1701 by his cousin, Prince Eugene of Savoy. In 1703 the Duke gave up the French alliance and joined Austria. The French under Vendôme then overran and devastated Piedmont, but after Vendôme's recall they were routed by the Duke and Prince Eugene under the walls of Turin, September 7, 1706. Victor Amadeus II. in the Treaty of Utrecht (1713) was accorded by Spain the possession of Sicily. The alliance with Austria also added the remainder of Montserrat to Savoy. Sicily was exchanged in 1720 for Sardinia (which had been given to Austria), and Victor Amadeus II. assumed the title of King of Sardinia. (For the subsequent history of the House of Savoy, see *SARDINIA, KINGDOM OF*, and *ITALY*.) In 1831 the succession to the throne of Sardinia passed to Charles Albert of the line of Savoy-Carignan. (See *CARIGNANO*.) Charles Albert was followed in 1849 by his son Victor Emmanuel II., who in 1861 assumed the title of King of Italy. Victor Emmanuel in 1860 ceded Savoy and Nice to France. He was succeeded in 1878 by Humbert. The latter's son, Victor Emmanuel III., ascended the throne on the death of his father in 1900.

See *ITALY*: CHARLES ALBERT; CAVOUR; VICTOR EMMANUEL II.; HUMBERT I.; VICTOR EMMANUEL III.

SAVOY, THE. A chapel in London, on the Thames, occupying the site where once stood the palace built in 1245 by Peter, Earl of Savoy and Richmond. In this building the French King John II. was imprisoned after his capture at the battle of Poitiers in 1356. The palace was twice the object of popular violence. It narrowly escaped destruction in an outbreak caused by the Duke of Lancaster's protection of Wiclif; and in Wat Tyler's insurrection it was burned and made a heap of ruins. In 1505 Henry VIII. erected on these ruins a house for the support of destitute, diseased, helpless, and homeless persons. This well-intended charity soon became a refuge for the dissolute and vicious. It was suppressed by Edward VI., but was restored by Queen Mary, and profusely refurnished by the ladies of her Court from their private resources, but in the management of this establishment great abuses prevailed. Its officials embezzled the funds, and the inmates continued to come from the degraded and criminal classes. The combined hospital and poorhouse maintained a nominal existence under the reign of Queen Anne. In building the Waterloo Bridge in 1810, the deep foundations on which the ancient buildings had rested were all removed. Nothing re-

mained but the chapel built alongside these ruins by Henry VII. This chapel was made a church by Queen Elizabeth, and was one of the chapels royal, under the name of Saint Mary le-Savoy. It was injured by fire in 1861, but was rebuilt and furnished for public worship by Queen Victoria. The vaults beneath contain the remains of many persons of distinction. Consult Loftie, *Memorials of the Savoy* (London, 1878).

SAVOY CONFERENCE. The name given to an ecclesiastical conference held in 1661 at the Savoy Palace, London, between the Episcopalian and Presbyterian divines, with the view of ascertaining what concessions would satisfy the latter, and thereby lead to "a perfect and entire unity and uniformity throughout the nation." During the rule of Cromwell the Church of England had been in a very anomalous condition. Most of the clergy who held office during the early period of the civil wars were strong Royalists, and either were ejected or fled when the cause of the Parliament triumphed. Their places had been supplied in many cases by zealous Presbyterians—a rather numerous body in England at that time—and thus it happened at the restoration of Charles II. that a considerable section of the ministers within the Church were hostile to the reintroduction of Episcopalian order and practice. Aware of this feeling, yet desirous of not adopting severe measures, if such could possibly be avoided, the King issued letters patent dated March 25th, appointing twelve bishops, with nine clergymen as assistants on the side of the Episcopal Church, with an equal number of Presbyterian divines, "to advise upon and review the Book of Common Prayer." Consult the "Order for the Savoy Conference," in Gee and Hardy, *Documents Illustrative of English Church History*, pp. 588-594 (London, 1896). Richard Baxter, with the consent of the Presbyterian Party, drew up a 'reformed liturgy' which the Episcopalian commissioners would not look at, considering the wholesale rejection of the older one *ultra vires* on their part. It was never used, but was republished by Prof. C. W. Shields, *Book of Common Prayer . . . as amended by Westminster Divines, 1661* (Philadelphia, 1867; new ed., New York, 1880). Finally, the parties separated without arriving at any conclusion; and this fruitless attempt at 'comprehension' was followed in 1662 by the Act of Uniformity (q.v.).

SAVU, sâ-vûv' (or SAVOU) ISLANDS. A group of three islands in the Dutch East Indies, situated between longitudes 122° and 123° E., and latitudes 10° 25' and 10° 36' S., southwest of Timor and southeast of Sandalwood (Map: East India Islands, F 7). The largest of the group, Great Savu, has an area of about 210 square miles. The soil is fertile and produces rice, indigo, sugar, tobacco, etc. The population consists of Malays, and once numbered nearly 40,000. The present estimate is about 15,000, of whom 13,000 are on Great Savu.

SAW (AS. *saga*, OIG. *saga*, *scga*, Ger. *Säge*, saw; connected with Lat. *secare*, to cut, *securis*, axe). An important tool used in working timber and metal. The wood saw usually consists of a long strip of thin steel, with one edge cut into a continuous series of sharp teeth. The two chief classes of saws are cross-cut saws and rip-saws. In the former the teeth are designed to

to the grain of the fibre of the wood, and the latter is adapted to cutting in any direction, and are alternately bent and straight, they make a broader cut than the ordinary hand saw. The hand saw has a broad edge at one end than the other, and a handle on the broad end. During the nineteenth century the *circular saw*, patented by Samuel Miller in England in 1777, came into universal use wherever machinery could be had for working it. It is generally so fitted as to be worked under a flat bench, a part only of the blade projecting through a narrow slit cut in the top of the bench. It is revolved with great rapidity, and the wood resting on the bench is pushed against the saw. Circular saws are made in diameters from 1 inch to 70 inches, and are extensively used in sawing logs into boards, planks, and other forms of timber. (See SAWMILL; WOOD-WORKING MACHINERY.) The *hand-saw* was invented in 1808 by William Newberry, an Englishman. It consists of a very long hand or web, as it is called, of steel, usually very narrow, and with finely cut teeth. The two ends are joined together so as to form an endless band, which is passed over two revolving drums, one above and the other below the working-bench, through holes in which the saw passes. The *cylinder saw* or *crown saw* is another variety, which was an invention of great antiquity. It is used for cutting curved staves for barrels, button blanks, sheaves, and other special forms. (See COOPERAGE.) For descriptions of saws for metal-working, see METAL-WORKING MACHINERY.

SAWAIL, sā-vī'e. The largest of the Samoan Islands. See SAVAIL.

SAWDUST. A by-product obtained from sawmills and other wood-working machinery. Besides its uses as a packing material, a stuffing for dolls and cushions, and an absorbent covering for floors, such substances as vegetable charcoal, tar, oxalic acid, and wood alcohol are made from it. In preparing oxalic acid the sawdust is first saturated with a concentrated solution of soda and potash in the proportion of two of the former to one of the latter; it is then placed in shallow iron pans, under which flues run from a furnace, whereby the iron pans are made hot, and the saturated sawdust runs into a semi-fluid pasty state. It is stirred about actively with rakes, so as to bring it all in contact with the heated surface of the iron, and to granulate it for the succeeding operations. It is next placed in similar pans, only slightly heated, by which it is dried. In this state it is oxalate of soda mixed with potash. It is then placed on the bed of a filter, and a solution of soda is allowed to percolate through it, which carries with it all the potash, leaving it tolerably pure oxalate of soda. It is then transferred to a tank, in which it is mingled with a thin milk of lime, by which it is decomposed, the lime combining with the acid to form oxalate of lime, and the soda being set free. Lastly, the oxalate of lime is put into a leaden cistern, and sulphuric acid is poured in; this takes up the lime, and sets free the oxalic acid, which readily crystallizes on the sides of the leaden cistern, or on pieces of wood placed there for that purpose.

In making charcoal the sawdust from hard and soft woods must be kept separate, as the former requires much more intense heat than the latter. After careful sifting the sawdust is

carbonized in fire-clay, plumbago, or cast-iron retorts. The resulting charcoal is sifted to remove the calcareous matter which has been detached during the burning process. This charcoal is used to remove unpleasant flavors from wine and as a filtering medium, especially in distilleries. An English patent was taken out in 1896 for making an artificial wood from a mixture of sawdust and certain quantities of gums, resins, or other suitable agglutinants, either in a dry state or dissolved, the compound being subjected to pressure at a temperature high enough to melt the gums. According to another English patent, taken out a year later, sawdust may be so prepared as to be non-inflammable, to be used as a jacketing for boilers and similar purposes. Sawdust, like other wood, may also be distilled by a process which not only saves the charcoal, but also furnishes such products as alcohol and tar.

SAWFISH. One of the elongated, shark-like rays of the family *Pristidae*, remarkable for prolongation of the snout into a flat bony sword, armed on each edge with about twenty large bony teeth, a formidable weapon for killing prey among shoals of fishes, slaying them right and left. Whales are said to be killed by saw-fishes occasionally, and the saw has been sometimes driven through the hull of a ship. About five species are known, living in the warm seas. One, the 'pez sierra' of the West Indies, is common about Florida and in the Gulf of Mexico, and ascends the Mississippi and other Southern rivers. It is often 15 feet long, a fourth of which measures the 'saw.' It plays havoc with fishermen's nets. See PLATE OF LAMPREYS AND DOGFISH.

A family of sharks (*Pristiophoridae*) similarly armed occurs in the Pacific Ocean.

SAW-FLY. A hymenopterous insect of the superfamily Tenthredinoidea, so named on account of the saw-like ovipositor of the female, which serves to drill holes in vegetable tissues and to assist in conveying the eggs into these holes. The saws are mechanically perfect tools. About 2000 species are known, most of which are found in temperate and cold regions. Many saw-flies in the larval stage are highly injurious to vegetation. The largest of the common North American saw-flies is *Cimbex Americana*, whose eggs are laid in the leaves of the elm, birch, linden, and willow. See ROSE INSECTS; PEAR INSECTS; CURRANT INSECTS.

SAWMILL. The mill or machine by which logs are sawed into boards and timber; by popular extension, the building, with its machinery, in which timber is sawed. The first form of saw-

TOOTH OF A SAWFISH.

Section of the rostrum including one tooth (*a*); *b*, ossified part of rostrum; *c*, canal for vessels supplying the tooth; *d*, medullary cavity of rostral cartilage; *e*, granular skin or shagreen.

mill was the sash sawmill, whose general construction and operation are shown by Fig. 1. In this the saw, which is simply a properly toothed straight band of steel, is strained taut by means

FIG. 1. SASH SAWMILL.

of the rectangular frame or sash, and this sash is given a vertical reciprocating movement between upright guide timbers by means of a connecting rod whose lever end extends to a crank on one end of an engine or water-wheel shaft. The log to be cut is fed endwise against the saw by means of a traveling carriage. In usual practice the sash sawmill makes about 150 strokes per minute and produces about 2000 feet, board measure, in ten hours. The next development in sawmills was the invention of the 'muley' sawmill (Fig. 2), the chief merit of which, compared with the sash sawmill, was the great reduction in the weight of the reciprocating parts. The saw is clamped to two light cross-heads, one at each end, which work up and down, but is not strained or kept taut by tension as it was in the sash in the earlier sash sawmill. To keep the saw straight in its movement, upper and lower guides, aided by the cross-heads and the log itself, were depended upon. The muley sawmill was followed by circular sawmills.

In the circular sawmill the saw is a circular disk of steel with teeth on its edge. This is mounted on a shaft which is given rapid rotary motion by gearing or belting operated by a water-wheel or steam engine. The saw projects something less than half its diameter above the frame or carriage on which the log is placed and fed endwise against the teeth. The circular sawmill gave a continuous cutting motion of from 6000 to 9000 feet per minute, with which great advantage, however, it combined a number of disadvantages. Its rigidity or capacity to maintain a true plane of rotation decreases with the diameter of the saw, or, in other words, with the depth of cut, and this is obviously just the reverse of the requirements. The only way to increase its rigidity is to increase the thickness of the

disk, and this means the cutting of a wider gash or kerf and a waste of a greater portion of the log in sawdust. All things considered, it was found impracticable to employ a circular saw much exceeding six feet in diameter. Less than half of this diameter is the cutting depth of the saw. To saw logs of greater diameter than about two feet, therefore, it is necessary to employ two saws, one mounted above so as to cut a kerf downward into the log and the other mounted in the ordinary way to cut a kerf upward to meet the kerf formed by the upper saw. It has been estimated by reliable authorities that the kerf waste with circular saws is about 20 per cent. greater than with the band sawmill, which succeeded them in the order of development.

The band sawmill (Fig. 3) was known long before the circular sawmill had come into general use, but its adoption was delayed for many years

FIG. 2. 'MULEY' SAWMILL.

FIG. 3. AMERICAN BAND SAWMILL.

by the difficulty of making saws which would endure under the severe service. When once it was possible to secure durable saws the development of the band sawmill was exceedingly rapid,

is generally used for sawing logs in places where the lumber industry is not so advanced. The plane of commercial industrial sawmills and consists of a frame or stand of heavy iron or steel, broad faced wheels mounted one above the other. Over these wheels a continuous band of steel works exactly like a belt between two pulley wheels. This steel band is the saw and the logs are fed endwise against its toothed edge by traveling carriages. In a modern band sawmill the saw has a continuous cutting speed to 80,000 feet, board measure, per day.

The most recent development in sawmills is the gang sawmill, and this has received its highest development in Europe, where the size of timber is smaller than in America. A gang sawmill operates on much the same principle as the old sawmill illustrated in Fig. 1. Indeed, if we imagine the single saw of Fig. 1 to be replaced by a dozen or more parallel saws spaced equal distances apart we have a very correct notion of a gang sawmill, except that in modern construction the mill is a compact self-contained construction of iron and steel, which often is in one piece with the steam engine which operates it. The gang sawmill usually operates on timber which has been roughly squared by band or circular sawmills, and its merit is, as is quite obvious, that it cuts the whole timber into boards in one passage through the mill. The forms of sawmills which have been described are specialized for such work as sawing shingles, clapboards, etc., by arranging and grouping the saws and by providing special carriages for automatically feeding the timber to the saws in such a manner as to produce the particular form of timber required. A sawmill plant is a plant in which logs from the lumber camps are sawed into rough lumber. According to the United States census there were in the United States in 1900 31,883 sawmill plants in operation. These plants represented a capital of \$805,785,226, employed 229,717 wage-earners, consumed raw material valued at \$226,138,992, and turned out a finished product valued at \$422,812,061. See LUMBER INDUSTRY; WOOD-WORKING MACHINERY.

SAWNEY. See NATIONAL NICKNAMES.

SAW-VIPER. A small viper of the Old World deserts, marked with a dorsal series of light spots, and a zigzag line along each side suggesting the teeth of a saw. It is fierce, aggressive, and very poisonous; and it has the peculiarity of making a "curious, prolonged, almost hissing sound, by rubbing the folds of the sides of the body against one another, when the serrated lateral scales grate together." The most widely distributed species, called 'eja' in Egypt, is *Echis carinata*, occurring from Morocco to Northern India; a second species (*Echis colorata*) inhabits Arabia and Palestine. Consult authorities cited under VIPER.

SAW WHET OWL. A small brown-streaked owl (*Nyctala Acadica*), without ear-tufts, rather common in the Northeastern States and Canada, so named from its curious rough cry.

SAW'YER. LEICESTER AMBROSE (1807-98). An American biblical scholar, one of the first of the higher critics in this country. He was born in Pinekey, N. Y., studied at Hamilton College and at Princeton Theological Seminary, was ordained to the Presbyterian ministry in 1832, but left that communion in 1854, after hav-

ing been pastor in New York and Connecticut and president of Central College, Ohio, and entered the Congregational ministry. Sawyer abandoned the doctrine of verbal inspiration, re-translated the Bible, publishing the New Testament in 1858 and the prophetic books of the Old Testament in 1860, and wrote: *Elements of Biblical Interpretation* (1834); *Organic Christianity* (1854); and *Final Theology* (1879).

SAX, säks, CHARLES JOSEPH (1791-1865). A Belgian-French instrument maker, born at Dinant-sur-Meuse. In 1815 he established himself in Brussels and soon became known for his brass instruments, although he also made other instruments. He is credited with the discovery of the exact proportion for the scale of wind instruments most conducive to a full round tone. Together with his son, ADOLPHE (1814-94), he made many improvements in musical instruments. Adolphe perfected the clarinet and the bass clarinet, and invented the saxophone (q.v.)

SAXA RUBRA (Lat., red stones). A station of the ancient Via Flaminia, eight miles north of Rome, so called from the red volcanic tufa of the locality. Here Maxentius was defeated in 312 by Constantine.

SAXE, JOHN GODFREY (1816-87). An American humorous poet. He was born in Highgate, Vt., and graduated at Middlebury College. He was called to the bar in 1843, and in 1850 bought the Burlington (Vt.) *Sentinel*, which he ran for six years. He then became Attorney-General of Vermont and deputy collector of customs. Later he was editor of the Albany (N. Y.) *Evening Journal*, wrote and lectured, and published verses in the *Knickerbocker Magazine* and *Harper's Weekly*. His works include: *Progress: A Satirical Poem* (1846); *Poems* (1850); *The Moncy-King, and Other Poems* (1859); *Clever Stories of Many Nations Rendered in Rhyme* (1865); *The Masquerade, and Other Poems* (1866); *Fables and Legends of Many Countries* (1872); *Leisure-Day Rhymes* (1875). His verse abounds in burlesque and puns, but there are not wanting sketches with genuine human interest.

SAXE, säks, MAURICE, Count de (1696-1750). A French marshal, born at Goslar, Germany. He was the illegitimate son of Augustus the Strong, Elector of Saxony and King of Poland, and the Swedish Countess Aurora von Königsmark. When only twelve years of age he joined the army of Prince Eugene, and took part in the capture of Lille and the siege of Tournay. In 1711 he served with the Russo-Polish army before Stralsund. He took part in a campaign against the Turks in 1717, and in 1720 he went to Paris, where he studied military tactics and engineering. In 1726 he was elected Duke of Courland, but he incurred the enmity of both Russia and Poland and was compelled to retire to France in the following year. Joining the French army on the Rhine, under the Duke of Berwick, he distinguished himself at the siege of Philippsburg (1734), and in the battle of Ettlingen. For these services he was made a lieutenant-general in 1736; and on the breaking out of the War of the Austrian Succession, he obtained the command of the left wing of the French army which was appointed to invade Bohemia. He captured Prague and Eger (1741) and showed signal ability in the field, and in 1744 was made a marshal of France and ap-

pointed to command the French army in Flanders. In the following year he laid siege to Tournay. On May 11, 1745, he met the combined forces of the English, Hanoverians, Dutch, and Austrians under the Duke of Cumberland at Fontenoy, and after a desperate struggle in which the allies were disorganized by his artillery fire, won a decisive victory. During the four succeeding months every one of the strong fortresses of Belgium fell into his hands. On October 11, 1746, Marshal Saxe gained the victory of Rancoux over the allied armies under Charles of Lorraine, for which he was rewarded with the title of Marshal-General of France, an honor which only Turenne had previously obtained. At Lauffeld (July 2, 1747) the English army under the Duke of Cumberland was again defeated by Saxe, and the capture of the fortress of Bergen-op-Zoom brought the allies to think of peace. The Dutch, however, were still disposed to hold out, till the capture of Maestricht (1748) destroyed their hopes, and the Peace of Aix-la-Chapelle followed. Saxe died November 30, 1750. Saxe's work on the art of war, entitled *Mes rêveries*, was published at Paris in 1757, and contains many novel and audacious ideas. In 1794 appeared his *Lettres et mémoires*. For his life, consult: De Broglie, *Maurice de Saxe et le Marquis d'Argenson* (Paris, 1891).

SAXE-ALTENBURG, ält'en-böörk. A duchy and constituent State of the German Empire, consisting chiefly of two nearly equal parts, of which the western is situated between Saxe-Weimar and Reuss, and the eastern between Reuss and Saxony. There are also a number of small exclaves. The total area is 511 square miles. The eastern part is broken somewhat by the offshoots of the Erzgebirge and has an undulating surface. The western part belongs to the region of the Thuringian Forest and is more mountainous. The Saale waters the western, and the Pleisse the eastern part. The latter portion is agricultural and very fertile. In the western part these conditions are less favorable, but the forests are an important source of income. Stock-raising is well developed. There are considerable deposits of lignite. The chief manufactures are woollens, gloves, iron products, glassware, porcelain, and woodenware. The Diet consists of 30 members, of whom 9 represent the most highly taxed citizens, 9 towns, and 12 the rural districts. The members of the Diet are elected directly for three years. Saxe-Altenburg has one vote in the Bundesrat and returns one Deputy to the Reichstag. Population, in 1890, 170,864; in 1900, 194,914, chiefly Protestants. Capital, Altenburg (q.v.).

HISTORY. In the Middle Ages a part of the region now comprised within Saxe-Altenburg was an Imperial domain, until in 1329 it was acquired by the margraves of Meissen. Another part, which was ruled by the landgraves of Thuringia, also passed into the possession of the same house. Upon the division of the Wettin lands in 1485 Saxe-Altenburg fell to the Ernestine line, from which it passed after the War of the Schmalkald League (1546-47) to the Albertine branch. The town of Altenburg and some other places, however, were restored in 1554 to the Ernestine branch. The elder House of Altenburg was founded in 1603 and became extinct in 1672. The greater portion of the land, thereupon, was united with Gotha. Upon the extinction of the

ducal line of Gotha in 1825, Altenburg passed in the following year to Duke Frederick of Hildburghausen, who founded the new line of Saxe-Altenburg. The duchy became a member of the North German Confederation in 1866 and of the German Empire in 1871.

SAXE COBURG GOTHA, kô'boörk go'tä. A duchy and constituent State of the German Empire, consisting of the two duchies of Coburg and Gotha, the former bordering on Bavaria and the latter on Prussia. Area, 755 square miles. Both portions of the duchy belong to the region of the Thuringian Forest and are mountainous with well watered and wooded fertile valleys. Agriculture is the principal occupation and considerable crops of cereals are raised. The vine is cultivated to some extent in Coburg. Stock-raising is also well developed. The manufactures comprise machinery, safes, small iron and steel ware, textiles, paper, buttons, leather, footwear, etc. Both duchies are well supplied with transportation facilities. The duchies of Coburg and Gotha have two separate Chambers of 11 and 19 members respectively, elected directly by restricted suffrage for four years. The common affairs of the two duchies are transacted by the two Chambers meeting in common, alternately at Coburg and Gotha. There is one Ministry divided into two sections and presided over by the Minister of State. Saxe-Coburg-Gotha is represented by one member in the Bundesrat and returns two Deputies to the Reichstag. Population, in 1890, 206,513; in 1900, 229,550, almost exclusively Protestants.

HISTORY. The town of Coburg was acquired about the end of the fourteenth century by the House of Wettin (see SAXONY), and upon the partition of the Wettin lands in 1485 it fell to the Ernestine line. In 1680 Albert, the son of Ernest the Pious of Saxe-Gotha, founded the line of Saxe-Coburg, which, however, became extinct in 1699. In 1735 Coburg was acquired by the Duchy of Saxe-Saalfeld, which became the Duchy of Saxe-Coburg-Saalfeld, with Coburg as its capital. In 1826 Duke Ernest III. ceded Saalfeld to Saxe-Meiningen, receiving Gotha in exchange, and henceforth called himself Ernest I. of Saxe-Coburg-Gotha. The feudal Constitution survived in Gotha down to 1849, when a liberal one was inaugurated. The connection between Coburg and Gotha was merely personal until 1852, when a constitution was enacted for both duchies, the union being further consolidated in 1874. Saxe-Coburg-Gotha joined the North German Confederation in 1866 and in 1871 became a member of the German Empire.

SAXE-MEININGEN, mä'ming-en. A duchy and constituent State of the German Empire, in Thuringia, extending in the shape of a crescent along the northern boundary of Bavaria. Area, 953 square miles. It belongs principally to the region of the Thuringian Forest and has a hilly surface, watered by the Werra, the Saale, and some tributaries of the Main. Saxe-Meiningen is not well adapted for agriculture. The forests, which belong largely to the Crown, and public foundations cover a considerable proportion of the area and yield material for the production of woodenware. Stock-raising is unimportant. The mineral products include slate, iron, and salt. The manufacturing industries are well developed. They produce glassware, cast-iron goods, tex-

of Saxo-Meiningen, and the line of Saxo-Weimar, which principally comprises the numerous flour-mills of the district. The Diet consists of 24 members, 5 of whom are elected by those paying the highest taxes, and 19 by the remaining citizens. The principal towns are: Weimar, in 1890, 100,740; Gotha, 24,810. Population, in 1890, 249,731, of whom 244,810 were Protestants. The capital is Meiningen (q.v.).

The duke, Ernest, the line of Saxo-Meiningen was founded in 1681 by Bernhard, the third son of Ernest the Pious of Saxo-Gotha. In 1826 Duke Bernhard added to his possessions the Principality of Saalfeld and most of Hildburghausen, together with parts of Gotha and Coburg. In 1829 a constitutional form of government was established, and in 1818 a number of liberal reforms were introduced. Saxo-Meiningen became a member of the North German Confederation in 1866 and in 1871 of the German Empire.

SAXE-WEIMAR-EISENACH, *vi'mâr i'ze-nâc*. A grand duchy and constituent State of the German Empire in Thuringia, consisting of the three main divisions of Weimar, Eisenach, and Neustadt, and 24 small exclaves. Area, 4388 square miles. The District of Weimar belongs to the Thuringian highlands; that of Eisenach is bounded by the Thuringian Forests on the north and the Rhön Mountains on the south; the District of Neustadt has also a more or less hilly surface. The chief rivers are the Saale and the Ilm in Weimar, the Werra in Eisenach, and the White Elster in Neustadt. Agriculture is the chief occupation. The principal crops are rye, wheat, barley, oats, potatoes, hay and fodder, and various kinds of beets. Fruit and the vine are cultivated to some extent. Stock-raising is an important industry, and the forests are exploited extensively. Industrially, Saxo-Weimar occupies a very prominent position among the minor Saxon States. Crockery and pottery and various textiles, yarns, and hosiery are exported. Other manufactures are beet sugar, leather, paper, woodenware, and footwear. The Constitution of the grand duchy dates from 1816 and is thus the oldest in Germany. The Diet is composed of 33 members, of whom 5 are returned by the landed aristocracy, 5 by those paying the highest taxes, and 23 are elected indirectly by the remaining citizens; the term is three years. The grand duchy has one vote in the Bundesrat and returns three Deputies to the Reichstag. Population, in 1890, 326,091; in 1900, 362,873, chiefly Protestants.

HISTORY. Weimar appears in the tenth century as a possession of the counts of Orlamünde, from whom it passed in 1376 to the House of Wettin. On the partition of the Wettin lands in 1485 Weimar passed to the Ernestine line. The elder line of Weimar was founded in 1572 by John William, Duke of Saxony, who died, however, in the following year. In 1603 followed the establishment of the younger line of Weimar by John, the son of John William. John died in 1605, and after a regency of some four years was succeeded by his eldest son, John Ernest, who in 1619 embraced the cause of the Elector Palatine Frederick against the Empire. (See THIRTY YEARS' WAR.) John Ernest was succeeded in 1626 by his brother William, who in 1629 made common cause with Gustavus Adolphus, Wilhelm's brother, Bernhard of Weimar

(q.v.), became one of the most celebrated anti-imperialist generals of the later part of the Thirty Years' War. In 1640 William made a division of the Weimar territories with his brothers, Albert and Ernest, and is thus considered as the founder of a new line of Saxo-Weimar. The ducal lands were partitioned in 1672 among the lines of Weimar, Jena, and Eisenach, of which the two latter became extinct in 1690 and 1741, respectively, their territories being united with Weimar. Under the celebrated Amalia (q.v.), Regent for her son Charles Augustus (q.v.), and under this enlightened prince Weimar became the great centre of German literature, the home of Goethe, Herder, Schiller, and Wieland, among others. At the Congress of Vienna in 1815, Charles Augustus received the title of Grand Duke, together with an increase of territory. A constitutional government was established in 1816, and in spite of the policy of repression enforced by the Federal Diet on the German princes under the inspiration of Metternich, the government system of Saxo-Weimar continued comparatively liberal. In 1866 it joined the North German Confederation and in 1871 became a member of the German Empire.

SAXHORN. A brass wind instrument, invented by Adolph Sax in 1842. It is a successor to the ophicleide (q.v.). See MUSICAL INSTRUMENTS.

SAXIFRAGA'CEÆ. An order of plants. See SAXIFRAGE.

SAXIFRAGE (Lat. *saxifraga*, maidenhair, stone-breaking, from *saxum*, rock + *frangere*, to break; so called because supposed to break stones in the bladder). *Saxifraga*. A genus of plants of the natural order Saxifragaceæ, including about 160 species of erect or decumbent, mostly perennial, herbs, natives chiefly of mountainous tracts in north temperate and Arctic regions, sometimes at the limits of perpetual snow. The cultivated varieties, obtained from many different species, are commonly grown on rockeries. Some are densely tufted moss-like plants, which form a flowery turf. The most common wild species of the United States are early saxifrage (*Saxifraga Virginicensis*) and swamp saxifrage (*Saxifraga Pennsylvanica*) in wet ground. *Saxifraga sarmentosa*, a well-known Chinese species, is generally grown as a hanging basket plant. The cultivated varieties grow well on ordinary good soil. They are propagated by division or cutting in the spring or by seeds sown as soon as they are ripe in cold frames. Most species prefer higher ground. See PLATES OF SPIRÆA, ETC.: MOUNTAIN PLANTS.

TUFTED SAXIFRAGE (*Saxifraga cespitosa*).

SAXO GRAMMATICUS (Lat., Saxo the grammarian). The most celebrated of the early

Danish chroniclers. He lived in the twelfth century and was secretary to Archbishop Absolon. He is said to have died at Roeskilde after 1208. His work is entitled *Gesta Danorum*, or *Historia Danica*, and consists of 16 books. The earlier portions are not critical, but in regard to times near his own Saxo Grammaticus is an invaluable authority. According to his own statement, he derived his knowledge of the remoter period of Danish history from old songs, runic inscriptions, and the historical notices and traditions of the Icelanders. A characteristic feature of the work is the large number of translations of early verses, most of which are preserved only in this form. The best edition of the *Historia Danica* is that undertaken by P. E. Müller, and finished by J. M. Velschov (Copenhagen, 1839). The first nine books, dealing with the heathen age, have been translated into English by O. Elton, with explanatory notes by F. York Powell, and issued by the English Folk Lore Society (London, 1892). For Saxo's treatment of the Hamlet story, see **AMLETH**.

SAXON ART. See **ANGLO-SAXON ART**.

SAXONLAND. The section of Transylvania to which large numbers of Germans migrated in the Middle Ages, and where their descendants still live.

SAXONS (Lat. *Saxones*; connected with OHG. *sahs*, AS. *soac*, archaic Eng. *sax*, knife, sword, Lat. *saxum*, rock, stone). A Germanic people who first appear in history after the beginning of the Christian Era.

The earliest mention of the Saxons is by Ptolemy in the second century A.D., at which time they appear to have dwelt in what is now Holstein. In the third and fourth centuries they pressed southward into the region of the Weser, where they encountered the Chauci and Angriarii, who were subdued and absorbed. In the second half of the fourth century we find them breaking into the Roman dominions. By the close of the sixth century all Northwest Germany as far east as the Elbe had come to be the land of the Saxons. They invaded Britain perhaps as early as the third century; in the fifth century they occupied the coasts of Normandy. In the fifth and sixth centuries a part of the Saxons passed over into Britain, where the Jutes had already established themselves, and where they were joined by the Angles. At the beginning of the seventh century the Anglo-Saxon conquest of Britain was in a great measure completed. Pepin, King of the Franks, attacked the Saxons in Germany (the Old Saxons) successfully, and Charles the Great subdued them after fierce wars (772-804), and forced their chiefs to accept Christianity. (See **CHARLES THE GREAT**.) In the course of the ninth century, when under the descendants of Charles the Great a strong central power had ceased to exist in Germany, a great national Saxon duchy rose into existence. This old Duchy of Saxony was dissolved toward the close of the twelfth century, and the name of Saxony passed over to an entirely different region from that which had been the home of the Saxons. See **SAXONY**. Consult Hey, *Die slawischen Siedlungen im Königreich Sachsen* (Dresden, 1893).

SAXON SWITZERLAND. A mountainous district in the eastern part of Saxony (q.v.).

SAXONY. A kingdom and a State of the German Empire, bordered on the north and east

by the Prussian provinces of Saxony and Silesia, on the southeast by Bohemia, on the southwest by Bavaria, and on the west by Reuss, Saxe-Weimar, Saxe-Altenburg, and Prussian Saxony (Map: Germany, E 3). It is triangular in form, with its longest side along the Austrian frontier. Its present limits were defined in 1815. Area, 5787 square miles. It is the fifth German State in size.

Saxony is a country of moderate elevations. The highlands of the southeast merge very gradually into the plains of the north. Over half of the total surface is arable. Along the Bohemian frontier are the important Erzgebirge, with the Elster Mountains at the southern apex of the country and the granite Lusatian group at the extreme eastern corner. On the northwest the slope is to the plain of Leipzig from a second and parallel range extending from the southwest to the vicinity of Döbeln in the northeast. The highest peak of Saxony is in the Erzgebirge—the Fichtelberg (about 4000 feet), rising south of Chemnitz. The Elbe River enters near the eastern end of the Erzgebirge, and here is found the famous district known as Saxon Switzerland. Its low but picturesque heights of the Elbsandstein (sandstone) Mountains, with their wonderful castellated rock formations, its forests of pine, and the narrow curving river valley form a region of great beauty. The Elbe, the only great commercial waterway of Saxony, traverses the kingdom in a northwestern direction. The Mulde flows north through the northwestern part. There are no lakes. The climate is on the whole moderate, agreeable, and favorable to agriculture. The rainfall is abundant. The precipitation is principally in the summer months.

Saxony has long been celebrated for its rich silver mines at Freiberg. They were discovered in the twelfth century. Coal, mostly lignite, is abundant in the Plauen region. Iron, lead, and tin, besides other minerals, as well as marble and precious stones, are mined. There are numerous mineral spring resorts, Bad Elster being the best known. About one-fourth of Saxony is covered with forests, nearly half of the forest area being owned by the State. About 90 per cent. of the trees are conifers. The annual income from the forest lands is large. Of the population approximately one-fifth are engaged in agriculture and stock-raising. Rye, oats, potatoes, and hay have the largest acreages. Fruit-raising latterly has greatly increased in importance. Sheep-raising and the quality of the wool have both seriously declined. Horse-breeding is still important. In 1900 there were 688,953 cattle, 166,730 horses, 74,628 sheep, 139,796 goats, and 576,953 swine.

Saxony has long been a famous manufacturing country. About one-fourth of the population is connected with the manufacturing interests, which are still increasing as compared with the agricultural. The most extensive and highly developed branch of manufacturing is the manufacture of textiles. Linens, cottons, woollens, silks, worsteds, muslins, hosiery, laces, embroideries, damask, ticking, clothing, furniture, paper of all kinds, smoking pipes, famous watches, entery, glass, steam machinery, and pianos may be mentioned among the prominent manufactures. The celebrated Meissen or Saxon porcelain is produced at the State Porcelain Factory at Meissen. Saxony makes famous glassware, and originated the

of the country. The printing of books and the book trade flourish on a vast scale. The serpen-tine of the industry employs many hands. The population has increased greatly (the first dating from 1883) and commerce (the first dating from 1883) has increased greatly in importance. The chocolate shipments are large. Milling and smelting are important industries. Since the Middle Ages, when the great fairs of Leipzig were founded, and it shared in the immense trade from the Levant, Saxony has been important in the commerce of and Europe. It is the centre of the transit trade of and Germany, and the book trade of Leipzig leads the world. Saxony is a heavy shipper to the United States, especially in textiles, leather goods, and musical instruments. The Elbe and other streams are canalized and transport an enormous amount of freight. All the classes of institutions for furthering and protecting the industrial interests are adequately developed and represent a highly complicated and effective system of industrialism and finance.

The government is a constitutional, hereditary monarchy, under the Constitution of 1831, which has frequently been modified. The Ministry of State, which shares the executive power with the King, is composed of six Ministers representing Finance, War, Interior, Justice, Foreign Affairs, and Public Instruction. There are two Chambers. The first corresponds to a Senate and is composed of princes and persons occupying high positions both religious and secular. Its president is named by the King. The Lower House contains 82 members, indirectly elected. Thirty-seven are from towns and 45 from the rural communities. Dresden is the capital. Saxony has four votes in the Bundesrat and sends 23 members to the Reichstag.

The budget covering 1902 and 1903 balanced at about \$68,500,000, including about \$17,500,000 of extraordinary expenses (i.e. for public works). The State railways contribute most largely to the revenues, the direct taxes next. The public debt in 1902 amounted to \$245,000,000. The total public property was valued at \$337,000,000. The property consists chiefly of railways (1900 miles) and forest lands. The King's annual civil list is nearly \$900,000.

The population in 1900 was 4,202,216—an increase of about 11 per cent. over 1895. Saxony is the third German State in population. The density is high—72.6 per square mile. The inhabitants are nearly all Lutheran Evangelicals, but the Court for the last two hundred years has been Catholic. The educational system is of the most complete order. The university at Leipzig stands at its head. In Dresden is the royal technical high school, and at Freiberg is the most famous mining academy in the world. Leipzig has a celebrated royal conservatory of music, and Dresden has also a royal music school. Saxony is famous for its art collections, libraries, museums, associations for the advancement of knowledge, and its Dresden Opera, for more particular mention of all of which see DRESDEN and LEIPZIG.

HISTORY. Saxony was the name originally given to the country which was the home of the great Lower German stock (see SAXONS), extending from the Eider River and the Zuyder Zee to where Cassel and Magdeburg are now.

Charles the Great, King of the Franks, began the conquest of the Saxons in 772. Their great leader Wittekind (Wittekind) submitted and ac-

cepted baptism in 785, but their subjugation was not complete until 804. By forcing a large number of Saxons to settle in different parts of his dominions, and by colonizing their territories with Frank settlers, Charles the Great succeeded in incorporating them into his own empire. A number of bishoprics were erected by Charles and his immediate successors in the Saxon land, which was soon Christianized. By the Treaty of Verdun (843) the country was given to Louis the German. The people were so harassed by Slavs and Northmen that powerful marks (see MARK) were created for the purpose of protection. Ludolf was appointed first Duke (Herzog) of a mark on the west side of the Elbe, and he and his descendants gradually extended their power over the whole of Saxony. This was the original of the old national Saxon Duchy. Ludolf was succeeded by his son Bruno, who was followed by Otto the Illustrious (d. 912), who added Thuringia to the duchy. His son Henry, surnamed the Fowler (912-936), was elected King of Germany in 919, founding a dynasty which ruled Germany until its extinction in 1024.

Henry the Fowler created the Schleswig Mark, to protect the country from the Danes. He also conquered the tribes between the Elbe and the Oder, creating the East Mark, which he protected by strongly fortified castles and border towns. Furthermore, the country which later became the powerful Mark of Brandenburg under Albert the Bear was conquered. Henry was succeeded by his son Otto I. the Great, whose coronation by the Pope at Rome in 962 inaugurated the Holy Roman Empire of the German Nation. Otto had to wage continuous war against his rebellious nobles, and to gain support gave the Duchy of Saxony in 960 to his loyal follower, Hermann Billung. When the duchy lapsed with the death of Magnus, the last of the Billungs, in 1106, Henry V. gave the duchy to Lothair, Count of Supplinburg, one of the most powerful German princes, who ascended the Imperial throne in 1125, with the aid of the Papal party. In 1127 he gave the Duchy of Saxony to his son-in-law, Henry the Proud, Duke of Bavaria, of the House of Guelph, who also inherited extensive private possessions in Saxony through his mother, a member of the Billung family. The Emperor Conrad III., of the House of Hohenstaufen, would not allow Henry to have the two duchies and bestowed the Saxon Duchy on Albert the Bear, who in 1134 had received the North Mark. During the strife which ensued Henry died. In the meantime the Saxons had revolted against Albert. After Henry's death the Emperor took away the duchy from Albert, bestowing it in 1142 on Henry the Lion (q.v.), the young son of Henry the Proud. Albert was allowed to rule the Mark of Brandenburg, which was composed of the North Mark and a part of the East Mark, as an independent State.

Henry the Lion at this time had almost royal possessions. But his insolent and defiant attitude toward the Emperor Frederick Barbarossa brought about his downfall (1180-81) and the dissolution of the old Saxon Duchy. To Bernhard of Ascania, son of Albert the Bear, was given the title of Duke of Saxony and a small district between the Elbe and the Weser, while the rest of the great duchy was divided among powerful bishops and princes. Henry was allowed to

keep only Brunswick and Lüneburg. Anhalt and Wittenberg also belonged to Bernhard, and when his two grandsons, John II. and Albert, divided their possessions in 1260, they created two small duchies of Saxe-Lauenburg and Saxe-Wittenberg. The capital of the latter, Wittenberg, was entirely outside of the old duchy. Both duchies claimed the electoral privilege, including the office of grand marshal; but in 1356 the Golden Bull confirmed the claims of Wittenberg. The Aseanian line became extinct in 1422 with Albert III. In 1423 the Emperor Sigismund conferred the Duchy of Saxe-Wittenberg, together with the electoral dignity, on Frederick the Warlike, Margrave of Meissen, of the House of Wettin, in consideration of aid received in wars waged against the Hussites. The name of Saxony was gradually extended to the Mark of Meissen and the other old possessions of the House of Wettin, and thus came to denote a very different region from the old Saxon Duchy.

Frederick the Warlike was descended from Henry of Eilenburg, who had received the Mark of Meissen in 1089. In 1123 Meissen passed to Conrad of Wettin. He divided the lands among his sons, and their descendants followed the same policy. Under Margrave Otho the Rich (1156-90) the Leipzig fairs were established. One of his descendants, Henry the Illustrious (1221-88), inherited Thuringia. In the fourteenth century the Pleißenland (including Altenburg, Zwickau, and Chemnitz) became a possession of Meissen. In 1381 Frederick the Warlike became Margrave. His successor was his son, Frederick II., the Gentle (1428-64), who gained some territory, but in 1445 began a destructive civil war between Frederick and his brother William for the possession of Thuringia. It was ended in 1451.

Frederick II. was succeeded by his two sons, Ernst (1464-86) and Albert (1464-1500), who, in accordance with the will of their father, reigned conjointly over the hereditary domains of the family; but in 1485 the territories were divided, most of Thuringia, the Electoral Duchy of Saxony, and other territories, with the electoral dignity, going to the Ernestine or elder line, which still rules in the Saxon duchies, and Meissen and other territories (including the city of Leipzig) to the Albertine line, which survives in the Kingdom of Saxony. Wittenberg was the capital of the electoral line, while Dresden became the capital of the Albertine or dual line. Ernst was succeeded by his son, Frederick the Wise (1486-1525), the friend and protector of Martin Luther, and one of the most influential of the German princes. His brother and successor, John the Constant (1525-32), was still more a partisan of the reformed doctrines, as was also John's son and successor, John Frederick the Magnanimous (1532-47). The latter and Philip, Landgrave of Hesse, were at the head of the League of Schmalkald in the disastrous war waged against the Emperor Charles V. (1546-47). Through the defeat at Mühlberg (q.v.) John Frederick lost his electoral dignity and the bulk of his dominions, which were transferred to the Albertine line. The Thuringian territories alone were left to the Ernestine princes. See SAXE-WEIMAR, SAXE-EISENACH, SAXE-COBURG-GOTHA, etc.

Albert, the founder of the younger, dual, or Albertine line, was succeeded by his sons, George

the Bearded (1500-39) and Henry the Pious (1539-41), a zealous Protestant, after whom came the celebrated Maurice (1541-53), who, though a Protestant, gave his aid to the Emperor against the League of Schmalkald, and was rewarded with the electoral title and the greater portion of the estates of his vanquished cousin. He afterwards turned against the Emperor and secured the triumph of Lutheranism in Germany. Maurice's brother Augustus (1553-86) established numerous excellent institutions and considerably increased his territories by purchase and otherwise. Christian I. (1586-91), a weak prince, surrendered the reins of government to his chancellor, Crell, who was sacrificed, in the succeeding reign of Christian II. (1591-1611), to the vengeance of the offended nobility. John George I. (1611-56) fought on the side of Austria at the beginning of the Thirty Years' War (q.v.), was afterwards forced into a half-hearted alliance with Gustavus Adolphus (1631), and in 1635 concluded a separate peace with Austria by which he obtained Upper and Lower Lusatia.

From the time of the Thirty Years' War Saxony ceased to be the leading Protestant State in Germany, its power being overshadowed by that of Brandenburg. John George's sons, John George II. (1656-80), Augustus, Christian, and Maurice, divided the paternal estates, the three latter founding cadet lines, all of which became extinct before 1750. The reigns of John George III. (1680-91) and John George IV. (1691-94) are unimportant. That of Frederick Augustus I., known as Augustus the Strong (1694-1733), well-nigh ruined the hitherto prosperous electorate. (See AUGUSTUS I.) Frederick Augustus was chosen King of Poland in 1697, embracing Catholicism, which remained the religion of his successors. His attempt with Peter the Great and the King of Denmark to dismember Sweden brought down upon him and his two States the vengeance of Charles XII. (q.v.). Poland was devastated and Saxony exhausted of money and troops. The King's habits were most extravagant, and to maintain his lavish magnificence he sold important portions of territory. Frederick Augustus II. (1733-63) contended with Stanislas Leszczynski (q.v.) for the Polish throne, being recognized as King in 1735. He plunged Saxony into the War of the Austrian Succession (see SUCCESSION WARS) and into the Seven Years' War (q.v.), and a long time elapsed before it recovered prosperity. (See AUGUSTUS II.; BRÜLL.) Frederick Augustus (1763-1827) joined Prussia against Napoleon in 1806, his army participating in the disastrous battle of Jena. The pressure of the French compelled him to join the Confederation of the Rhine in 1806; at the same time he assumed the kingly title as Frederick Augustus I. (q.v.). He became the ally of Napoleon, who, after the Peace of Tilsit in 1807, conferred upon him the newly created Duchy of Warsaw (see POLAND); and the Saxon troops fought at Wagram, in Russia, and at Leipzig. After the overthrow of Napoleon at Leipzig (October, 1813) he was for a time a prisoner in the hands of the allies, and the Congress of Vienna (1814-15) deprived him of more than half of Saxony, which was handed over to Prussia, although he was allowed to retain the title of King. He did much for the internal welfare of his country.

Anthony (1827-36) reformed the entire legis-

of Saxony. He founded a liberal party, which was taken up by a popular movement in 1818-19. His nephew, Ernst Freiherr von Schickel (1836-54), who had been a member of the Diet since 1819, succeeded, but, though a liberal, he was not a constitutionalist, the new party was not well. In 1849 there was an uprising in Dresden, which was suppressed by Prussian arms. Toward the close of the King's reign he was a mere tool in the hands of the reactionary party, headed by his brother Johann Adolf, succeeded him in 1854. John's policy was guided by Count Bunsen (q.v.), Prussia's inveterate enemy, and Saxony was kept in line against Bismarck's policy. She joined Austria in the Seven Weeks' War (q.v.), shared in the defeat of Sadowa, and was compelled to join the North German Confederation (1866). In 1871 Saxony became a member of the new German Empire. John was succeeded October 29, 1873, by his son Albert.

SAXONY. A province of Prussia, bounded by Hanover and Brunswick on the north, Brandenburg and Silesia on the east, the Kingdom of Saxony and the Thuringian States on the south, and Hesse-Nassau, Hanover, and Brunswick on the west (Map: Prussia, D 2). It is broken up by numerous enclaves belonging to other provinces. It covers an area of 9550 square miles. The surface is level in the north, while the western and southern parts belong to the region of the Harz Mountains and the Thuringian Forest. It is watered chiefly by the Elbe with its tributary the Saale and several tributaries of the Weser, most of them navigable. Saxony is one of the most fertile, and agriculturally the best developed, parts of the German Empire. Its chief crops are rye, wheat, oats, barley, and sugar beets. Tobacco and the vine are also cultivated to some extent. Gardening is carried on extensively and the yield of fruit is very considerable. The raising of domestic animals, and especially sheep, is also very important. There are rich deposits of lignite and rock salt, and iron, copper, silver, and nickel are found. There are manufactures of metal-ware, arms, machines, tools, etc. Chemical works, woolen and linen mills, tanneries, paper and sugar mills, shoe factories, and distilleries are prominent. The centres of commercial activity are Magdeburg and Halle. Administratively the province is divided into the three districts of Magdeburg, Merseburg, and Erfurt. The capital is Magdeburg. In the Prussian Landtag the province is represented by 38 delegates in the Lower and 30 members in the Upper Chamber, while to the German Reichstag it returns 20 members. Population, in 1900, 2,833,224, chiefly Protestants. The province was formed in 1815.

SAXOPHONE (from *Sax* + Gr. φωνή, *phônê*, sound, voice). A musical instrument invented

about 1840 by Adolphe Sax. It consists of a conical brass tube, having about twenty lateral orifices covered by keys, and it is played by means of a mouthpiece and a simple reed, like the clarinet. The compass of the various instruments of this family extends over five octaves from *a* to *a*⁵. The music for all, even the lower saxophones, is written in the treble clef.

SAX'TON, JOSEPH (1799-1873). An American inventor, born at Huntingdon, Pa. He received a common school education, and at an early age made improvements in nail-making machinery. He went to Philadelphia in 1817, and while there invented a machine for cutting the teeth of chronometer wheels, and an escapement and compensating pendulum for clocks, and constructed a clock for the temple of Independence Hall. He went to London in 1828, and resided there nine years, enjoying the acquaintance of Faraday. On his return to Philadelphia he superintended the making of machinery for the United States Mint, and afterwards had charge of the construction of standard weights and measures, accurate sets of which he furnished to National and State governments. Among his ingenious contrivances may be mentioned the mirror comparator for comparing standard measures, and a new form of machine for dividing them; the deep-sea thermometer, used by the United States Coast Survey in exploring the Gulf Stream; the self-registering tide gauge, and the immersed hydrometer.

SAY, sâ, JEAN BAPTISTE (1767-1832). An eminent French economist, born at Lyons. His father intended him for business life and gave him some experience in England. In 1790 he took up the profession of journalism, and in 1794 became editor of the *Décade philosophique littéraire et politique*. In 1799 he was called to the tribunate by Napoleon, and was assigned to the Committee of Finance. In 1803 he published the first edition of his *Traité d'économie politique*. His views on finance displeased Napoleon, and as the author was unwilling to modify them his retirement to private life followed. In 1819 he became professor of industrial economy at the Conservatoire des Arts et Métiers, and in 1830 professor of political economy at the Collège de France. He died November 15, 1832.

Say may properly be regarded as a popularizer of the work of Adam Smith. While he cannot be classed with him and Ricardo as an original thinker, he made some important contributions to economic theory, among them the familiar division of the science into Production, Distribution, and Consumption, the theory of the productivity of capital, and the distinction between profits and interests. In his advocacy of free trade he went beyond Adam Smith. His work exercised a wide influence, not only in France, but in other countries as well.

SAY, LEÓN (1826-96). A French economist. He was a grandson of Jean Baptiste Say, and came into prominence through his connection with the *Journal des Débats*, exercising a great influence on the financial administration of the country. In 1871 Say was made prefect of the Department of the Seine and the next year Minister of Finance. Six times thereafter he held the financial portfolio. He presided over the international monetary conference at Paris in 1879, and was sent to London in 1880 as ambassador to nego-

tiated a treaty of commerce, but failed. A large part of the remainder of his life was spent in one House or the other of the French Legislature. Say was a very prolific writer on financial subjects. A comprehensive *Dictionnaire des finances*, a standard authority upon French financial practice and history, was published under his supervision. His work, *Les finances de la France* (1883), in four volumes, gathers together his various expositions of financial questions arising during a long parliamentary career. He wrote also: *Histoire de la caisse d'escompte* (1848); *Rapport sur le paiement de l'indemnité de guerre* (1874); *Les solutions démocratiques de la question d'impôts* (1886); *Turgot* (1887); *Durid Hume* (1888); *Cobden* (1891).

SAY, THOMAS (1787-1834). An American zoölogist, born in Philadelphia. In 1812 he became one of the founders of the Academy of Natural Sciences in Philadelphia and its first curator. In 1818 he took part in a scientific exploration of Georgia and Florida, and in 1819-20 he was zoölogist to Long's expedition to the Rocky Mountains. Say was a collector of insects and mollusks, and his works describing them were the beginnings of the sciences of entomology and conchology in America. His larger works were: *Vocabularies of Indian Languages* (1822); *American Entomology* (1824-28); *American Conchology* (1830-34). He became interested in, and after 1825 a member of the Socialistic community at New Harmony, Ind., where he died.

SAYAN. See CHAY ROOT.

SĀYANA, sā'yā-nā (?-1387). A Sanskrit commentator, who flourished at the courts of Sangama II. and Harihara II., kings of Vijayanagara, the modern Hampi on the Tungabhadra, in the Bellary district of Madras. He terms himself also the teacher and minister of Bukka I. (1379-99) of the same line. Between 1331 and 1386 Sayana was abbot of the monastery of Sringeri. Although few details of his life are known, it is clear that he belonged to a family of importance both in political and in religious circles. By far the most important work of Sayana was his commentary on the Rig-Veda. Internal evidence shows that this, like several other commentaries ascribed to him, was only partly his, and that his incompleted work was finished by the school of commentators which he founded. The varying estimates given to this gloss have formed one of the hardest problems of Vedic interpretation. (See VEDA.) The 'traditional' school accepted Sayana as its guide. Herein the 'traditionalists' were in sharp conflict with the 'linguistic' or philological school. The safest plan seems to be a combination of the two methods, so that the results of comparative philology and of tradition serve as a mutual check. This commentary has been admirably edited by Max Müller in his *Rig-Veda-Samhitā* (2d ed., 4 vols., Oxford, 1890-92). Besides this there is a long list of works attributed either to Sayana or to his brother Madhava, who was also called Vidyanaya. In his commentaries he devoted himself almost exclusively to texts of the Vedas, Brahmanas, Upanishads, and other early religious texts. Comparatively few of his works have been published, although his commentary on the *Atharva* is printed in an edition of this Veda by Pandit (Bombay, 1895), that on the

Āitarīya Āraṅyaka by Agase (Poona, 1896), on the *Sāma Veda* by Sumasrami (Calcutta, 1874-76), on the *Tandya Mahābrāhmana* by Vedantavagisa (ib., 1869-74), on the *Tapasabrāhmana* by Burnell (Mangalore, 1873), on the *Taittirīya Āraṅyaka* and on the *Taittirīya Brāhmana*, by Apte (Poona, 1897-98). A list of the works attributed to Sayana is given by Aufrecht, *Catalogus Catalogorum* (Leipzig, 1891-1903).

SAYBROOK. A town in Middlesex County, Conn., 19 miles west by south of New London, on the New York, New Haven and Hartford Railroad (Map; Connecticut, F 4). Population, in 1900, 1634. In 1635 a small fort was built in what is now Old Saybrook, and during the Pequot War was commanded by Lion Gardiner. In 1639 George Fenwick, as agent for the Connecticut patentees, settled here and named the place in honor of Lord Say and Sele and Lord Brooke, the two most influential men in the company represented by him. For six years Saybrook was an independent colony, but in December, 1644, Fenwick ceded the settlement and the land in its vicinity to the Connecticut colony, receiving in return, for ten years, the proceeds from taxes levied on the domestic trade in beaver, and from a tax levied on live stock, and duties collected on such corn and biscuit as were carried out of the river. The amount thus paid has been estimated at £1600. Saybrook was the early home of Yale College, which remained here until removed to New Haven in 1716. In 1708 the celebrated Saybrook Platform, for Church government, was adopted here. Saybrook formerly included the towns of Old Saybrook, Westbrook, Essex, Chester, and part of Lynn.

SAYBROOK PLATFORM. A name given to certain articles adopted by a synod consisting of twelve ministers and four laymen, representing the churches of Connecticut, which met at Saybrook, September 9, 1708. The articles provided that the churches of the colony should be grouped in 'consociations' or standing councils, by which questions of discipline and church matters such as the installation and dismissal of ministers should be decided. Ministers were grouped in associations and an annual 'general association' was provided. The articles were approved by the Legislature and carried into effect in 1709. They remained the legally recognized standard till 1784.

SAYCE, SĀS, ARCHIBALD HENRY (1846-). An English Orientalist. He was born at Shirehampton, and graduated at Queen's College, Oxford, where he became fellow in 1869. From 1874 to 1884 he was a member of the Old Testament Company of the Bible Revision Committee. From 1876 to 1890 he was deputy professor of comparative philology at Oxford and became professor of Assyriology in 1891. Professor Sayce is an exceedingly fertile writer, whose activity covers a large range of subjects—Assyriology, Oriental history, biblical criticism, the Hittites, comparative philology, and general archaeology. Through his popular books he has become widely known to the general public. Among his works may be mentioned: *An Assyrian Grammar for Comparative Purposes* (1872); *The Principles of Comparative Philology* (1874); *Introduction to the Science of Language* (1879; 4th ed. 1900); *The Monuments of the Hittites* (1881); *The Ancient Em-*

SAYCE, JOHN (1851; *ibid.* 1885). The author of *Religion in America*; *Religion in the United States*; *Religion in the Old Testament*; *Religion in the New Testament*; *Religion in the Middle Ages*; *Religion in the Renaissance*; *Religion in the Modern Age* (1894); *Patriarchal Palestine* (1895). He also edited the *Records of the Past*, 24 volumes (1888-92).

SAYRE, SÁR. A borough in Bradford County, Pa., 29 miles northwest of Scranton, on the Susquehanna River, and at the terminus of a division of the Lehigh Valley Railroad (Map: Pennsylvania, E. 2). It has the R. A. Packer Hospital. There are shops of the Lehigh Valley Railroad, wheel and foundry works, metal works, a picture frame factory, a foundry, and manufacturing of various iron products. Sayre was settled in 1810, and received its present charter in 1891. Population, in 1900, 5243.

SAYRE, LEWIS ALBERT (1820-1900). An American surgeon, born at Madison, N. J. He graduated at the College of Physicians and Surgeons in New York in 1842, and during the following ten years was prospector in surgery there. He was also for many years connected with Bellevue Hospital and the Charity Hospital on Blackwell's Island. He published *Practical Manual of the Treatment of Club-Foot*; *Lectures on Orthopædic Surgery*; and *Spinal Curvature and Its Treatment*.

SAYRE, STEPHEN (1734-1818). An American adventurer, born on Long Island. He was educated at the College of New Jersey, and after engaging in various pursuits went to London, where, in 1774, during the Wilkes excitement, he was elected a sheriff. Soon afterwards he was committed to the Tower on a charge of plotting to overturn the Government, but five days later was discharged on a writ of habeas corpus. During the Revolutionary War he made himself conspicuous in the capitals of Northern Europe by his activity in behalf of the United States, though he was entirely without authorization from the American Government except during a brief period when he was secretary to Arthur Lee (q.v.) in Berlin. His claims for remuneration for these services were repeatedly refused by Congress until 1807, when it allowed him a certain sum for his services in Berlin. In 1795 he became a violent opponent of Washington's administration and was especially bitter in attacking the Jay Treaty.

SCABBARD FISH. See CUTLASS-FISH; FROST-FISH.

SCABIES. See ITCH; MANGE.

SCABIOUS (OF., Fr. *scabieuse*, from ML. *scabiosa*, fem. sg. of Lat. *scabiosus*, rough, scaly, from *scabius*, scurf, scab; so called because regarded as a remedy for skin diseases). *Scabiosa*. A genus of herbs of the natural order Dipsacaceæ, natives of the Eastern Hemisphere. The flowers are collected in terminal heads, surrounded by a many-leaved involucre, which resembles the head of a species of Compositæ. The devil's-bit scabious (*Scabiosa Succisa*), common in European pastures, is astringent and was formerly in medicinal repute in skin eruptions. The root is very abruptly pointed, on which account Middle Age superstition regarded it as bitten off by the devil, out of envy, because of its usefulness to mankind.

SCAD (probably a variant of *shad*; less plausibly explained as from Ir., Gael. *squidun*, herring). Any of several fishes of the family Carangide, or horse-mackerels; especially a small species (*Trachurus trachurus*), rare in America, but numerous and valuable on the southern coast of Europe. It is a foot long, and greenish, with silvery sides and a dusky opercular spot. (See PLATE OF HORSE-MACKERELS, ETC.) The name is also applied to species of other genera of the family, especially to a small similar fish, the mackerel-scad (*Decapterus punctatus*), common along the eastern American coast, and especially about the West Indies, where also is a second species. Other names for them are 'antonino,' 'cigar-fish,' 'round-robin,' and 'quia-quia.'

SCÆVOLA, scæv'ô-lâ, GAÏUS MUCCIUS. See PORSENA.

SCALA, skäl'â, DELLA. The name of an Italian family, whose seat was Verona, of which place the Ghibelline Mastino della Scala was elected *podestà* in 1260. He became perpetual captain of the city and Imperial vicar, and was assassinated in 1277. His successors, Alberto (d. 1301), Bartholomew (d. 1304), and Alboino (d. 1311), extended the influence of the family. The greatest of the family was Can Francesco, or Can Grande, as he was called (1291-1329), who filled his Court with sculptors and poets, preëminent among whom stands Dante, who eulogizes his patron in glowing terms in the *Paradiso*. He was a friend of Henry of Luxemburg, who appointed him Imperial vicar and head of the Ghibelline League of Lombardy. He carried on a bitter warfare with Padua and extended his power over Este, Cremona, Monselice, Feltre, Vicenza, and Treviso. Under Mastino II. (d. 1351) the family declined in influence, and in 1387 Verona came under the dominion of the Visconti.

SCABIOUS (*Scabiosa Succisa*).

SCALA, LA (It., the staircase). A famous theatre in Milan, Italy, built in 1778, next in size to the San Carlo Theatre at Naples, and holding 3600 spectators.

SCALA SANTA. *sán'tá.* See LATERAN, CHURCH OF SAINT JOHN.

SCALCHI, *skál'ká,* SOFIA (1850—). An Italian operatic singer, born in Turin. She made her début in Mantua, in 1866, and sang in opera throughout Europe. In 1883 she made her first appearance in the United States, where she became a great favorite. Her voice, a rich contralto of extensive compass, enabled her also to sing mezzo-soprano. Her most successful rôles include Siebel in Gounod's *Faust*; Fides in Meyerbeer's *Prophète*; Amneris in Verdi's *Aida*; Arsace in Rossini's *Scaramouche*; and Pierotto in Donizetti's *Linda di Chamounix*.

SCALD-HEAD. See FAVUS.

SCALDS. See BURNS AND SCALDS.

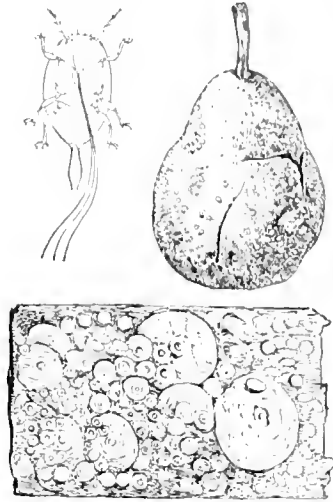

SCALE (Lat. *scala*, staircase, ladder, from *scandere*, to climb, SKI, *skand*, to spring, ascend). In music, a succession of notes arranged in the order of pitch, and comprising those sounds which may occur in a piece of music written in a given key. The scale consists of a series of seven steps leading from a given note (fixed on as the tonic or key-note) to its octave, which may be extended indefinitely up or down, so long as the sounds continue to be musical. For an explanation of the principles on which these scales are founded, and of their derivation from the harmonic triad, see MAJOR; MINOR. See also GREEK MUSIC; MODES.

SCALE INSECT (AS. *scalu*, *scalc*, ORG. *scala*, Ger. *Schale*, shell, husk, scale, Goth. *skalja*, tile; connected with Ochurch Slav. *skolika*, mussel, Russ. *skala*, bark, shell, Lith. *skalti*, to split; probably connected ultimately with Eng. *shell*). Any insect of the family Coccidae (q.v.), sometimes also called 'scale-bug,' or 'bark-louse.' The scale insects are distinguished from their nearest allies by the absence of wings in the females, by the possession of only two wings in the males, by the absence of any mouth or feeding apparatus in the adult males, which, instead, are usually supplied with large supplementary eyes. Further, in both sexes the legs (when present) terminate in a single claw at the tip of a single-jointed tarsus. The group is now divided into twelve subfamilies, which are distinguished as follows: The true scale-bearers belong to the subfamilies Conchaspinae and Diaspinae, the scale in the former group being composed of secreted matter, in the latter cast skins and secreted matter together. The so-called 'naked' scales compose the ten other subfamilies, nearly all the species of which secrete some substance which more or less disguises them. The subfamilies are more or less characterized as follows: Dactylopiinae (mealy bugs, q.v.), covered with a white, waxy, powdery secretion which sometimes forms long, apparently fibrous bundles; Lecaninae proper, a cleft posterior extremity in the female; Hemicochinae, larvae with abdominal lobes; Tachardiinae, lac insects (see LAC), enclosed in a resinous cell with three orifices; Coccinae, no anal tubercles in the female; Idiococcinae, short antennae; Brachyseelinae, gall-making coccids. In each of these subfamilies the males have simple eyes; in the Orthezinae and Monophlebinae they have compound eyes. The last-named group, mainly Australian, contains the largest species, some of which are more than an inch long.

The scale insects live upon the sap of plants, and with few exceptions are considered pests.

(See SAN JOSÉ SCALE; OYSIER-SHELL BARK-LOUSE; ORANGE INSECTS.) Since they are insignificant in appearance and are attached to all parts of the plant, some of them have spread upon nursery stock and fruit and have become cosmopolitan in their distribution. With many the original home is a matter of doubt.

Among the most notable American scale insects are the following: Cottony cushion scale (*Icerya purchasi*), once troublesome in California, but subdued by a ladybird (*Norius cardinalis*) imported from Australia (see LADYBIRD); species of the genus *Kermes*, remarkable for the gall-like form of the adult females, which closely re-

SAN JOSÉ SCALE.

A young larva; a pear covered with scale insects; and the scales, enlarged.

semble small oak galls; cottony maple scale (*Pulvinaria innumerabilis*), a brown naked scale which secretes a large, white, waxy, unribbed egg-mass; black scale of the orange and olive (*Lecanium olea*), a cosmopolitan species, troublesome in California; hemispherical scale (*Lecanium hemisphaericum*), a common greenhouse pest throughout the world, living out of doors upon citrus trees in the Gulf States. Of the true armored scales, aside from those mentioned, there are the scurfy bark-louse of the apple (*Chionaspis furfurus*); pine-leaf scale (*Chionaspis pinifolia*); and the common rose scale (*Diaspis rosae*), all of which are often troublesome upon their host plants. Most scale insects are oviparous. Certain species, however, are viviparous, and some must be parthenogenetic. With one species, the common 'flat' scale (*Lecanium hesperidum*), which is cosmopolitan and a frequent denizen of hothouses, the male has never been found, although the females occur in incalculable numbers.

REMEDIES FOR SCALE INSECTS. In temperate regions, with those species which hibernate in the egg stage, scale insects can usually be controlled by spraying the plants with kerosene emulsion in the early spring as soon as the young have hatched, the young insects being unprotected by a scaly covering. With species which hibernate in the adult or half-grown condition protected by the scale, and which give birth to young at irregular and prolonged periods, pure kerosene and crude petroleum may be lightly

of the scales, and generally in the case of the scales, the evaporation will be more rapid than in uninjured scales. The scales, and have been successfully used to have resulted in the loss of value of the scales. Petroleum and water mixed by specially devised pumps has been effective. A mixture of unslaked lime (30 pounds), sulphur (20 pounds), and salt (15 pounds) has been successful in California against armored scales, and in portions of the East also. The ingredients are placed together in a barrel

FIGURED SCALE.

a, full-grown female; b, same, after secretion of blitted size has

with thirty or forty gallons of water and boiled with steam for three or four hours. The mixture should be diluted to sixty gallons and should preferably be applied hot. It leaves a liny coating which acts as a deterrent to the young scales, and when not washed off by rains it retains its value for several weeks. Whale-oil or fish-oil soap, preferably made with potash lye, is dissolved in water by boiling at the rate of two pounds of soap to a gallon of water, and makes an excellent winter wash for armored scales. If applied hot and on a warm day in winter it can easily be put on trees with an ordinary spray pump. On a cold day, however, it will clog. Many of the States have passed laws to prevent the introduction of nursery stock unless accompanied by a certificate from a State official or a recognized expert that it has been inspected and found free from scale insects, or unless it has been fumigated with hydrocyanic acid gas. To perform this fumigation at a nursery a small air-tight fumigation house is usually constructed. See INSECTICIDE.

Consult: Green, *Coccide of Ceylon* (London, 1896-90); Comstock, *Manual for the Study of Insects* (Ithaca, 1895); Howard, *The Insect Book* (New York, 1902); Cockerell, "Tables for the Determination of the Genera of Coccide," in the *Canadian Entomologist* (London, Ont., 1899); Marlatt, *Farmers' Bulletin No. 127, United States Department of Agriculture* (Washington, 1901); Marlatt, *Circular 42, second series* (ib., 1902).

SCALES. Small plates arising from the skin and forming the covering or armature of the bodies of various animals, as fishes, lizards, snakes, and a few mammals. In fishes they are present in most forms as calcified plates in the skin, which may be so minute as to be almost microscopic, or in the form of large plates. Agassiz classified scales into placoid, ganoid, etenoid, and cycloid, and classified fishes into these four groups. The most primitive scales, found in the elasmobranchs, consist of a basal plate of dentine bearing a central spine, covered externally by an enamel coat. The former is derived from the derma and the enamel is secreted by the epidermis. These are the placoid scales, and they show a great similarity in their structure and development to teeth (q.v.). In ganoid scales the basal portion is formed as in placoid scales and is covered by a coating of smooth, hard substance called ganoin. These

are generally of a rhomboid form, as in the gar-pike (Lepidosteus). Both etenoid and cycloid scales may occur within the same family, or even smaller group, so that their lack of importance as characters upon which to base a classification must be conceded. Among the Amphibia more or less calcified or ossified scales are entirely restricted to the Stegocephali and Apoda. Those of the former group (which is extinct) were small and partly calcified or perhaps ossified, "and we can only surmise," says Gadow, "that these scales were covered by corresponding dermal sheaths." The modern caecilians have a partial scale-armature which consists of calcareous cell-secretions, and is consequently an entirely mesodermal product of the deeper layers of the cutis. (See MORTING.) Reptiles have from the earliest times been characterized by their coating of scales in most groups. The term in its ordinary sense, however, applies mainly to the covering of modern lizards and snakes. The scales of these creatures are formed by the cutis, and have a horny epidermal covering, which peels off periodically when the skin is 'shed.' In some lizards they are nearly absent; in many they contain 'osteoderms' or ossified portions of the cutis, over a part or all of the body. Snakes never have osteoderms. Well-developed scales overlap, but in some cases lie flat, edge to edge.

In birds, where a semblance of scales appears, as in the penguins, they are to be accounted for as modified feathers; and in scaly mammals, such as the manis and the scale-tailed squirrel (*Anomalurus*), the scales are formed of agglutinated hairs.

SCALES OF NOTATION. Systems for writing numbers have been formed with various bases; those known to have been used by civilized or semi-civilized peoples are chiefly the *quinary* (scale of 5), *denary* (scale of 10), *duodecimal* (scale of 12), *vicenary* (scale of 20), and *seagesimal* (scale of 60) systems. The *binary system* (scale of 2) was advocated by Leibnitz for scientific purposes. Such a system requires only the figures 0, 1, and reduces the fundamental operations to addition and subtraction. But these advantages are offset by the excessive repetitions of the digits to express ordinary numbers. Thus 289 is expressed in the binary scale 100,100,001. The *ternary* and *quaternary* systems, the latter of which is known to have been used by certain savage tribes, are open to the same objection. The quinary system (scale of 5) probably originated in the practice of finger reckoning. (See FINGER SYMBOLISM.) It is known to have been used by many savage tribes, especially among the primitive South Americans and probably among the early Russians. The *senary* system (scale of 6), *septenary* (scale of 7), *octary* (scale of 8), and *nonary* (scale of 9) may be said to exist in theory only. The denary scale as a system of numeration is practically co-extensive with civilization. It, like the quinary scale, doubtless originated in the finger reckoning of primitive peoples. This system owes its popularity largely to the simplicity and power of the Hindu notation. The base 12 of the duodecimal scale may have been suggested by the twelve lunations in the solar year. Its popularity among the Romans is well attested, and the dozen, gross, shilling, foot, and

pound are evidences of its longevity. The notation for such a system would evidently require 12 figures and possess peculiar advantages. Thus, $\frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5}, \frac{1}{6}$ of 12 units are all integral, while $\frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5}, \frac{1}{6}$ of 10 units are not. For manipulation and direct measurement which depend upon the convenient graduation of the measuring scale the duodecimal system is convenient, but for the other purposes of calculation the decimal scale is superior. The primitive Scandinavians, the Caribbees, and the Mexicans seem to have used the scale of 20. The sexagesimal system (scale of 60) was undoubtedly originated by the Babylonian priests for astronomical calculations. Perhaps the Babylonians also divided their days into 60 equal parts, as is found in the Veda calendars of the ancient Hindus. This system was also used among the Greeks, having been introduced by Hipparchus.

For the history of various scales, consult: Tylor, *Primitive Culture* (London, 1871); Coanant, *The Number Concept* (New York, 1896), and the bibliographies there given. For doubts as to the commonly accepted origin of the sexagesimal system, consult Sayce and Bosanquet, "Babylonian Astronomy," in the *Monthly Notices of the Royal Astronomical Society* (1880, vol. xl, No. 3).

SCALIGER, JOSEPH JUSTUS (1540-1609). A celebrated French scholar, the tenth child of Julius Caesar Scaliger, born August 4, 1540, at Agen, in Guienne, whence at the age of twelve he was sent to the college of Bordeaux. A pestilence breaking out in Bordeaux, he was recalled by his father, who put him under a narrow but rigorous classical training, under which he attained great proficiency as a Latinist; and in his nineteenth year, on the death of his father, he went to Paris, where he studied Greek under the famous Turnebus. He was less indebted, however, to any master than to himself; and finding that his progress was slow under his great preceptor, he closeted himself alone with Homer, and in 21 days read him through, with the aid of a Latin translation, and committed him to memory. In less than four months he mastered all the Greek poets. Hebrew, Syriac, Persian, and most of the modern European languages were acquired in rapid succession. He was a professor at Geneva, 1572-74; became a Protestant, and was thus cut off from any considerable appointment in France. Except that he traveled a good deal, and visited the chief universities of France and Germany, and even found his way to Scotland, we know little of his life up to 1593. In that year he was invited to succeed Lipsius in the chair of literature at the University of Leyden, where he spent the rest of his life. He died January 21, 1609, recognized as the leading scholar in Europe. He was a man of immense vigor of understanding and must be credited with having been the first to lay down in his treatise *De Emendatione Temporum* (Paris, 1583) a complete system of chronology formed upon fixed principles. It was this achievement that secured for him the title of father of chronological science. It was subjected to much emendatory criticism by critics like Petavius, and also by himself, its errors having been partly corrected by him in his later work, the *Thesaurus Temporum* (Amsterdam, 1658). Among the classical authors whom he criticised and anno-

tated are Theocritus, Seneca (the tragedies), Varro, Ausonius, Catullus, Tibullus, Propertius, Manilius, and Festus. His other works are: *De Tribus Sæculis Juliarum; Poemata; Epistola*; a translation into Latin of Arabian proverbs, etc. Interesting notices of him are preserved in the two volumes of *Scaligeriana*, which embody his conversations. Consult: Bernay, *Joseph Justus Scaliger* (Berlin, 1855), with a list of his works; Mark Pattison, "The Lives of the Two Scaligers," in *Essays, ed. by Nettleship* (Oxford, 1889).

SCALIGER, JULIUS CESAR (1481-1558). An Italian classical scholar, born at Riva, on Lake Garda, Italy. Up to his forty-second year Giulio Bordoni, as he was originally called, resided chiefly in Venice or Padua, engaged in the study of medicine and natural science. In 1529 he went to Agen to practice medicine and resided there until his death. He left a mass of publications and a great reputation for the extent and depth of his learning. His best known publications are: *Commentarii in Hippocratis Librum de Insomniis; De Causis Lingua Latina Libri VIII.*, celebrated as the first considerable work written on the Latin language in modern times, and not without value even to-day; his Latin translation of Aristotle's *History of Animals*; his *Excortationum Exotericarum liber quintus decimus de Subtilitate ad Hieronymum Cardanum*; his seven books of *Poetics* (also in Latin, and on the whole his best work); his *Commentarius on Aristotle and Theophrastus*; his two orations against Erasmus; his Latin poems, etc. Consult: Pattison, *Essays* (Oxford, 1889); Nisard, *Les gladiateurs de la république des lettres* (Paris, 1860); Bourronse de Lafore, *Julius César de l'Escale* (Agen, 1860); Magen, *Documenta sur Julius Cesar Scaliger et sa famille* (ib., 1873).

SCALLOP (OF, *scallop*, from MDutch *schelpe*, Dutch *schelp*, shell; probably connected with Eng. *sculp*, *scale*, *shell*). A bivalve mollusk of the family Pectinidae. The outline is regularly fan-shape, though one valve is often more convex than the other. The hinge is extended by ears, and in most species both valves have ribs radiating from the umbo to the margin. The animal has a small foot. Some of the species are capable of attaching themselves by a byssus; they are capable also of leaping by opening and rapidly closing the valves. Two species occur along the Atlantic coast of the United States, the common scallop (*Pecten irradians*) and the larger and handsomer Northern one (*Pecten Islandicus*), which is sometimes four or five inches across, the valves very much flattened and without radiating ridges; the latter species is found from Vineyard Sound northward, but is most common along the coast of Maine, Nova Scotia, etc. The common scallop is scarcely half the size of the other, the shell is considerably arched, and the radiating ridges are prominent. The scallop is in great demand as a delicacy, the large adductor muscle being the part specially sought after.

Careful and extended studies on the breeding habits of the scallop of Narragansett Bay have been made by Risser. It is a hermaphrodite, and the entire mass of eggs, probably more than a million, may be discharged in the course of an hour and a half. The breeding season is in June. The eggs, which may be artificially fertilized, are spherical and about $\frac{1}{8000}$ of an inch in diameter. The embryo begins to swim within 36 hours after

scallops are formed when the mantle edge contracts, with the characteristic 'scalloping' which appears when one year old. The average size is about 2½ inches across, to the ventral margin. It is supposed that the scallop does not live more than two years, and it is evident that taking scallops earlier than a year old is most injurious to the industry. Scallops which are marked with the 'line of growth' are those which have spawned. Although the ordinary scallop is regarded as a delicacy, the great Northern scallop (*Pecten tenuicostatus*), common in retired harbors on the Labrador coast and in the Gulf of Saint Lawrence, is still more delicious eating.

Fossil scallops are common in the rocks of all formations above the Silurian. For embryology and culture, consult Risser, *1st Report Commissioner of Rhode Island Fisheries* (Providence, 1901). For fossil species, consult Zittel and Eastman, *Textbook of Palaeontology*, vol. i. (London, 1900). See Colored Plate of CLAMS AND MUSSELS.

SCALLOP. A device in heraldry. See ESCALOP.

SCALP (probably connected with MDutch *schelp*, Dutch *schelp*, ORIG. *secliva*, dialectic Ger. *Schelle*, shell, husk, scale, and ultimately with Eng. *shell*, *scalp*). The term employed to designate the outer covering of the skull. Except in the fact that hair in both sexes grows more luxuriantly on the scalp than elsewhere, the skin of the scalp differs slightly from ordinary skin. Besides the skin, the scalp is composed of the expanded tendon of the occipito-frontal muscle, and of intermediate cellular tissue and blood-vessels. Injuries to the scalp are to be treated according to the usual antiseptic methods with especial care to drainage, since any extensive suppurative process beneath the tendon of the occipito-frontalis muscle is likely to cause serious trouble. Extensive injuries with accompanying brain shock of course require absolute rest. Burns of the scalp are very liable to be followed by erysipelas and diffuse inflammation, but the brain is comparatively seldom affected in these cases. Tumor of the scalp is not uncommon, the most frequent being the cutaneous cyst popularly known as *wen* (q.v.), and the vascular tumor.

SCALPING. The custom of removing the scalp of a slain enemy, a practice common to all the Indian tribes east of the Rocky Mountains and in the arid Southwest and the region of the upper Columbia, but apparently unknown, unless as an intrusive custom, among the Eskimo, along the Northwest coast, on the Pacific coast west of the Cascade range and the Sierras, excepting with a few California tribes, or in Mexico and southward. It is said to have existed also among the ancient Scythians. The reason for scalping seems to be that the scalp was the best possible evidence of the warrior's prowess and the most convenient souvenir for ornamentation and exhibition. Men, women, and children alike were scalped, but no scalp was ever knowingly taken from the living enemy. The scalp trophy consisted of the skin, with the hair attached, from the crown of the head over a circular diameter of about four inches. With the warriors of the Northwest, the practice of this custom had the hair on the crown of the head was always permitted to grow to its full length and was carefully braided

and ornamented with beads or other trinkets, it being held a point of honor not to shave the scalplock. The scalp was removed by drawing the knife in a circle around the scalplock and giving a strong pull, sometimes even using the teeth to help the operation. The scalp was then stretched on a little hoop to dry, after which it was painted on the under side with red paint and mounted at the end of a light rod, to be carried by the women in the subsequent scalp dance. It was afterwards kept by the warrior between the covers of his shield, to be taken out on ceremonial occasions and fastened at his horse's bridle, or was put with the tribal 'medicine,' or perhaps sacrificed to the sun by hanging it upon a tree or pole in some lonely spot. If opportunity permitted, the remainder of the hair with the skin attached was taken at the same time to be divided into scalplocks for use as fringes upon 'war shirts' or leggings.

The custom of scalping was adopted by the whites and extensively practiced, frequently with direct official encouragement, in all the border wars from King Philip's War down to within the last thirty years. The border fighters of a later period invariably scalped their slain Indians when opportunity permitted, and during the Revolutionary struggle both English and American officers encouraged their Indian allies in the practice by offers of bounties and rewards, even, in some cases, where the scalps taken were those of white people. The Mexican Government formerly employed a company of American scalp-hunters against the Apache at the fixed price of one ounce of gold per scalp. Scalps were taken by troops in the Modoc war in 1873.

SCAMAN'DER (Lat., from Gk. *Σκάμανδρος*, *Skamandros*). The ancient name of a river in the *Troad*, which, according to Homer, was also called Xanthus (Gk., yellow) by the gods. The Scamander rose in Mount Ida (q.v.), and, flowing west and north, discharged itself into the Hellespont, after being joined by the Simois, about two miles from its mouth. Like most other points in Trojan topography, the identity of this river has been disputed. It is now clear that it is the modern Menderes, though its course has probably changed since ancient times.

SCAMAN'DRIUS (Lat., from Gk. *Σκαμάνδριος*, *Skamandrios*). The son of Hector and Andromache, called Astyanax (q.v.) by the Trojans.

SCAMMONY (OF. *scammonce*, *scamonce*, *scammonie*, Fr. *scammonée*, from Lat. *scammonu*, *scammonia*, from Gk. *σκαμμωνία*, *skammonia*, scammony). A gum resin of an ashy gray color, rough externally, and having a resinous, splintering fracture. Few drugs are so uniformly adulterated as scammony, which when pure contains from 81 to 83 per cent. of resin (which is the active purgative ingredient), 6 or 8 of gum, with a little starch, sand, fibre, and water. The ordinary adulterations are chalk, flour, guaiacum, resin, and gum tragacanth. Scammony is an excellent and trustworthy cathartic of the drastic kind. The resin of scammony, which may be extracted from the crude drug by means of alcohol, possesses the advantage of being always of a nearly uniform strength, and of being almost tasteless. The *scammony mixture*, composed of four grains of resin of scammony, triturated with two ounces of milk until a uniform emulsion is obtained, forms an

admirable purgative. Another popular form for the administration of scammony is the *compound powder of scammony*, composed of scammony, jalap, and ginger. Scammony is frequently given surreptitiously in the form of biscuit to children troubled with threadworms. Scammony is derived from *Convolvulus scammonia* (natural order Convolvulaceæ), growing in Asia Minor, in Greece, and in the south of Russia. It is a perennial, with a thick, fleshy, tapering root 3 to 4 feet long, and 3 to 4 inches in diameter, which sends up several smooth, slender, twining stems, with leaves shaped like arrow-heads, on long stalks. All parts contain a milky juice. The scammony plant is not cultivated, but the drug is collected from it where it grows wild. The ordinary mode of collecting scammony is by laying bare the upper part of the root, making incisions, and placing shells or small vessels to receive the juice as it flows, which soon dries and hardens in the air.

SCAMOZZI, ská-mót'sé, VINCENZO (1552-1616). An Italian architect, born in Vicenza. He studied under Sansovino in Venice. In 1582 he had become master of works of the Procuratie Nuove, and, going to Rome in 1585, came under the influence of Fontana and Bernini. His later works in the Baroque style include the Cornaro Palace on the Grand Canal. To an earlier and less ornate period belong the Barbari monument in the Church of the Carità, which first made him famous, and the library of Saint Mark's, which he completed. He wrote *Idea dell'architettura universale* (1615). Consult the *Life by Seclari* (Treviso, 1837).

SCAMP, or BACALAO. A name in Florida for either of two species of grouper (q.v.), of the genus *Myeteroperca*, both excellent food-fishes.

SCAN'DERBEG (from Turk. *Iskenderbeg*), Prince ALEXANDER (c.1404-68). A celebrated patriot chief of Albania. His real name was George Castriota, and his father, John Castriota, was one of the hereditary princes of Epirus. In 1413 he was delivered to the Turks as one of the hostages for the allegiance of the Albanian chiefs, and his beauty and intelligence so pleased Amurath II. that he was lodged in the royal palace and brought up in Islami-sm. Placed at the head of a Turkish force, he fled in 1443 with some three hundred companions to his native country and by a stratagem made himself master of the town of Croia. At the news of his success, the whole country rose in insurrection, and in thirty days he had driven every Turk, except the garrison of Sfetigrad, out of the country. He raised an army of 15,000 men with which he scattered (1444) a Turkish force of 40,000 men. Three other Turkish armies shared the same fate. The Venetians, too, were made to feel the power of the Albanian leader, Amurath II. took the field in 1449 against Seanderbeg and stormed many of the principal fortresses, but was baffled at Croia (1450). Seanderbeg's splendid success brought him congratulations and substantial aid from the Pope and the sovereigns of Naples and Aragon. Mohammed II. granted him favorable terms in 1461, and Seanderbeg thereupon entered Italy, where he maintained the cause of the Aragonese in Naples against the partisans of the House of Anjou (1461-62). At the instigation of the Pope, he broke the truce with the Turks in 1461.

Mohammed II. dispatched two great armies for the reduction of Albania, and Croia was unsuccessfully besieged in 1466; but the restless and indomitable chief, worn out with incessant toil, died at Alessio on January 17, 1468. The war continued, but the great mainstay of the country was now wanting, and before the end of 1468 the Turkish power had been firmly established in Epirus. Seanderbeg is said to have vanquished the Turks in twenty-two pitched battles. Consult: Pisko, *Skanderbeg* (Vienna, 1894); Gibson, *Decline and Fall*, ed. Bury, vol. vii. (London and New York, 1900).

SCAN DINA'VIA. A name generally used as a collective term for the three kingdoms of Norway, Sweden, and Denmark. In a more restricted and purely geographical sense the name is confined to the great peninsula of Northern Europe, including only Norway and Sweden. The name *Scandia* was first employed by the Romans to designate a large island supposed to lie north of the Baltic Sea. This was probably Southern Sweden, which still bears the name of Skaue, and which was then not known to be connected with the mainland in the north.

SCANDINAVIAN LANGUAGES AND LITERATURE. See DANISH LANGUAGE AND LITERATURE; NORWEGIAN LANGUAGE; NORWEGIAN LITERATURE; SWEDISH LANGUAGE AND LITERATURE.

SCANDINAVIAN MUSIC. Since the beginning of the sixteenth century music has been extensively cultivated in Scandinavia, but until the nineteenth century all forms were modeled after the music of Italy, Germany, and France.

DENMARK. The earliest operas written upon Danish texts were by German composers who lived in Denmark. The more prominent among these are J. A. Schulz, Kunzen, Weyse, and Kuhlau. The first native Danish composer of note is Berggreen (1801-80), whose opera *Billedet og Busten* appeared in 1832. In the works of Johan Peder Emilius Hartmann (1805-1900) specifically northern traits appear, so that he is to be regarded as the founder of a national Danish school. This new school obtained general recognition through the works of Gade (1817-90), in whose overtures and symphonies distinctive Scandinavian themes are developed. Hartmann's son, Emil Hartmann (1836-98), added several operas to the Danish repertoire. Although in his instrumental works he strictly adheres to classical forms, he gives them a national coloring by consciously emphasizing the Scandinavian element. Winding (1835-99) was an instrumental composer of merit, in whose works the national element appears rather as the expression of his natural talent than as a conscious attempt to obtain local color. Hanmerik (1843—) at first attracted some attention with his *Northern Suites*, but gradually subordinated Scandinavian characteristics to an excessive technical development of the orchestra. The younger Danish composers include Ludwig Schytte (1848—), whose works are also warmly appreciated outside of Denmark, and Ema (1860—), whose opera *The Witch* created a sensation in 1892 in Copenhagen. In the field of dance music Denmark has produced Lumbye (1810-71), who wrote about 300 dances that are remarkable for their original and piquant

of the instrument. Special mention is made of the event with century of the organ, which he lived chiefly in the city of Buxtehude (1637-1707). He was the first to create a distinctly independent style for the organ and materially to change the style of organ playing. He also introduced instrumental forms of the toccata

During the sixteenth century Gustavus Adolphus attracted many noted foreign artists to his Court, and thus in Sweden also the cultivation of music at first remained in the hands of foreigners. The first composer of note was a German, Hillner (1759-1833), who settled in Stockholm in 1789. In his operas he is a mere imitator of Gluck, but in his Swedish songs he struck a distinct national tone. He also did much for the cause of Swedish music by his arrangements and publication of old Swedish national folk-song, and the restoration of the melodies in the "Svensk choralbok." The first native-born composer of significance was Franz Berwald (1796-1868), who wrote some good chamber music and six operas, and attracted the attention of Liszt and Bülow. Of more importance is Lindblad (1801-78), the teacher of Jenny Lind. He wrote little besides songs, which, however, are remarkable, especially in their skillful use of local color. Hillström (1826—) is highly esteemed by his compatriots for his operas, which are characteristically Swedish. Södermann (1832-76) was a musician of rare talent, a master of orchestral writing, and became well known outside of Sweden for his large works for chorus and orchestra. His harmony is refined and individual, his melodic invention original. A composer much esteemed for his symphonies, overtures, and chamber-music is Norman (1831-85). The operas of Hallén (1846—) are strongly influenced by Wagner, yet they also preserve Swedish characteristics. Sjögren (1853—) has written songs and beautiful compositions for the piano. He enjoys the reputation of being Sweden's greatest melodist. Stenhammar (1876—) attracted considerable attention through four concerts for the piano. His other works include choral ballads, overtures, and three string quartets.

NORWAY. The way for national Norwegian composers was prepared by Lindemann (1812-87), who collected and published more than 500 folk-songs. The first native composer is Kjerulf (1815-68). The number of his works is small, but both his songs and his instrumental music show national characteristics. Svendsen (1840—) has an international reputation. His works are thoroughly individual and often betray the composer's nationality by a certain harshness, although in his orchestral works he follows the neo-German school of programme music, as becomes evident from the titles of some compositions: prelude to Björnson's *Sigurd Skube*, overture to *Roméo and Juliet*, legend for orchestra *Zarahayde, Northern Carnival*. In his two symphonies op. 4 and 15 he uses the form established by the classic masters, but does not hesitate to introduce national melodies. Norwegian music suffered a serious loss through the premature death of the talented Nordraak (1842-66). At an early age he was attracted by the peculiarities of Norwegian folk-music. Shortly before his death he became acquainted with

Grieg (q.v.), who at that time was under the influence of Hartmann and Gade, and Nordraak soon aroused in his new friend the same enthusiasm which he himself felt for Norwegian melodies.

The works of Sinding (1856—) have attracted universal attention. He does not confine himself to the exclusive cultivation of national traits, but employs the larger forms (symphony, chamber-music, concertos). If he is somewhat lacking in the refinement and delicacy of Grieg, he exhibits greater power in delineating passion. Consult: Von Ravn, "Skandinavische Musik," in supplement to Mendel's *Leirikon* (Leipzig, 1882); H. Riemann, *Geschichte der Musik seit Beethoven* (Leipzig, 1901); Sombise, *Histoire de la musique ("États Scandinaves")* (Paris, 1901).

SCANDINAVIAN and TEUTONIC MYTHOLOGY. The religion of the Germanic peoples. Teutonic mythology is so largely based upon Scandinavian sources as to render the two terms almost synonymous. The number of nature gods, with marked, strong individuality, is small; the proportion of spirits and demons, elves, dwarfs, and giants, valkyries, swan-maidens, and norns, unusually large. Most of these creations are mere folk-lore or poetic personifications, rather than real mythic figures, founded upon a definite fact in outside nature, or some permanent element in the inner consciousness of man.

The final conversion of the Northern Teutons to Christianity took place about A.D. 1000. The native sources of mythology are in general not earlier than that date, many of them much later. The *Elder* or *Poetic Edda* (see *EDDA*) dates from the tenth century; the *Younger* or *Prose Edda* and the Sagas are about two centuries later. Both these dates make it likely, first, that the native ideas on the subject are present in an advanced and tangled form, considerably removed from the mythic roots that started them; secondly, that there is a strong admixture of Christian, and perhaps even classical ideas. There are indeed foreign influences in Scandinavian mythology, but, despite this non-Teutonic element, the mythology is essentially national in spirit and character.

The Scandinavian gods are anthropomorphic, like the Greek gods, but not as plastic as they. Their personality is rugged, even if they fall short both in the graceful fancy and the finished mastery of the Greek deities. In the main, however, the gods portray men: Odin (q.v.) is a powerful, shrewd, not unkindly old man; Loki is ill-tempered, fickle, deceitful, and calumniating; Balder is wondrously fair, beloved of all; Thor performs incredible deeds, but only when he has his hammer Mjöllnir; Frigg or Frigga is Odin's housewife, the mother of Balder (q.v.). The gods are human in their needs and infirmities; they eat and drink—solemnly and copiously, as Teuton gods should. Odin has lost an eye, having pledged it for a draught from the fountain of Mimir, the source of all wisdom; Tyr has lost a hand; Balder perishes. Their character, their emotions, and such morality as they claim are entirely human. They are kind or ferocious, shrewd or foolish. Frigg, Odin's wife, is the highest representation of heavenly virtue; she is the severe, rather shrewish guardian of domestic virtue and sexual morality.

The absence of truly lofty traits, æsthetical or

ethical, from the character of the gods is reflected in their worshippers. There is no piety, nor is there much faith beyond the assurance that the gods are likely to take a hand in the affairs of men. Neither gods nor men are always acting rightfully, nor are accursed deeds always avenged. Hence the gloomy idea of the so-called *urns* (q.v.). Over and above the natural sequence of either divine or human events, and above right and wrong, there is a higher inexorable law which dominates over gods and men alike. Hence, too, the power of gods and men is often dependent, not upon their inner quality, but rather upon external conditions, or upon the possession of sundry magical objects. Odin's throne Hlithskjalf enables him, or any one else who may happen to sit on it, to see all the world, and Thor's strength depends upon his hammer. The gods called Æsir (q.v.) fasten the hell wolf Fenrir (see FENRIR; RAGNARÖK) with the fetter Gleipnir, made out of the sound caused by the footfall of cats, of the beards of women, the roots of mountains, the breath of fish, and the spittle of birds.

The Edda furnishes an account of creation, and of the Scandinavian Olympus, which presents a fair average of Teutonic ideas on these subjects. The first and eldest of the gods is Odin, the All-Father, who lives from all ages, rules over all his realm, heaven and earth, and man. All the righteous shall live and be with himself in Walhalla (q.v.); but the wicked fare to Hel and thence into Nifheim (q.v.) or Nidhel, beneath in the ninth world. At first neither heaven nor earth existed, only a yawning abyss. Then the giants made a citadel for the gods called Asgard (q.v.), to which the gods ascended by the rainbow bridge called Bifröst (q.v.). There Odin sits in his high seat. His wife is Frigg, and their offspring are the Æsir (q.v.). Odin's first son is Thor (q.v.), the strongest of the gods. He has a hammer, called Mjöllnir, a strength-belt, and iron gloves that he may hold his hammer's haft. Balder is Odin's second son, fair and beautiful, and praised by all. Tyr (q.v.) is daring and stanch, while Bragi (q.v.) is famous for wisdom, clever in speech and song-craft. Among others who are good and great are Heimdallr (see RAGNARÖK), Hocmir, Vidharr, and Vali. Loki (q.v.), fair of face, ill in temper, and fickle of mood, is called the back-biter of the Æsir, the speaker of evil speech and shame of all gods and men, whom he constantly deceives. The highest seat of the gods is at the ash-tree Yggdrasil (q.v.). One of the three roots of this 'world-tree' goes to heaven to the Æsir. A second reaches to the winter giants. Under that root is the spring of Mimir (q.v.), Odin's uncle. There, once upon a time, came Odin, and begged a drink. His wisdom was exhausted, and the end of things seemed near. Mimir asked for the eye of Odin as a pledge, which the god sacrificed. The third root reaches to lowest hell. A fair hall stands under the ash by the spring, and out of it come the three norms 'Has-been' (*Urdr*), 'Being' (*Verdandi*), and 'Will-be' (*Skuld*), and grave on a shield the destiny of men.

The heroes that have fallen in battle, from the beginning of the world, go to Odin in Walhalla. Odin's 'battle-maidens,' the walkyries, protect his favorites, and grant them victory. But, when their day has come, the walkyries,

who have hitherto been invisible, reveal themselves, and conduct the fallen heroes to Walhalla. There they eat of the flesh of the boar Sœchmunnir every day and drink the mead from the goat Heidrun. Every day the heroes put on their armor and fight with each other for their sport. At evening they ride home to Walhalla and sit down to drink. But an uncertain future throws its shadow even over the citadel of the gods, for no one knows when the enemies of the Æsir will break their bonds and cause the downfall of the world. See RAGNARÖK.

Only a small stock of the Teutonic divinities can be traced with certainty to the Indo-Germanic period. In Scandinavian *teiv*, a collective designation of the gods, and in the name *Tyr*, Old High German *Zio*, we have the shining-sky-god of the prehistoric myth, reflected by Sanskrit *devas*, Lithuanian *dévas*, Old Irish *dia*, 'god,' Lat. *divus*, 'divine.' The direct equation of *Tyr*, *Zio*, with Vedic *Dyāus pitar*, Greek *Zeús πατήρ*, Lat. *Jupiter* (q.v.), has been questioned, but there is no doubt that *Tyr*, *Zio*, is the prehistoric sky and day god. The Scandinavian Æsir, German *Asen*, another generic designation of the gods, points with great certainty, through Sanskrit *asu*, 'life, spirit,' Avestan *añhu*, 'lord,' to the *Asura-Áhura*, the highest generic name for Indo-Iranian divinities. *Odin* or *Wotan* may not be severed from the Vedic storm god *Vāta*, 'Wind.' Slight phonetic obscurities notwithstanding, the Scandinavian god and goddess *Fjörgynn* and *Fjörgyn* are identical with the Lithuanian *Perkūnas*, Vedic *Parjanya* (q.v.), 'god of thunder.' Less certain, though probable, is the connection of the words for *elf* (Anglo-Saxon *ælfr*, Scandinavian *alfr*) with the *ghlu* (see RHINUS) of the Veda. Both types of divinities are famed for skill rather than strength; they are probably divinities of light, connected with the fashioning of the seasons and the year.

In the common Teutonic period three mighty gods and one goddess were worshiped, Tyr, Odin, Thor, and Frigg. Four days of the week, Tuesday, Wednesday, Thursday, and Friday, were consecrated to them. Tyr, the ancient sky god, became a war god and lost his early importance. Wodanaz (Scandinavian Odin) was originally a storm god. In the belief of the Germans he figures as the leader of the 'Furious Host,' or 'Wild Hunt.' The souls of the dead are thought to sweep with him through the air, so he becomes the leader of the souls and god of the dead. He develops also into a god of war, and finally in the Scandinavian North into the head of Walhalla, creator, orderer of the world, and god of wisdom. Each day he lets fly his two ravens, Huginn and Munin (thought and memory); when they return they alight upon his shoulders, and tell him of all that comes to pass and all that is to be.

The most popular god of Scandinavia is Thor. His mother is Fjörgyn, a female personification of thunder, and he is himself thunder personified. He is surnamed Hlorriði, 'roarer'; his hair and beard are red, typifying the lightning, and he wields the hammer Mjöllnir, which returns of itself to the hand of the god after crushing his enemies. In many myths he is the chief defender of the heavenly citadel Asgard against the attacks of the giants. He is a popular god in distinction from the more aristocratic Odin, being simple and rough, passionate, and de-

and drinking. Thor's picture is one of the seats of honor of the gods, bringing comfort and prosperity to the household.

The last of the Teuton divinities, to whom was consecrated a day of the week, is Frigg, the wife of Odin. With him she surveys, from his seat Hlithskjalf, the whole universe, and knows, as Odin's confidante, the fates of men. She is in charge of marriage, of housewifely success and happiness, and of marital fidelity. Sterile women pray to her for children, and she gives aid in the throes of childbirth. Veiled, with a distaff in her hand, and a bunch of keys at her side, she typifies the true Teuton housewife. She is the devoted mother of Balder, and weeps when he is slain. The Scandinavian myth has created a goddess Freyja (q.v.), in addition to Frigg, as a female abstraction, or sister, of the male god Freyr. The latter is one of the Vanir, a class of gods who appear to be in some kind of opposition to the Æsir. As Freyr is a god of love and truthfulness, his female counterpart Freyja is the fairest of goddesses, beneficent, and invoked in affairs of love, and is invoked in company with Frigg.

The two most important remaining characters of Scandinavian mythology are Balder and Loki. Balder, the son of Odin, and husband of Nanna, is the darling of the gods. He is so fair that light streams from him, and the whitest of all flowers is likened to him. He has an evil dream of impending danger, and therefore Frigg, his mother, puts all animate and inanimate things under a vow not to harm Balder. On the field the gods, certain not to hurt him, begin to throw all sorts of objects at him. Nothing harms him. Loki changes into a woman and extracts from Frigg the information that she had put all things under a vow, except the mistletoe, which was too young to be able to do him harm. Loki then puts the mistletoe into the hands of Hodhr, Balder's brother, to shoot as an arrow. The missile hits the mark and Balder falls dead. The kernel of the myth is probably the vanishing of the summer sun in winter. Balder, god of physical light, has become the emblem of purity and innocence. Balder's death ushers in the destruction of the world in Ragnarök (q.v.)

Loki is deceitful and malicious in character, and his naturalistic basis is problematical. He appears only in the Scandinavian myth. Though he often goes in the company of the gods, himself one of the Æsir, yet on the whole, whatever his origin, Mephistophelean devilry is a constant element of his character. Both his origin and name have been traced to Lucifer. His part in Balder's death has been shown above. Loki once ate the heart of a courtesan, became pregnant thereof, and gave birth to monsters, the wolf Fenrir, the serpent Midlgardhr, and Hel (q.v.), the goddess of death. As a boatswain upon a ship he leads the dark powers against the Æsir at Ragnarök. No Teutonic god has been explained more variously, as Fire, as the equivalent of the Vedic demon Vritra, as Prometheus, Vulcan, Lucifer, and other types. His name is supposed to mean the "closer"—a vague and doubtful appellation. It seems likely that he contains at least in part a demonic personification of fire, and as such Richard Wagner pictured him in his *Nibelungen* tetralogy.

SCANDINAVIANS. People of the Scandinavian group of the Teutonic stock consisting of the Norwegians, Swedes, Danes, and Icelanders. They are long-headed blonds. Prehistoric remains show that Scandinavia was settled in the Neolithic Stone Age, probably by migrants from the Eurasian steppes who followed a more northern route than the Slavs and developed the physical characters which are noticeable in the Teutonic stock. Scandinavia is believed by many to be the true home of the Teutonic race. These original migrants were the Gotar and Svear, who are now collectively grouped as the Scandinavians.

The settlement of Scandinavia began after the retreat of the ice cap of the Glacial period; hence the earliest and by far the most abundant traces of Neolithic man are found in the southern portion. Nowhere is the sequence of culture periods more orderly than in this region, and from this fact the students of Scandinavia have been foremost in giving to the science of archaeology a sequential basis. The burial places of the Polished Stone Age in Southern Sweden and Norway consist of dolmens, stone graves, and mounds; funeral chambers with galleries and kitchen-middens (q.v.) are also found. The Bronze Age brought in a higher civilization, and through this age and the succeeding age of iron to the historic period may be traced an increasing culture. With the Iron Age came the alphabet and the writing of runes, the use of which survived in Gothland till the sixteenth century. The Scandinavians appear in history at the time of the sea-roving expeditions, when they came in actual contact with many civilized nations and carried back to the north coins and art works of these nations. The trade in amber, which followed a well-known route, also had its effect upon the culture of Scandinavia. The inexhaustible supply of food, especially of fish, gave rise to early commerce between the peoples of this region and the nations to the south, explaining largely the diffusion of foreign culture in Scandinavia. The Swedes have taken less of blending than the Norwegians or Danes, and preserve the best type of the early migrants, especially in the Dalecarlians. The only foreign types of the region are the Laps and the settlements of short-heads on the west coast of Norway.

SCAPA. The popular designation of the Society for Checking the Abuses of Public Advertising, in London, founded for the purpose of restraining, through legislation and social influence, the disfigurement of towns and rural districts by glaringly hideous business announcements. It has been fairly successful in London, where it has been instrumental in abolishing certain abuses, mostly the obnoxious "sky-signs." It publishes a journal, *A Beautiful World*.

SCAPHOID BONE (from Gk. *σκαφοειδής*, *skaphoeidēs*, boat-shaped, bowl-shaped, from *σκάφη*, *skapḗ*, *σκάφος*, *skapḥos*, boat, bowl + *εἶδος*, *eidos*, shape). A term applied to a somewhat boat-shaped bone in the carpus or wrist (see *HAND*), and in the tarsus of the foot (q.v.).

SCAPHOP'ODA (Neo-Lat. nom. pl. from Gk. *σκάφη*, *skapḗ*, *σκάφος*, *skapḥos*, boat, bowl + *πούς*, *pous*, foot). A class of mollusks represented by the tooth-shells (*Dentalium*). The scaphopods are intermediate between the gastropods and pelecypods. The shell is white, very long and slender, slightly curved, and open at both ends. The scaphopods are found in shallow water near shore, chiefly in the warmer parts of the world. Fossil scaphopod shells are known from Paleozoic rocks, but they were not common until the Cretaceous.

SCAPIN, *σκῆπῆν*. The valet of Léandre in Molière's comedy *Les fourberies de Scapin*; a master in deceit, who manages the love affairs of his master and friend by false pretenses, and finally gains forgiveness by feigning a dying state. The name became current in France for a trickster, and the Abbé de Pradt called Napoleon 'Jupiter Scapin.'

SCAPULA (Lat., shoulder), or SHOULDER-BLADE. A flat triangular bone, which, when the arm hangs loosely down, extends posteriorly and laterally from the first to about the seventh rib. It presents for examination an outer convex and an inner, smooth, concave surface, three borders (a superior, an inferior or axillary, and a posterior), three angles, and certain outstanding processes.

Its outer, or posterior, surface is divided into two unequal parts, the supraspinous fossa, and the infraspinous fossa, by the spine, a crest of bone commencing at a smooth triangular surface on the posterior border, and running across toward the upper part of the neck of the scapula, after which it alters its direction, and projects forward so as to form a lofty arch, known as the acromion process, which overhangs the glenoid cavity, or receptacle for the head of the humerus or main bone of the arm. This acromion serves to protect the shoulder-joint, as well as to give great leverage to the deltoid muscle which raises the arm. It is this process which gives to the shoulder its natural roundness. From the upper part of the neck there proceeds a remarkable curved projection, called the coracoid process, from its supposed resemblance to the beak of a raven. It is about two inches long, and gives attachments to several muscles. The upper border of the scapula presents a notch, which in the recent state is bridged over with a ligament, and gives passage to the suprascapular nerve. This bone articulates with the clavicle and humerus, and gives attachment to no less than sixteen muscles, many of which, as the biceps,

triceps, deltoid, and serratus magnus, are very powerful and important.

SCAPULAR (ML. *scapularium*, *scapulare*, from *scapularis*, pertaining to the shoulders, from Lat. *scapula*, shoulder). A portion of the monastic habit in certain religious Orders. It consists of a long strip of serge or stuff which passes over the head, one flap hanging down in front, the other behind. With the growth of pious confraternities of people living in the world but affiliated with the religious Orders, the practice grew up and is usual today among devout Roman Catholics of wearing a small scapular, which is simply two little pieces of cloth joined by strings. These scapulars are of different colors according to the confraternities of which they are the badges. The oldest and most widespread of such associations is that of Our Lady of Mount Carmel, founded by Saint Simon Stock, sixth general of the Carmelites (q.v.), in 1251, as a consequence of a revelation which he believed himself to have received from the Blessed Virgin Mary in a vision. The granting of the scapular is generally a privilege of religious Orders, and the wearing of them is encouraged by many indulgences. By benediction they acquire the character of sacramentals (q.v.).

SCAR'ABÆIDÆ (Neo-Lat. nom. pl. from Lat. *scarabeus*, beetle; connected with Gk. *κάραβος*, *karabos*, SKI. *šarabha*, *śarabha*, locust - Gk. *εἶδος*, *eidos*, form), or CHAFERS. A family of beetles of the lamellicorn group, many of remarkable size and strange structure. About 13,000 species are already known, and about 300 new species are described each year. The leaflets of the antennæ are well adapted to each other and may be separated; the number of visible ventral segments of the abdomen is six. The family is divided into five subfamilies: Coprinae, Melolonthinae, Rutelinae, Dynastinae, and Cetoniinae. The Coprinae (about 5000 species) have already been treated under *DUNG-BEETLES*. The Melolonthinae (1000 species) resemble the common May beetle, and their larvæ, for the most part, live beneath the surface of the ground and feed upon the roots of various plants, frequently doing great damage to pasture land. The rose-chaffer (see *ROSE INSECTS*) is a prominent representative of this group. Many of the adult beetles feed upon leaves of trees and smaller plants, but some, usually found upon flowers, feed upon pollen, and are of some service in the cross-fertilization of plants. The Rutelinae (about 1500 species) are insects of brilliant metallic colors, and are more abundant in tropical than in temperate regions. Their larvæ resemble those of the Melolonthinae. Well known examples of this group in the United States are the goldsmith beetle (*Cotalpa lunigera*), the spotted vine-chaffer (*Pelidnota punctata*), and the wonderfully beautiful *Plusiôtis gloriosa*, from Arizona, which is pale green in color, and has the margins of all parts of the body and broad stripes on the elytra of a pure polished gold color. It is one of the most beautiful beetles in the world, and is figured on the Colored Plate of *BEETLES*. The Dynastinae, which comprise many very conspicuous insects, include only about 1000 species, among which are some of the largest insects in existence, especially in the genera *Dynastes* and *Megasoma*. The males of these genera and others bear large horns upon the head and prothorax,

larva of the species. The eggs and larvae are usually deposited upon decaying vegetable matter. The circumference of the elytra is usually entirely in the tropical regions of the Old World. During flight the elytra of these beetles are raised, the wings extending out from the base of the wing covers. Some of the species eat honey, others overripe or decaying fruits, and others lick the sap from wounded trees. To this group belong the sap beetle, the goldsmith beetle, and the June beetle (q.v.) of the Southern United States. Both adults and larvae of some species live in ants' nests. See BELLÉ; CHAFER; ROSE CHAFER; see also Figs. 7 and 9 of Plate BEETLES; also the figure of larva of a beetle in the same article, which is a good example of the scarabæid type of larva.
